(2) Non-technical. These FBRs are intended to support PMS requests that do not require technical review, including WC changes, such as shift of maintenance responsibility. Non-technical FBRs are submitted to request classified or other PMS documentation which cannot be obtained locally or to request clarification of issues not of a technical nature.

m. Feedback Report Submission. SKED users will generate FBRs via SKED using the Feedback Report Wizard. Command 3MCs will then export FBR text file for submission to NLSC for uploading to the Planned Maintenance System Management Information System (PMSMIS). Following adjudication NLSC will send FBR response to command 3MC for uploading into SKED for implementation as required. Non-SKED user can also generate FBRs in PMSMIS at https://pmsmis.navy.mil/Default.aspx by selecting the "Feedback" tab and "Feedback Report Wizard" from the drop-down tab. Non-SKED users accessing this web site for the first time will need to request an account. Click on "File Manager" and select "New User Account Request". This displays options to select a form and readme file, which can be downloaded, filled out and sent via e-mail as directed in the readme file. An e-mail will be sent confirming your account and providing access to the main screen.

n. Feedback Report Screening.

(1) Initial screening is accomplished by the originator or WCS who is responsible for ensuring all data is accurate and complete.

(2) The division LCPO or DIVO accomplishes the second level screening and verifies the content and validity of the FBR within three days of origination.

(3) The DH, next to screen the FBR, is responsible for verifying the content and validity of the FBR and digitally signing FBRs within five days of origination.

(4) The 3MC is responsible for screening, serializing, and forwarding FBRs within seven days of origination. The 3MC will also:

(a) Maintain accountability for all PMS FBRs submitted and actions taken until updated PMS documentation is received.

(b) Ensure that the originator and all applicable WCs are kept apprised of action taken and ensure the originating and other applicable WCSs implement the changes or corrections when received.

o. Feedback Report Screening (External to Activity). FBRs are next processed by the TYCOM. The TYCOM will verify the content and validity of the FBR and either return the document to the originator or pass it on for further processing and resolution.

p. Feedback Processing Activities.

(1) The central control points for processing FBRs are the Planned Maintenance System Coordinating Activities (PMSCA). Depending on the type of FBR and level of technical authority necessary to answer the FBR, the PMSCAs will either respond to the originator with a resolution or forward the FBR to the appropriate technical authority for action.

(2) ISEAs are those activities designated by NAVSEA as the technical experts for specific systems or equipment. Naval Surface Warfare Center, Philadelphia Detachment is the ISEA for the majority of non-nuclear hull, mechanical and electrical equipment installed on most ships. ISEAs under the direction of the NAVSEA Technical Warrant Holder adjudicate the FBR request and forward the response to the PMSCAs. The PMSCAs provide the final response to the originator and update the PMS database to reflect ISEA changes. PMS changes are issued with the next available FR.

NOTE: IT IS POSSIBLE AN FBR RESPONSE MAY NOT MAKE A SPECIFIC FR BASED ON THE DATE THE RESPONSE WAS RECEIVED BY NAVSEALOGCEN. PROCESSING TIME AND HANDLING MAY CAUSE THE REVISED DOCUMENTATION TO MISS AN FR CUTOFF DATE. HOWEVER, SINCE ALL FRS ARE NOW RECEIVED QUARTERLY, IF A REVISION MISSES THE CURRENT FR CUTOFF WINDOW, THE REVISED DOCUMENTATION WILL BE AVAILABLE WITHIN THE NEXT THREE (3) MONTHS.

q. Feedback Processing. FBRs are processed per NAVSEA policy:

(1) Urgent FBRs.

(a) The PMSCA will provide a message response to all urgent FBRs within one working day of receipt. If the FBR is forwarded to a Design Activity or ISEA for resolution, then the Design Activity or ISEA will provide a message response informing the originator of specific actions or required changes as a result of the adjudication of the FBR within one working day of receipt. This message response must be addressed to the originator and distributed to all TYCOMs of units holding the affected documentation. TYCOMs will forward this message to all commands that could be affected by the PMS change.

(b) The PMSCA will distribute revised PMS documentation to all affected users within 30 calendar days of receipt of the FBR, via special issue or ACN.

(2) Routine FBRs.

(a) The PMSCA will perform technical review, research, and provide a response to routine FBRs where resolution does not require technical authority action.

(b) FBRs that the PMSCA cannot resolve will be sent to the cognizant Design Activity or ISEA. The cognizant Design Activity or ISEA will provide the response to the appropriate PMSCA describing the action taken. The PMSCAs will provide the response to the originator by electronic means.

(c) Distribution of the revised MRC to the originator and other affected users will be accomplished via ACN or the next available FR.

(d) NAVSEA's existing policy calls for technical review activities and ISEAs to provide FBR responses in less than 21 working days from time of receipt. In addition, NAVSEA has established a goal of providing answers to FBRs in one day. While some FBRs will require extensive research and days, weeks or in some cases months to resolve, the vast majority of FBRs can and should be answered much sooner. One day may be overly optimistic, but the intent is to put the emphasis back on the timely resolution of FBRs.

(e) If no revision to PMS documentation is required, pertinent comments will be provided in the response to the PMSCA. When not concurring with the feedback report, the rationale for the non-concurrence must be provided to the PMSCA.

r. Feedback Response Implementation. Units will implement responses to FBRs based on the category and content as determined by the unit's 3MC.

(1) Urgent FBR. Within 24 hours of receipt of FBR response.

(2) Urgent FBR with an ACN. Within 24 hours of receipt, the ship or unit will implement an administrative change to incorporate the new PMS documentation. These revised documents will be utilized to conduct maintenance until the revised PMS document is incorporated into the next FR.

(3) Routine FBR:

(a) Technical. The response deals with content such as a revision to technical specifications, tolerances, test equipment, materials, acceptance criteria or the sequence of procedural steps. These changes need to be implemented within two weeks of receipt of the FBR response or prior to the next scheduled accomplishment date should that date fall within the two-week window.

(b) Administrative. The response deals with issues that do not affect the technical content or procedural steps. Administrative changes might be added steps to provide a better degree of clarity, formatting revisions to tables or figures that do not change technical content, or updating of "Notes, Warnings or Cautions" that do not impact the performance of the MRC. These changes do not need to be implemented prior to receipt of the next FR. If the next FR does not reflect the revised documentation, implementation is required before the next scheduled accomplishment date of the MRC.

(4) Routine FBR with an ACN:

(a) Technical. These changes need to be implemented via an administrative change within two weeks of receipt of the FBR response or prior to the next scheduled accomplishment date should that date fall within the two-week window. These revised documents will be utilized to conduct maintenance until the revised PMS document is incorporated into the next FR.

(b) Administrative. These changes do not need to be implemented prior to receipt of the next FR. If the next FR does not reflect the revised documentation, implementation is required via an administrative change before the next scheduled accomplishment date of the MRC.

19-4.3.13 Assessment Procedure MRCs. Assessment Procedure (AP) MRCs need not be scheduled within SKED, but they will be maintained "active" through the FR and TFR process. AP MRCs need only be printed on an "as needed" basis. The completion of AP MRCs is recorded on the work candidate. There is no need for recording unit participation in an assessment event on their PMS schedule within SKED. FBRs submitted requesting deletion of a MIP that only contains AP MRCs will be disapproved and returned to the originator.

19-4.4 MAINTENANCE AND MATERIAL MANAGEMENT EVALUATION CRITERIA.

19-4.4.1 Self-Assessments. The ability of an activity to perform critical self-assessments is instrumental to the success of the command's PMS program. The PMS Self-Assessment Program needs to address all aspects of 3-M.

a. TYCOM Policy. Each command and subordinate command(s) must conduct a rigorous quarterly 3-M Self-Assessment. The 3-M checklists contained in appendix A will be utilized and retained for 12 months. The CO will receive a formal briefing of the findings of the Self-Assessment and intended corrective actions.

b. Self-Assessment Elements. The major program elements of a Self-Assessment include an evaluation of the PMS Performance Rate (PPR) and CSMP Validity, monitoring MRC performance (monitored MRC), and conducting PMS Spot-Checks, WC audits, and deficiency abatement. 3MCs will retain monitored PMS results, Spot

Checks and WC audits from the last completed quarter in either hard copy or digital format for review supporting the self-assessment.

(1) PMS Performance Rate. The PPR is made up of the Maintenance Accomplishment Rate (MAR) multiplied by the Spot Check Accomplish Rate (SCAR) divided by 100.

$$PPR = MAR \times SCAR \div 100$$

(2) CSMP Validity. The CSMP Validity factor is evaluated utilizing the check sheets provided via Section IV (MDS) of the TYCOM's 3-M Inspection Criteria, Appendix (A).

(3) Monitored MRC. Supervisory personnel must periodically monitor the performance of PMS to provide feedback and training to maintenance personnel and to enforce command maintenance standards. Personnel charged with monitoring must be system matter experts (SME) for the system, equipment, or component for which the MRC applies. LCPOs, LPOs or personnel with similar system knowledge are appropriate. Monitored checks can be used like on the job training to teach the "right way" to conduct maintenance. These monitored MRCs will be documented as a monitored evolution and findings will be provided to the WC's CoC for inclusion into training and deficiency abatement. The value of monitor maintenance cannot be overstated, and commands are encouraged to establish a robust monitored maintenance program.

(4) PMS Spot Check. PMS Spot Checks are utilized to validate that previously scheduled and accomplished MRCs were performed and the degree to which they were performed. The checklist contained in appendix A Section II, is the tool supervisory personnel utilize to determine the accomplishment status of a completed MRC. Deficiencies noted and the final grade will be provided to the WC's CoC for abatement. The WCS will record the Spot Check grade into SKED to generate the SCAR for the quarterly PMS Performance Report. Spot Checks will involve all elements of the CoC to include the CO, CMC, XO, 3MC, department CPOs, DHs, DIVOs, divisional CPOs, and first class petty officers. By following the checklist, the inspector can determine if the sailor is competent, the maintenance was accomplished, required TPMTE was available and used, and safety precautions were followed. The focus should be less on administration and more on the condition of the gear.

(a) Avoid Spot-Checks of MRCs with insufficient complexity. Performing a Spot-Check on a 3 or 5 step MRC does not provide the CoC an accurate picture of the health of the command's maintenance program. Selected MRCs should be of sufficient content to provide the auditor with evidence of satisfactory performance (e.g., tag-outs, QA packages, parts required, off-hull reporting, test equipment, safety equipment, etc.).

(b) Command 3MCs can request modification of the Spot Check matrix if it is believed that due to the size of the command and location of their

WCs, they are unable to accomplish that requirement. Requests must be submitted in writing to CNIC 3-M team (via Regional Commander as applicable) and include their proposed Spot Check matrix for review. If approved by CNIC, the command 3MC will retain a copy of the request approval.

(c) Spot-Checks evaluated as "below standards" will require immediate training and re-performance as determined by the XO. Any re-accomplishment of the MRC must be monitored by the LCPO to ensure noted deficiencies are not repeated.

(d) Table 19-4-3 represents the minimum number of Spot Checks for CNIC activities.

(5) Work Center Audits. Each WC must receive an audit once per quarter by a supervisory individual, CPO or above. Deficiencies noted from this audit will be reported to the WC's CoC for abatement. The 3MC will report recurring deficiencies to the XO for further investigation and corrective action.

(6) Deficiency Abatement. The status of discovered deficiencies will be kept current within the monitoring program. Recurring deficiencies must be reported to the XO for further investigation and corrective action. Deficiencies that have been reported as corrected will be subject to follow up monitoring to ensure corrective action was effective and results of the follow up monitoring will be reported to the XO. The unit's 3-M Abatement Program will include the previous quarter's audits, Spot-Checks, monitored evolutions and CSMP validity audits noting trends and corrective actions.

Table 19-4-3 - CNIC Spot Checks

Management Level	Number of Checks	Interval
CO or Officer in Charge	1	Quarterly
XO or AOIC	2	Quarterly
CMC	1	Quarterly
DH	2	Monthly
DIVO	2	Monthly
3MC	1	Weekly
LCPO	2	Monthly

19-4.4.2 Inspections. The goal of the 3MI is to evaluate the effectiveness of the unit's 3-M Program. It is critical that the inspection be conducted in a similar fashion in every command and detachment across the force. CNIC does not have a dedicated 3M inspection team or 3MO to conduct independent 3MIs. Inspections will be completed concurrently with other TYCOM or ISIC inspections or visits by N31, N32, and N34 representatives. Inspections will be conducted

at the department level with results provided to CNIC N32 Ground Electronics Officer for consolidation and retention.

a. Frequency of Inspections. The TYCOM or ISIC (command exercising administrative control) will conduct a complete inspection of each command under their cognizance as follows:

(1) When deemed necessary by the TYCOM, ISIC or the unit's CO.

(2) Every 24 months in conjunction with other TYCOM inspections and not to exceed 36 months.

b. Inspection Team Composition. The team will be comprised of members from the respective TYCOM N-code that is conducting the primary inspection.

c. Method for Assignment of Numerical Evaluations. The minimum performance requirements are as identified below:

(1) Formula Acronyms:

(a) CLER = Command Level Effectiveness Review

(b) CTS = Command Total Score

(c) CVF = CSMP Validity Factor

(d) DTS = Department Total Score

(e) MAR = Maintenance Accomplishment Rate

(f) MDS = Maintenance Data System

(g) MPR = MDS Performance Rate

(h) PAR = Periodic Accomplishment Rate

(i) PPR = PMS Performance Rate

(j) SAR = Situational Accomplishment Rate

(k) SEER = Scheduling and Execution Effectiveness Review

(l) SCAR = Spot Check Accomplishment Rating

(2) CTS must 80 percent or higher. Any CTS score evaluated below 80 percent will be re-evaluated on a case by case basis.

CNIC CTS = Sum of all Departments ÷ Total number of Departments

(Example 1: CTS = N31 DTS + N32 DTS + N34 DTS ÷ 3)

(3) Each Department is required to meet the DTS minimum of 80 percent.

(a) DTS = Sum of all Work Center Scores ÷ Total number of Work Centers

(b) Work Center Score= (PPR x .5) + (CVF/MDS x .3) + (SEER x .2)

(c) PPR = 50% of the Work Center Score

(d) CVF/MDS = 30% of the Work Center Score

(e) SEER = 20% of the Work Center Score

(f) PPR = MAR x SCAR ÷ 100

(g) MAR = (PAR x .5) + (SAR x .5)

(h) MAR = PAR (If WC holds no situational maintenance)

(i) SCAR = Sum of Spot Check Scores ÷ Total number of spot checks

(4) Ranking Standards.

(a) Commands, departments, and WCs will be evaluated as "Above Standards" overall in 3-M if the unit's total score is 90% or higher.

(b) Commands, departments, and WCs will be evaluated as "At Standards" overall in 3-M if the unit's total score is between 80% and 89.99%.

(c) Commands, departments, and WCs will be evaluated as "Below Standards" overall in 3-M if the unit's total score is less than 80%.

(d) All calculations will be rounded to two decimal places.

d. Inspection Procedures. Appendix A provides a standard means for evaluating the 3-M Program. These procedures, centered on a set of core attributes applicable to all, are used to conduct 3-M Inspections. Inspection procedures are divided into six major areas:

(1) Section I - Work Center and Command Effectiveness Reviews

(a) Scheduling and Execution Effectiveness Review.

(b) Command Level Effectiveness Review.

(2) Section II – Spot Check Accomplishment Rating (Spot Checks).

(3) Section III - Assessment of Maintenance Accomplishment Rate.

(4) Section IV - Maintenance Data System.

(5) Section V – Proficiency

(6) Section VI - 3-M Inspection Command Total Score.

e. Inspection Reporting. Significant deficiencies and numerical assessments are reported to the assessed unit's CO, ISIC and TYCOM using the format shown in Appendix C. Reporting may be accomplished on the entire unit or on a departmental basis.

(1) Significant deficiencies require a report of corrective actions taken by the unit to be forwarded to the TYCOM via the ISIC within 30 days following the inspection.

(2) Any command or department receiving an overall evaluation of below standard in either PPR or CVF and MDS must be re-evaluated within a reasonable period, not to exceed six months, to ensure below standard areas have been corrected.

f. Inspection Data Retention. CNIC will maintain an inspection data file for each unit. As each command is evaluated, the individual evaluation standards and calculated values identified will be recorded in the data file with a copy of the inspection report provided to the inspected command. Section I through Section VI of Appendix A of this chapter provides specific criteria to be used in the assessment of each command.

APPENDIX A
INSPECTION CRITERIA

APPENDIX A

SECTION I-A1

SCHEDULING AND EXECUTION EFFECTIVENESS REVIEW (SEER)

Complete the SEER checklist below for each WC. Enter a numeric evaluation of each inspection attribute and provide amplifying information to describe the deficiencies driving point deductions on the "Remarks" page provided. Significant deficiencies will be reported via the final inspection report.

Command	Department	Division	Work Center	Date

		General Attributes	Value	Points
1.	Does the WC PMS file contain:			
	a.*	The current Service Brief?	1	
	b.*	Current and applicable 3-M messages, notices, and supplementary information?	2	
2.		Do MIPs and MRCs accurately reflect equipment configuration; are non-applicable MRCs correctly lined-out and are applicable MRCs active?	10	
3.	*	Does the WC retain an auditable record of 3-M personnel qualification standards and designation letters?	5	
		Maintenance Requirement Card (MRC) Deck		
4.		Is the WC deck of MRCs, including classified MRC locator cards, complete and current? (Per TYCOM direction)	2	
5.		Are locally generated MRCs complete and current?	3	
6.		Are blanks requiring installation data (including MRC location block) filled in prior to use? Specific location must reflect BLDG # with Room #.	3	
		Chain of Command SKED Administration		
7.	Are all administrative changes approved at the appropriate level?			
	a.	Is the FR approved by DH? (Verify using Journal tab.)	2	
	b.	Are weekly closeouts are performed by close of business on the first workday of the week by the LCPO?	2	
	c.	Are lineouts and MRC customization approved by the LCPO?	2	
	d.	Are check notes reviewed, and alerts approved by the DH?	2	
		Location Guide Lists		

8.	a.	Do LGLs contain required information (e.g., equipment name, equipment location, equipment serial number or unique identifier)?	3	
	b.	Are maintenance items in SKED associated to the existing equipment configuration?	3	
Situational Requirements				
9.	*	Are all situational (states, triggered or metered) events being scheduled and executed in SKED?	8	
PMS Execution and Accountability				
10.		Are check note entries accurate, valid, and complete?	3	
11.	*	Was maintenance assigned only to qualified maintenance personnel for MRCs requiring unique qualifications, NECs, or billet?	4	
12.		Are current quarter and previous quarter 13-week reports maintained?	3	
13.		Is a check note made for maintenance actions not completed or rescheduled during the week and retained in SKED?	2	
14.		Is a unique tag-out serial number or "tag-out not required" entered as a "check note" for maintenance actions requiring a lock out or tag-out and marked as complete?	2	
15.		Have the minimum number of spot checks and monitored checks been accomplished?	3	
FBR File				
16.		Are FBRs tracked in SKED, "Action Taken" block updated by WCS?	3	
Inactive Equipment Maintenance				
17.	*	Is the start of an inactive period correctly annotated and approved by DH?	2	
18.		Are all **Inactive Equipment Maintenance** requirements properly scheduled?	5	
19.		Is the completion of the inactive period correctly annotated?	2	
Totals (Attributes evaluated as NA are not calculated)		Total Points Available:_____	Total Points Awarded:_____	
SAT ☐ **SAT is 80% or better (Score = Points Awarded Divided by Points Available)			UNSAT ☐	

*** Electronic Versions Acceptable**

Attribute Scoring:

≥ 85% = Satisfactory = Full Credit

< 85% = Unsatisfactory = No Credit

Example - Attribute 18 – If 85% or better of IEM requirements were properly scheduled, points awarded would be five (5). If less than 85% of IEM requirements were properly scheduled, points awarded would be zero (0).

APPENDIX A

SECTION I-A2

SEER REMARKS

Provide amplifying information to describe the deficiencies driving point deductions. Significant deficiencies must be reported via the final inspection report.

Attribute #	Amplifying Information
Print Inspector's Name: _____ Signature: _____	
Command: _____ Date: _____	

APPENDIX A

SECTION I-A3

SKED 3.2 SEER CHECKLIST GRADING ATTRIBUTES

*** Indicates electronic versions acceptable.**

1. **Attribute 1**: Does the WC PMS file contain:
2. **Attribute 1a. (*)**:
   a. Current Service Brief?
   b. Is the latest FR PMS Service Brief available?
3. **Attribute 1b. (*):**
   a. Current and applicable 3-M messages, notices, and supplementary information?
   b. Are applicable messages and bulletins that provide additional guidance, information or areas of focus that pertain to MIPs or MRCs available?
4. **Attribute 2:**
   a. Do MIPs and MRCs accurately reflect equipment configuration; are non-applicable MRCs correctly lined-out and are applicable MRCs active? (May be MIP standardization violations)
   b. Does WC meet TYCOM MIP standardization requirements? Are any MRCs listed on MIP lined-out that are applicable to installed equipment configuration and within the cognizance of the WC to perform maintenance? (Split MIP log will be verified against the LOEP and MIP.)
   c. Are applicable MRCs active on all applicable maintenance items?
   d. Are non-applicable MRCs lined-out? MRCs that are not applicable to the WC's installed equipment configuration.
   e. Are line out justifications on MIPs accurate?
5. **Attribute 3 (*):**
   a. Does the WC retain an auditable record of personnel PQS qualifications and designation letters?
   b. Does the WC have record of the following: Designation letters for the 3MC, DIVO, Departmental 3-MA, LCPO and WCS; 3-M PQS completion validation for 3MC (307), DH (306), Departmental 3M Assistant (305), DIVO (304), LCPO (304), WCS (303), MP (301)? FLTMPS report, if available, must be used. If FLTMPS is not available, PQS watch station cover sheets signed by the XO or DH must be used.
6. **Attribute 4**:
   a. Is the WC deck of MRCs, including classified MRC locator cards, complete and

current? (Per TYCOM direction)

b. Does WC MRC deck contain all MRCs that are not lined-out on MIP? As a minimum, the deck will contain all quarterly checks and below, all R-checks, and all MRCs with fill in the blanks or pen and ink changes. Any MRC completed within the previous 13 weeks must be retained in the WC MRC deck. Verify SYSCOM MRC control number against MIPs per the 3-M Manual or TYCOM guidance?

c. Does MRC location block contain one of the following entries, as appropriate?

(1) BLDG # with room #;

(2) "See LGL,"

(3) "See Metbench Calibration Management System (MCMS),"

(4) "See Account Inventory Summary (AIS),"

(5) "LGL attached."

d. Is the MRC SYSCOM correct and matches the SYSCOM number on the MIP?

7. Attribute 5:

a. Are locally generated MRCs complete and current?

b. Does the command perform local maintenance?

c. Has the local maintenance been recently updated?

d. Is there a locally generated LOEP with MIPs associated to these MRCs?

e. Shore stations that do not have a locally generated MRC documentation mark as "NA".

8. Attribute 6:

a. Are blanks requiring installation data (including MRC location block) filled in prior to use? Specific location must reflect BLDG # with Room #.

b. Are all WC MRCs with blank fields or tables within the MRC procedure block requiring data completed?

9. Attribute 7: Are all administrative changes approved at the appropriate level?

10. Attribute 7a: FR approved by DH. (Verify using Journal tab.) Has the final approval of revisions (FR, ACNs, FBR, Document Information Transmittals (DIT), and administrative changes) been completed by DH?

11. Attribute 7b:

a. Weekly closeouts are performed by close of business on the first workday of the week by the LCPO?

b. Is the weekly closeout completed on the first workday of the week?

c. Is the weekly closeout completed by LCPO?

12. Attribute 7c: All lineouts and MRC customization approved by the LCPO. Are all lineouts approved and initialed by LCPO?

13. Attribute 7d:

a. Are check notes reviewed, and alerts approved by the DH?

b. Are check notes and alert details approved by DH?

14. Attribute 8a (*):

a. Do LGLs contain required information (e.g., equipment name, equipment location, equipment serial number or unique identifier)?

b. WCs with LGLs: Does the LGL have equipment nomenclature, serial number or unique identifier, and location (BLDG # and Room #) block completed for each line item?

c. If equipment manufacture serial number is available, it must be used.

15. Attribute 8b:

a. Are maintenance items in SKED associated to existing equipment configuration?

b. Are maintenance items in SKED correctly associated with equipment configuration?

16. Attribute 9 (*):

a. Are all situational (states, triggers, metered) events being scheduled and executed in SKED?

b. Are all local triggers and states executed as required?

c. Are all required R-Checks listed on the accountability logs and scheduled in SKED?

d. Are metered readings entered and tracked in SKED (if applicable)?

17. Attribute 10:

a. Are check note entries accurate, valid, and complete?

b. For all entries on the WC schedule that are not marked complete, is there a corresponding check note entry?

c. Does the check note entry begin with either: rescheduled, out of periodicity, non-accomplished, not applicable (NA) for situational checks and with the date the check went out of periodicity, the reason why the MR was not accomplished, or the reason check was not applicable?

d. Cent (¢) sign entries will begin with "Performed by" and followed by the detailed information of the outside activity completing the maintenance, JSN, work order or applicable documentation used to complete the maintenance. Proof of the completion will be maintained in the WC PMS file until the next accomplishment of the maintenance action. DH will sign for accountability of all maintenance actions completed by outside activities.

18. Attribute 11:

a. Was maintenance assigned only to qualified maintenance personnel for MRCs requiring unique qualifications, NECs, or billet?

b. For MRCs that indicate or require unique qualifications such as: Safety Petty Officer, Damage Control Petty Officer, gage calibration or NECs, does the assigned individual(s) hold that qualification or billet? (Utilize school completion certificates, position descriptions or FLTMPS for verification.)

19. Attribute 12: Current quarter and previous quarter 13-week reports? (Due to unreliability of SKED 3.2 ashore databases hard copy 13-week reports are required in the event of database corruption.)

20. Attribute 13:

a. Is a check note made for maintenance actions not completed or rescheduled during the week and retained in SKED?

b. Do all check note entries match all entries in SKED?

21. Attribute 14:

a. Is a unique tag-out serial number or "tag-out not required" entered as a "check note" for maintenance actions requiring a lock out or tag-out and marked as complete?

b. No entry is required for maintenance not completed.

22. Attribute 15:

a. Have the minimum number of spot checks and monitored checks been accomplished?

b. Are all required spot checks completed per Table 19-4-3 of this chapter.

23. Attribute 16:

a. Are FBRs being tracked in SKED, "Action Taken" block updated by WCS?

b. Does the WC retain copies of FBR responses requiring changes to PMS documents until reflected in the FR?

c. Are FBRs being tracked in SKED?

d. Are FBR responses entered in SKED when received and action taken updated within seven days?

e. If no outstanding FBRs, mark as NA.

24. Attribute 17 (*):

a. Is the start of an inactive period correctly annotated and approved by DH?

b. Does WCIEM tab annotate the proper IEM status?

c. If WC has systems or equipment in IEM Status II , is a JSN, work documentation, DH authorization and outside activity or repair WC annotated?

d. Did the WC obtain DH written authorization prior to placing equipment in IEM?

e. If there is no equipment in IEM in the last 13 weeks, mark as NA.

25. Attribute 18:

a. Are all IEM requirements properly scheduled?

b. Does the WC annotate the proper scheduling of all applicable IEM maintenance (e.g., LU and PM)?

c. If there is no equipment in IEM in the last 13 weeks, mark as NA.

26. Attribute 19:

a. Is the completion of the inactive period correctly annotated?

b. Does the WC schedule annotate the proper scheduling when removing equipment from IEM (e.g., SU and OT)?

c. If there was no equipment removed from IEM in the last 13 weeks, mark as NA.

APPENDIX A

SECTION I-B1

COMMAND LEVEL EFFECTIVENESS REVIEW

Using the attributes and grading criteria described below, conduct the CLER. Provide amplifying information for deficiencies causing point reduction on the remarks page.

Command			**Date**	
General Attributes			**Value**	**Points**
1.	Does the 3MC maintain:			
a.		A Change Accountability Log (including FBR Accountability Log in SKED)?	2	
b.	*	A log tracking the assignment of MRCs from split MIPs to ensure all applicable MRCs are assigned (if applicable)?	3	
c.		A LOEP containing locally generated MIPs and a record of the associated MRC files?	2	
d.	*	A current PMS (and where applicable TFR) DVD or downloaded file?	3	
2.		Does the command have a reliable system for backing up MDS and PMS data?	5	
3.	*	Does the 3MC have an effective system in place to track, route and explain externally provided PMS changes?	3	
4.		Is there an effective system in use (Spot Check Program) whereby supervisory personnel periodically and routinely monitor PMS performance?	10	
5.		Have all FBRs entered in SKED been properly reviewed by the CoC and submitted off station within seven days?	3	
6.		Have CSMP reconciliations been conducted per JFMM and TYCOM instructions?	5	
7.	*	Does the activity conduct internal audits (Quarterly Self-Assessments) of all WCs and retain for one year copies of deficiencies, corrections, and abatements?	15	
8.	*	Does the 3MC provide weekly status reports to the 3-M Manager per specific TYCOM directives?	3	
9.	*	Does the 3MC have an approved master copy of 3-M PQS specifically tailored for the command?	3	
10.	*	Does the 3MC maintain an auditable record of PMS PQS for the command (e.g., copy of service record entries, signed copy of	3	

		PQS cover letter, officer verified divisional training record or FLTMPS report)?		
11.		Does the 3MC maintain the status of command FBRs, responses and follow up actions taken in SKED?	3	
12.		Does the activity conduct 3-M Program training per directives?	10	
13.		Does the 3MC have an active AWN account with proper permissions?	2	
14.		Does the 3MC retain one years' worth of quarterly reports?	2	
15.		Are the quarterly reports signed and dated by the CoC?	2

SECTION I-B2

COMMAND LEVEL EFFECTIVENESS REVIEW REMARKS

Provide amplifying information describing the deficiencies and associated point deductions. Significant deficiencies will be reported via the final inspection report.

Attribute #	Amplifying Information
Print Name: _____ Signature: _____	
Command: _____ Date: _____	

APPENDIX A

SECTION I-B3

CLER CHECKLIST GRADING ATTRIBUTES

* Indicates electronic versions acceptable.

1. Attribute 1: Does the 3MC maintain:
2. Attribute 1a:
   a. A Change Accountability Log (including FBR Accountability Log in SKED)?
   b. Is the Accountability Log and FBR record in SKED updated?
3. Attribute 1b:
   a. A log tracking the assignment of MRCs from split MIPs to ensure all applicable MRCs are assigned (if applicable)?
   b. Is a log available and approved by the XO to track the assignment of MRC(s) from split MIPs?
4. Attribute 1c:
   a. A LOEP containing locally generated MIPs and a record of the associated MRC files?
   b. Does the 3MC maintain a LOEP that contains locally generated MIPs?
   c. Does the 3MC maintain a master file with the locally generated MRC documentation?
   d. Shore stations that do not have a locally generated LOEP or associated locally generated MRC documentation mark as “NA”.
5. Attribute 1d (*):
   a. A current PMS (and where applicable TFR) DVD or downloaded file?
   b. Is the latest PMS FR and TFR loaded and finalized on the first Monday of the quarter or on the later date as authorized by TYCOM?
   c. Is the latest version of SKED implemented?
6. Attribute 2 (*): Does the command have a reliable system for backing up MDS and PMS data?
   a. Are back-ups and daily systems checks conducted?
   b. Are external back-ups available?
   c. Are multiple data points saved on NMCI or ONE-NET servers as required?
7. Attribute 3 (*):
   a. Does the 3MC have an effective system in place to track, route and explain externally provided PMS changes?
   b. Does the 3MC route, maintain and track externally provided PMS changes?

8. Attribute 4:
   a. Is there an effective system in use (Spot Check Program) whereby supervisory personnel periodically and routinely monitor PMS performance?
   b. Does the 3MC maintain a Spot Check Matrix for the current week and the past 13 weeks?
9. Attribute 5:
   a. Have all FBRs entered in SKED been properly reviewed by the CoC and submitted off hull within seven days?
   b. Are all FBRs entered in SKED?
   c. Are all FBRs reviewed and processed off station (PMSMIS) within seven days?
10. Attribute 6:
   a. Have CSMP reconciliations been conducted per JFMM and TYCOM instructions?
   b. Does the command or activity routinely submit CSMP reports to the ISIC or TYCOM per TYCOM direction?
11. Attribute 7 (*):
   a. Does the activity conduct internal audits (Quarterly Self-Assessments) of all WCs and retain for a one year the copies of deficiencies, corrections, and abatement?
   b. Does the unit conduct quarterly internal audits or self-assessments of all WC PMS?
   c. Are quarterly self-assessments retained for one year?
   d. Are complete quarterly self-assessment deficiencies and POAM submitted to ISIC or TYCOM?
12. Attribute 8 (*):
   a. Does the 3MC provide weekly status reports to the 3-M Manager per specific TYCOM directive?
   b. Does 3MC provide weekly status reports to the 3-M Manager ?
   c. Does 3MC retain the last 13 weeks of weekly reports?
   d. Does 3MC retain the cover pages of one years' worth of weekly reports signed by the CoC?
13. Attribute 9:
   a. Does the 3MC have an approved master copy of 3-M PQS specifically tailored for the command?
   b. Does 3MC have a master copy of 3-M PQS specifically tailored for the command that is approved by the CO?
   c. Is the command using the latest version of 3-M PQS?
14. Attribute 10 (*):

a. Does the 3MC maintain an auditable record of PMS PQS for the command (e.g., copy of service record entries, signed copy of PQS cover letter, officer verified divisional training record, or FLTMPS report)?

b. Does the 3MC will maintain a list of all assigned 3-M positions and PQS qualifications?

c. Are all personnel qualified for their assigned 3-M positions?

15. Attribute 11:

a. Does the 3MC maintain the status of command FBRs, responses and follow up actions taken in SKED?

b. Are the FBR response actions noted in SKED Feedback Report Manager?

c. Are command generated FBRs, responses and action taken tracked in SKED.

16. Attribute 12:

a. Does the activity conduct 3-M Program training per directives?

b. Is 3-M training included in PB4T (Planning Board for Training).

c. Is 3-M training scheduled and published in the POW or POD?

d. Does the 3MC retain copies of 3-M training muster sheets for a minimum of one year?

17. Attribute 13: Does the 3MC have an active AWN account with proper permissions?

18. Attribute 14: Does the 3MC retain one years' worth of quarterly reports?

19. Attribute 15: Are the quarterly reports signed and dated by the CoC?

20. Attribute 16: Are the Check Note Reports included?

APPENDIX A

SECTION II-A

SPOT CHECK ACCOMPLISHMENT RATING (SCAR)

Using the basic definitions and guidelines described, determine the PMS Spot Check Accomplishment Rating (SCAR) for each WC. Enter the values determined on the Spot Check Monitor Form, section II-A of this appendix.

For all completed maintenance (including daily, weekly, and bi-weekly) from the last 13 weeks. Every WC will receive at least one periodic and one situational documented spot check. The maximum spot checks accomplished during the inspection will be five per WC.

1. Complete an MRC Evaluation, SCAR Check Sheet, section II-A of this appendix, for each MRC selected. Based on the results, evaluate the overall effectiveness of the accomplishment of each MR selected. Enter a numeric evaluation of each assessment attribute and provide amplifying information describing the deficiencies and associated point deductions. Significant deficiencies will be reported via the final inspection report.

2. The SCAR Check Sheet reflects a series of questions to be asked to determine the accomplishment status of an MRC previously reported as accomplished. Although, the sheet may be used as a reference for conducting a real time monitored MRC evaluation, for the purposes of conducting a 3MI, all spot checks will be conducted on accomplished (historic) MRCs.

3. Due to the nature of MRC completion, supporting programs such as Tag-Outs and HAZMAT are encountered. Care should be taken to avoid expanding the spot check to a review of the processes of those programs thereby preventing the assessor from determining the accomplishment status of the MRC under review.

4. The following is expanded guidance for completion of the SCAR check sheet. Best practices or other policies not supported by source documentation will not be included in evaluating compliance:

a. (1.a.) Determine if the MP is qualified to perform the maintenance task. PQS 301 is required for all MRCs but attention should also be paid to other qualifications required such as Quality Maintenance (see volume 5, part I, chapter 3, paragraph 3.4 of this manual) or graduation from a required school such as gage calibration technician.

b. (1.b.) Determine if the correct TPMTE were used during the performance of the MRC. If the MP did not have the required TPMTE, it is unlikely that he or she would have been able to complete all the procedural steps of the MRC as required. If an item of TPMTE was required to perform a conditional step and that step was not required to be accomplished, it is not considered deficient. If the required test equipment required calibration, ensure that the calibration is within date and the equipment is of sufficient scale to accomplish the MRC.

c. (1.c.) Determine if the MP maintained the correct equipment.

d. (1.d.) Examine the MRC to determine that any locally applied changes are authorized by procedural notes, external correspondence, or allowed by reference (b).

e. (1.e.) Determine applicability of the MRC to the component that the MP signed for completion on the 13-Week Accountability Log.

NOTE: IF A PROCEDURAL STEP WAS NOT COMPLETED, THE MRC SHOULD NOT HAVE BEEN REPORTED AS COMPLETE AND THEREFORE THE ATTRIBUTE GRADE SHOULD BE ZERO AND ALL SUBSEQUENT ATTRIBUTES SHOULD ALSO BE ZERO, EFFECTIVELY "FAILING" THE SPOT CHECK.

f. (2.a.) From a variety of potential techniques, determine if the MP performed all the required steps of the MRC. This may be accomplished via re-enactment, a discussion regarding the steps or re-performance. The inspector should come away with a clear impression that all the steps of the MRC were either fully accomplished or not.

NOTE: IF A REQUIRED TAG-OUT WAS NOT CONDUCTED IN SUPPORT OF ACCOMPLISHING THE MRC, THE MRC SHOULD NOT HAVE BEEN CONDUCTED AND REPRESENTS A SERIOUS SAFETY VIOLATION. THEREFORE, THE ATTRIBUTE GRADE SHOULD BE ZERO AND ALL SUBSEQUENT ATTRIBUTES SHOULD ALSO BE ZERO, EFFECTIVELY "FAILING" THE SPOT CHECK.

g. (2.b.) If required by the MRC, verify that a Tag-Out was hung before the maintenance was performed. Ensure the isolation boundaries were appropriately identified and correctly positioned to ensure complete isolation of the maintained equipment. If no tag-out was required, write NA on the sheet.

NOTE: FAILURE TO ADHERE TO A SAFETY PRECAUTION PROVIDED ON THE MRC CONSTITUTES A SERIOUS SAFETY VIOLATION AND THE FAILURE TO PERFORM THE MRC AS WRITTEN. THE ATTRIBUTE GRADE WILL BE ZERO AND ALL SUBSEQUENT ATTRIBUTES WILL ALSO BE ZERO, EFFECTIVELY "FAILING" THE SPOT CHECK.

h. (2.c.) Determine compliance with all specific safety precautions listed on the MRC. If no safety requirements were invoked, write NA on the sheet.

i. (3.a.) By physical examination of the maintained equipment, determine if maintenance of the nature required by the MRC had been performed. Take note of fasteners that would have had to be disturbed, dirt in filters, fresh oil, etc. to make a judgment as to whether the maintenance has been performed.

NOTE: DUE TO THE POTENTIAL LIABILITY INCURRED BY IMPROPER USE AND DISPOSAL OF HAZMAT, SOME WCS HAVE ASSIGNED SPECIALLY TRAINED PERSONNEL TO PROVIDE HAZMAT AND DISPOSAL SERVICES FOR SURPLUS MATERIAL INSTEAD OF THE MP. THIS IS ACCEPTABLE PROVIDED THE INSPECTOR CAN DETERMINE FULL COMPLIANCE.

j. (3.b.) Determine through questioning and record verification that HAZMAT was properly used and disposed of as a means of determining whether the MRC was accomplished. Once the inspector has determined that the HAZMAT was used and

disposed of correctly, this attribute is considered fulfilled. If no HAZMAT was required to be utilized, write NA on the sheet.

k. (3.c.) Determine if the MP could have performed the MRC from a standpoint of being trained and proficient in the tasks called out for by the procedure.

l. (4.a.) Determine if the MP filled out the 13-Week Accountability Log or annotated proper disposition of maintenance in SKED correctly for the accomplished MRC with the appropriate accomplishment date. Ensure that if a tag-out isolation was used; the tag serial number is recorded in the space allowed or as a check note in SKED. Ensure that the printed name and legal signature of the MP who performed the maintenance is recorded or, in case of group performed PMS, the MP in charge of the group.

m. (4.b.) From reviewing the discussions and findings during the spot check, determine if an FBR had been submitted if required. If no FBR was required, write NA on the sheet.

n. (4.c.) Determine if a material deficiency was noted during the PMS; if so, examine the CSMP to ensure the deficiency was documented. If no material deficiency was noted, write NA on the sheet. If material discrepancies are properly documented in the CSMP attribute graded as a two. Material discrepancies which are not documented in the CSMP will be entered with an automatic grade of zero.

5. When a Spot Check is determined to be below standards, the command undergoing inspection is likely to have numerous questions. To facilitate root cause analysis and the formulation of an effective corrective action plan, care should be taken to clearly identify factors contributing to deficiencies that led to the conclusion that the MRC was not conducted as written or not conducted at all.

APPENDIX A

SECTION II-B

SCAR CHECK SHEET

Planned Maintenance System (PMS) 3-M Spot Check Form						
COMMAND	**DEPARTMENT**	**EQUIPMENT**	**WORK CENTER**	**DATE PERFORMED**	**MIP EVALUATED**	**MRC EVALUATED**
Maintenance Person:				**Spot Check Date:**		

NOTES:

1. If an attribute marked with an "*" is evaluated as unsatisfactory, all subsequent attributes will be graded as "0".

2. Attribute marked with a pound sign "#" – Due to the potential liability incurred by improper use and disposal of HAZMAT, some WCs have assigned specially trained personnel to provide HAZMAT and disposal services for surplus material instead of the MP. This is acceptable provided the inspector can determine full compliance.

Inspection Attribute			Value	Grade	Notes
Contact the MP assigned responsibility for the accomplishment of the MRC, have the individual deliver MRC, and determine the following by questions, personal observation, or both.					
1.	**a.***	**Is the MP qualified (PQS) to perform the MR?**	**2**		
	b.	**Did the MP present the correct tools, personal protective equipment, parts (NSN), material (Military Specification** (Military Specification)**) and calibrated test equipment?**	**3**		
	c.	**Did the MP properly identify the equipment (location, equipment validation)?**	**4**		
	d.	**Are there unauthorized changes or corrections to the MRC?**	**3**		
	e.	**Is the MRC correct for the equipment maintained?**	**3**		
Demonstrated all steps of MR including all Notes, Warnings and Cautions according to the MRC.					
2.	**a.***	**Followed all steps of the MRC.**	**5**		
	b.*	**Correctly performed equipment Tag-Out.**	**5**		
	c.*	**Followed all safety precautions.**	**5**		
Does the equipment condition reflect accomplishment of the MRC?					
3.	**a.**	**Is it apparent that maintenance was performed recently?**	**10**		
	b.#	**Correctly demonstrated use and disposal of Hazardous Material.**	**3**		

	c.	**Was the MRC within the capability of the assigned individual?**	**5**		
PMS Reporting					
4.	**a.**	**MP reported status of MR to the WCS if Completed or Not Fully Accomplished and made appropriate updates in SKED.**	**2**		
	b.	**WC generated FBR for any problem with MRC.**	**2**		
	c.	**Material deficiencies detected by the PMS action were recorded in MDS.**	**2**		
Attributes Evaluated as NA are not Calculated					
Total Points Available:_____				**Total Points Awarded:_____**	
Spot Check (SCAR) (Grade = Points Awarded ÷ Points Available): SCAR =					
Above Standards (90% or greater)		**At Standards (80-89.99%)**		**Below Standards (less than 80%)**	
☐ **Above Standards**		☐ **At Standards**		☐ **Below Standards**	
Below Standard grade requires immediate accomplishment (if XO determines re-performance is required) monitored by a Chief Petty Officer

APPENDIX A

SECTION III

MAINTENANCE ACCOMPLISHMENT RATE (MAR)

1. The Maintenance Performance formula has been redefined to more effectively capture maintenance that was not scheduled.

2. The PAR and SAR reports are automatically generated by SKED.

3. The MAR grade will be determined utilizing the formula reflected and a date range consisting of the previous 13 weeks of maintenance.

MAR = (PAR x .5) + (SAR x .5)

MAR = PAR (If WC holds no situational maintenance)

PAR = Comp ÷ (Comp + Lost + Alerts + Omitted)

SAR = Comp ÷ (Comp + Lost + Omitted)

4. Omitted is defined as any maintenance action that should have been performed on any and every maintenance item and no matter the reason did not get scheduled. For example:

   a. Situational or state maintenance that did not get scheduled when the situation dictated.

   b. Improperly lined-out periodic checks.

   c. Non-accomplished IEM checks.

   d. Non-accomplished maintenance added via ACN, FBR, Preliminary PMS, etc.

APPENDIX A

COMMENTS

APPENDIX A

SECTION V-B

SPF DESCRIPTION AND GRADING ATTRIBUTES

1. **Able to log on**.
   a. Click on SKED 3.2 desktop icon.
   b. Enter username and password.
   c. Click "**Enter**".
2. **Able to open a Work Center**.
   a. On the view tab bar, click "**WORKCENTER**". A box opens.
   b. Click to highlight the WC to be open.
   c. Click "**Open**" or double click the highlighted WC to open it.
3. **Able to view the Schedule, Review, Forecast, Situational, IEM, Journal and PMS Document display**.
   a. From the WC toolbar, click "**Schedule**".
   b. From the WC toolbar, click "**Review**".
   c. From the WC toolbar, click "**Forecast**".
   d. From the WC toolbar, click "**Situational**".
   e. From the WC toolbar, click "**IEM**".
   f. From the WC toolbar, click "**Journal**".
   g. From the WC toolbar, click "**PMS Documents**".
4. **Able to annotate disposition of maintenance**. (Mark a check as complete etc.)
   a. From an open WC, in the grid, click to highlight the desired check.
   b. Right click the selected item and select the "**Complete** (Green X) **Check**" icon from the menu.
   c. The icon (Green X) will be displayed in the grid.
   d. To unmark the check, right click the same item and click the (Green X) again.

NOTE: WHEN THE PIN ACCOUNTABILITY FEATURE IS ENABLED THE CREW MEMBER THAT WAS ASSIGNED THE MAINTENANCE MUST BE PRESENT TO INPUT PIN WHEN WCS MARKS THE CHECK COMPLETE.

5. **Able to view previous 13-Weeks**.
   a. From an open WC, in Schedule display view, on the secondary tool bar, click on the "**Quarterly**" icon drop-down arrow.
   b. Click one of the available quarters in the past to be reviewed.

c. Once done reviewing, click on the "**Quarterly**" icon drop-down arrow and select the current quarter.

6. Able to view Check Details.

a. From an open WC, in Schedule display view, highlight a check in the grid and right click it.

b. From the menu, select "**View Details**".

c. From the "**Check Details**" window, select the desired tab, such as General, SPMIG, MIP Document and MRC Document.

d. Close when done.

7. Able to schedule Spot Checks and update Spot Check results.

a. Able to update Spot Check results:

(1) From an open WC, in Schedule display view, highlight a check that has been scheduled for a spot check. A circle with a yellow ✓ (check mark), is the spot check icon.

(2) Double click it.

NOTE: A SPOT CHECK MUST HAVE BEEN ALREADY ASSIGNED ON THE SCHEDULE.

(3) The check details box opens, select the "Spot Checks", click on the "**Edit Spot Check**" icon and a spot check window displays.

(4) Fill in the scores of the spot check. The task will be in your task list.

(5) Double click the task to edit the spot check results.

b. Able to Schedule Spot Check.

(1) On the view bar tab, click "**SPOT CHECK**".

(2) On the secondary tool bar select "**Schedule Spot Check**".

(3) The Spot Check scheduling wizard will appear**.** Click "**Next**".

(4) Select "**Spot Check**".

(5) Select the person that will be conducting the spot check, then click "**Next**".

(6) Select the date the spot check will be conducted and the WC the spot check will be conducted in.

(7) Select the check, click "**Next**".

(8) Review the information and click "**Finish**".

8. Able to view and enter Check Note remarks.

a. From an open WC, in Schedule display view; click to highlight the desired check.

b. Right click the highlighted check.

c. Select the "**Check Note**" icon from the menu.

d. Enter your remarks (Lost, Not Applicable, Reschedule etc.).

e. Click "**OK**".

9. Able to add, delete or modify MIPs and MRCs in Revision Mode.

NOTE: THE WC MUST BE PUT IN REVISION MODE, DONE BY THE LCPO (STEP #25 LCPO OR 3MC ONLY). PROCEDURES 12 THROUGH 16 ARE PERFORMED FROM THE REVISION EDITOR:

a. Able to add a New MIP**.**

(1) On the Revision Editor toolbar, click "**New MIP"** icon.

(2) The Add MIP dialog box opens.

(3) Select the MIP to be added to your WC.

NOTE: IF YOUR MIP IS NOT LISTED, ENTER THE MIP NUMBER IN THE BLANK PROVIDED IN THE LOWER PORTION OF THE SCREEN. THIS WILL ONLY BE AN ADMINISTRATIVE CHANGE UNTIL THE NEW MIP IS ADDED TO THE FR DVD. CLICK "OK". THE NEW MIP WILL BE GREEN.

b. Able to make a maintenance item active or inactive (Delete).

(1) Follow the MIP outline to the desired maintenance item and highlight it.

(2) On the toolbar, click the "**Make Active or Inactive**" icon. The maintenance item icon in the outline will become blue for active and gray for inactive. Clicking the button will toggle back and forth.

NOTE: MAKING A MAINTENANCE ITEM ACTIVE OR INACTIVE WILL AUTOMATICALLY MAKE ALL MRCS FOR THAT MAINTENANCE ITEM ACTIVE OR INACTIVE TO MATCH THE MAINTENANCE ITEM.

c. Able to add MRCs (Same as add cross MIP related MRCs). Follow the MIP outline to the desired maintenance item and highlight the item.

(1) On the toolbar, click the "**New MRC**" icon. The add MRC wizard opens.

(2) Click "**Next".**

(3) Click the check box next to Check to select an MRC from the reference data. A check appears and the MIP Outline on the screen becomes active.

(4) Follow the MIP Outline to the MRC to be added. Highlight the MRC and click "**Next**".

(5) Review the MRC details and make needed adjustments. Click "**Next**".

(6) Click "**Finish**" and the MRC is added to the WC's MIP Outline.

NOTE: STEPS 4 AND 5 MAY BE SKIPPED BUT THE INDIVIDUAL BEING EVALUATED NEEDS TO MANUALLY ENTER ALL DETAILS OF THE MRC IN STEP 6.

d. Able to modify the details of a maintenance item or MRCs.

(1) Follow the MIP outline to the desired maintenance item or MRC and highlight the item.

(2) Modify or add data in the white grids only on the right pane of the window. The maintenance item or MRC icon on the MIP outline and the grid that has changed becomes yellow.

NOTE: "BOLD" TEXT INDICATES A STATUS CHANGE FOR THAT MRC. THE MRC SYSCOM CONTROL NUMBERS (MRC CODE) MAY NOT BE EDITED. IF A REVISED DOCUMENT IS RECEIVED BECAUSE OF AN FBR OR DIT REPLY, THE "ADD MRC" FUNCTIONALITY IS USED TO ADD THE DOCUMENT.

NOTE: DHs MUST APPROVE LINEOUTS BEFORE THEY ARE PRINTED.

10. Able to perform MRC lineout.

a. From an open WC, click "**PMS Documents**".

b. Expand the appropriate MIP folder and follow the path to the MRC.

c. On the secondary toolbar, click "**Customize MRC**". The Customize MRC Document dialog box opens.

d. Scroll through the MRC and double click and highlight the procedure lines that are to be omitted.

e. To remove a lineout, double click the procedure line again.

f. Type the notes to appear on the MRC in the Tools, Parts and Materials Custom Note field. Click "**OK**".

g. Your custom note is now part of the MRC and all the icons in the organizational outline become red. (**Not yet approved**)

11. Able to modify MRC line out justification.

a. From an open WC, click the "**PMS Documents**" button on the top of the screen.

b. Expand the MIP for the MRC that needs changes.

c. Expand the tree for that MIP to get to the list of MRC(s) under that MIP.

d. Highlight the MRC that needs modification.

e. Click on the "**Pencil**" icon on the top left-hand corner of the screen (this the "customize MRC" icon).

f. A "Customize MRC Document" box will come up containing the MRC selected.

(1) Scroll through the MRC and click on the procedural step(s) that need(s) to be lined-out. The affected procedural step will have a red line going through it.

The red line indicates that the lineout has been performed but not yet approved. Lineouts approved by LCPO or higher turn the lineout from red to blue.

(2) In the Tools, Parts and Materials Custom Note on the bottom, refer to the specific procedural step lined-out and provide detailed justification for lineout (e.g., Step 1.a.(2)(a) – Step omitted per FBR 2025-18).

(3) To reverse a lineout marked in red, click on the procedural step again. As long as the lineout is not yet approved, this will clear the lineout.

12. Able to approve MRC lineout.

a. "MY TASKS" displays MRCs that have custom review and omit line outs which require lineout for a WC in your role in the CoC. Since multiple users may belong to the same role in the CoC, only one of the user's needs to approve the lineout to remove it from everyone's list. Lineouts appear in red, indicating they are not yet approved. When approving or disapproving lineouts, the requirement is to approve All or None of the lineouts. Partial lineouts are not allowed.

b. Expand the Lineout approval list.

c. Highlight the desired row.

d. Double click the row; the Approve Customizations details screen displays for the selected item.

e. On the "View Details" toolbar, click "**Approve and Close or Reject and Close"**. The task is removed from your "My Task" list.

13. **Able to perform weekly closeout**.

a. From an open WC, on the "Toolbar", click to open the WC menu.

b. Scroll down to "Weekly Closeout" and click it. A window opens, if there are no issues in the WC to resolve, the "**Close Out**" icon at the top of the window will be active.

c. Select it and the week will be closed out.

d. If there are issues, they must be resolved prior to the week being closed out.

14. Able to acknowledge PMS Alerts.

a. "MY TASKS" displays PMS Alerts for MRCs that are out of periodicity. When PMS cannot be accomplished before going out of periodicity, the WCS must provide a reason, which should be specific and include well-defined details. The CoC, from the LCPO to the 3MC sees the alerts displayed in their "MY TASKS" list. Only one user needs to acknowledge the alert to remove it from everyone's list.

b. On the secondary toolbar at the top of the screen click on "**Tasks**".

c. Expand the PMS Alert list.

d. Highlight the desired row, double click it, or on the tool bar select "**VIEW DETAILS**" icon.

e. Click "**OK**".

NOTE: IF "CANCEL" IS SELECTED, THE PMS ALERT IS NOT ACKNOWLEDGED AND THEREFORE NOT REMOVED FROM THE TASK LIST.

15. Able to Reschedule Checks. Checks that are manually added or reschedule checks when the periodicity is **weekly or greater**.

a. From an open WC in the grid, right click a check, a menu will open.

b. Scroll down to the "**Reschedule**" calendar icon and click it.

c. A calendar opens with the originally scheduled date highlighted.

d. Click the date the check is to be rescheduled. (**Only the white dates are available for the check to be rescheduled to.)**

e. Click "**Next**". Click "**Finish**".

NOTE: A CHECK NOTE MUST BE ENTERED FOR RESCHEDULED, OUT OF PERIODICITY, NON-ACCOMPLISHED CHECKS.

16. **Able to assign maintenance responsibilities**.

a. From an open WC, in Schedule display view.

b. In the grid, click to highlight the desired check.

c. On the "Toolbar", click "**Assign Crew Member**" icon, or right click the desired check and select "**Assign Crew**" from the menu.

d. Under the column heading for Crew Member, click the drop-down arrow to view available crew members.

e. Click the crewmember's name.

f. Click the small box to apply changes. A checkmark will appear in this box.

g. Click "**OK**".

17. Able to modify equipment associations.

a. From an open WC, on the toolbar, click to open the WC menu.

b. Select "**Edit Equipment Details**".

c. Follow the MIP outline to the desired maintenance item and highlight the item.

d. Click the ellipses button in the SHIP RIN or CDM RIN row, which is found in the white grids. A dialog box will open. Use the drop-down menus to locate criteria or enter search text. Click "**GO**". Highlight the row of data needed. Click "**OK**".

e. Alternately, from the Revision Editor:

f. Follow the MIP outline to the desired maintenance item and highlight the item.

g. Click the ellipse button in the SHIP RIN or CDM RIN row, which is found in the white grids.

h. A dialog box will open. Use the drop-down menus to locate criteria or enter search text. Click "**GO**". Highlight the row of data needed. Click "**OK**".

18. Able to archive 13-weeks.

NOTE: THIS IS PERFORMED ONLY BY THE 3MC. ALL WCS MUST BE UP TO DATE WITH THE LAST WEEK OF THE CURRENT QUARTER CLOSED OUT FOR THE QUARTER BEING ARCHIVED. WHEN THE 3MC ARCHIVES A QUARTER, A NEW QUARTER WILL BE CREATED.

a. On the view tab bar, click "**ADMIN**".

b. From the "Admin" drop-down on the top of screen, click "**Archive Quarter**".

c. If any WC has not closed out a week in the quarter being archived, a message will appear, and the archive process will not be allowed to continue until close issues are resolved.

19. Able to create an Event List.

a. Local Event List.

(1) Click on **"Reports tab".**

(2) Double click **"Local Events"** from the left-side menu**.**

(3) Click **"Next".**

(4) Select your WC from the drop-down menu. Click **"Next".**

(5) Select your date ranges when prompted. Click **"Next".**

(6) Click **"Finish"** to run your report.

b. Situational "**Event List**".

(1) Click on "**Reports tab**".

(2) Double click "**Situational Events**" from the left-side menu. Click "**Next"**.

(3) Select your WC from the drop-down menu. Click "**Next"**.

(4) Select your situational event from the drop-down menu. Click "**Next"**.

(5) Click "**Finish**" to run your report.

20. Able to add checks to an Event List.

a. Click "**Add Trigger"** on the toolbar. A dialog box opens.

b. Select a trigger from the menu. Use the scroll bar to view all selections.

c. Click the date the trigger is to occur. The trigger icon now displays on the EVENTS calendar.

21. Able to trigger a Local Event.

a. From the Situational view, on the secondary toolbar, click "Events".

b. In the left pane, open the desired MIP outline.

c. Click to highlight the maintenance item.

d. Click the "ADD TRIGGER" icon to launch the Add Trigger Wizard.

e. From the list, highlight a trigger. Then select the date for the trigger to occur.

f. Click "OK".

22. Able to trigger a Global Event.

NOTE: THIS IS PERFORMED ONLY BY THE 3MC.

23. Able to generate an FBR.

NOTE: THERE ARE SEVERAL WAYS TO CREATE AN FBR IN SKED 3.2. THE FOLLOWING IS JUST ONE WAY OF DOING IT.

a. From an open WC, highlight a check from the grid.

b. On the WC toolbar menu, scroll down to "**Submit Feedback Report**" and click it.

c. Select "**Technical MIP Changes** or **Technical MRC Changes**".

d. The Feedback Report Wizard opens.

e. Several choices will be available for your selection. Choose one. Click **"Next"**.

f. Enter any additional comments. Click "**Next"**.

g. Your information will be displayed, if changes are required, click the back button, or click "**Finish".**

24. Able to review and approve an FBR.

a. "My Tasks" displays FBRs awaiting your review and approval.

b. Expand the FBR list.

c. Highlight the desired row.

d. Double-click the row, the FBR Details block opens.

e. The ability to view, approve, modify, make urgent or reject the FBR is here.

f. The LCPO, DIVO, and DH must review and sign the FBR before it goes to the 3MC.

NOTE: THE 3MC CAN BYPASS THE CoC IF REQUIRED TO GET THE FBR TRANSMITTED ASAP.

25. Able to start a revision.

NOTE: THE LCPO WILL PUT THE WC IN REVISION MODE FOR THE WCS.

a. Open the WC, on the "Toolbar", click to open the "Work Center" menu.

b. Scroll down to "**Start Revision**" and click it. The Start Revision wizard opens.

c. Click "**Next**". The Start Revision dialog box opens.

d. Select the Revision Type.

e. Enter a valid Revision Name. Click "**Next**".

f. Provide a revision reason. A reason for starting a revision for anything other than an FR is required. Click "**OK**", click "**Finish**".

g. The Revision editor will load, and the evaluated individual should now be in **Revision Editor Mode**.

26. Able to approve a revision.

a. "MY TASKS" displays revisions ready for approval.

b. Expand the revision approval list. Highlight the desired row.

c. Double click the row; the Revision Editor opens. Expand the path to the revision.

d. On the toolbar, click "**Approve**" (Star icon)

e. The Revision Editor screen closes and is removed from your task list.

27. Able to finalize a revision.

a. Same as paragraph 26, except that if performed by the DH or 3MC once they click on "**Approve**" (Star icon), the revision is finalized.

b. Revisions should be approved (signed) by the LCPO and DIVO before being approved by the DH. When the DH goes in to approve the revision, they will see a window indicating whether the revision was approved by the LCPO and DIVO. The DH can choose to approve the revision regardless.

28. Able to generate and view PMS Reports.

a. Open the "REPORTS" tab at the bottom right of the SKED 3.2 program.

b. A window opens with two panes; the left-hand pane has all the reports available to view, the right-hand pane is blank, this is where your data will be displayed.

c. Double click the report of your choice and follow the report wizard to display your requested data.

29. Able to add users.

a. Select the Admin tab (Last tab on the lower right).

b. Select User Management from the top menu.

c. Click "**Add User"** icon. The Edit User Details, New User dialog box opens.

d. Enter pertinent information for the new user.

e. Click the General, Feedback Reports, and Work Center tabs to check allowed permissions.

30. Able to edit users.

a. Select the Admin tab (Last tab on the lower right).

b. Select User Management from the top menu.

c. Highlight a crewmember from the display grid, and double click it.

d. The User Details box opens.

e. Update User information in the appropriate fields.

f. Click "**OK**" to save changes.

31. Able to disable users.

a. Select the Admin tab (Last tab on the lower right).

b. Select User Management from the top menu.

c. Highlight a crewmember from the display grid, and double click it.

d. The User Details box opens.

e. Click the Status Field arrow. Select disabled.

f. Click "**OK**" to save changes.

32. Able to view or modify the CoC.

a. Select the Admin tab (Last tab on the lower right).

b. Select CoC from the top menu.

c. A screen displays for the activity and lists the username, role, rate, last name, first name, and signature.

d. Click the plus sign at the far left to view by department, division, and WC.

e. Select the "**Edit Chain of Command**" icon (top left corner, under File menu). An Edit CoC display box opens. Edit accordingly (add or delete) DH, DIVO, LCPO, or WCS.

APPENDIX A

SECTION VI

3-M INSPECTION COMMAND TOTAL SCORE (CTS)

The CTS is weighted equally between Departments.

CNIC CTS = Sum of all Departments ÷ Total number of Departments

(Example: CTS = N31 DTS + N32 DTS + N34 DTS ÷ 3)

A minimum grade point of 80 is required for a passing score.

APPENDIX B

DIVISION INACTIVE EQUIPMENT MAINTENANCE (IEM) PLAN

From: Division Leading Chief Petty Officer,

To: Department Head,

Subj: Division Inactive Equipment Maintenance (IEM) Plan

Ref: (a) COMUSFLTFORCOMINST 4790.3

Encl: (1) Inactive Equipment Maintenance Plan Matrix

1. Per reference (a), the following systems and equipment will be placed in an IEM status in SKED while the command conducts.
2. Enclosure (1) lists all Systems and Equipment that this division will place in IEM for the upcoming maintenance period. This list was checked for accuracy and linked to the appropriate system/equipment restoration and key event. The IEM Plan is considered a living document; reviews will occur when key events timelines change.
3. A current copy of this plan will be provided to the command 3MC and be made available to the LMA, CTE and Project Superintendent.

//SIGNATURE//

I.M. CHIEF

I concur with placing the Systems or Equipment identified in Encl (1) in an IEM Status.

//SIGNATURE//

Department Head

System or Equipment	MIP	CAT 1 / 2	LU	PM	SU/OT	Due MRs	Restoration Key Event	Estimated Restoration Date
#1 Burner	5151/902	1	LU-3 LU-4	PM-1 PM-2	SU-2 SU-3 OT-1	A-8	43 Ventilation Restore	12/25/16

C Division IEM Plan for Fleet and CNO Availabilities
D Sample 3-M Quarterly Assessment Report

19-5.1 APPLICABILITY. All content of reference (a) has been incorporated into this chapter to provide easier access to Maintenance and Material Management (3-M) guidance and requirements. This chapter applies to Submarine Groups and Submarine Squadron Commanders within the following assigned regions:

a. Northeast Region. Commander, Submarine Squadron (COMSUBRON) 4 and COMSUBRON 12 in Groton, Connecticut, COMSUBRON 2 ships undergoing overhaul in Portsmouth Naval Shipyard, new construction submarines, and shore-based submarine support activities under Commander Submarine Force Atlantic (COMSUBLANT) cognizance.

b. Mid-Atlantic Region. COMSUBRON 6 and COMSUBRON 8 in Norfolk, Virginia, submarines undergoing overhaul in Norfolk Naval Shipyard, new construction submarines, and shore-based submarine support activities under COMSUBLANT cognizance.

c. Southeast Region. Commander, Submarine Group (COMSUBGRU) 10, COMSUBRON 16 and COMSUBRON 20 in Kings Bay, Georgia, COMSUBGRU 8 in Naples, Italy, Diego Garcia, and shore-based submarine support activities under COMSUBLANT cognizance.

d. Northwest Region. COMSUBGRU 9, COMSUBRON 17, COMSUBRON 19, Unmanned Undersea Vessel Group (UUVGRU) 1, and Commander, Submarine Development Squadron (COMSUBDEVRON) 5 in Bangor, Washington, submarines

being maintained in Puget Sound Naval Shipyard, and shore-based submarine support activities under Commander Submarine Force Pacific (COMSUBPAC) cognizance.

e. Southwest Region. COMSUBRON 11, Commanding Officer, Undersea Rescue Command (URC) in San Diego, California, and shore-based submarine support activities under COMSUBPAC cognizance.

f. Mid-Pacific Region. COMSUBRON 1 and COMSUBRON 7 in Pearl Harbor, Hawaii, submarines undergoing overhaul in Pearl Harbor Naval Shipyard, and shore-based submarine support activities under COMSUBPAC cognizance.

g. West Pacific Region. COMSUBGRU 7 in Yokosuka, Japan, COMSUBRON 15 in Guam, COMSUBRON 21 in Bahrain, and shore and tender based support activities under COMSUBPAC cognizance, including the Australia, the United Kingdom, and the United Sates (AUKUS) Submarine Transfer Authorization Act.

19-5.2 ROLES AND RESPONSIBILITIES.

a. Commander Submarine Forces. Commander Submarine Forces assigns the responsibility for management of the Submarine Force Maintenance and Material Management (3-M) Program to COMSUBLANT and COMSUBPAC, Director for Maintenance and Material Readiness (N4).

b. TYPE Commander. The Type Commander (TYCOM) 3-M Office is comprised of the headquarters staff (N43) and Fleet representatives (TYCOM 3-M REP) to fulfill the TYCOM requirements of reference (a). The TYCOM exercises primary responsibility for the effective operation and support of the 3-M System. Areas of responsibility include but are not limited to the following:

(1) Afloat Maintenance Data System (MDS).

(a) Organizational Maintenance Management System (OMMS) and Automated Work Notification.

(b) R-Admin, R-Supply, Organizational Maintenance Management System – Next Generation (OMMS-NG).

(2) Ashore MDS.

(a) Maintenance Figure of Merit family of systems.

(b) Advanced Industrial Management for Regional Maintenance Centers.

(c) Validation, Screening and Brokering System

(d) Maintenance Resource Management System.

(e) TRIDENT Logistical Data System.

(3) Planned Maintenance System (PMS) Scheduling Software (SKED).

(4) Alteration Management System.

(a) Navy Data Enterprise.

(b) Type Commander Alteration Management System.

(5) Current Ship's Maintenance Project (CSMP).

(6) Master Job Catalog.

(7) The screening and processing of feedback reports (FBR) and PMS Service Requests (PSR).

(8) Maintaining an inspection data file per paragraph 19-5.5.2.f of this chapter.

(9) Providing program enhancement requirements to the Fleet Commander via N43.

(10) Ensuring ships and units are manned with Navy Enlisted Classification (NEC) qualified 3-M Coordinators (3MC).

(11) Analyzing 3-M inspection (3MI) and self-assessment data, identifying common concerns, conducting problem root cause analysis with the development and implementation of solutions.

(12) Ensuring TYCOM inspection team members are qualified to inspect assigned areas.

c. TYCOM 3-M Regional Representatives. TYCOM 3-M Regional Representatives (3-M Rep) have been established at all submarine homeports. These positions were established to provide for the continuous monitoring of the 3-M Program on submarine assets and to assist submarine force activities and squadron commanders in the operation and administration of the 3-M Program. The 3-M Rep reports to the submarine force Maintenance Program Manager and organizationally supports the efforts of the ISIC and TYCOM. Areas of responsibility include but are not limited to the following:

(1) Acting as team "lead" for all 3-M Inspections conducted on activities under their cognizance and using the format of Appendix A, provide inspection results to the ship or activity via the ISIC.

(2) Originating all correspondence relating to 3-M Inspections, periodic monitoring, and reporting of non-compliance with reference (a) and this manual.

(3) Carrying out the duties and responsibilities of the TYCOM during PMS installations.

(4) Monitoring MDS documents and reporting deficiencies to the ISIC for corrective action.

(5) Providing the following support to the ISIC:

(a) Provide end of quarter (EOQ) summary highlighting below standard areas to ISIC Deputy for Readiness based upon ship provided EOQ data.

(b) TYCOM 3-M Assist Visits as described by reference (a).

(c) PMS and MDS technical assistance.

(d) On-site training in PMS, MDS and PMS Scheduling.

(e) Assistance with the preparation and submission of FBRs and PSRs.

(f) Assistance in obtaining prompt correction to faulty PMS documentation (liaison with an In Service Engineering Agent (ISEA)).

(g) On a case basis, provide authorization to use modified (red lined) PMS documentation.

(h) The review the ship's K-MRC plan for all Continuous Maintenance Availabilities (CMAV) to ensure compliance as discussed in volume II, part III, chapter 3 of this manual.

(6) Initiating 3-M Program reviews when concerns regarding 3-M performance arise.

(7) Receive ships Tailored Force Revision Data file (.tfd) from ships and submit following directions in the PMS Service Brief to TFR Support Team.

d. The ISIC is responsible for the routine monitoring and evaluation of the 3-M system for all assigned activities. ISICs will fully employ the TYCOM 3-M REP to assist the ISIC 3-M Maintenance Officer (3MO) in the execution of these responsibilities. 3-M related matters will be communicated directly to the TYCOM 3-M Rep for resolution. As an incentive for sound 3-M performance, major commanders will consider 3-M performance as part of the annual intra-squadron efficiency competition. Areas of responsibility include but are not limited to the following:

(1) Deputy for Readiness (DFR) is responsible for the satisfactory administration of 3-M Programs, per reference (a) Designating a 3MO in writing.

(2) The 3MO:

(a) Will maintain staff PMS and Personnel Qualification Standards (PQS) records.

(b) Provide DFR with corrective actions from below standard areas identified by the activity EOQ Assessment Report. ISIC will assess corrective actions and identify areas not identified by the activity. Monitoring and evaluating the 3-M Program for all assigned units in accordance with ISIC monitoring instruction.

(3) Ensuring 3MIs are current.

(4) Ensuring subordinate commands comply with standard Work Center (WC), division and department structure. If an activity deems creating work centers with associated MIPs and MRCs are required, perform actions delineated in reference (a) (i.e., RCM, FBR and PSR submissions). Work centers created for small valve maintenance and calibration are not allowed. Ensure requirements of ref (a) are followed for equipment not covered by PMS.

(5) Monitoring the status of troubled systems and Top Management Attention Items using the quarterly 3-M Self-Assessment.

(6) Ensuring subordinate commands comply with standard Work Center (WC), division and department structure as published on the JFMM TYCOM website https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/TYCOM/. If an activity deems creating work centers with associated MIPs and MRCs are required, perform actions delineated in reference (a) (i.e. RCM, FBR and PSR submissions). Work centers created for small valve maintenance and calibration are not allowed. Ensure requirements of reference (a) are followed for equipment not covered by PMS.

(7) Tracking and monitoring 3-M major milestones and training events, overseeing, and providing inspection teams and conducting 3-M Spot Checks during ISIC or staff visits.

(8) Ensuring assigned maintenance coordinators notify the tended activity of unsatisfactory work candidates submitted for action.

(9) Ensuring material failures are adequately examined for the detection of 3-M system inadequacies.

(10) Ensuring assigned staff has adequate knowledge of the 3-M system to detect inadequate 3-M performance during routine shipboard monitoring (i.e., PMS PQS 304 & 306).

(11) Directing the performance of a 3MI or Assist Visit when concerns regarding 3-M performance arise.

(12) Review and approval of pre-deployment PMS plans per reference (b).

e. Commanding Officer or Officer In Charge. The Commanding Officer (CO) or Officer In Charge is responsible for establishing an aggressive Self-Assessment Program that validates the administration and execution of maintenance and detects improperly conducted maintenance or falsely reported accomplishments.

f. Executive Officer. The Executive Officer (XO) is the command's 3-M System Manager responsible to the CO for the overall management of the 3-M Program. The XO will:

(1) Chair quarterly 3-M System meetings with Department Heads (DH) and the 3MC. Utilize ship quarterly assessment as basis for discussion.

(2) Brief the CO on the status of 3-M.

(3) Integrate 3-M System training into the command's training and qualification program. Develop next quarters training plan covering weak areas from previous quarter's self-assessment.

(4) Ensure personnel receive adequate and effective 3-M System training.

(5) Ensure the effectiveness of the command's 3-M Self-Assessment Program.

(6) Act as the final review officer for shifts of maintenance responsibility between departments.

g. Command Master Chief or Chief of the Boat. The Command Master Chief or Chief of the Boat will:

(1) Attend the XO's quarterly 3-M System meetings providing senior enlisted feedback.

(2) Conduct PMS Spot Checks following the command's policy to ensure required maintenance is being properly performed and documented.

(3) Establish command's Zone Inspection Program.

h. Command 3-M Coordinator. Due to the unique nature of submarine manning, the 3MC is routinely assigned as the availability coordinator and should, at a minimum, be a Chief Petty Officer (CPO). As both these functions are critical to the ship's material readiness, careful consideration should be given prior to assigning the 3MC additional collateral duties. The 3MC will:

(1) Serve as the key 3-M System assistant to the XO.

(2) Maintain a file of 3-M System directives, newsletters, notes, and correspondence containing current 3-M program information and ensure distribution to WC personnel.

(3) Maintain copies of the current Force Revision (FR) NAVY PMS Digital Video Disk (DVD) and Tailored Force Revision (TFR) Disk, changes issued between FRs in their original format and classified Maintenance Requirement Cards (MRC). Digital copies are allowed unless there have been changes between FRs.

(4) Advise, monitor, and assist DHs, Division Officers (DIVO), Leading Chief Petty Officers (LCPOs) and Work Center Supervisors (WCS) in matters concerning the 3-M System.

(5) Monitor the Ship's 3-M PQS Program and maintain an auditable record of personnel qualified in 3-M PQS.

(6) Maintain a master accountability log of all PMS changes.

(7) Develop and maintain a Split Maintenance Index Page (MIP) Log.

(8) Administer the configuration management program onboard the ship or unit.

(9) Supervise the command's 3-M Self-Assessment Program and provide a weekly status to the XO.

(10) Develop and administer the ship or unit's PMS Spot Check Program.

(11) Generate a weekly PMS Spot Check assignment matrix for officers, CPOs, and designated supervisory personnel.

(12) Ensure corrective actions are taken on all unsatisfactory PMS Spot Checks and report same to the XO as part of weekly PMS reporting.

(13) Ensure a complete back up of the SKED system is made on removable media (e.g., DVD or CD-ROM or solid-state drive) following completion of the FR update and retain as part of the PMS Master File.

(14) Ensure that Global States and Triggers are properly set at the command level.

(15) Screen all FBRs and PSRs, verify content, validity, serialize and forward within seven days of origination.

(16) Maintain accountability of all submitted FBRs and PSRs and actions taken until corrected or new PMS documentation is received.

(17) Ensure the FBR and PSR originator and all applicable WCs are apprised of action taken and that changes or corrections are implemented when received.

(18) Ensure 3-M documents such as Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), Ship's Configuration Change Form, OPNAV 4790/CK (CK), etc. that require forwarding to a data processing activity are forwarded within seven days of origination or as operationally feasible.

(19) Validate 3-M MDS data elements following the 3-M validation specifications.

(20) Ensure 3-M documents returned for the correction of data are promptly revised and resubmitted.

(21) Track the reporting of completed maintenance actions related to an alteration or as a result of a configuration change with timely processing of Automated Shore Interface configuration and logistic data.

(22) Report up-line CSMP maintenance transactions and command's equipment file corrections at least once a week.

(23) Maintain outstanding copies of message work candidates and Supplemental Form, OPNAV 4790/2L (2-Lima), paper or electronic.

(24) If desired, assign a command 3-M Assistant (3MA). The 3MA will be qualified PQS 305 or 306. The command 3MC will assign the 3MA duties as necessary to fulfill the commands 3-M functions. The 3MA will report to the command's 3-M Coordinator.

(25) Generate and forward the ships Tailored Force Revision Data file (.tfd) to TYCOM 3-M Rep by the 15th of the first month of the quarter.

i. Command Maintenance Availability Coordinator. The Command Maintenance Availability Coordinator will be responsible for the coordination of all Fleet Maintenance Activity (FMA) repairs and coordinate closely with the 3MC. The Maintenance Availability Coordinator will also provide a single working level point of contact and coordinate the command's requirements with the requirements of the FMA. These duties include:

(1) Technical review of work requests submitted for FMA accomplishment.

(a) Ensure readability and technical correctness.

(b) Prevent duplication of work requests for Ship Alterations, Unrestricted Operation and other Master Job Catalog originated deferrals.

(c) Ensure corrective maintenance described in 2-Kilo Block 35 (Remarks) includes reference to the associated Maintenance Standard when applicable.

(d) Collect 2-Lima requests for routine work (i.e., lagging, painting, label plates, tiling, etc.) from all WCs and prepare an integrated priority list for each type of routine work to maximize the FMA's effectiveness.

(2) Ensuring command preparations for an FMA availability are conducted per volume II, part III, chapter 3 of this manual.

(3) Meeting daily during an availability with the assigned Ship Superintendent to discuss the status of all active jobs.

(4) Attending all FMA production, night work and management meetings.

(5) Providing a daily FMA job status to each DH, DIVO and leading petty officer (LPO).

(6) Prior to Work Package Execution Review, conducting a joint meeting with the Performance Monitoring Team (PMT), TYCOM 3-M Representative and ISIC (typically at A-40) to review current K-MRC status, ensure the ship's records match that of PMT and develop a K-MRC execution plan.

(7) Establishment of a Planning Board for Maintenance (PB4M).

j. Department Head. The DH is responsible to the XO for the operation and execution of the 3-M System within the department. Duties and responsibilities assigned to the DH are not be delegated. The DH will:

(1) Designate departmental 3-M personnel.

(2) Ensure maintenance is prioritized to facilitate accomplishment.

(3) Review and approve all department PMS schedules and force or administrative revisions. For Tenders, provide administrative revision rights to division officer as necessary.

(4) Review maintenance action annotations.

(5) Acknowledge weekly alerts if no DIVO is assigned to the WC.

(6) Take corrective action on all "Unsatisfactory" PMS Spot Checks and report to the XO via the 3MC as part of weekly PMS reporting.

(7) Ensure all material deficiencies are documented and promptly reported.

(8) Review and verify the content and validity of all FBRs and PSRs, digitally sign FBRs and PSRs within five days of origination.

(9) Ensure the Configuration Management Database accurately reflects equipment changes whether the action is performed by command personnel or outside activities.

(10) Authorize placement of equipment into an Inactive Equipment Maintenance (IEM) status, ensure PMS scheduling is annotated accordingly.

(11) The review and approval of all department work candidates within four days of creation; ensure completeness, accuracy, and the correct assignment of priority.

(12) Review all work candidates in the departmental CSMP every 90 days.

(13) Ensure that no classified data or Navy Nuclear Propulsion Information is reflected on 3-M documents designated for off hull distribution.

(14) Conduct quarterly meetings with DIVOs, LCPOs and WCSs; provide status of departmental 3-M System to the XO.

k. Department Leading Chief Petty Officer. The department LCPO is responsible for the proper operation of the 3-M System within their department. The department LCPO will:

(1) Provide 3-M System guidance and training to DIVOs and division LCPOs within their department.

(2) Participate in quarterly Self-Assessments.

l. Division Officer. The DIVO is responsible to the DH for the execution of maintenance within the division. As submarine division officers rotate frequently, it is imperative that DIVOs aggressively gain the requisite 3-M Qualifications and proficiency required to effectively perform 3-M functions. The DIVO will review and approve all PMS and MDS documents within their division. This includes all Automated Work Notifications (AWN), SKED, OMMS-NG, and Propulsion-Organizational Maintenance Management System (P-OMMS) submissions to ensure all required 3-M system documents are submitted to the DH. The DIVO will:

(1) Ensure all PMS scheduling changes have been properly annotated and applied prior to DH review and finalization.

(2) Review the 13-Week Accountability Log at the beginning of the PMS week and sign at the end of the week, if not using electronic accountability in SKED or when SKED is not available.

(3) Review and verify the content and validity of PMS FBRs and PSRs within three days of origination.

(4) Ensure 3-M documents generated within the division are complete, accurate and promptly submitted to the DH.

(5) Conduct 3-M Self-Assessments as directed by the command’s policy.

(6) Provide weekly updates to the DH concerning the status of the 3-M System within the division.

(7) Incorporate 3-M System training into the Divisional Training Plan.

(8) Review divisional work candidates and the CSMP for validity and accuracy.

(9) Conduct CSMP review weekly during CMAV and brief the DH on the status of all work candidates.

(10) Acknowledge PMS Alerts ensuring accurate reason and estimated time of performance.

m. Division Leading Chief Petty Officer. The division LCPO is responsible for the proper operation of the 3-M System within their division. The division LCPO will:

(1) Supervise WCSs in the execution of daily maintenance.

(2) Ensure WCSs are properly trained, equipped and are knowledgeable of all WC divisional equipment maintenance requirements.

(3) Ensure divisional personnel are properly trained and qualified to conduct maintenance.

(4) Verify all divisional WC equipment is covered by PMS.

(5) Ensure PMS is properly scheduled and conducted, including all underway and special evolution situational "R" checks.

(6) Review WC PMS records (e.g., FRs, Advanced Change Notices (ACNs) and PMS FBRs and PSRs and Responses), approve all lineouts and additions on the LOEP, MIP, and PMS schedules prior to DIVO and DH reviews. Ensure proper justification is noted on each lineout.

(7) Review and approve non-applicable procedural steps lined-out on MRCs.

(8) Review and sign the 13-Week Accountability Log at the end of the PMS week and ensure checks added that week are hand-written into the blank accountability log, if not using electronic accountability in SKED or when SKED is not available.

(9) Review the PMS Scheduling Maintenance Outlook and Forecasting Report to ensure efficient planning of maintenance prior to becoming overdue and that all Tools, Parts, Material and Test Equipment (TPMTE) are available to support upcoming maintenance actions.

(10) Provide the DIVO a weekly status of the division's Self-Assessment Program, CSMP and PMS.

(11) Ensure the Configuration Management Database reflects the ship's current configuration.

(12) Ensure FBRs and PSRs are submitted requesting LOEP changes to reflect system, equipment and component installs or removals.

(13) Review and verify the content and validity of PMS FBRs and PSRs within two days of origination.

(14) Ensure the divisional CSMP accurately reflects material conditions.

(15) Review and approve work candidates, act as the second point of contact for work candidates and provide the DIVO a weekly brief on the status of all work candidates in the CSMP.

(16) Ensure proper testing and inspection of work done by outside activities prior to job acceptance.

(17) Coordinate repair activities within the division.

(18) Review all quarterly Self-Assessments and promptly correct discrepancies found within the division.

(19) Review, approve and close out weekly schedules. This closeout of the previous week's schedules must occur on the first non-holiday day of the following week (i.e., Monday).

(20) Review Check Notes for required and updated information.

(21) Write PMS Alert details to include why planning allowed loss of periodicity and the plan to complete PMS.

n. Work Center Supervisor. The WCS will be a senior petty officer assigned to the WC and qualified per reference (c). The WCS will:

(1) Record all equipment deficiencies within their WC, utilizing AWN, OMMS-NG and P-OMMS to ensure all required 3-M System documents are submitted to the division LCPO.

(2) Ensure WC personnel have completed 3-M PQS training commensurate with position held.

(3) Ensure PMS covers all maintenance worthy equipment in the WC.

(4) Maintain an accurate and current LOEP.

(5) Ensure 3-M System WC files and publications are complete, current, and available to WC personnel.

(6) Ensure WC initiated 3-M documentation is correct, legible, promptly prepared and submitted.

(7) Maintain a 13-Week Accountability Log containing the current and previous 13-Week Log, if not using electronic accountability in SKED or when SKED is not available.

(8) Prepare weekly WC schedule, obtain required approval, assign maintenance personnel, and update schedule to reflect status.

(9) Ensure equipment changes, adds and removals are reflected in the Configuration Management Database and, if not, report via Configuration Change Form 4790/CK to the Configuration Data Manager.

(10) Ensure FBRs and PSRs are submitted whenever:

(a) Maintenance requirements are not fully understood.

(b) Errors are believed to exist.

(c) Entries in the TPMTE block are wrong or inadequate.

(d) Additional coverage is needed.

(e) Performance of the maintenance requirement would cause a hazardous condition to exist.

(11) Ensure prompt reporting of all material deficiencies and completed maintenance actions.

(12) Ensure inactive equipment Periodic Maintenance Requirements scheduled for command accomplishment are completed and reported as required.

(13) Ensure PMS is properly scheduled and conducted including all underway and special evolution situational "R" checks by utilizing local states, triggers and metered events.

(14) Ensure test and measurement equipment or other portable support equipment is delivered for test or calibration as scheduled.

(15) Ensure the DIVO and division LCPO or LPO are advised of all 3-M System activity within the WC.

(16) Review the PMS Scheduling Forecasting Report to ensure that all TPMTE is available to support upcoming maintenance actions.

(17) Ensure all WC weekly schedules are updated daily.

(18) Use the Edit Equipment Details function of SKED to the maximum extent possible to associate maintenance items to the Configuration Data Managers Database - Open Architecture database embedded in SKED 3.2 for configuration items. The association should be made to the highest level (piece) of the applicable equipment being maintained (i.e., #1 Torpedo Tube vice the Slide Valve).

o. Damage Control Petty Officer and Safety Petty Officer. The Damage Control Petty Officer and Safety Petty Officer will be a warfare qualified petty officer 3rd class or above and responsible for the accomplishment of damage control and safety related PMS.

p. Maintenance Personnel. Maintenance personnel will perform all PMS as assigned utilizing PMS documents in SKED and ensure Check Notes contain amplifying information and tagout identifiers as required. Maintenance personnel will:

(1) Perform assigned maintenance.

(2) Notify the WCS when:

(a) An MRC is not fully understood, appears to be incorrect or cannot be accomplished as written.

(b) There are issues with the TPMTE block of the MRC.

(c) The technician has doubts concerning their ability to perform the maintenance.

(d) Equipment deficiencies or casualties are discovered.

(e) Factors exist which would make performance of the maintenance unwise or dangerous.

(3) Initiate FBRs or PSRs when discrepancies are discovered during the performance of an MRC.

(4) Inform the WCS when planned maintenance requirements are complete.

(5) Digitally sign for maintenance accomplishment with associated checknotes (i.e. eSOMS, eTagout Identifier).

(6) Sign 13-Week Accountability Log (if not using electronic accountability in SKED or when SKED is not available).

19-5.3 QUALIFICATIONS. All personnel assigned to billets associated with the 3-M system must be 3-M PQS qualified for the assigned billet per reference (c). Evidence of qualification in support of 3-M requirements must be maintained by the command in an auditable fashion. In addition to 3-M PQS qualifications, all personnel assigned to accomplish 3-M related maintenance on systems listed in Volume V, Part 1, Chapter 2 Paragraph 2.2.1 of this manual, must be qualified per reference (d). Table 19-5-1 reflects the PQS qualifications required to fill SUBFOR 3-M billets.

Table 19-5-1 - Required PQS Qualifications

3-M Coordinator	PQS-307
3-M Assistant	PQS-306
Department Head	PQS-306
Department LCPO	PQS-305
Division Officer	PQS-304
Division LCPO	PQS-304
Work Center Supervisor	PQS-303
Repair Parts Petty Officer	PQS-302 or RPPO Continuing Training and Qualifications Software
Maintenance Personnel	PQS-301

19-5.4 PLANNED MAINTENANCE.

19-5.4.1 Minimum Standards. MRC accomplishment is critical for maintaining equipment in a ready state and achieving expected service life. The maintenance tasks directed by MRCs are the minimum standards for organizational shipboard planned maintenance and therefore equipment degradation can be assumed if maintenance is deferred. The following provisions are provided to maximize on time performance of PMS and provide increased Fleet latitude in maintaining equipment.

a. MRCs are prepared as instructions to complete a maintenance task based upon the premise that the personnel assigned to perform the task have sufficient knowledge of the rate listed on the card and are qualified to perform maintenance as directed by the MRC. The MRC will be accomplished in sequential order, adhering to all Warnings, Cautions and Notes. Routine sub-steps (e.g., fastener removal, steps to don and remove Personnel Protective Equipment, turning on a vacuum) may or may not be included in the MRC and their absence should not prevent the maintainer from completing the maintenance task.

b. Per Naval Sea Systems Command (NAVSEA), procedures are written at a level of detail based on the assumption maintenance personnel are trained, qualified, and supervised by experienced leadership to execute the maintenance consistently and expertly. They exist to provide a common standard, specify acceptance criteria, communicate warnings, and cautions specific to the maintenance and provide proven maintenance practices. They are not intended to:

   (1) Supplement or duplicate rules and procedures that must be followed for hazards generally associated with the equipment (Hazardous Material Handling, Electrical Shock Risk Management, etc.) but not specifically associated with a step of the procedure.

   (2) Identify every process and every warning associated with the maintenance environment of the component being maintained (aloft, in tanks, near an active flight deck, in a heat stress area, etc.)

   (3) Specify every possible action of the maintainer.

c. Leadership will uphold standards for complying with maintenance procedures.

d. If a step is missing that is necessary to complete the task, and that step is not obvious to the Maintenance Person (MP), a FBR or PSRs should be submitted.

e. MRC completion status is dependent on the accomplishment of all procedural steps on all the equipment listed on the MRC or its accompanying Equipment Guide List or Location Guide List.

f. The performance of additional rational actions during the accomplishment of an MRC is authorized. Examples of such actions include turning on and off items utilized during the performance of the MRC, vacuum cleaners, test equipment, etc. and general housekeeping such as cleaning up or containing spilled fluids or dirt.

g. The substitution of any tools, materials or test equipment not held by the activity should be considered prior to deciding to defer the maintenance until the exact tools, materials or test equipment listed on the MRC are procured. This is especially critical for frequently required maintenance where several performance cycles can be missed while waiting for supply to provide the correct items. Substitution requirements are provided by reference (a) and other technical documents.

19-5.4.2 Functional Components.

a. PMS Master File. The Master File, maintained by the units 3MC, contains information relative to PMS requirements that are specific to equipment for which the command is responsible. The Master File provides for duplicate issue of missing MIPs and MRCs, contains supplementary information provided by Naval Sea Logistics Center (NSLC) Detachments Norfolk or San Diego and serves as a repository for changes received between FR distributions, which must be retained on file until the changes are reflected in a subsequent FR. Master File content is delineated in Appendix B section I-B, Command Level Effectiveness Review (CLER).

b. Work Center PMS File. The WC File provides a ready reference of planned maintenance requirements and information to be retained in the working area for use by the WCS and maintenance personnel. The WC File contains only the documents and information applicable to a specific WC. The content of the WC File is delineated in Appendix B Section I-A, Scheduling and Execution Effectiveness Review (SEER).

c. PMS Administrative Requirements. In lieu of a WC or Master File the following should be retained:

(1) Work Center

(a) Current classified MRCs.

(b) Recently completed K-MRC data sheets.

(c) Current TFR reports.

(4) Approved Divisional IEM Plans.

(2) 3-M Coordinator

(a) SKED 3.2 Help file:

(1) Split MIP Tracking Log (updated to current FR)

(2) Applicable 3-M Instructions (Ship, ISIC, and TYCOM)

(3) Current 3-M messages and guidance

(4) Current 3MC TFR Reports

(5) SEER Audit Guide

(6) VI 19-5

(7) VI 19-7

(8) VI 19-8

(9) 3-M Handbook

(b) Master classified MRCs.

(c) Current SKED Database back-up files on DVD or CD-ROM and an Excel spread sheet from the SKED report Checks and Maintenance Outlook Report of all WCs, for the current and next two quarters.

(d) 3-M Program short and long range training plan approved by the XO.

(3) The following post-quarter SKED reports will be generated on a ship-wide basis by the 3MC and forwarded to the ISIC and TYCOM 3M Representative by the 3rd Monday of the quarter (as conditions permit). TFD file will be forwarded by the 15th of the first month. These reports will be analyzed and electronically routed through the applicable DH to the CO. These reports will be retained as objective quality evidence, by the 3MC for four quarters.

(a) Quarterly Assessment Report using the format of Appendix D along with associated enclosures.

(b) Calibration H Report (last completion).

(c) A copy of the SKED Database back-up files (sked32.bak and sked32xml_archive.bak) on DVD, CD-ROM, or solid-state drive delivered to the 3M Rep and ISIC 3MO.

(d) Previous quarters SEER completions.

(e) Tailored Force Data (.tfd file), by the 15th of the new quarter. All shore and afloat activities will submit TFD files prior to deadline. If deployed and as soon as operationally feasible, submit TFD file. This is to ensure activity maintenance history is transferred to Open Architectural Retrieval system (OARS).

d. Performance Monitoring Requirements. MRCs that are K coded require PMT data collection. As the submission of the data sheet(s) to the PMT is a procedural step of the MRC, the MRC cannot be considered completed until the data sheet(s) is submitted to the 3MC or the local PMT field office by the most expeditious means or format. Electronic is preferred. WCs will maintain a copy of the most recent performance data sheet(s). Data sheets are maintained until maintenance action is documented complete in the Submarine Maintenance Monitoring Information System and reflected in the monitoring period planning and tracking report.

(1) K-MRC in-periodicity completion percentage must be a minimum of 90 percent.

(2) 3MC will provide the Checks – K-MRCs Active Report (Excel Format) at the end of each quarter to the PMT for reconciliation. The ship will coordinate with the PMT to correct schedule disparities.

(3) LCPOs will keep the PMT apprised of all K-MRC IEM beginning and ending dates.

e. Interim MRC Procedures. The ship may develop interim MRC procedures based on experience and applicable technical manuals in support of equipment or systems without PMS coverage until formal documentation is received. Before scheduling preliminary MIP requirements, the WCS and the DH must verify their applicability to installed equipment.

f. Weekly Status Report. The weekly PMS monitoring status reports will be retained, electronically if desired, by the 3MC for the current and previous quarter. These reports from the 3MC to the XO will contain the following:

(1) Completed Spot-Check and Monitored MRC results.

(2) Completed WC audits and results.

(3) The number of FBRs and PSRs over seven days old that have not been reviewed by the Chain Of Command (CoC).

(4) Abatement and corrective actions completed as a result of a monitoring program finding.

(5) IEM Details Current Report.

(6) Overdue (Alerting) MRCs and plan of corrective action.

g. Change Service Accountability Log. The Change Service Accountability Log (CSAL) (Figure 19-5-1) provides a definitive record of all changes to a command's 3-M Program. Whenever a change to a command's 3-M Program is directed (be it from an FR, FBR, PSR, ISIC direction, etc.), the change will be routed to the concerned WCS(s) via a memorandum. Whenever such a memorandum is issued, it must be recorded in the CSAL. Once the WCS reports the directed change has been completed, the 3MC will file the WCS's response and annotate in the CSAL that the action is complete.

(1) The CSAL is comprised of the actual log sheet, a copy of all memos routed to the WCS and the memo from the WCS to the 3MC indicating completion.

(2) The importance of the CSAL cannot be overstated. Basically, it provides for a day-to-day, year-to-year record of changes to a command's planned maintenance program. It is also a turnover document at deployment sites, allowing a current command to quickly identify all changes from a previous command. Finally, it will be inspected during all command 3-M assessments and inspections, providing visibility as to how well a command manages 3-M from one inspection to another.

Figure 19-5-1 - Change Service Accountability Log

FR Change Number or Authority	Date RCVD	Cognizant Dept. or WC	Date Cover Sheet Issued	Date Cover Sheet Returned	Date Master File Updated or Item Closed	Summary of Change

19-5.4.3 Submarine Safety, Scope of Certification, Flight Critical Components and Survivability and Escape.

a. Submarine Safety. MRCs that direct work or entry within the Submarine Safety (SUBSAFE) Certification Boundary require Re-Entry Control (REC) to be invoked. SUBSAFE MRCs are annotated on the MIP with either an "RS" (re-entry control required) or "XS" (no re-entry control required) in the "OTHER" column.

b. Scope of Certification. MRCs that direct work or entry within the Scope of Certification (SOC) Boundary also require REC to be invoked. SOC documentation is applicable and governing to Dry Deck Shelter (DDS) host platforms and must be loaded to WC WK02 for those platforms. SOC MRCs are annotated on the MIP with either an "RD" (re-entry control required) or an "XD" (no REC required) in the "OTHER" column. Non-DDS platforms need not establish WK02 nor are they governed by SOC directives.

c. Submarine Flight Critical Component. MRCs which work within the Submarine Flight Critical Component Boundary where REC documentation is required are annotated on the MIP with an "RF" in the "OTHER" column.

d. Survivability, Escape, and Rescue Equipment. All MIPs and associated MRCs dealing with Survivability, Escape, and Rescue Equipment are to be loaded to WCs per table 19-5-2.

Table 19-5-2 - Load-out of Survivability and Escape Related MIPs

MIP	SYSTEM	REQUIRED WC
5940/908	Submarine Escape and Immersion Equipment (SEIE), Escape Trunk	EA01 (SSN 688 Class)

Table 19-5-2 - Load-out of Survivability and Escape Related MIPs		
MIP	SYSTEM	REQUIRED WC
5940/906	Submarine Escape and Immersion Equipment (SEIE), Escape Trunk	EA01 (SSBN and SSGN 726 Class)
5940/905	Submarine Escape and Immersion Equipment (SEIE), Escape Trunk	EA01 and WK02 (SSN 774 Class, SOF)
5940/904	Submarine Escape and Immersion Equipment (SEIE), Escape Trunk	EA01 (SSN 774 Class, non-SOF)
5940/901	Submarine Escape and Immersion Equipment (SEIE), Escape Trunk	EA01 (SSN 21 Class)
5940/007	Backup Oxygen Redistribution System	EA01 (SSBN/SSGN 726 Class)
5940/006	Submarine Survivability Life Support Systems, ExtendAir	EA01 (SSN 774 Class only)
5940/005	Submarine Escape, Rescue, and Survival Equipment, Escape Trunk	WK01 (WF01 for SSN 774 Class)
5940/003	Manual Reverse Osmosis Desalinator (MROD)	RL01 (SSBN and SSGN 726 Class and 21 Class only)
5940/002	Atmospheric Sampling, Submarine Survivability Life Support Systems	NE01
5940/001	Lithium Hydroxide (LiOH) Curtain Kits	EA01
59400/015	Submarine Emergency Position Indicating Radio Beacon (SEPIRB)	OC01
5882/021	Helicopter Transfer Kit,(Submarine)	WK01 (WQ01 for SSN 774 Class)

19-5.4.4 Related Maintenance. Related maintenance, so designated by the ISEA or Technical Warrant Holder, is determined from the MIP. The "RELATED MAINT" column of the MIP reflects related maintenance requirements. Related requirements are positioned on the MIP to line up directly across from the MRC to which they are related. Related maintenance requirements are also identified in the TPMTE section of the MRC under "MISCELLANEOUS".

a. Related Maintenance Categories.

(1) Mandatory Related. Mandatory related maintenance requirement(s) are those maintenance actions that must be accomplished concurrently with another maintenance requirement. The mandatory relationship is indicated with the use of the # sign. If the mandatory related maintenance resides on the same MIP, it will be reflected in the RELATED MAINT column as "periodicity#" (e.g., M-3#). If the related maintenance resides on another MIP, it will be reflected as "MIP:periodicity#" (e.g., IC-013/033:M-4#). Mandatory related maintenance requirements are automatically scheduled by SKED.

NOTE: MANDATORY RELATED REQUIREMENTS MUST BE LINKED IN SKED TO BE AUTOMATICALLY SCHEDULED.

(2) Convenience Related. Convenience related maintenance requirement(s) are those maintenance actions that can be accomplished concurrently with another maintenance requirement to save time (preliminary steps and tag-outs already accomplished) or for work force considerations. If the convenience related maintenance resides on the same MIP, it will be reflected in the RELATED MAINT column as "periodicity" (e.g., M-5). If the related maintenance resides on another MIP, it will be reflected as "MIP:periodicity" (e.g., EL-010/001:M-4)). In both cases, the # symbol is omitted. The WCS manually schedules convenience related requirements.

(3) Conditional Related. Conditional related maintenance requirement(s) are those maintenance actions that are performed when specific conditions are present or specified parameters are not met on the referencing MRC. Conditional related maintenance will appear on the MIP in the same manner as convenience related maintenance. The WCS manually schedules conditional related requirements.

(4) None. No related maintenance is reflected as "None" in the "RELATED MAINT" column.

b. Work Center Supervisors Actions. WCSs shall review their schedules on a regular basis for opportunities to perform other PMS when an equipment or system has maintenance actions scheduled. Rescheduling of PMS to take advantage of other system maintenance that may be convenience related is highly recommended.

(1) If an MRC has related maintenance from another MIP, review the related MIP and MRC and determine if it requires assistance from another WC.

(2) If the related MIP and MRC does not require assistance from another WC and is not on the lead WC LOEP, submit an FBR or PSR to have it added to the LOEP.

(3) If the related MIP and MRC requires assistance or completion by another WC and is mandatory, convenience or conditional related then it should also be on the lead WC LOEP. If it is not on the lead WC LOEP, submit an FBR or PSR to have it added to the LOEP. If the related MRC requires technical

assistance, a special NEC, or another rating, that is not part of the lead WC, then the person with the technical training, special NEC or required rating should be temporarily added to the lead WC "Crew List" and assigned the related maintenance in either an assist or performance role. All WCSs involved will collaboratively plan the required maintenance and may adjust schedules based upon individual workload. When the maintenance is completed, the lead WCS will mark the MRC as completed.

19-5.4.5 Inactive Equipment Maintenance.

a. Inactive Equipment. A piece of equipment or system intentionally placed in a hibernated state for a specific period with the intention of reactivating that equipment or system at the end of that period.

(1) Status I. Equipment that will:

(a) Remain onboard,

(b) Is not scheduled for corrective maintenance or overhaul, or

(c) Will be inactive during extended shutdown periods and maintenance availabilities as determined by the DH with DH approval stated in the IEM note.

Example: Submarine CO_2 Removal Plant in wet or dry lay-up.

NOTE: PERFORM A "WET LAY-UP", SUCH AS THE CO_2 REMOVAL PLANT FILLED WITH DISTILLED OR DEMINERALIZED WATER, PRIOR TO ENTERING PORT WHEN THE SHIP IS EXPECTED TO BE IN PORT FOR 7 TO 45 DAYS OR A "DRY LAY-UP", CO_2 REMOVAL PLANT LEFT EMPTY AFTER FLUSHING AND DRAINING, PRIOR TO ENTERING PORT WHEN THE SHIP IS EXPECTED TO BE IN PORT FOR GREATER THAN 45 DAYS, OR PRIOR TO ENTERING PORT WHEN MAINTENANCE REQUIRING THE REMOVAL OF ALL CO_2 REMOVAL PLANT FLUID IS EXPECTED.

(2) Status II. Equipment that is inactive and:

(a) Subject to corrective maintenance, overhaul, or removal for safe storage,

(b) Temporarily transferred to another activity for maintenance responsibility for extended shutdown periods as determined by the DH, with DH approval stated in the IEM note

Example: Submarine Refrigeration Compressor removed for depot level overhaul or transferring Trim System to repair activity.

(c) When system(s) components are scheduled for replacement.

b. Implementation and Responsibility. While inactive, minimum maintenance is performed to ensure the success of the reactivation. The IEM section of the MIP will cover this maintenance. However, consideration should also be given to active PMS

maintenance checks that can be manually added and performed during this period of inactivity.

(1) The ship will develop an IEM plan for all inactive equipment during availabilities lasting 21 days or longer. The plan will include reason for inactivation, duration, impact to division maintenance schedule and reflect integration with the Lead Maintenance Activity (LMA) work schedule and operational recovery. DH approval of this plan will be documented in the SKED IEM remarks. Use Appendix C.

(2) In accordance with the appropriate SWLIN 044 and using the applicable Preventive Maintenance Manual, submarines in CNO availabilities will negotiate operational control requirements with the maintenance activity at the arrival conference, to define responsibility for IEM. IEM periodic maintenance requirements and any applicable active PMS maintenance checks must be added manually at the appropriate frequency.

(3) To implement procedures for the accomplishment of PMS for equipment declared in an inactive status, current PMS schedules are modified to annotate the requirements listed in the IEM section of the MIP. For advance planning and scheduling of maintenance to take place, it is necessary to determine and identify the extent to which unit or Ship's Force personnel will conduct PMS during an inactive period. MIPs in each WC will be reviewed to determine if equipment has IEM coverage (e.g., Lay-Up (LU), Periodic Maintenance (PM), Start-Up (SU) and Operational Test (OT)), if the coverage is adequate, and what procedures to follow if there is no IEM coverage on the MIP or provided coverage appears inadequate. The DH is responsible for determining equipment IEM status. When placing a system or equipment in IEM status, the DH will also determine the IEM start date to be reflected in SKED. The IEM end date will not be applied in SKED until the system or equipment is ready to be brought out of IEM status. All periodic PMS that would have been scheduled during the IEM period should be reviewed for applicability, and documented on Appendix C for planned execution with applicable maintenance accomplished prior to operating equipment.

(4) IEM procedures are listed on MIPs and separated from operational PMS by a horizontal line. The IEM section is titled "Inactive Equipment Maintenance" and is prefaced by the following statement: "The following requirements will be scheduled when equipment is inactivated for periods of prolonged idleness." When there are no IEM requirements the words "None required" will appear under the IEM Section of the MIP. When IEM procedures are inadequate, submit an FBR or PSR. The unit or ship should consider all factors that affect equipment deterioration and take necessary precautionary measures. These factors include environmental conditions, equipment location, susceptibility to damage or other factors that cannot be anticipated when IEM procedures were originally developed by the cognizant ISEA or design activity.

(5) The lack of IEM requirements on a MIP does not prohibit placing that system or equipment into an inactive state. Additionally, certain locations require precautions and maintenance not required force-wide. The unit or ship should consider all factors that affect equipment deterioration and take necessary precautionary measures. The LCPO is responsible for identifying factors that are inadequate and may require additional preparation and maintenance of the inactive equipment while reporting same to the DH for approval. Factors may include environmental conditions, equipment location or susceptibility to damage. For those actions that are recurring in nature, the LCPO should submit an FBR PSR for possible MRC development.

c. IEM Scheduling. SKED provides the capability to perform IEM scheduling.

(1) Status I. The scheduling of maintenance for Status I inactive equipment utilizes conventional PMS scheduling techniques. LU checks will automatically be added to the schedule at the beginning of IEM by SKED. PM checks will be manually added to the schedule by the WCS for the period of IEM following the guidelines of the MIP. At the conclusion of IEM, SU checks and routine PMS will automatically be added to the schedule by SKED. SU checks must be accomplished the week IEM ends. All periodic checks added at the end of IEM, can be moved to the right, not to exceed the allowable date range. Since the MRC date range cannot be applied to the left (into the IEM period), the MRC date range can only be moved to the right and therefore only the plus value of the specific range, i.e., the date range for a monthly is 21-41 days. The requirement can only be moved or scheduled ten days to the right and will not go into “alert” until after the tenth day. This allows the MP or WCS scheduling flexibility within the plus side of the date range of the MRC.

(2) Status II. The scheduling of maintenance for Status II inactive equipment utilizes conventional PMS scheduling techniques, however, not all scheduled IEM PMS may need to be accomplished by the unit or Ship’s Force. LU checks will automatically be added to the schedule at the beginning of IEM by SKED and may be marked “NA” if the LU check did not support the equipment being removed from the ship or unit or “Accomplished by Higher Authority” symbol if completed by the intermediate or depot level maintenance activity. PM checks may be required to be schedule during the IEM period. At the conclusion of IEM, SU checks and routine PMS will automatically be added to the schedule by SKED. SU checks must be accomplished the week IEM ends and may be marked with the “Accomplished by Higher Authority” symbol if they were completed by the intermediate or depot level maintenance activity. Routine PMS added at the end of IEM may also be marked with the “Accomplished by Higher Authority” symbol if they were completed by the intermediate or depot level maintenance activity. All periodic checks added at the end of IEM, can be moved to the right, not to exceed the allowable date range. Since the MRC date range cannot be applied to the left, the MRC date range can only be

moved to the right and therefore only the plus value of the specific range, i.e., the date range for a monthly is 21-41 days. The requirement can only be moved (scheduled) ten days to the right and will not go into "alert" until after the tenth day. This allows the MP or WCS scheduling flexibility within the plus side of the date range of the MRC.

19-5.4.6 Deactivated Equipment. A piece of equipment or system intentionally placed out-of-service with no intention of reactivating the equipment or system. Refer to reference (a) for guidance in deactivating equipment.

19-5.4.7 Scheduling. PMS is a portion of the command's 3-M Program that provides, in one authoritative system, the scheduling information and technical procedures governing planned maintenance. PMS provides a simple method for scheduling and documenting the execution of planned maintenance procedures. Fleet policy and scope are provided in chapter 19 of this volume.

NOTE: WHERE THE GOAL OF 100% ACCOMPLISHMENT CANNOT BE REACHED, THE UNIT'S COC MUST BE KEPT INFORMED OF THE CIRCUMSTANCES THAT PREVENT ACCOMPLISHMENT OF SCHEDULED MAINTENANCE.

a. Situational maintenance scheduling will be managed utilizing the tools provided by the computer based PMS scheduling software employed by the activity. All event driven situational requirements will be "triggered" when required and performed per reference (a).

b. The creation and use of generic crewmembers such as "Torpedoman of the Watch" and "Engineering Laboratory Technician" is not authorized. For those instances where the watchstander performs the MRC, the senior watchstander's name will be indicated in SKED.

c. The MP will be assigned prior to commencing the week and must complete the maintenance as directed. If a different person is required, the WCS will reassign the PMS accordingly.

d. Systems with many multiple components (greater than 30) can use general spaces (Crew's Mess, Turbine Generator Lube Oil, Locker#) for terms to designate maintenance items (drain funnels, Emergency Air Breathing masks, photo luminescent marking and battle lanterns).

e. "H" coded MRCs, having calibration maintenance items listed in tables, will be listed as individual SKED equipment maintenance items. The instrument serial number must match the Calibration Requirements List system designator (i.e., AHP-100-GA-001). All "H" coded MRCs will be considered overdue based on the due date annotated on the calibration label regardless of MRC date ranges allowed by reference (a) and reflected in Table 19-5-3.

f. "NZ" coded MRCs may degrade acoustic performance. Ship's posture should be considered prior to performing maintenance designated "NZ".

g. Check Notes are required in SKED under the following circumstances.

(1) When PMS is marked as “lost”.

(2) When PMS is marked as not-applicable.

(3) When PMS is marked with the ‘¢’ symbol, “satisfied by Higher Level Maintenance.” Accomplished by Higher Level Maintenance will be entered by the Division LCPO who will verify and enter the Maintenance Activity and work document identification that reflects completion of all steps of the MRC (i.e. PHNSY X38, TGI # 45645A).

(4) When PMS requires a tag-out, the tag-out program of record identifier will be entered.

h. Alert Notes will be in the format of paragraph 19-5.4.10 of this chapter.

i. After the FR is approved, the 3MC will conduct quarter archival to maintain one completed quarter, one current quarter, and at least four future quarters. This permits the ability to review past records and forecasting of upcoming maintenance actions.

19-5.4.8 SKED. The use of SKED version 3.2 or subsequent versions for PMS scheduling constitutes full compliance with all administrative provisions of the 3-M Manual.

a. Guidance for use of SKED is provided via the SKED users guide with help menus, and wizards associated with SKED functionality.

b. The Navy PMS DVD or TFR DVD is used to update the command or unit’s SKED PMS data.

c. The SKED program uses days to schedule and keep track of calendar periodicities. MRCs are displayed as out of periodicity when they fall outside the established date ranges in the SKED program. These date ranges are as reflected in Table 19-5-3.

Table 19-5-3 - SKED Periodicity – Date Ranges

Periodicity	Date Range
Daily	None
2D	None
3D	None
Weekly	None
2W	9 - 19 days
3W	14 - 28 days
Monthly	21 - 41 days
2M	41 - 83 days

Table 19-5-3 - SKED Periodicity – Date Ranges	
Periodicity	Date Range
Quarterly	61 - 121 days
4M	83 - 165 days
Semi-Annually	121 - 243 days
8M	165 - 331 days
9M	+ or - 90 days from scheduled date
Annual	+ or - 90 days from scheduled date
Multi-month after annual	+ or - 90 days from scheduled date

19-5.4.9 SKED Server Failure. In the event of a SKED server failure, operation of PMS performance and tracking is as follows:

a. Retrieve Maintenance Outlook Report that was created following approval of current FR.

b. The WCS or LCPO will maintain the assignment of PMS with the Maintenance Outlook Report until server is restored.

c. Print assigned MRCs from the PMS viewer program that is located on the FR DVD.

d. Document and retain accomplished maintenance on printed blank 13-Week Reports that are in the documents folder on the FR DVD.

e. When the server is restored, update SKED based on accomplished maintenance documented on 13-Week Reports.

19-5.4.10 Accomplishing PMS. Maintenance personnel use MRCs to accomplish assigned planned maintenance as described here:

a. From SKED “My Task” view, review the 13-Week Report.

b. Determine maintenance task(s) assigned.

c. Determine when the maintenance task(s) are due.

d. Determine what tools, parts, material, test equipment or supplies are needed. For MRCs that contain inspections and then maintenance actions based upon the inspection findings, the TPMTE needed to perform the follow-on maintenance caused by the inspection findings does not need to be obtained prior to performing the MRC but rather, may be obtained as needed.

e. Perform the maintenance on schedule.

f. Notify the WCS immediately whenever one or more of the following conditions exist:

(1) Anything on an MRC is not fully understood, appears to be incorrect or cannot be accomplished as written.

(2) TPMTE prescribed by the MRC is not available, is not correct or questions about substitutions arise.

(3) Any doubt exists about your capability, training, or experience to properly perform the maintenance requirement as prescribed.

(4) Factors exist which would make performance of the maintenance requirement unwise or dangerous, for example, disassembly of equipment needed for operations, radiation when prohibited, situations causing safety hazard to exist, etc.

(5) Equipment deficiencies or casualties are discovered.

(6) Any provisions or requirements on the MRC cannot be accomplished as prescribed. See para. 19-5.4.1 of this chapter for clarification

g. If an MRC can be completed step by step as written, then the maintenance action can be signed off as completed. Report completed planned maintenance actions to the WCS, update the PMS schedule to reflect the completed maintenance, annotate and sign the 13-Week Report (if used). If multiple maintenance personnel are assigned to a single maintenance action, the most senior person assigned must update the PMS schedule, annotate, and sign the 13-Week Report or Check Note if using SKED 3.2 electronic accountability.

h. Maintenance actions not fully completed will be reported to the WCS. However, if material deficiencies or casualties which are unrelated to that MR are discovered, the MR can be checked off provided the MR was fully completed, but the discrepancy must be reported via MDS.

19-5.4.11 Non-Accomplished PMS Categories. The WCS or LCPO will add a brief description for each Alert Note for non-accomplished categories using subparagraphs 19-5.4.10.a through 19-5.4.10.g of this chapter. Alert note will include an accurate description of why the maintenance was not completed within periodicity and an estimated completion date or availability.

a. System or Equipment Failure. System or equipment is not operational or in a reduced operational status thus preventing maintenance from being accomplished. CSMP Job Sequence Number (JSN) required in additional text description.

b. Inadequate Maintenance Procedures. MRC procedure or steps cannot be accomplished to a point where the maintenance can be considered accomplished. FBR or PSR number required in additional text description.

c. Ship Operational Requirements. Operations prevent the maintenance from being accomplished. Requires additional text description.

d. System or Equipment Operational Requirements. Required operation of system or equipment prevents maintenance from being accomplished. Requires additional text description.

e. Lack of Hazardous Material. Correct hazardous material (HAZMAT) not available at the time maintenance was to be performed. CSMP JSN required in additional text description.

f. Missing or Incorrect TPMTE. Correct or calibrated TPMTE was not available at the time maintenance was to be performed. CSMP JSN required in additional text description.

g. Other. Requires additional text description.

19-5.4.12 Accountability. The credibility of the Navy PMS program relies heavily on the individual accomplishing the maintenance. The required dedication and integrity of that individual cannot be overstressed.

a. To maintain accountability, personnel are required to sign for the completion of assigned maintenance in an Accountability Log (if used). The WCS is required to review and sign the Accountability Log weekly to verify the accuracy and completeness of entries. Accountability sheets will be maintained in the WC PMS File for a period of not less than 13 weeks.

b. Electronic accountability will be utilized by ships employing SKED 3.2. When an individual updates the disposition of a check, this is the same as signing and dating a check completion on a 13-Week Accountability Sheet. The disposition of a check will become permanent when the weekly closeout is performed. All PMS maintenance assigned to a MP is presented to them immediately upon SKED 3.2 log-on. The CoC review can be tracked on the Weekly Closeout Signature Sheet.

19-5.4.13 Force Revision Implementation. In addition to the requirements of reference (a), the following steps ensure the most efficient and thorough implementation of an FR:

a. MRC deletions on MIPs will be marked to indicate the reason for deletion:

(1) Scheduling aids (SA). Indicate applicable scheduling aid.

(2) Split MIP. Indicate responsible WC if the MRC is applicable to the ship, the responsible WC designation will be used versus a scheduling aid.

(3) “Other” includes approved responses to FBRs or PSRs, ACNs, Message Date-Time-Group, dual periodicity. Indicate guiding notation for deletion: “SA-1” or “Note 1”, configuration change number.

b. The FR will be completed on or before the first Monday of the new calendar quarter. When operational schedules do not provide adequate time to implement the revision prior to the start of the quarter, the XO may direct an alternate implementation date. This deferred FR will be reported to the ISIC unless deployed. If two or more FRs were not available while the unit was deployed, only the most recent FR will be installed and implemented.

c. It is advisable to complete the FR process through DH approval before conducting quarterly audits by a chief or more senior.

d. The 3MC will:

(1) Update PMS and TFR data into SKED prior to routing the change documentation to WC.

(2) Route the FR to WCS for implementation. (See Figures 19-5-2 and 19-5-3 of this chapter for an example of a routing memorandum and an FR implementation checklist, respectively.)

(3) Delete SKED FBRs and PSRs after reflection within the FR.

(4) When the FR is approved, the 3MC will generate and forward the ship's Tailored Force Revision Data (.tfd) file to the TYCOM 3-M Rep by the 15th of the first month of the quarter. The 3MC will provide the SKED TFD file to the TYCOM 3-M REP immediately following completion of FR in all WC.

e. The WCS, upon receipt of the change document from the 3MC, will:

(1) Apply changes to the WC PMS schedule utilizing SKED Revision Editor.

(2) Route revision changes to division LCPO for review and concurrence.

f. The division LCPO will:

(1) Verify that all PMS changes have been properly applied to the WC schedule utilizing SKED Revision Editor.

(2) Submit PMS schedule to the DIVO for review and concurrence.

g. The DIVO will:

(1) Verify that all PMS changes have been properly applied to the WC schedule utilizing SKED Revision Editor.

(2) Submit PMS schedule to DH for review and approval.

h. The DH will:

(1) Verify that all PMS changes have been properly applied to the WC schedule utilizing SKED Revision Editor.

(2) Review and approve WC PMS schedules.

i. The WCS makes final entries in the WC Record of Change Log, completes the PMS Change Documentation Routing Memorandum, and returns it to the 3MC.

j. The 3MC updates the CSAL and notifies the XO that the FR has been installed after receiving all FR PMS Change Documentation Routing Memorandums from the WCs.

NOTE: ADMINISTRATIVE REVISION WILL BE DOCUMENTED BY ENTERING A SEQUENTIAL NUMBERING SYSTEM STARTING WITH 01 AND ENDING WITH THE TWO DIGIT YEAR EXAMPLE 01-23. IT WILL CONTAIN THE

SPECIFIC REASON FOR THE ADMINISTRATIVE CHANGE AND THE FULL MIP AND OR MRC AFFECTED.

Figure 19-5-2 - Force Revision Routing Memorandum

MEMORANDUM

From: 3-M Coordinator

To: _____ Work Center Supervisor

Subj: FORCE REVISION PACKAGE X-XX

Encl: (1) Force Revision Implementation Checklist

(2) List of Effective Pages (LOEP)

1. Force Revision Serial: X-XX has arrived from NSLC.

2. The SKED Force Revision (FR) update is complete. Begin your work center FR implementation using Enclosures (1) and (2); complete through your Department Head no later than Day/Month/Year.

3. Corrections, including those to LOEP, MIP and MRC, should be made immediately. Make certain ACNs and FBR or PSR responses are reflected in the FR. If not, maintain the copies and changes to your MIP(s) and MRC(s) until reflected in a subsequent FR.

4. MRCs with procedural line-outs previously approved by the LCPO must again be reviewed by the LCPO to confirm they continue to meet the requirements of Volume VI, Chapter 19 of this manual. Specifically, in the procedure block, Work Center Supervisors may line-out the non-applicable line items that do not pertain to current equipment or configuration when the step includes the words “if applicable” or a note identifies steps to be omitted. These items must be reviewed and approved by the division LCPO. As these changes are work center and maintenance item specific, submission of an FBR or PSR is not required.

3MC

Figure 19-5-3 - Force Revision Implementation Checklist

MEMORANDUM

From _____ Work Center Supervisor

To: 3-M Coordinator

Subj: FORCE REVISION IMPLEMENTATION CHECKLIST COMPLETION

1. The following actions have been accomplished in SKED to implement Force Revision X-XX.

Task Description	Initial
Verified all equipment is listed under each MIP.	
Verified new or changed MRCs (green or yellow) are added to the correct Maintenance Item (equipment).	
Verified all applicable MRCs for each piece of equipment are active.	
Verified all MRC's have associated "Related Maintenance" attached.	
Verified that Safety of Ship is toggled to "YES" if applicable.	
Verified that all MIP lineout's have a technical reason documented for deletion. (Select the "Pencil" Icon on top row)	
Verify Maintenance Item Serials & Locations are correct.	
Upon completion of implementation Marked Complete for digital approval by: LCPO, Division Officer and Department Head.	LCPO
	DIVO
	DH

2. After DH approval:

LCPO run SKED report PMS Documents and Customized MRCs – Line-outs. Verify each procedural lineout meets JFMM volume VI chapter 19, paragraph 19.6.11 requirements.	
WCS create an excel spread sheet from the Maintenance Outlook Report as a minimum electronic backup forecasting as many quarters in advance as available and store it on your hard drive (not a LAN drive) in the event of the LAN crashing.	

WCS select "Work Center" from the upper menu and "Update Unassigned Slots." Initially, any MRC without ownership will be assigned to the WCS. Reassignment by the WCS or LCPO will follow.

3. Printing requirements for MRCs are determined by individual command policy. Printed MRCs must come from "PMS Documents" (not PMS Viewer).
4. The only required documents in the WC PMS File are:
   a. Classified MRCs.
   b. MRCs required by the command.
   c. MRCs with pen & ink changes authorized by ACNs or answered FBRs or PSRs.
   d. K-MRC performance data (if no digital record).
5. Approval Signatures:

3MC	

*Safety of Ship. An asterisk (*) will be inserted in SKED against any Maintenance Requirement (MR) which is a "Safety of Ship" item. A "Safety of Ship Item" is defined as any maintenance action vital to the maintenance of a submarine's watertight integrity or its ability to return safely to the surface. "Safety of Ship" MRs, so designated by the cognizant technical authority, are annotated on the MIP with a single asterisk (*) in the periodicity code column. Commanding Officer notification is required for non-accomplishment of any "Safety of Ship" designated MR.

19-5.4.14 Planned Maintenance System Feedback Reports and PMS Service Requests. PMS FBRs or PSRs are used to identify problems with PMS documentation or to request the addition or deletion of PMS coverage. Issues with the periodicity, rates, man-hours, TPMTE and procedure may all be reported via an FBR or PSR. An FBR or PSR is also used to request copies of classified MRCs, request the addition or deletion of an MRC (maintenance requirement) to or from a MIP, splitting a MIP between WCs, shifting of maintenance responsibility or to request PMS coverage for newly installed systems or equipment. Paragraphs 19-5.4.13.a through 19-5.4.13.j of this manual provide amplifying information dealing with the issues that may prompt the submission of an FBR or PSR.

a. Periodicity. An FBR or PSR can be used to request the increase or decrease in the frequency of a maintenance action, i.e., an MRC. However, the originator needs to

keep in mind that the ship or unit has the prerogative to increase the frequency because of harsh weather, unusual operating conditions or corrective maintenance and associated testing requirements.

b. Rates. The Rates block on the MRC represents the developer's recommendation of the skill level (rate and rank) best suited to accomplish the maintenance action. The key word is recommendation. Qualified personnel other than the rate and ranking specified may be assigned. When an NEC is assigned or Damage Control Petty Officer or Safety Petty Officer as per sub-paragraph 19-5.2.o of this chapter, substitution of other personnel is not allowed other than those exceptions as noted in reference (a). An FBR or PSR requesting the rate on an MRC be changed from an ET2 to an FT2 will probably not pass TYCOM screening, yet an FBR requesting the addition or deletion of personnel will generally pass to the cognizant technical activity for review.

c. Man-hours. The MRC reflects the average time per equipment, per person. It does not reflect or account for gathering and putting away tools, tag-outs or time removing and replacing interferences. From a maintainer's perspective, this is not an accurate representation of the time required to accomplish the maintenance action. The Future of PMS initiative will attempt to do a better job of accounting for this additional time but until then, FBRs should be submitted only when the allotted time per equipment is significantly out of synch with the actual time required. For example, an MRC calls out 0.5 man-hours per equipment, but it takes 1.0 man-hours.

d. Tools, Parts, Material and Test Equipment. TPMTE FBRs or PSRs should be submitted when the procedure calls for an item not listed in the TPMTE block or when the TPMTE block lists an item not called out in the procedure. Updating the MRC to reflect common hand tools, administrative or office supplies and basic housekeeping items is addressed in paragraph 19-5.4.13.k.(1) of this chapter.

e. Procedure. Procedures are written at a level of detail based on the assumption maintenance personnel are trained, qualified, and supervised by experienced leadership to execute the maintenance consistently and expertly. MRCs exist to provide standardized proven procedures, specify consistent acceptance criteria and to communicate warnings and cautions relative to the specific maintenance action. They are not intended to specify every possible action of the maintainer. There may be instances where an obvious typographical error exists on the MRC. For example turn switch to "ON". However, the switch may already be "ON" and the intent of the step is to turn unit off. The card should read "Turn switch to OFF". This type of error should not prevent the scheduling or performance of maintenance. However, in this situation, the accomplishment of the MRC is not possible until the WCS reviews the error and concurs that it is safe to proceed. A temporary notation including the reason for the correction must be made on the MRC, initialed by the WCS and an FBR or PSR submitted. Extreme caution will be taken when reviewing MRCs for this type of error. Errors must be obvious typographical errors and a PMS FBR or PSR must be submitted immediately upon discovered. Do not permanently alter the MRC until authorized by the applicable Systems Command, ISEA or NSLC Detachment. If a

step is missing that is necessary to complete the task, and that step is not obvious to the MP, submit an FBR or PSR to have it added. An FBR or PSR submitted to request procedural changes should include the originators contact information and supporting rationale or justification. If, however, a step is missing that is clearly obvious, an FBR or PSR only serves to overload a process that should be focused on more technical issues.

f. Duplicate MRCs. Unclassified MIPs and MRCs are now available from the DVD. Copies of classified MRCs still require an FBR or PSR request due to handling requirements.

g. Addition or Deletion of an MRC. During the life cycle of a system, equipment, or component it may become necessary to add a maintenance action to prevent an age related functional failure or to delete a maintenance action due to inherent reliability not foreseen during maintenance development. An FBR or PSR submitted to request the addition or deletion of an MRC should include the originator's contact information and supporting rationale or justification.

h. Newly Installed or Removed Equipment. While an FBR or PSR request for PMS coverage will provide initial maintenance coverage or deletion of MIP(s) because of equipment removal, submission of a CK is still required to initiate the rest of the logistic support change process. This point cannot be overstressed; the submission of the FBR or PSR does not relieve the ship or unit from initiating a CK. The CK initiates supply support, CDMD-OA changes, ship selected record drawing updates and class maintenance plan updates.

i. Splitting a MIP. There are instances in which a MIP includes MRCs for more than one WC to perform. When this occurs, a decision is required by the command as to whether the MIP will be split or will be scheduled singly by one WC. Only the XO can authorize the splitting of a MIP if an MRC requires another WC to perform the entire maintenance action. If the decision is made not to split the MIP, then the MRs will be accomplished through the coordination of WCSs.

(1) If the MIP is split, the following procedures apply:

(a) Submit to the XO a Non-Technical PMS FBR or PSR requesting approval to split the maintenance responsibility.

(b) Upon receipt of the XO's concurrence, the 3MC will make an annotation in the remarks block of the FBR or PSR stating, "XO concurs with splitting MIP maintenance responsibility".

(2) Upon receipt of the FBR or PSR approval:

(a) Utilizing the SKED Revision Editor, delete the MRC from the MIP and show the reason for deletion as the designation of the WC assuming responsibility.

(b) If the WC assuming responsibility does not reflect the MIP and maintenance items, utilize the SKED Revision Editor to add them. Schedule only the MRC(s) that pertain to the WC. Reflect remaining

as deleted with the reason for deletion the designation of the parent WC.

(3) If the situation occurs where a WC removes a split MIP, the following procedures apply:

(a) Submit an XO approved, non-technical PMS FBR or PSR reporting the decision to remove the split maintenance responsibility. Upon receipt of the XO's concurrence, the 3MC will make an annotation in the remarks block of the FBR or PSR "XO concurs with removing split MIP maintenance responsibility".

(b) Upon receipt of FBR or PSR approval, utilize the SKED Revision Editor, remove the MIP, MRC(s) and maintenance item(s) from the WC no longer involved. Ensure that the lead WC assumes full responsibility for the MIP and MRC(s) and annotates their schedules accordingly.

j. Shift of Maintenance Responsibility. Individual ships or units sometimes consider it necessary to shift maintenance responsibility from one WC to another, to combine two or more existing WCs or to split an existing WC. These requests for changes of PMS maintenance responsibility require XO concurrence and may require final approval by the applicable TYCOM. Due to the considerable administrative burden, requests to accommodate a temporary situation such as short-term assignment of two WCs to one supervisor should not be submitted.

(1) The following factors should be carefully considered before submitting such requests:

(a) Composition of WCs by size and ratings.

(b) Scope of maintenance responsibilities.

(c) WC workload.

(d) Ease of administration of a WC as a cohesive maintenance group.

(e) Importance of WC grouping to equipment maintenance responsibilities, PMS scheduling, MDS reporting and CSMP listings.

(2) When changes in maintenance responsibility are considered necessary, the following procedures apply:

(a) Submit a PMS FBR or PSR (non-technical). Indicate from which WC(s) equipment is to be deleted and to which it is to be transferred. Upon receipt of the XO's concurrence, the 3MC will make an annotation in the remarks block of the FBR or PSR "XO concurs with the shift of maintenance responsibility."

(b) WC or equipment changes will also be reported in the OMMS system via a CK through the CSMP up-line reporting process.

(3) Upon receipt of the FBR or PSR approval, perform the following actions:

(a) The PMS Master File is updated to reflect deletion of the MIP from one WC and addition to the WC receiving the responsibility. The originating FBR or PSR serial number is annotated on the affected line item on the LOEP for both WCs. The PMS Master File must contain a record of deleted equipment until the change is reflected in a future FR.

(b) Utilizing the SKED Revision Editor, load the affected MIP(s) and MRC(s) to the WC receiving maintenance responsibility. Delete the MIP(s) and MRC(s) from WC shifting responsibility.

(c) Utilizing SKED, perform a revision to move the equipment from the original WC's current schedule to the WC receiving the maintenance responsibility. Data is exported from one and imported to the other maintaining equipment history.

k. MRC Changes Not Requiring Feedback Reports. The only MRC modifications shipboard or unit personnel may make without submitting a PMS feedback report are as listed in subparagraphs 19-5.4.13.k.(1) and (2) of this chapter.

(1) TPMTE Block.

(a) Common hand tools, administrative or office supplies and basic housekeeping items may be substituted or added by the WCS. The WCS may add notes to the MRC to reflect these substitutions. In the case where specific common tools are called out by description, substitutions are not authorized. For example, substitutions such as using synthetic fiber brushes in place of animal hairbrushes or rags and paper towels in place of lint free cloths are not allowed.

(b) Approved parts, materials and miscellaneous item substituted from the supply system, technical manual, or Military Specification, etc., which meet or exceed the requirements may be used. Ensure that substitutions satisfy both the basic maintenance and safety requirements of the MRC. If there is any doubt, a PMS FBR or PSR should be submitted specifying substitution desired and reason.

(c) Test equipment or certified tools, which meet or exceed the Sub-Category code requirement, may be used.

(d) When an MRC pertains to multiple configurations of equipment and the TPMTE block contains tools, parts, test equipment and materials for each unique configuration, the TPMTE block may be tailored for the unit's specific configuration by lining out the items that do not pertain to equipment held.

(e) Exception to TPMTE block change: If an item listed in the TPMTE block is not called for in the procedure block, submit an FBR or PSR explaining the circumstances. Conversely, if a tool, piece of test

equipment, part or material is called for in the procedure block and is not listed in the TPMTE block an FBR or PSR should be submitted.

(2) In the procedure block, WCSs may line-out the non-applicable line items (alternate procedures) that do not pertain to current equipment or configuration when the step includes the words "if applicable" or a note identifies steps to be omitted. These items must be reviewed and approved by the division LCPO. As these changes are WC and maintenance item specific, submission of an FBR or PSR is not required. If a step or steps in the procedure block have been lined-out and tools, parts, material, or test equipment in the TPMTE block pertain only to that step or steps, then they will be lined-out as well with a reference to the step or steps lined-out and approved by the division LCPO. Warnings, cautions, and notes associated with the lined-out step or steps will also be lined-out.

l. Types of Feedback Reports. There are two types of FBRs, Technical and Non-Technical.

(1) Technical. These FBRs or PSRs are used to report technical discrepancies inhibiting PMS performance. Technical feedbacks normally adjudicated by an ISEA responsible for the system or equipment covered by the PMS documentation require all the supporting information the originator can provide. The originator should identify the issue, providing as much supporting technical information, such as Allowance Parts List, Reparable Identity Code, and drawing or Hierarchical Structure Code as available and a proposed response or solution if known. Most importantly, provide point of contact information, including name and phone number so that the ISEA can contact the originator should they have questions. The FBR or PSR must be accurate and complete to "stand alone", that is, the FBR or PSR will be understood without additional explanation. The better the FBR or PSR describes the problem, the more likely the originator will receive a timely response. There are two sub-categories of technical FBRs or PSRs:

(a) Routine. An FBR or PSR will be considered routine when it relates to the technical requirements of PMS. It is used to report technical discrepancies or request clarification of procedures.

(b) Urgent FBR. An FBR or PSR will be considered urgent when it relates to the technical requirements of PMS and involves safety of personnel, safety of ship or the potential for equipment damage. Urgent FBRs or PSRs will be forwarded by naval message containing a PMS FBR or PSR serial number, to both NSLC Detachments Norfolk and San Diego, with info to the cognizant Systems Command, TYCOM and the Naval Safety Center NSLC MECHANICSBURG PA//67//, and SUBMEPP PORTSMOUTH NH. The message must describe the unsafe procedure(s) or condition(s), must identify the MIP and MRC involved and reflect the serial number of the FBR or PSR generated in SKED or Planned Maintenance System -Management

Information System. Once the message has been sent, include the date-time-group of the message in the FBR or PSR and submit.

(2) Non-technical. These FBRs or PSRs are intended to support PMS requests that do not require technical review, including WC changes. Non-technical FBRs or PSRs are submitted to request classified or other PMS documentation which cannot be obtained locally or to request clarification of issues not of a technical nature.

m. Feedback Report Submission. Submarines transmit FBRs and PSRs to their homeport TYCOM 3-M Representative as a text file attachment via email. 3MCs will change the default e- mail address that is programmed into SKED to the 3MC@ email alias address of their command.

n. Feedback Report Screening (Shipboard or Activity).

(1) Initial screening is accomplished by the originator or WCS who is responsible for ensuring all data is accurate and complete.

(2) The division LCPO or DIVO accomplishes the second level screening and verifies the content and validity of the FBR or PSR within three days of origination.

(3) The DH, next to screen the FBR or PSR, is responsible for verifying the content and validity of the FBR or PSR and digitally signing FBRs or PSRs within five days of origination.

(4) The 3MC is responsible for screening, serializing, and forwarding FBRs or PSRs within seven days of origination. The 3MC will also:

(a) Maintain accountability for all PMS FBRs or PSRs submitted and actions taken until updated PMS documentation is received.

(b) Ensure that the originator and all applicable WCs are kept apprised of action taken and ensure the originating and other applicable WCSs implement the changes or corrections when received.

o. Feedback Report Screening (External to Hull or Activity).

(1) 3M Reps will review FBRs or PSRs and will return to activity with comment or forward for further processing.

(2) The TYCOM will verify the content and validity of the FBR or PSRs and either return the document to the originator or pass it on for further processing and resolution. Submarine Force FBRs or PSRs are screened by Submarine Maintenance, Engineering, Planning and Procurement (SUBMEPP) Activity.

(3) SUBMEPP will return an FBR or PSR to the originator under the following conditions:

(a) An answer currently recorded in the Submarine Technical Feedback Report History Tracking Program satisfies the proposed FBR or PSR. The FBR or PSR will be returned with authorization to implement the

previously received response or rationale is provided justifying the non-concurrence.

(b) A similar request has already been submitted and submission of another duplicate request will add no value to the process.

(c) The FBR or PSR requests actions contrary to the direction of this manual or reference (a).

(d) The request does not adequately address or identify the problem. In cases of this nature, the FBR or PSR is returned to the originator for amplifying information. This will be a last resort for submarine force units, as SUBMEPP will attempt to contact the originator to better define the issue.

p. Feedback Processing Activities.

(1) The central control points for processing FBRs or PSRs are the Planned Maintenance System Coordinating Activities (PMSCA). Depending on the type of FBR or PSR and level of technical authority necessary to answer the FBR or PSR, the PMSCA will either respond to the originator with a resolution or forward the FBR or PSR to the appropriate technical authority for action.

(2) ISEAs are those activities designated by NAVSEA as the technical experts for specific systems or equipment. Naval Surface Warfare Center, Philadelphia Detachment is the ISEA for the majority of non-nuclear hull, mechanical and electrical equipment installed on most ships. ISEAs under the direction of the NAVSEA Technical Warrant Holder adjudicate the FBR or PSR request and forward the response to the PMSCAs. The PMSCA provides the final response to the originator and updates the PMS database to reflect ISEA changes. PMS changes are issued with the next available FR.

q. Feedback Processing. FBRs or PSRs are processed per NAVSEA policy:

(1) Urgent FBRs.

(a) The PMSCA will provide a message response to all urgent FBRs or PSRs within one working day of receipt. If the FBR or PSR is forwarded to a Design Activity or ISEA for resolution, then the Design Activity or ISEA will provide a message response informing the originator of specific actions or required changes because of the adjudication of the FBR or PSR within one working day of receipt. This message response must be addressed to the originator and distributed to all TYCOMs of units holding the affected documentation. TYCOMs will forward this message to all commands that could be affected by the PMS change.

(b) The PMSCA will distribute revised PMS documentation to all affected users within 30 calendar days of receipt of the FBR or PSR, via special issue or Advance Change Notice (ACN).

(2) Routine FBRs.

(a) The PMSCA will perform technical review, research, and provide a response to routine FBRs or PSRs where resolution does not require technical authority action.

(b) FBRs or PSRs that the PMSCA cannot resolve will be sent to the cognizant Design Activity or ISEA. The cognizant Design Activity or ISEA will provide the response to the appropriate PMSCA describing the action taken. The PMSCA will provide the response to the originator by electronic means.

(c) Distribution of the revised MRC to the originator and other affected users will be accomplished via ACN or the next available FR.

(d) Reference (a) calls for technical review activities and ISEAs to provide FBR or PSR responses in less than 21 working days from time of receipt. In addition, NAVSEA has established a goal of providing answers to FBRs or PSRs in one day. While some FBRs or PSRs will require extensive research and days, weeks or in some cases months to resolve, the vast majority of FBRs or PSRs can and should be answered much sooner. One day may be overly optimistic, but the intent is to put the emphasis back on the timely resolution of FBRs or PSRs.

(e) If no revision to PMS documentation is required, pertinent comments will be provided in the response to the PMSCA. When not concurring with the feedback report, the rationale for the non-concurrence must be provided to the PMSCA.

NOTE: IT IS POSSIBLE AN FBR OR PSR RESPONSE MAY NOT MAKE A SPECIFIC FR BASED ON THE DATE THE RESPONSE WAS RECEIVED BY NSLC. PROCESSING TIME AND HANDLING MAY CAUSE THE REVISED DOCUMENTATION TO MISS AN FR CUTOFF DATE. HOWEVER, SINCE ALL FRS ARE NOW RECEIVED QUARTERLY, IF A REVISION MISSES THE CURRENT FR CUTOFF WINDOW, THE REVISED DOCUMENTATION WILL BE AVAILABLE WITHIN THE NEXT THREE MONTHS.

r. Feedback Response Implementation. Units will implement responses to FBRs or PSRs based on the category and content as determined by the unit's 3MC.

(1) Urgent FBR or PSR. Within 24 hours of receipt of FBR or PSR response.

(2) Urgent FBR or PSR with an ACN. Within 24 hours of receipt, the ship will implement an administrative change to incorporate the new PMS documentation. These revised documents will be utilized to conduct maintenance until the revised PMS documentation is incorporated into the next FR.

(3) Routine FBR or PSR:

(a) Technical. The response deals with content such as a revision to technical specifications, tolerances, test equipment, materials, acceptance criteria or the sequence of procedural steps. These changes need to be implemented within two weeks of receipt of the FBR or PSR response or prior to the next scheduled accomplishment date should that date fall within the two-week window.

(b) Administrative. The response deals with issues that do not affect the technical content or procedural steps. Administrative changes might be added steps to provide a better degree of clarity, formatting revisions to tables or figures that do not change technical content, or updating of Notes, Warnings or Cautions that do not impact the performance of the MRC. These changes do not need to be implemented prior to receipt of the next FR. If the next FR does not reflect the revised documentation, implementation is required before the next scheduled accomplishment date of the MRC.

(4) Routine FBR or PSR with an ACN:

(a) Technical. These changes need to be implemented via an administrative change within two weeks of receipt of the FBR or PSR response or prior to the next scheduled accomplishment date should that date fall within the two-week window. These revised documents will be utilized to conduct maintenance until the revised PMS documentation is incorporated into the next FR.

(b) Administrative. These changes do not need to be implemented prior to receipt of the next FR. If the next FR does not reflect the revised documentation, implementation is required via an administrative change before the next scheduled accomplishment date of the MRC.

19-5.4.15 Transferring Dry Deck Shelter. Transferring of DDS PMS from Logistics Support Unit (LOGSU) to the host submarine. All units receiving a LOGSU maintained asset operating on laptops will:

(a) When the DDS is transferred to the host submarine the Seal Delivery Vehicle Team that is transferring custody will transfer the DDS division SKED program on a laptop, a paper copy of the current quarter List View, 13-Week Accountability Sheets and WC Space Manual to the receiving command 3MC. Any time the DDS is transferred between commands, a Scheduling and Execution Effectiveness Review (SEER) will be conducted on the WC by both commands.

(b) The ship will maintain the DDS WCs under the cognizance of the Special Operations Force (SOF) Division using the DDS SKED Laptop.

(c) All FRs, administrative changes and PMS performed will be documented on the DDS laptop by the WCS and approved by the weapons officer. All records of audits and reviews will be retained between ship's 3-M Inspections.

(d) Backups of the DDS SKED Laptop will be performed monthly and stored on media external to the DDS SKED Laptop hard drive. At a minimum, the external media will be labeled with DDS WC, host ship's hull number, and date of backup.

(e) All end of quarter reports required by paragraph 19-5.4.2.c(3) of this chapter must be maintained for 12 months after DDS removal by the host ship 3MC.

19-5.4.16 Planning Board for Maintenance. Ships will develop a maintenance plan encompassing the entire Pre-Overseas Movement and Patrol Cycle timeline to include the first post deployment CMAV or Post Patrol Refit for the PB4M schedule or as otherwise directed by the TYCOM. For submarines homeported in Guam this maintenance plan will cover the next two scheduled CMAV periods. This plan will be forwarded to the squadron 3MO and forwarded to the Squadron Engineer by the end of post deployment stand down, crew turnover for SSBN and SSGN and prior to A-90 for submarines homeported in Guam. The ISIC will review and forward this plan to PMT, FMA and TYCOM N4. Ships will review and update their plans upon the completion of each CMAV or Refit and forward this update prior to A-60 of the next CMAV. For submarines homeported in Guam, this maintenance plan will cover the next two scheduled CMAV periods. To successfully plan and execute all maintenance during the submarine maintenance cycle each ship will utilize the following maintenance planning tools:

a. SKED Forecasting – Parts and Material

b. K-MRC Active Report

c. OMMS-NG

d. P-OMMS

e. SKED Forecasting – Parts & Materials

f. Calibration Management System Report (Level 3)

g. PMR Periodic Maintenance Requirements schedule and inventories

h. Unrestricted Operations listing

i. PMT Submarine Maintenance Monitoring Information System list

j. Type Commander Alteration Management Systems Report

k. Production Status Report or equivalent status report provided by LMA.

19-5.4.17 Assessment Procedure MRCs. Assessment Procedure (AP) MRCs need not be scheduled within SKED, but they will be maintained "active" through the FR and TFR process. AP MRCs need only be printed on an "as needed" basis for use by assessment personnel or Ship's Force. The record of completed AP MRCs by off-ship personnel is recorded on the work candidate and Ship's Force participation is recorded in their completion remarks of that work candidate. There is no need for recording Ship's Force participation in an assessment event on their PMS schedule within SKED. FBRs or PSRs submitted requesting deletion of a MIP that only contains AP MRCs will be disapproved and returned to the originator.

19-5.5 MAINTENANCE AND MATERIAL MANAGEMENT AFLOAT AND ASHORE EVALUATION CRITERIA.

19-5.5.1 Self-Assessments. The ability of an activity to perform critical self-assessments is instrumental to the success of the command's PMS program. The PMS Self-Assessment Program needs to address all aspects of 3-M.

a. TYCOM Policy. Each activity must perform a complete 3-M Self-Assessment at the mid-point of the 3-M inspection cycle and retain results until the next 3-M Inspection. The 3-M checklists contained in Appendix B will be utilized and retained until the next formal 3-M Inspection. Utilization of TYCOM, ISIC and 3-M Representative personnel to assist the command is encouraged and should be requested. As the Self-Assessment senior member, the XO will ensure that personnel performing the audits have adequate knowledge of 3-M practices and procedures to ensure a thorough review. The CO will receive a formal briefing of the findings of the Self-Assessment and intended corrective actions. The ship's mid-term 3-M Self-Assessment and Abatement Program will include all aspects of reference (a) utilizing all the inspection sheets of Appendix B. 3MCs will retain the command's mid-term Self-Assessment Report until the next 3MI.

b. Self-Assessment Elements. The major program elements of a Self-Assessment include an evaluation of the PMS Performance Rate (PPR) and CSMP Validity, monitoring MRC performance, and conducting PMS Spot-Checks, WC audits, and deficiency abatement. 3MCs will retain monitored PMS results, Spot Checks and WC audits from the last completed quarter in either hard copy or digital format for review supporting the Self-Assessment.

(1) Monitored MRC. Supervisory personnel must periodically monitor the performance of PMS to provide feedback and training to maintenance personnel and to enforce command maintenance standards. Personnel charged with monitoring must be a System Matter Expert for the system, equipment, or component for which the MRC applies. LCPOs, LPOs or personnel with similar system knowledge are appropriate. Monitored checks can be used for on the job training to teach the "right way" to conduct maintenance. These monitored MRCs will be documented as a monitored evolution and findings will be provided to the WC's CoC for inclusion into training and deficiency abatement. The value of monitor maintenance cannot be overstated, and commands are encouraged to establish a robust monitored maintenance program.

(2) PMS Spot Check. PMS Spot Checks are utilized to validate that previously scheduled and accomplished MRCs were performed and the degree to which they were performed. The checklist contained in Appendix B section II, is the tool supervisory personnel utilize to determine the accomplishment status of a completed MRC. Deficiencies noted and the final grade will be provided to the WC's CoC for abatement. The WCS will record the Spot Check grade into SKED to generate the Spot Check Accomplishment Rating (SCAR) for the quarterly PMS Performance Report. Spot Checks will involve all elements of the CoC to include the CO, Chief Of The Boat, Command Master Chief, XO, 3MC, department CPOs, DHs, DIVOs, divisional CPOs, and First-

Class Petty Officers. By following the checklist, the inspector can determine if the sailor is competent, if the maintenance was accomplished, if required TPMTE was available and used, and were safety precautions followed. The focus of a spot check should be directed more to the material condition of the gear and less on the administrative issues related to the maintenance requirement.

(a) Avoid Spot-Checks of MRCs with insufficient complexity. Performing a Spot-Check on a 3 or 5 step MRC does not provide the CoC an accurate picture of the health of the command's maintenance program. Selected MRCs should be of sufficient content to provide the auditor with evidence of satisfactory performance (e.g., tag-outs, QA packages, parts required, off-hull reporting, test equipment, safety equipment, etc.).

(b) Spot-Checks evaluated as "below standards" will require immediate training and re-performance as determined by the XO. Any re-accomplishment of the MRC must be monitored by the LCPO to ensure noted deficiencies are not repeated.

(c) The minimum number of Spot Checks or Monitored evolutions conducted per quarter will be based on Tables 19-5-4 and 19-5-5 of this chapter. WCS Spot Checks or Monitors, E-5 & above, may be used to meet these requirements only when no LCPO or DIVO is available. The number of spot and monitored checks for ships in CNO availabilities will be determined at the command's discretion.

(d) The spot-checker or monitor will ensure that the Spot-Check or monitored data is immediately entered into SKED. When applicable, a brief synopsis of any deficiencies resulting from the Spot-Check will be indicated within the Spot Check.

(e) The minimum number of Spot-Checks and Monitored Maintenance actions required for Submarine Force surface ships, auxiliary and shore commands (AS, ARDM, URC Class ships) are based on number of MIPs in the WC, Table 19-5-6 refers.

Table 19-5-4 - Submarine Spot Checks and Monitoring per Quarter

DIVISION	NUMBER		DIVISION	NUMBER		DIVISION	NUMBER
DS01*	3/1		DS02*	3/1		DS03*	3/1
DS04*	3/1		DS05*	3/1		DS06*	3/1
DV01	2/1		EA01	9/3		EDC1	6/2
EE01	9/3		EM01	9/3		MA01	2/1

ME01	2/1	MH01	2/1	MN01	2/1
MV01	2/1	MV02	2/1	NE01	6/2
OC01	6/2	OC02	3/1	OC03	3/1
RC01	2/1	RC01 (774CL)	4/1	RL01	2/1
SS02	1/1	WF01	5/1	WF02	2/1
WI01	8/2	WK01	6/2	WK02	3/1
WM01	2/1	WQ01	8/2		

* Only when shelters are installed on host units greater than 30 days.

Table 19-5-5 - Submarine Force Surface Ships and Shore Commands Spot Checks and Monitoring

# of MIPs in Work Center	Minimum # of Spot Checks	Minimum # Monitoring
2	1	1
3-4	2	1
5-7	3	1
8-9	4	1
10-11	5	1
12	6	2
13	7	2
14	8	2
>15	9	3

(3) Work Center Audits to include SEER, Spot-Checks, CSMP validity. Each WC must receive an audit once per quarter by a supervisory individual, (CPO) or above. Deficiencies noted from this audit will be reported to the WC's

CoC for abatement. The 3MC will report recurring deficiencies to the XO for further investigation and corrective action.

(4) Deficiency Abatement. The status of discovered deficiencies will be kept current within the monitoring program. Recurring deficiencies must be reported to the XO for further investigation and corrective action. Deficiencies that have been reported as corrected will be subject to follow up monitoring to ensure corrective action was effective and results of the follow up monitoring will be reported to the XO. The ship's 3-M Abatement Program will include the previous quarter's audits, Spot-Checks, monitored evolutions and CSMP validity audits noting trends and corrective actions.

19-5.5.2 Inspections. The goal of the 3MI is to evaluate the effectiveness of the ship's 3-M Program. It is critical that the inspection be conducted in a similar fashion in every homeport and across the force. Inspections will be completed once commenced. Early below-standards indications will not be used to change an inspection into an assistance visit. The current sheets are available on the COMSUBPAC Secret Internet Protocol Router Network webpage at https://cffo.fleetforces.navy.smil.mil/csp-nf/N4/N43 -> 3M -> 3M Inspection PMS-MDS Forms.

a. Frequency of Inspections. The TYCOM or ISIC command exercising administrative control will conduct a complete inspection of each command under their cognizance as follows:

(1) Every Fleet Response Training Plan preferably within Pre-Overseas Movement 1 or Optimize Report Plan cycle.

(2) SSBNs and SSGNs will execute 3MIs within 24 months with Kings Bay crews receiving independent inspections.

(3) Forward Deployed Naval Forces will execute 3MIs every 24 months.

(4) When deemed necessary by the TYCOM, ISIC or the unit's CO.

(5) SUBFOR ships undergoing a CNO availability will have their 3MI deferred six months following sea trials.

(6) SUBFOR shore commands will execute 3MIs every 24 months.

(7) The ISIC will submit a 3MI periodicity extension request via the TYCOM 3-M REP to the TYCOM 3-M Office if a 3MI will exceed the Fleet Response Training Plan or Optimize Report Plan cycle or 24 months has elapsed since the last inspection. The TYCOM, when replying to the request for extension, will include Commander, United States Fleet Forces Command N43 or Commander Pacific Fleet N43, as applicable, as information addressees. Only the TYCOM can authorize such an extension.

(8) 3MAs will not be performed within 13 weeks of a 3MI.

b. Inspection Team Composition.

(1) Senior Member. The senior member will be a deputy from the squadron staff.

(2) Team Leader. The inspection team leader will be the TYCOM 3-M Representative who will concur with the assignment of inspection team members. The team leader will ensure inspection attributes are evaluated in a manner consistent with current guidance and directives provided by Commander Submarine Forces and provide guidance to the inspection team members to ensure a common process.

(3) Team Members. Team members will consist of squadron staff and support staff personnel who are adequately trained in the area to which they are assigned to assess. They will report findings to the team leader. PMT personnel may also report findings to the PMT Officer In Charge as they pertain to PMT data collection subsequent to PMS.

c. Method for Assignment of Numerical Evaluations. The minimum performance requirements are as identified below:

(1) Formula Acronyms:

(a) AAR = Administrative Accomplishment Rate

(b) CLER = Command Level Effectiveness Review

(c) CTS = Command Total Score

(d) CVF = CSMP Validity Factor

(e) DTS = Department Total Score (aggregate of all work centers)

(f) MAR = Maintenance Accomplishment Rate

(g) MDS = Maintenance Data System

(h) MPR = MDS Performance Rate

(i) PAR = Periodic Accomplishment Rate

(j) PPR = PMS Performance Rate

(k) SAR = Situational Accomplishment Rate

(l) SEER = Scheduling and Execution Effectiveness Review

(m) SCAR = Spot Check Accomplishment Rating

(2) CTS must be 80 percent or higher.

(3) Any CTS or Work Center Score evaluated below 80 percent will be re-evaluated within six months of receiving the signed letter from the inspecting activity or areas identified by the ISIC (i.e. below standard command PAR).

(4) CTS Formula:

CTS = (DTS x 0.8) + (CLER x 0.2)

DTS = (Work Center Score) x (Work Center Weight Factor)

Work Center Score (80% of CTS) = (PPR x 0.65) + (MPR x 0.25) + (SEER x 0.05) + (AAR x 0.05)

PPR = (MAR x 0.8) + (SCAR x 0.2)

MAR = (PAR x 0.6) + (SAR x 0.4)

SCAR = (3MI Spot Check/Monitor x 0.5) + (% of Self-Assessment Spot and Monitored Checks Completed x 0.5)

MPR = MDS + CVF

AAR = [(Closeouts + Alerts + TFBRs + Lineouts) - (Closeouts Late or Not performed by Chief + Alerts Late or not conducted by DO|DH + TFBRs routed late + Lineouts Late or Not approved by Chief)] ÷ (Total Closeouts + Alerts + TFBRs + Lineouts)

(5) Ranking Standards.

(a) Commands and WCs will be evaluated as “Above Standards” overall in 3-M if the unit’s total score is 90% or higher.

(b) Commands and WCs will be evaluated as “At Standards” overall in 3-M if the unit’s total score is between 80% and 89.99%.

(c) Commands and WCs will be evaluated as “Below Standards” overall in 3-M if the unit’s total score is less than 80%.

(d) All calculations will be rounded to two decimal places.

(6) Table 19-5-6 will be used to determine divisional weighting factor for submarine commands. Non-submarine commands will use scheduled maintenance from the last 13 weeks to determine divisional weighting factor.

Table 19-5-6 - Divisional Weighting Factors

Work Center	688	21-22	23	774	SSBN	SSGN
DV01	1	1	1	1	0	1
EA01	13	13	12	13	14	13
EDC1	4	4	4	4	4	4
EE01	13	13	12	9	12	12

WQ01	8	8	7	8	8	8
Total	100	100	100	100	100	100

d. Inspection Procedures. Appendix B provides a standard means for evaluating the 3-M Program aboard ship and shore commands. These procedures, centered on a set of

core attributes applicable to all, are used to conduct 3-M Inspections. Inspection procedures are divided into five major areas:

(1) Section I - Work Center and Command Effectiveness Reviews.

(a) Scheduling and Execution Effectiveness Review.

(b) Command Level Effectiveness Review.

(2) Section II – Spot Check and Monitor Accomplishment Rating.

(3) Section III - Assessment of Maintenance Accomplishment Rate.

(4) Section IV - Maintenance Data System.

(5) Section V - 3-M Inspection Command Total Score.

e. Inspection Reporting. Significant deficiencies and numerical assessments are reported to the assessed unit's CO, ISIC and TYCOM using the format shown in Appendix A of this chapter. Reporting may be accomplished on the entire unit or on a departmental basis.(1) All correspondence pertaining to the 3MI will be routed via the squadron commander and a copy provided to TYCOM N4 for trend analysis.

(2) Significant deficiencies require a report of corrective actions taken by the unit to be forwarded to the TYCOM via the ISIC within 30 days following the inspection.

(3) 3-M performance graded as "Below Standards" will be re-inspected following the completion of corrective actions. Subsequent repeat "Below Standards" will include a CO summary discussing the inadequacy of applied corrective action in correcting the deficient area.

(4) Each TYCOM will report the findings of the previous year's inspections to Commander, United States Fleet Forces Command N43 or Commander Pacific Fleet N43 (as applicable) at the end of the calendar year.

f. Inspection Data Retention. COMSUBLANT and COMSUBPAC are to maintain an inspection data file for each unit. As each command is evaluated, the individual evaluation standards and calculated values identified will be recorded in the data file with a copy of the inspection report provided to the inspected command. Sections I through V of Appendix B provide specific criteria to be used in the assessment of each command.

APPENDIX A

FORMAT FOR REPORTING 3-M INSPECTIONS

4790
Ser
Date

From: Accomplishing Activity
To: Commanding Officer (Command Name and Hull Number (if applicable.)

Subj: REPORT OF 3-M INSPECTION OF

Ref: (a) NAVSEAINST 4790.8 - Ships' Maintenance and Material Management (3-M) Manual

(b) COMUSFLTFORCOMINST 4790.3 - Joint Fleet Maintenance Manual, Volume VI, Chapter 19

Encl: (1) (as required)

1. Per references (a), a 3-M Inspection of (_____) was conducted during the period (Date) to (Date).

2. During this inspection, the following significant deficiencies were discovered:

   a. (List)

Specific department and WC deficiencies are provided in enclosure(s) (1) through (__).

3. The following overall ship or department numerical assessments are assigned:

   a. Command Total Score _____

   b. 3-M Inspection _____
   (Above, At or Below Standards)

4. Corrective Actions required.

   a. Corrective Action Letter 30 days upon receipt, which will include specific action via POAM of significant deficiencies and deficiencies annotated on enclosures.

   b. Perform re-inspect of below standard work centers and areas identified by ISIC

X. X. LAST NAME

SECTION I-A

SCHEDULING AND EXECUTION EFFECTIVENESS REVIEW (SEER)

Complete the SEER checklist below for each WC. Enter a numeric evaluation of each inspection attribute and provide amplifying information to describe the deficiencies driving point deductions on the "Remarks" page provided. Significant deficiencies will be reported via the final inspection report.

Command	Department	Division	Work Center	Date

		General Attributes	Value	Points
1.		Do MIPs and MRCs accurately reflect equipment configuration, are nonapplicable MRCs correctly lined-out and are applicable MRCs active? (May be MIP standardization violations)	10	
2.	*	Does the WC retain an auditable record of personnel PMS qualifications?	5	
3.		Are K-MRC data sheets maintained; last completed?	10	
		Maintenance Requirement Card (MRC) Deck		
4.		Is the WC deck of printed MRCs, ACNs, and Preliminary MRCs complete and current?	2	
5.		Are classified MRCs complete and current?	2	
6.		Are blanks requiring Ship's Force data filled in prior to use?	3	
		Chain of Command SKED Administration		
7.	.	Is the FR approved by DH? (Verify using journal tab.)	3	
		Equipment Configuration		
8.	a.*	Do LGLs contain required information (e.g., equipment name, equipment location, and either an equipment serial number or unique identifier)?	3	
	b.*	Are maintenance items in SKED associated to existing equipment configuration?	3	
	c.	Are H-coded calibration items listed as individual SKED equipment maintenance items?	3	
	d.	Are calibration items associated to the correct MRC?	3	
		Situational Requirements		
9.		Are all situational events being scheduled and executed in SKED? Document omitted situational checks in Block 16.		
	a.*	All applicable Local States.	4	

	b.*	All applicable Triggers.	3	
	c.*	All Metered Events.	3	
PMS Execution and Accountability				
10.		Are Check Note entries accurate, valid, and complete?	3	
11.		Was maintenance assigned only to qualified maintenance personnel?	4	
12.		Was currently scheduled, previously completed, and unscheduled maintenance entered in SKED? Document omitted periodicities in Block 16.	10	
13.		Is a tagout identifier recorded in "Check Notes" for maintenance actions marked as complete that required Tag-outs?	10	
14.		Have the minimum number of Spot and Monitored Checks been accomplished?	8	
15.		Is K-MRC completion rate within periodicity at 90% or above?	15	
16.		Record number of omitted checks: Periodic_____ Situational _____		
FBR and PSR File				
17.		Are FBRs and PSRs accurate and processed timely in SKED; "Action Taken" block updated by WCS?	2	
18.		Are feedback responses with an ACN processed timely in SKED: "Response" block and MRC Customization" updated by WCS?	**3**	
Inactive Equipment Maintenance (IEM)				
19.		Is the start of an inactive period (CAT I & II) correctly annotated and approved by Department Head?	3	
20.		Are IEM requirements properly scheduled? (CAT I only)	5	
21.		Is IEM for maintenance periods greater than 21 days approved in writing by DH?	2	
22.		Is the completion of the inactive period correctly annotated?	3	
*** Electronic Versions Acceptable**				
Totals (Attributes evaluated as NA are not calculated)		Total Points Available: **125**		Total Points Awarded _____
☐ SAT			☐ UNSAT	

At Standard = 80 percent

SEER REMARKS

Provide amplifying information describing the deficiencies and associated point deductions. Significant deficiencies will be reported via the final inspection report.

Attribute #	Amplifying Information
Print Name: _____ Signature: _____	
Command: _____ Date: _____	

APPENDIX B

SECTION I-B

COMMAND LEVEL EFFECTIVENESS REVIEW (CLER)

Using the attributes and grading criteria described below, conduct the CLER for the ship. Provide amplifying information for deficiencies causing point reduction on the remarks page.

Command			Date	
PMS Attributes			**Value**	**Points**
1.	Does the 3MC:			
a.		Maintain Change Service Accountability Log?	6	
b.	*	Maintain a log tracking the assignment of MRCs from split MIPs to ensure all applicable MRCs are assigned and updated with current FR?	3	
c.	*	Maintain all classified MRCs?	2	
d.	*	Maintain a current PMS (and where applicable TFR) DVD or downloaded file?	3	
e.		Maintain SKED Default Permissions, CoC and user roles per TYCOM guidance?	4	
f.	*	Have an approved master copy of 3-M PQS specifically tailored for the command?	3	
g.	*	Provide weekly status reports to the 3-M Manager?	3	
h.		Provide End of Quarter (EOQ) Summaries to the 3-M Manager and ensure the summaries are reviewed by DHs and deficiencies abated? Was the assessment forwarded to the ISIC?	10	
i.		Generate ship-wide EOQ reports and forward to the ISIC by the 3rd Monday of the quarter? Did the ship perform Quarterly 3M Meeting chaired by the 3M Manager?	4	
j.	*	Generate ship-wide post-quarter SKED reports and forward to the ISIC by the 3rd Monday of the quarter?	4	
k.		Generate and forward the ships Tailored Force Revision Data file (.tfd) to the TYCOM 3-M Rep by the 15th of the month of the quarter?	5	

l.	*	Have an effective system in place to track, route and explain externally provided PMS changes?	3	
m.		Conduct end of quarter archives to maintain one completed quarter, one current quarter, and at least four future quarters?	2	
n.		Maintain the status of command FBRs and PSRs, responses and follow up actions taken in SKED?	3	
o.		Maintain the status of command FBRs and PSRs with ACNs responses and follow up actions taken in SKED? PMS documents retained until FR update?	4	
p		Capture Global Triggers and States?	15	
q.		Ensure all 3-M databases are being routinely maintained? (Use the RAF computation sheet)	8	
2.		Is a complete back up of the SKED Database Recovery Files and Maintenance Outlook Report created on removable media (DVD, CD-ROM, or solid state drive) following completion of the FR?	8	
3.		Is there an effective system in use (Spot Check Program) for supervisory personnel to monitor PMS performance periodically and routinely?	10	
4.		Have CSMP reconciliations been conducted quarterly?	5	
5.	*	Does the command conduct quarterly SEER internal audits of all WCs? Were the SEERs sent to the ISIC? (Retain latest copies of deficiencies, corrections, and abatement for current & previous quarter)	10	
6.	*	Does the command maintain an auditable record of PMS PQS?	3	
7.	*	Does the command conduct 3-M Program training PER TYCOM, ISIC and command directives?	10	
8.		Was maintenance completed with all Safety Precautions accomplished?	10	
9.		Did the command conduct a mid-term 3-M Self-Assessment? (ISIC or command to include actions and abatements)	10	
10.		Does the command track K-MRCs and verify completion (reconciliation) with the local agency quarterly?	10	

11.		Are there jobs in a returned status to the ship by the ISIC greater than 30 days?	5

APPENDIX B

SECTION II-A

SPOT CHECK AND MONITOR ACCOMPLISHMENT RATING (SCAR)

Using the basic definitions and guidelines described, determine the PMS Spot Check and Monitor Accomplishment Rating (SCAR) for each WC. Enter the values determined on the SCAR Check Sheet, section II-A of this appendix. The SCAR for each WC will be made up of two parts. Fifty percent of the grade will be based on the results of the 3MI spot checks and Monitors and fifty percent of the grade will be based on the percentage of completed self-assessment spot and monitored checks. At a minimum, the last completed quarter of self-assessment spot and monitored checks will be reviewed.

SCAR =

(3MI SC x 0.5) + (% of Self-Assessment Spot and Monitored Checks Completed x 0.5)

The combined number of Spot Checks has been established at:

Division	Number		Division	Number		Division	Number
DDS	2		DV01	2		EA01	4
EDC1	3		EE01	4		EM01	4
MA01	2		ME01	2		MH01	2
MN01	2		MV01	2		MV02	2
NE01	3		OC01	3		OC02	3
OC03	2		RC01	2		RC01(774CL)	3
RL01	2		SS02	2		WF01	2
WF02	2		WI01	4		WK01	2
WK02	3		WM01	2		WQ01	3

Specifically: Periodic and situational for all completed maintenance (including Daily, Weekly, and bi-weekly) from the last 13 weeks. If a WC did not perform any maintenance in the last 13 weeks, the SCAR portion will be NA.

1. Complete an MRC evaluation, SCAR Check Sheet, Section II-A of this appendix, for each MRC selected. Based on the results, evaluate the overall effectiveness of the accomplishment of each MR selected. Enter a numeric evaluation of each assessment attribute and provide amplifying information describing the deficiencies driving associated point deductions. Significant deficiencies will be reported via the final inspection report.
2. The SCAR Check Sheet reflects a series of questions to be asked to determine the accomplishment status of an MRC previously reported as accomplished. Although the sheet may be used as a reference for conducting a real time monitored MRC evaluation, for the purposes of conducting a 3MI, all spot checks will be conducted on accomplished (historic) MRCs.

3. Due to the nature of MRC completion, supporting programs such as Tag-Outs and HAZMAT are encountered. Care should be taken to avoid expanding the spot check to a review of the processes of those programs thereby preventing the assessor from determining the accomplishment status of the MRC under review.

4. The following is expanded guidance for completion of the SCAR Check Sheet. Best practices or other policies not supported by source documentation will not be included in evaluating compliance:

   a. (1.a). Determine if the MP is qualified to perform the maintenance task. PQS 301 is required for all MRCs but attention should also be paid to other qualifications required such as Quality Maintenance (see volume V, Part I, Chapter 3, paragraph 3.4 of this manual) or graduation from a required school such as gage calibration technician.

   b. (1.b). Determine if the correct TPMTE were used during the performance of the MRC. If the MP did not have the required TPMTE, it is unlikely that they would have been able to complete all the procedural steps of the MRC as required. If an item of TPMTE was required to perform a conditional step and that step was not required to be accomplished, it is not considered deficient. If the required test equipment required calibration, ensure that the calibration is within date and the equipment is of sufficient scale to accomplish the MRC.

   c. (1.c). Determine if the MP maintained the correct equipment.

   d. (1.d). Examine the MRC to determine that any locally applied changes are authorized by procedural notes, external correspondence, or allowed by reference (a).

   e. (1.e). Determine applicability of the MRC to the component that the MP signed for completion.

NOTE: IF A PROCEDURAL STEP WAS NOT COMPLETED, THE MRC SHOULD NOT HAVE BEEN REPORTED AS COMPLETE AND THEREFORE THE ATTRIBUTE GRADE SHOULD BE ZERO AND ALL SUBSEQUENT ATTRIBUTES SHOULD ALSO BE ZERO, EFFECTIVELY "FAILING" THE SPOT CHECK.

   f. (2.a). From a variety of potential techniques, determine if the MP performed all the required steps of the MRC. This may be accomplished via re-enactment, a discussion regarding the steps or re-performance. The inspector should come away with a clear impression that all the steps of the MRC were either fully accomplished or not.

NOTE: IF A REQUIRED TAG-OUT WAS NOT CONDUCTED IN SUPPORT OF ACCOMPLISHING THE MRC, THE MRC SHOULD NOT HAVE BEEN CONDUCTED AND REPRESENTS A SERIOUS SAFETY VIOLATION. THEREFORE, THE ATTRIBUTE GRADE SHOULD BE ZERO AND ALL SUBSEQUENT ATTRIBUTES SHOULD ALSO BE ZERO EFFECTIVELY "FAILING" THE SPOT CHECK.

   g. (2.b). If required by the MRC, verify that a tag-out was hung before the maintenance was performed. Ensure the isolation boundaries were appropriately identified and correctly positioned to ensure complete isolation of the maintained equipment. If no tag-out was required, write NA on the sheet.

NOTE: FAILURE TO ADHERE TO A SAFETY PRECAUTION PROVIDED ON THE MRC CONSTITUTES A SERIOUS SAFETY VIOLATION AND THE FAILURE TO PERFORM THE MRC AS WRITTEN. THE ATTRIBUTE GRADE WILL BE ZERO AND ALL SUBSEQUENT ATTRIBUTES WILL ALSO BE ZERO, EFFECTIVELY "FAILING" THE SPOT CHECK.

h. (2.c). Determine compliance with all specific safety precautions listed on the MRC. If no safety requirements were invoked, write NA on the sheet.

i. (3.a). By physical examination of the maintained equipment, determine if maintenance of the nature required by the MRC had been performed. Take note of fasteners that would have had to be disturbed, dirt in filters, fresh oil, etc. to make a judgment as to whether the maintenance has been performed.

NOTE: DUE TO THE POTENTIAL LIABILITY INCURRED BY IMPROPER USE AND DISPOSAL OF HAZMAT, SOME WCS HAVE ASSIGNED SPECIALLY TRAINED PERSONNEL TO PROVIDE HAZMAT AND DISPOSAL SERVICES FOR SURPLUS MATERIAL INSTEAD OF THE MP. THIS IS ACCEPTABLE PROVIDED THE INSPECTOR CAN DETERMINE FULL COMPLIANCE.

j. (3.b). Determine through questioning and record verification that HAZMAT was properly used and disposed of as a means of determining whether the MRC was accomplished. Once the inspector has determined that the HAZMAT was used and disposed of correctly, this attribute is considered fulfilled. If no HAZMAT was required to be utilized, write NA on the sheet.

k. (3.c). Determine if the MP could have performed the MRC from a standpoint of being trained and proficient in the tasks called out for by the procedure.

l. (4.a). Determine if the MP filled out the 13-Week Accountability Log or annotated proper disposition of maintenance in SKED correctly for the accomplished MRC with the appropriate accomplishment date. Ensure that if a tag-out isolation was used, the tag serial number is recorded in the space allowed or as a check note in SKED. Ensure that the printed name and legal signature of the MP who performed the maintenance is recorded or, in case of group performed PMS, the MP in charge of the group.

m. (4.b). From reviewing the discussions and findings during the spot check, determine if an FBR or PSR had been submitted if required. If no FBR or PSR was required, write NA on the sheet.

n. (4.c). Determine if a material deficiency was noted during the PMS; if so, examine the CSMP to ensure the deficiency was documented. If no material deficiency was noted, write NA on the sheet. If material discrepancies are properly documented in the CSMP attribute graded as a two. Material discrepancies which are not documented in the CSMP will receive an automatic grade of zero.

5. When a Spot Check and monitor is determined to be below standards, the command undergoing inspection is likely to have numerous questions. To facilitate root cause analysis and the formulation of an effective corrective action plan, care should be taken to clearly

identify factors contributing to deficiencies that led to the conclusion that the MRC was not conducted as written or not conducted at all.

APPENDIX B

SECTION II-B

SPOT CHECK ACCOMPLISHMENT RATING (SCAR) CHECK SHEET

Planned Maintenance System (PMS) 3-M Spot Check Form						
COMMAND	**DEPARTMENT**	**EQUIPMENT**	**WORK CENTER**	**DATE PERFORMED**	**MIP EVALUATED**	**MRC EVALUATED**
Maintenance Person:				**Spot Check Date:**		

NOTES:

1. If an attribute marked with an "*" is evaluated as unsatisfactory, all subsequent attributes will be graded as "0".
2. Attribute marked with a pound sign "#" – Due to the potential liability incurred by improper use and disposal of HAZMAT, some WCs have assigned specially trained personnel to provide HAZMAT and disposal services for surplus material instead of the MP. This is acceptable provided the inspector can determine full compliance.

Inspection Attribute			Value	Grade	Notes
Contact the MP assigned responsibility for the accomplishment of the MRC, have the individual deliver MRC, and determine the following by questions, personal observation, or both.					
1.	a.*	Is the MP qualified (PQS) to perform the MR?	2		
	b.	Did the MP present the correct tools, Personal Protective Equipment (Personnel Protective Equipment), parts (NSN), material (Military Specification) and calibrated test equipment?	3		
	c.	Did the MP properly identify the equipment (location, equipment validation)?	4		
	d.	Are there unauthorized changes or corrections to the MRC?	3		
	e.	Is the MRC correct for the equipment maintained?	3		
Demonstrated all steps of MR including all Notes, Warnings and Cautions according to the MRC.					
2.	a.*	Followed all steps of the MRC.	5		
	b.*	Correctly performed equipment Tag-Out.	5		
	c.*	Followed all safety precautions.	5		
Does the equipment condition reflect accomplishment of the MRC?					
3.	a.	Is it apparent that maintenance was performed recently?	10		

	b.#	Correctly demonstrated use and disposal of Hazardous Material.	3		
	c.	Was the MRC within the capability of the assigned individual?	5		
PMS Reporting					
4.	a.	MP reported status of MR to the WCS if Completed or Not Fully Accomplished and made appropriate updates in SKED.	2		
	b.	WC generated FBR or PSR for any problem with MRC.	2		
	c.	Material deficiencies detected by the PMS action were recorded in MDS.	2		

Attributes Evaluated as NA are not Calculated

Command: _____ Date: _____

APPENDIX B

SECTION III

MAINTENANCE ACCOMPLISHMENT RATE (MAR)

1. The Maintenance Performance formula has been redefined to more effectively capture maintenance that was not scheduled.
2. The PAR and SAR reports are automatically generated by SKED.
3. The MAR grade will be determined utilizing the formula reflected and a date range consisting of the previous 13 weeks of maintenance.

MAR = (PAR.6 + SAR.4)

PAR = Comp ÷ (Comp + Lost + Alerts + Omitted)

SAR = Comp ÷ (Comp + Lost + Omitted)

4. "Omitted" is defined as any maintenance action that should have been performed on any and every maintenance item and no matter the reason did not get scheduled. For example:
   a. Situational or state maintenance that did not get scheduled when the situation dictated.
   b. Improperly lined-out periodic checks.
   c. Non-accomplished IEM checks.
   d. Non-accomplished maintenance added via ACN, FBR or PSR, Preliminary PMS, etc.

APPENDIX B

SECTION V

COMMAND TOTAL SCORE (CTS)

1. The FINAL GRADE consists of two parts and weighted as follows:
   a. Department Total Score accounts for 80% of the final grade.
   b. CLER accounts for 20% of the final grade.
2. OVERALL GRADE is computed as:

   CTS = DTS.8 + CLER.2

   DTS = Work Center Scores x Work Center Weight Factor

   Work Center Score (80% of CTS) = PPR.65 + MPR.25 + SEER.05 +AAR.05

   PPR = MAR.8 + SCAR.2

   MAR = PAR.6 + SAR.4

   SCAR = (3MI Spot Check x.5) + (% of Self-Assessment Spot and Monitored Checks Completed x.5)

   A minimum grade point of 80 is required for a passing score.

APPENDIX C

DIVISION IEM PLAN FOR FLEET AND CNO AVAILABILITIES

From: Division Leading Chief Petty Officer, USS SUBMARINE (SSN XXX)
To: Department Head, USS SUBMARINE (SSN XXX)

Subj: Division Inactive Equipment Maintenance (IEM) Plan for Fleet or CNO Availability

Ref: (a) COMUSFLTFORCOMINST 4790.3 – Joint Fleet Maintenance Manual

Encl: (1) Inactive Equipment Maintenance Plan Matrix

1. Per reference (a), the following systems or equipment will be placed in an IEM status in SKED while the command conducts Fleet or CNO Availability.

2. Enclosure (1) lists all Systems and Equipment that this division will place in IEM for the upcoming maintenance period. This list was checked for accuracy and linked to the appropriate system or equipment restoration and key event. The IEM Plan is considered a living document; reviews will occur when key events timelines change.

3. A current copy of this plan will be provided to the command 3MC and be made available to the LMA, CTE, and Project Superintendent.

//SIGNATURE//
I.M. CHIEF

4. I concur with placing the Systems or Equipment identified in Enclosure (1) in an IEM Status.

APPENDIX D

SAMPLE 3-M QUARTERLY ASSESSMENT REPORT

4790
Ser N40/
DD Mmm YY

From: Commanding Officer, USS XXXXXXX (SSN XXX)

To: Commander, Submarine Squadron #

Subj: 3-M QUARTERLY ASSESSMENT FOR QUARTER X-XX

Ref: (a) NAVSEAINST 4790.8D, Ship's Maintenance and Material Management (3-M) Manual

(b) COMUSFLTFORCOMINST 4790.3, Joint Fleet Maintenance Manual (JFMM)

Encl: (1) Command Quarterly 3-M Metrics for Quarter X-XX

1. Using references (a) and (b), a Quarterly 3-M Assessment for quarter X-XX was conducted for USS XXXXXXX (SSN XXX). Reports analyzed were derived from SKED 3.2 and OMMS-NG encompassing DD Month YYYY to DD Month YYYY. A breakdown of Level I calibration, K-MRC Accomplishment, Maintenance Accomplishment Rate (MAR), the Spot Check/Monitor Program, and MDS Performance Rate (MPR) can be found in enclosure (1).

2. The ship conducted a review of Level 1 and Level III Calibration with the following findings:

   a. Level I calibration at XX.XX%. There are XXX Level I items out of calibration, with XXX Level I items that due before the end of next quarter.

   b. Level III calibration at XX.XX%. There are XXX Level III items out of calibration, with XXX Level III items due before the end of next quarter and XXX items due prior to the end of Deployment. These items are listed below:

Work Center	Maintenance Item	Serial Number	Periodicity	Last Completed	Calibration Due	Planned Resolution	Remarks

3. A review of PMT data was conducted with the following findings:

a. The Ship completed XX K-MRC's of the XX K-MRC's scheduled for CY 2024. This equated to a completion rate of XX.XX%. In accordance with reference (b) Volume VI, Chapter 19-5, paragraph 19-5.4.2.d(1), the ship is required to maintain 90% or greater K-MRC completion rate. The last K-MRC reconciliation was conducted with PMT on DDMMMYYYY. A breakdown of overdue K-MRC's with a plan to complete is listed below.

Work Center	MIP	MRC	Component	Instances Missed	Last Accomplished	Planned Resolution

b. There are a total of XXX OSAR's with XX being greater than the 6 months old threshold.

4. The ship conducted a review of Maintenance Accomplishment Rate (MAR) with the following findings:

a. The Ship's average PAR score (XX.XX%) was determined to be (Above/At/Below) Standards. Factors contributing to the low PAR score were XXXXXXX. Work Center(s) XXXX had a low PAR Score due to XXXXXXX.

b. The Ship's average SAR Score (XX.XX%) was determined to be (Above/At/Below) Standards. Factors contributing to the low SAR Score were XXXXXX. Work Center(s) XXXX had a low SAR Score due to XXXXXX.

c. The Ship's average MAR Score (XX.XX%) was determined to be (Above/At/Below) Standards. Factors contributing to the low MAR Score were XXXXXX. Work Center(s) XXXX has a low MAR score due to XXXXXX

d. The Ship had a total of XXX Periodic alerts. Factors contributing to the Periodic alerts were XXXXXXX.

5. A review of the Spot Check/Monitor Program was conducted with the following findings:

a. The ship conducted a total of XXX number of spot checks and XXX Monitors.

b. Work center(s) XXXX did not complete the required number of Spot Checks and/or Monitors.

c. Work center(s) XXXX exceeded the required number of Spot Checks and/or Monitors.

6. A review of OMMS-NG was conducted, with the following findings:

a. There are a total of XXX T/A-2 (IMA) jobs in the CSMP, and XXX T/A-4 (S/F) jobs in the CSMP. Of these, there are XXX T/A-2 jobs and XXX T/A-4 jobs that are greater than 180 days old.

b. There are a total of XXX T/A-0 (Other/Not applicable) jobs in the CSMP. These jobs have not been screened to any maintenance activity and need to be re-coded to the correct T/A level commensurate with the level of repairs.

7. A review of the Periodic Maintenance Requirement (PMR) was conducted, with the PMR completion rate at XX.XX%. There are a total of XX I-level PMR's overdue. Based on the upcoming schedule the Ship (is/is not) in extremis to reach the goal of 95% or better completion rate by the end of the year.

8. Plan of Actions and Milestones:

a.

(f) NAVEDTRA 43523 - Personnel Qualification Standard for Quality Maintenance Program
(g) NAVSEA S0400-AD-URM-010/TUM - Tag-Out Users Manual
(h) COMNAVSURFPAC/COMNAVSURFLANTINST 3502.7 - Surface Force Readiness and Training Manual (SFTRM)

19-6.1 APPLICABILITY. All content of the Commander Naval Surface Force Pacific Fleet (COMNAVSURFPAC) and Commander Naval Surface Force Atlantic Fleet (COMNAVSURFLANT) 3-M Instruction has been incorporated into this chapter to provide easier access to 3-M guidance and requirements.

19-6.2 PURPOSE. To issue Maintenance and Material Management (3-M) program requirements within COMNAVSURFPAC and COMNAVSURFLANT. The 3-M program is executed per references (a) through (h) and as clarified by this instruction. The goal is to maintain an effective unit maintenance program that will ensure a high state of material readiness.

19-6.3 ROLES AND RESPONSIBILITIES.

a. Type Commander. The Type Commander (TYCOM) exercises primary responsibility for the effective operation and support of the 3-M System. Areas of responsibility include but are not limited to the following:

(1) Ensure each unit has authorized programs:

(a) Maintenance Data System (MDS) system installed.

(b) Planned Maintenance System (PMS) Scheduling (SKED software).

(2) Ensure ships and units are manned with Navy Enlisted Classification (NEC) qualified Maintenance and Material Management Coordinators (3MC).

(3) Be the certifying authority of all 3-M certifications.

(4) Oversee surface Force 3-M representatives, including periodically observing 3-M representatives conducting 3-M Virtual Assessments (VA) and training events.

(5) Review and approve curriculum content for Maintenance University and Surface Force Representative 3-M Training.

(6) Ensuring subordinate commands comply with standard work center (WC), division, and department structure as published on the JFMM TYCOM website https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/TYCOM/.

b. Immediate Superior In Command. The Immediate Superior in Command (ISIC) is responsible but are not limited to reviewing the status of assigned unit's 3-M pillars from detailed reports provided from Surface Force 3-M Representatives assigned to units.

c. Afloat Training Group. Afloat Training Group will fill the role as the Surface Force 3-M Representatives and areas of responsibility include but are not limited to the following:

(1) Monitor the assigned unit's Maintenance Accomplishment Rate (MAR) utilizing the 3-M 365 Virtual Snap-Shot Report weekly.

(2) Monitor the assigned unit's Spot Check Program utilizing the 3-M 365 Virtual Snap-Shot Report weekly.

(3) Monitor the assigned unit's Current Ships Maintenance Project (CSMP) management utilizing the 3-M 365 CSMP Self-Sufficiency Report monthly at a minimum.

(4) Monitor the assigned unit's Knowledge, Skills, and Experience (KSE) utilizing the 3-M 365 KSE Analysis Report quarterly at a minimum.

(5) Train assigned units on conducting CSMP Reconciliation and aligning the CSMP in the MDS.

(6) Conduct command level training for all assigned Work Center Supervisors, Leading Chief Petty Officers, Division Officers and Department Heads as required to maintain the KSE.

(7) Conduct Command Level Effectiveness Reviews (CLERs) for all subordinate commands quarterly per 3-M 365 Surface Force Representative standard operating procedure.

(8) Schedule and participate in Program Validations for unit's failing to meet 3-M 365 Pillar of Performance standards.

(9) Assist assigned units with preparing to enter or exit a Chief of Naval Operations Availability as defined in Volume II, Part I, Chapter 3 of this manual.

(10) Submit a bi-weekly report to TYCOM containing all assigned unit performance metrics.

(11) Submit training muster sheets to TYCOM as required.

d. Commanding Officer or Officer in Charge. The Commanding Officer (CO) or Officer In Charge (OIC) is responsible for maintaining an effective 3-M program. The CO or OIC will:

(1) Designate a 3MC in writing.

(2) Conduct rigorous 3-M self-assessments.

(3) Chair the Planning Board for Maintenance (PB4M).

(4) Ensure material deficiencies are properly documented in the CSMP and tracked to resolution.

(5) Conduct Spot Check the Spot Checker assessments to perform a Quality Assurance evaluation of the command's Spot Check Program.

(6) Assault Craft Unit, Beach Master Unit, Naval Beach Unit and Amphibious Construction Battalion may designate the detachment OIC to perform Department Head (DH) 3-M functions. All designations must be in writing and signed by the CO.

(7) *Ticonderoga* and *Arleigh Burke* Class COs may designate in writing the Weapons Officer to perform DH 3-M functions for the following Work Centers (WC): CA01, CA02, CG01, CG02, CG03, CG04, CM01, CM02, and CM03 only.

(8) Surface Force ships may have a billeted Plans and Tactics Officer. Plans and Tactics (PT) department will be an MDS only department. The PT department will NOT have responsibility for maintenance, PMS, or configuration management.

e. Executive Officer. The Executive Officer (XO) is the command's 3-M System Manager responsible to the CO for the overall management of the 3-M Program. The XO will:

(1) Chair quarterly 3-M System meetings with DH and the 3MC.

(2) Brief the CO on the status of 3-M. The brief will include results from the Virtual Snap-Shot, CSMP Reconciliation, CSMP Self-Sufficiency, and KSE Reports.

(3) Serve as the CO's principal assistant for management of all on-ship (TA 4) maintenance.

(4) Maintain an aggressive 3-M spot check program involving all levels of the Chain of Command (CoC) from the First Class Petty Officer (FCPO) to the CO.

(5) Conduct Spot Check the Spot Checker assessments to perform a Quality Assurance evaluation of the command's Spot Check Program.

(6) Authorize shifts of maintenance responsibility between departments.

(7) Maintain a command Zone Inspection program.

f. Command Master Chief. The Command Master Chief will:

(1) Attend the XO's quarterly 3-M System meetings providing senior enlisted feedback.

(2) Conduct Spot Check the Spot Checker assessments to perform a Quality

Assurance evaluation of the command's Spot Check Program.

g. Command 3-M Coordinator. The 3MC will:

(1) Serve as the key 3-M System assistant to the XO.

(2) Maintain current directives, policies, and instructions.

(3) Send Virtual Snap Shot, CSMP Reconciliation, CSMP Self Sufficiency results to the Surface Force 3-M Representative. A Plan of Actions and Milestones will be submitted for all scores from Virtual Snap-Shot and CSMP Self Sufficiency in "Red" (below standards) and discrepancies identified from the CSMP Reconciliation report.

(4) Monitor the Ship's 3-M Personnel Qualification Standards (PQS) Program and maintain an auditable record of personnel qualified in 3-M PQS. In ships R-Admin, ASM or any other installed program that tracks PQS and training, develop following training items for capture of TYCOM training as below:

(a) 3-M TYCOM Office direct.

(b) 3-M Advance SKED ANTECH.

(c) 3-M Advance MDS from COMNAVSURFPAC N41.

(d) 3-M TYCOM Representative training for Work Center Supervisor (WCS), Lead Chief Petty Officers (LCPO), DIVO and DH.

(e) Maintain command Change Service Accountability Log (CSAL).

(f) Develop and maintain the master split Maintenance Index Page (MIP) tracker and ensure applicable split MIPs are appropriately assigned to affected WCs.

(g) Ensure the Technical Librarian is maintaining the Naval Sea Systems Command (NAVSEA) Advanced Technical Information Support (ATIS) and WebATIS program are operational.

(h) Develop and administer the ship or unit's PMS Spot Check Program.

(i) Ensure a complete back up of the SKED system is made on removable media (e.g. Digital Video Disk (DVD) or Compact Disk (CD)) following completion of the FR update and retain as part of the PMS Master File. If the 3MC is able to access locally stored report if network is down, then not required to save to external source.

(j) Ensure command's 26-week maintenance outlook report is electronically saved on removable media (e.g. DVD or CD) after all WCs have closed out weekly from SKED. If the 3MC is able to access locally stored report if network is down, then not required to save to external source.

(k) Notify Surface Force 3-M Representative anytime Naval Tactical Command Support System (NTCSS), Maintenance Figure of Merit, Automated Work Notification (AWN), ATIS or SKED are

unavailable.

(l) Maintain an effective MDS program.

(m) Maintain an effective PMS program.

(n) Request authorization to delay implementation of the Force Revision to TYCOM Force 3MC via the Surface Force 3-M Representative.

(o) Maintain access to the following programs:

1 RADWEB

2 PMS-MIS

3 WEBATIS

4 MCMS

5 ATM (Ashore AWN for AWN Platforms only)

6 COMNAVSURFPAC 3-M SharePoint

h. Ship's Maintenance and Material Officer. The Ship's Maintenance and Material Officer (SMMO) has cognizance of the material condition of the ship. In that capacity, the SMMO will:

(1) Coordinate the execution of PB4M.

(2) Serve as the CO's principal assistant for management of all off-ship (TA 1, TA 2 and TA 3) brokered maintenance.

(3) Conduct monthly command CSMP to shore Validation Screening and Brokering (VSB) file reconciliation.

(4) Develop and provide Ship's Force work package to the executing activity and assist in coordinating Ship's Force work with the executing activity during availabilities.

(5) Review all work candidates for WC ES01 monthly. Ensure TA 1, 2 and 3 jobs are planned for upcoming availabilities. Ensure all TA 4 jobs are sent to correct work centers and are rewritten under the work center with reference to ES01 job. Once a new job is written to correct material deficiency, close the original ES01 job.

(6) Conduct the DH review for WC ES01.

(7) Ensure the ship's initial conditions are established for work prior to start by outside activities.

(8) Responsible for all PMS conducted by outside activities and documented utilizing the Personal Identification Number (PIN) feature in SKED.

(9) Maintain access to VSB.

i. Training Officer

(1) Implement a short-range and long-range training plan per reference (a).

(2) Update the Training and Operational Readiness Information Services - Training Figure of Merit for 3-M 365. Repetitive Exercise (RE) RE-01-RE-03 report monthly and RE-04-RE-05 report quarterly.

j. Department Head. The DH is responsible to the XO for the operation and execution of the 3-M System within the department. Duties and responsibilities assigned to the DH are not to be delegated. The DH will:

(1) Designate and assign the departmental 3-M Assistant (3MA) and WCS.

(2) Ensure maintenance is prioritized to facilitate accomplishment.

(3) Review and approve all department PMS schedules and revisions.

(4) Responsible for all on-ship TA 4 Work Candidates within the department.

(5) Review maintenance action annotations.

(6) Review and acknowledge weekly check notes and PMS alerts.

(7) Take corrective action on all unsatisfactory PMS spot checks and report to the 3MC as part of weekly PMS reporting.

(8) Ensure all material deficiencies are documented and promptly reported.

(9) Review and verify the content and validity of all Feedback Reports (FBR), digitally sign FBRs within four days of origination.

(10) Authorize placement of equipment into an Inactive Equipment Maintenance (IEM) status, ensure PMS scheduling is annotated accordingly.

(11) The review and approval of all department work candidates within four days of creation; ensure completeness, accuracy and the correct assignment of priority.

(12) Conduct quarterly meetings with Division Officers (DIVO), LCPO and WCS and provide status of departmental 3-M System to the XO.

k. Departmental 3MA. The Departmental 3MA is responsible to the DH for the operation and execution of the 3-M System within the department. The departmental 3MA will:

(1) Assist the 3MC in the proper execution of the 3-M Program within the department.

(2) Serve as the department's 3-M Program technical expert and advisor.

(3) Supervise and coordinate the 3-M Self-Assessments for the department.

(4) Assist 3MC with command 3-M Training.

(5) Assist 3MC in executing quality command spot check program (spot check the spot checker).

l. Division Officer. The DIVO is responsible to the DH for the execution of maintenance within the division. The DIVO will:

(1) Ensure all PMS scheduling changes have been properly annotated and applied

prior to DH review and finalization.

(2) Review, approve, and close out weekly schedules.

(3) Review maintenance to ensure it is level loaded from week to week and among assigned maintenance personnel to not overload particular weeks or personnel.

(4) Review and verify the content and validity of PMS FBRs within three days of origination.

(5) Ensure 3-M documents generated within the division are complete, accurate and promptly submitted to the DH.

(6) Conduct 3-M Self-Assessments as directed by the command's policy.

(7) Provide weekly updates to the DH concerning the status of the 3-M System within the division.

(8) Incorporate 3-M System training into the divisional training plan.

(9) Review with LCPO all divisional work candidates and the CSMP for validity and accuracy prior to approval.

(10) Conduct space walkthroughs of all divisional spaces at least weekly and ensure all equipment and material discrepancies discovered are documented in the CSMP.

m. Division Leading Chief Petty Officer. The division LCPO is responsible for the proper operation of the 3-M System within their division. The division LCPOs will:

(1) Ensure quality maintenance is performed on all equipment in their WCs and divisions per procedural documentation.

(2) Supervise WCs in the execution of daily maintenance.

(3) Ensure WCs are properly trained, equipped and are knowledgeable of all WC divisional equipment maintenance requirements.

(4) Ensure PMS is properly scheduled and conducted, including all underway or special evolution situational "R" checks.

(5) Ensure that when equipment fails PMS, due to material deficiency or equipment discrepancy(s), the failure is properly entered into the CSMP.

(6) Implement Force Revision reviews.

(7) Review and electronically approve non-applicable procedural steps lined-out on Maintenance Requirement Cards (MRC).

(8) Review the PMS Scheduling Forecasting Report to ensure that all Tools, Parts, Material and Test Equipment (TPMTE) are available to support upcoming maintenance actions.

(9) Review and verify the content and validity of PMS FBRs within two days of origination and implement response as required.

(10) Review and approve work candidates, and serve as the second point of contact

on all work candidates. Brief the DIVO weekly on the status of all work candidates in the CSMP.

(11) Ensure proper testing and inspection of work done by outside activities prior to job acceptance.

(12) Review check notes for required and updated information.

(13) Write PMS alert details to include plan of action to accomplish maintenance.

(14) Conduct space walkthroughs of all divisional spaces at least weekly and ensure all equipment and material discrepancies discovered are documented in the CSMP.

(15) In the absence of the DIVO, complete weekly close out of maintenance in SKED.

n. Work Center Supervisor. The WCS must be a senior petty officer assigned to the WC and qualified per reference (d). The WCS will:

(1) Maintain a detailed working knowledge of all equipment deficiencies within the WC.

(2) Ensure WC personnel have completed 3-M PQS qualifications and training commensurate with position held.

(3) Maintain an accurate and current List Of Effective Pages (LOEP).

(4) Ensure 3-M system WC files and publications are complete, current and available to WC personnel.

(5) Maintain a 13-Week Accountability Log containing the current and previous 13-Week Log (if not using electronic accountability in SKED or when SKED is not available).

(6) Ensure equipment changes, adds, removals are reflected in the Configuration Management Database and, if not, report to the 3MC.

(7) Ensure FBRs are submitted whenever:

(a) Maintenance requirements are not fully understood.

(b) Errors are believed to exist.

(c) Entries in the TPMTE block are wrong or inadequate.

(d) Additional coverage is needed.

(e) Performance of the maintenance requirement would cause a hazardous condition to exist.

(8) Ensure prompt reporting of all material deficiencies and completed maintenance actions.

(9) Ensure the DIVO and LCPO or Lead Petty Officer (LPO) are advised of all 3-M system activity within the WC.

(10) Ensure Equipment Verification and Validations are submitted for equipment prior to CSMP entry.

(11) Ensure all SKED schedules are updated daily.

(12) Ensure WC personnel make necessary preparations and ensure presenters and spaces are ready for zone inspection.

o. Damage Control Assistant. The Damage Control Assistant will be the principal advisor to the XO for all matters pertaining to damage control maintenance including scheduling, performance and the technical aspects of planned maintenance for all damage control equipment. The Damage Control Assistant will:

(1) Provide a comprehensive weekly training and qualification program for Damage Control Petty Officers.

(2) Schedule and control the performance of planned and corrective maintenance of damage control equipment requiring outside or off hull assistance.

(3) Advise DHs of scheduled dates for maintenance actions requiring coordination between departments or throughout the ship for Damage Control systems.

(4) Coordinate PMS on damage control gear not assigned to a WC, division, or department.

p. Maintainer. Maintenance personnel will perform all PMS as assigned utilizing PMS documents in SKED and ensure check notes contain amplifying information and tag-out identifiers as required. Maintenance personnel will:

(1) Review PMS assignments, perform quality maintenance per procedural documentation, and properly document completion.

(2) Notify WCS when:

(a) MRC is not fully understood, appears to be incorrect or cannot be accomplished as written. (If a need to deviate from documented procedures is perceived, “stop.” Inform the WCS, LPO and LCPO. Do not proceed until the CoC has resolved the apparent discrepancies and provided guidance.)

(b) There are issues with the TPMTE block of the MRC.

(c) The technician has doubts concerning his or her ability to perform the maintenance.

(d) Equipment deficiencies or casualties are discovered.

(e) Factors exist which would make performance of the maintenance unwise or dangerous.

(3) Initiate FBRs when discrepancies are discovered during the performance of an MRC.

19-6.4 SHIPBOARD MAINTENANCE

19-6.4.1 Preventative Maintenance System. PMS constitutes the scheduling and

accomplishment of all periodic and situational maintenance conducted on shipboard equipment. All PMS is scheduled and completion reported via the SKED program.

a. Qualifications and Accountability. The key to a successful 3-M Program is having highly-trained, knowledgeable, and qualified maintenance personnel accomplishing the maintenance. All personnel must complete the corresponding Personnel Qualification Standards (PQS) for their assigned billet associated to the 3-M program per references (c), (d) and (e).

b. SKED guidance and utilization.

(1) Guidance for use of SKED is provided via the SKED users guide with help menus, and wizards associated with SKED functionality.

(2) The Navy PMS DVD or CD-ROM is used to update the command or unit's SKED PMS data. Electronic backup of the command or unit's SKED database will be used to restore SKED databases.

(3) The SKED program uses days to schedule and keep track of calendar periodicities. MRCs are displayed as out of periodicity when they fall outside the established date ranges in the SKED program. These date ranges are as reflected in Table 19-6-1 of this chapter.

19-6.4.2 SKED Program Failure And Restoration. SKED Program failure. In the event of a SKED failure, operation of PMS performance and tracking is as follows:

a. The 3MC will notify CoC and TYCOM immediately upon loss of system, or if planned outage will last longer than seven days and report status of backups.

b The 3MC will utilize electronically saved copy of 26-week outlook report, situational requirements page, MIPs, MRCs available on Tailored Force Revision (TFR) DVD and distribute to WCs.

c. Work Center Supervisors will utilize paper 13-week accountability logs (available on FR DVD) and will manually fill out maintenance required within their WCs and sign for completed maintenance.

d. Work Center Supervisors will verify situational requirements page to ensure they do not miss scheduling situational checks.

e. Work Center Supervisors will ensure MPs annotate tag-out number in the required block. Work Center Supervisors will identify checks that have mandatory related maintenance, and ensure there is an alphanumeric code assigned to parent check and all associated related checks.

f. LCPOs will review and sign the 13-Week Accountability Log at the end of the PMS week and ensure checks added that week are hand-written into the blank accountability log.

g. DIVOs will review sheets weekly to ensure 13-week accountability logs are complete.

h Once SKED is confirmed back in operation, the 3MC will notify all hands. In the event of a SKED restoration, operation of PMS performance and tracking is as

follows:

(1) Each WCS will have to manually arrange SKED to match 13-week accountability logs. Maintenance personnel will use SKED PIN as applicable to annotate completion of maintenance. Check notes and alert notes will be made per standard SKED entries as directed by sub-paragraph 19-6.4.9.f of this chapter

(2) Once SKED has been updated to the current week, normal accounting for maintenance will resume.

(3) If the 3MC turned off SKED PIN feature to ease the burden of catching the system back up, then paper 13-week accountability logs will have to be maintained for 13 weeks. They can be scanned and kept on the WC's electronic folder on the LAN, Intranet.

(4) If the 3MC did not turn SKED PIN feature off, once SKED matches the 13-week accountability logs exactly, then the paper reports can be disposed of. The WCS or LCPO will maintain the assignment of PMS with the Maintenance Outlook Report until SKED is restored.

(5) Re-enable SKED PIN feature if previously turned off.

19-6.4.3 Minimum Standards. MRC accomplishment is critical for maintaining equipment in a ready state and achieving expected service life. The maintenance tasks directed by MRCs are the minimum standards for organizational (shipboard) preventative maintenance and therefore equipment degradation can be assumed if maintenance is deferred. The following provisions are provided to maximize on time performance of PMS and provide increased fleet latitude in maintaining equipment.

a. MRCs are prepared as instructions to complete a maintenance task based upon the premise that the personnel assigned to perform the task have sufficient knowledge of the rate listed on the card and are qualified to perform maintenance as directed by the MRC. The MRC will be accomplished in sequential order, adhering to all Warnings, Cautions and Notes. Routine sub-steps (e.g., fastener removal, steps to don and remove Personnel Protective Equipment (PPE), turning on a vacuum) may or may not be included in the MRC and their absence should not prevent the maintainer from completing the maintenance task.

b. Per NAVSEA, procedures are written at a level of detail based on the assumption maintenance personnel are trained, qualified and supervised by experienced leadership to execute the maintenance consistently and expertly. They exist to provide a common standard, specify acceptance criteria, communicate warnings and cautions specific to the maintenance and provide proven maintenance practices. They are not intended to:

(1) Supplement or duplicate rules and procedures that must be followed for hazards generally associated with the equipment (Hazardous Material Handling, Electrical Shock Risk Management, etc.) but not specifically associated with a step of the procedure.

(2) Identify every process and every warning associated with the maintenance

environment of the component being maintained (aloft, in tanks, near an active flight deck, in a heat stress area, etc.).

(3) Specify every possible action of the maintainer.

c. Leadership will uphold standards for complying with maintenance procedures. This standard does not mean the maintainer is expected to robotically follow the MRC word-by-word. Leadership, trainers, monitors, auditors and inspectors should not expect it. The key word here is "intent". The objective is to perform the intent of each step (not necessarily step-by-step) performance.

d. If a step is missing that is necessary to complete the task and that step is not obvious to the Maintenance Person (MP), an FBR should be submitted.

e. MRC completion status is dependent on the accomplishment of all procedural steps on all of the equipment listed on the MRC or its accompanying Location Guide List.

f. The performance of additional rational actions during the accomplishment of a MRC is authorized. Examples of such actions include turning on and off items utilized during the performance of the MRC (vacuum cleaners, test equipment, etc.) and general housekeeping (cleaning up or containing spilled fluids or dirt).

g. The substitution of any tools, materials or test equipment not held by the activity should be considered prior to deciding to defer the maintenance until the exact tools, materials or test equipment listed on the MRC are procured. This is especially critical for frequently required maintenance where several performance cycles can be missed while waiting for supply to provide the correct items. Substitution requirements are provided by reference (a) and other technical documents.

19-6.4.4 Functional Components.

a. PMS Master File. The Master File, maintained by the ship or unit's 3MC, contains information relative to PMS requirements that are specific to equipment for which the command is responsible. The Master File provides for duplicate issue of missing MIPs and MRCs, contains supplementary information provided by NAVSEA Logistics Center (NAVSEALOGCEN) Detachments Norfolk or San Diego and serves as a repository for changes received between FR distributions, which must be retained on file until the changes are reflected in a subsequent FR.

b. PMS Administrative Requirements. In lieu of a WC or Master File the following should be retained:

(1) Hard copy Change Service Accountability Log: The CSAL will now shift to only 3MC managing one CSAL electronically stored on Local Area Network (LAN), Intranet or SKED help tab etc. that all hands have access to view. This will hold all command changes (Force Revision (FR) dates, Advanced Change Notice (ACN), FBRs, Significant system down time, etc.) to the 3-M Program. The WC Journal Tab in SKED houses all the changes the WC has made to their individual program (revisions, lineouts, custom notes, weekly closeouts, alert acknowledgements, check notes, alert notes, etc.).

(2) Service Brief: Will be electronically stored on LAN, Intranet or SKED help tab etc. that all hands have access to view.

(3) Qualifications, Designation letters and NECs: Will be stored electronically in each WC's folder stored on LAN or Intranet in a .pdf document that can be electronically signed by required personnel (DH, DIVO, and OIC etc.).

(4) Feedback Report Log: The FBR Log will be maintained in each WC's folder located on LAN or Intranet. This will house all external feedback responses that apply to the WC. There will also be an FBR response memo that will be saved to this folder for each FBR when the WC implements the FBR into their WC MRCs. This will also match the 3MC's CSAL. Upon FBR implementation, a custom note on the affected MRC will be created that will house the FBR number; changes directed or can paste the entire FBR response. If ACNs are applicable to an MRC that replaces the existing MRC a custom note will be made on affected MRC that states the ACN number and statement: This MRC is superseded by ACN number and can be electronically found: (list where WC electronic folder is kept). The superseded MRC will be printed only if it contains the Location Guide List, and the ACN MRC will be printed and utilized. All internal FBRs are tracked in SKED FBR Tab. Ensure these are implemented the same as external FBRs noted above.

(5) List Of Effective Pages PMS-5: The 3MC will keep all WC LOEPs as part of the Master File. The WC's LOEP will be verified by using the SKED LOEP Manager, all listed MIPs should say "normal", if "On WC not on LOEP" or "Not on WC on LOEP" is listed, and the FBR log should be reviewed for approved FBRs that added or removed the MIP from the WC.

(6) Maintenance Index Page: Electronically stored in SKED. Lineouts are approved when LCPO or DIVO, and DH review and approve any revisions in SKED. If the lineout approval report in SKED is ran, it will only list the person who selected "Mark Complete", not who approved the lineouts. To ensure the required approval level is identified for lineout approval, the LCPO will select "Mark Complete" on any revision. If there is a FBR that is applied to a MIP to change Situational Reference numbers, ensure that the changed Scheduling Aid (SA) code references the FBR that approved the change. This will be verified against the FBR log or SKED FBR tab. If there was an ACN that updated the MIP, then ensure the .pdf copy is saved to the WC's folder and available for all maintenance personnel to utilize.

(7) Maintenance Requirement Card deck: This will be electronically stored in SKED PMS Documents and will be printed out of PMS Documents each time maintenance is conducted unless you have portable laptops or hand held computers that have PMS documents and is available to the command. Custom notes must be utilized for any fill in data that is required on the MRC, any FBR changes that may apply, or any information that will assist the MP in conducting the maintenance. Custom lineouts on the MRC are also allowed when the FBR directs or the MRC states if applicable on steps or note on MRC that directs WCS to line out steps that are not applicable. MRCs with either of these changes will have the LCPO approval with name documented on the MRC.

(8) Forecasting Report: Will be electronically sent to Supply before the start of each quarter to ensure the WC has all the proper tools, parts and Hazardous Material (HAZMAT) required. There is no need to maintain these reports. If using these reports to verify tools, parts, etc. it can be generated within SKED.

(9) Space Inspection Sheets: Sheets are electronic and are on the FR disc if command does not have electronic version. These will be updated to reflect space requirements and discrepancies noted as described in the MRC. These will be maintained in WC folder on LAN, Intranet per the MRC prescribed timeline.

(10) All required instructions and references (OPNAV 5100.19, NSTM 670, NSTM 300, PPE Glove matrix, PPE Eye protection matrix, respirator matrix, etc.) will be electronically stored on LAN, Intranet or SKED help tab etc. that all hands have access to view. Individual WC tech manuals and other reference material will be kept electronically in their WC folder on the LAN, Intranet or on ATIS.

(11) HAZMAT receipts can be electronically saved from Hazardous Inventory Control Systems for Windows (HICSWIN) program if applicable. Reports can be generated from HICSWIN for any period the WC will need.

19-6.4.5 3-M Coordinator.

a. 3MC will create electronic folders on the LAN, Intranet for each WC and for 3MC.

b. 3-M messages and notices: These will be kept in a central location on LAN, Intranet or SKED help tab etc. that all hands have access to view. Each WC will have their own 3-M folder that will house extra applicable messages, documentations, notices and equipment advisories that applies only to their individual WC.

c. 3MC will establish an electronic CSAL and ensure everyone has access to view it. The CSAL is vital to documenting any changes that occur within the commands program. (FBR number, date of change, date when entire command has fully implemented it across the command, any ACN, any external FBR, down time of SKED or MDS, etc.).

d. 3MC will utilize SKED for tracking all internal FBRs. 3MC will utilize electronic email to route all FBRs and to ensure WCs get the FBR installed and CoC are aware when the FBR has been implemented (means of tracking). This will be saved electronically in 3MC FBR log folder and in the WC electronic folder.

e. 3MC will keep current electronic copy of PMS-22 report, compare, and reconcile all FBRs against SKED. Any FBR over 60 days need to be verified they are still valid and not corrected by FR.

f. 3MC will ensure command spot check matrix is accessible to crew and is current and updated weekly.

g. 3MC will ensure 3-M PQS is current, tailored, electronically kept and approved by the CO.

h 3MC will provide Training Officer with a short-range and long-range training plan.

i. 3MC will ensure an electronic event listing is available and updated weekly and maintain history of 13 weeks of events.

j. 3MC will ensure all designation letters are electronically generated and signed by required official and kept in 3MC electronic folder or respective WC folder. Multiple personnel can be listed on designation letters; one designation letter per individual is not required.

k. Weekly reports are not required from WCs or divisions and will not be generated by any WC or division. WCs will be reviewed daily and closed out weekly in SKED by WC CoC. DHs will acknowledge all alerts in SKED on the day the week is closed out and review status of departmental maintenance disposition.

l. 3MC will generate weekly Virtual Snap-Shot electronically and all required files will be saved electronically to weekly folders (folder per corresponding week). This location will be listed on the Virtual Snap-Shot report.

m. 3MC will route weekly Virtual Snap-Shot electronically to CoC and Surface Force 3-M Representative and will maintain for 13 weeks.

n. Interim MRC Procedures. The ship may develop interim MRC procedures based on experience and applicable technical manuals in support of equipment or systems without PMS coverage until formal documentation is received. Before scheduling preliminary MIP requirements, the WC CoC and the DH must verify their applicability to installed equipment and approved by the CO.

o. Change Service Accountability Log. The CSAL provides a definitive record of all changes to a command's 3-M program. Whenever a change to a command's 3-M program is directed (be it from a FR, FBR, etc.), the change will be routed to the concerned WC(s) via a memorandum. Whenever such a memorandum is issued, it must be recorded in the CSAL. Once the WC reports the directed change has been completed, the 3MC will file the WC's response and annotate the CSAL that the action is complete.

(1) The CSAL is comprised of the actual log sheet, a copy of all memos routed to the WCs and the memo from the WC's CoC to the 3MC indicating completion.

(2) The importance of the CSAL cannot be overstated. In essence, it provides for a day-to-day, year-to-year record of changes to a command's planned maintenance program. It is also a turnover document at deployment sites, allowing a current command to quickly identify all changes from a previous command. Finally, it will be inspected during all command 3-M assessments and inspections, providing visibility as to how well a command manages 3-M from one inspection to another.

19-6.4.6 Related Maintenance. Related maintenance, so designated by the In Service Engineering Activity (ISEA) or Technical Warrant Holder, is determined from the MIP. The RELATED MAINT column of the MIP reflects related maintenance requirements. Related requirements are positioned on the MIP to line up directly across from the MRC to which they are related. Related maintenance requirements are also identified in the TPMTE section of the MRC under MISCELLANEOUS.

NOTE: MANDATORY RELATED REQUIREMENTS MUST BE LINKED IN SKED TO BE AUTOMATICALLY SCHEDULED.

a. Related Maintenance Categories.

(1) Mandatory Related. Mandatory related maintenance requirements are those maintenance actions that must be accomplished concurrently with another maintenance requirement. The mandatory relationship is indicated with the use of the # sign. If the mandatory related maintenance resides on the same MIP, it will be reflected in the RELATED MAINT column as "periodicity#" (e.g., M-3#). If the related maintenance resides on another MIP, it will be reflected as "MIP: periodicity#" (e.g., IC-013/033: M-4#). Mandatory related maintenance requirements are automatically scheduled by SKED.

(2) Convenience Related. Convenience related maintenance requirements are those maintenance actions that can be accomplished concurrently with another maintenance requirement in an effort to save time (preliminary steps and tag-outs already accomplished) or for work force considerations. If the convenience related maintenance resides on the same MIP, it will be reflected in the RELATED MAINT column as "periodicity" (e.g., M-5). If the related maintenance resides on another MIP, it will be reflected as "MIP: periodicity" (e.g., EL-010/001: M-4)). In both cases, the # symbol is omitted. The WCS manually schedules convenience related requirements.

(3) Conditional Related. Conditional related maintenance requirements are those maintenance actions that are performed when specific conditions are present or specified parameters are not met on the referencing MRC. Conditional related maintenance will appear on the MIP in the same manner as convenience related maintenance. The WCS manually schedules conditional related maintenance.

(4) None. No related maintenance is reflected as "None" in the RELATED MAINT column.

b. Work Center Supervisor Actions. WCS will review their schedules on a regular basis for opportunities to perform other PMS when an equipment or system has maintenance actions scheduled. Rescheduling of PMS to take advantage of other system maintenance (convenience related) is highly recommended.

(1) If an MRC has related maintenance from another MIP, review the related MIP and MRC and determine if it requires assistance from another WC.

(2) If the related MIP and MRC does not require assistance from another WC and is not on the lead WC LOEP, submit an FBR to have it added to the LOEP.

(3) If the related MIP and MRC requires assistance or completion by another WC and is mandatory, convenience or conditional related then it should also be on the lead WC LOEP. If it is not on the lead WC LOEP, submit an FBR to have it added to the LOEP. If the related MRC requires technical assistance, a special NEC, or another rating that is not part of the lead WC, then the person with the technical training, special NEC or required rating should be temporarily added to the lead WC "Crew List" and assigned the related

maintenance in either an assist or performance role. All WCSs involved will collaboratively plan the required maintenance and may adjust schedules based upon individual workload. When the maintenance is completed, the lead WC will mark the MRC as completed.

19-6.4.7 Inactive Equipment Maintenance.

a. Inactive Equipment. Equipment should only be placed into IEM when in an inactive or out of commission status of seven days or longer. Inactive status is defined as tagged out or removed from service regardless of the equipment having associated Lay Up (LU), Periodic Maintenance (PM), Operational Test (OT), or Start Up (SU) maintenance checks. Equipment maintained by multiple WCs will be placed into or removed from IEM using the same date.

(1) Status I. Equipment that will:

(a) Remain onboard.

(b) Is not scheduled for corrective maintenance or overhaul.

(c) Will be inactive during extended shutdown periods and maintenance availabilities as determined by the DH. (Example: Main lube oil cooler in freshwater lay-up.)

NOTE: PERFORM A "FRESHWATER LAY-UP" (LUBE OIL COOLER FILLED WITH FRESHWATER) IF LUBE OIL COOLING IS NOT REQUIRED FOR SEVEN DAYS OR LONGER. THE SEAWATER SIDE OF THE MAIN PROPULSION LUBE OIL COOLER SHOULD BE FILLED WITH FRESHWATER AS SOON AS POSSIBLE TO MINIMIZE MARINE GROWTH AND FOULING.

(2) Status II. Equipment that is inactive and:

(a) Subject to corrective maintenance, overhaul or removal for safe storage.

(b) Temporarily transferred to another activity for maintenance responsibility for extended shutdown periods as determined by the DH. Example: Refrigeration compressor removed for depot level overhaul.

(c) When system(s) components are scheduled for replacement.

b. Implementation and Responsibility. While inactive, minimum maintenance is performed to ensure the success of the reactivation. The IEM section of the MIP will cover this maintenance.

(1) To implement procedures for the accomplishment of PMS for equipment declared in an inactive status, current PMS schedules are modified to annotate the requirements listed in the IEM section of the MIP. For advance planning and scheduling of maintenance to take place, it is necessary to determine and identify the extent to which unit or Ship's Force personnel will conduct PMS during an inactive period. MIPs in each WC will be reviewed to determine if

equipment has IEM coverage (e.g., LU, PM, SU and OT), if the coverage is adequate, and what procedures to follow if there is no IEM coverage on the MIP in question or provided coverage appears inadequate. The DH is responsible for determining equipment IEM status. When placing a system or equipment in IEM status, the DH will also determine the IEM start date to be reflected in SKED. The IEM end date will not be applied in SKED until the system or equipment is ready to be brought out of IEM status. All SU and OT checks will be completed before taking the system or equipment out of IEM in SKED. All periodic PMS scheduled at the end of IEM should be reviewed for applicability, with applicable maintenance accomplished prior to operating equipment.

(2) IEM procedures are listed on MIPs and separated from operational PMS by a horizontal line. The IEM section is titled "Inactive Equipment Maintenance" and is prefaced by the following statement: "The following requirements will be scheduled when equipment is inactivated for periods of prolonged idleness." When there are no IEM requirements the words "None required" will appear under the Inactive Equipment Maintenance Section of the MIP. When IEM procedures are inadequate, submit an FBR. The unit or ship should consider all factors that affect equipment deterioration and take necessary precautionary measures. These factors include environmental conditions, equipment location, susceptibility to damage or other factors that cannot be anticipated when IEM procedures were originally developed by the cognizant ISEA or design activity.

(3) The lack of IEM requirements on a MIP does not prohibit placing that system or equipment into an inactive state. Additionally, certain locations require precautions and maintenance not required force-wide. The unit or ship should consider all factors that affect equipment deterioration and take necessary precautionary measures. The LCPO is responsible for identifying factors that are inadequate and may require additional preparation and maintenance of the inactive equipment while reporting it to the DH for approval. Factors may include environmental conditions, equipment location or susceptibility to damage. For those actions that are recurring in nature, the WC should submit a FBR for possible MRC development.

c. IEM Scheduling. SKED provides the capability to perform IEM scheduling.

(1) Status I. The scheduling of maintenance for Status I inactive equipment utilizes conventional PMS scheduling techniques. LU checks will automatically be added to the schedule at the beginning of IEM by SKED. The WCS will manually add PM checks to the schedule for the period of IEM following the guidelines of the MIP. At the conclusion of IEM, SU checks and routine PMS will automatically be added to the schedule by SKED. SU checks must be accomplished the week IEM ends. All periodic checks added at the end of IEM, can be moved to the right, not to exceed the allowable date range. Since the MRC date range cannot be applied to the left (into the IEM period), the MRC date range can only be moved to the right and therefore only the plus value of the specific range, (i.e., the date range for a monthly is

21-41 days). The requirement can only be moved (scheduled) 10 days to the right and will not go into "alert" until after the 10th day. This allows the WCS scheduling flexibility within the plus side of the date range of the MRC.

(2) Status II. The scheduling of maintenance for Status II inactive equipment utilizes conventional PMS scheduling techniques, however, not all scheduled IEM PMS may need to be accomplished by the unit or Ship's Force. LU checks will automatically be added to the schedule at the beginning of IEM by SKED and may be marked "NA" if the LU check did not support the equipment being removed from the ship or unit or "Accomplished by Higher Authority" symbol if completed by the intermediate or depot level maintenance activity. PM checks may be required to be scheduled during the IEM period. At the conclusion of IEM, SU checks and routine PMS will automatically be added to the schedule by SKED. SU checks must be accomplished the week IEM ends and may be marked with the "Accomplished by Higher Authority" symbol if they were completed by the intermediate or depot level maintenance activity. Routine PMS added at the end of IEM may also be marked with the "Accomplished by Higher Authority" symbol if they were completed by the intermediate or depot level maintenance activity. All periodic checks added at the end of IEM, can be moved to the right, not to exceed the allowable date range. Since the MRC date range cannot be applied to the left (into the IEM period), the MRC date range can only be moved to the right and therefore only the plus value of the specific range, i.e., the date range for a monthly is 21-41 days. The requirement can only be moved (scheduled) 10 days to the right and will not go into "alert" until after the 10th day. This allows the WCS scheduling flexibility within the plus side of the date range of the MRC.

19-6.4.8 Assessment Procedure MRCs. Assessment Procedure (AP) MRCs are not required to be scheduled in SKED, but they will be maintained "active" through the FR and TFR process. Assessment personnel or Ship's Force need only print AP MRCs on an "as needed" basis for use. The record of completed AP MRCs by off-ship personnel is recorded on the work candidate and Ship's Force participation is recorded in their completion remarks of that work candidate. There is no need for recording Ship's Force participation in an assessment event on their PMS schedule within SKED. FBRs submitted requesting deletion of a MIP that only contains AP MRCs would be disapproved and returned to the originator.

19-6.4.9 Scheduling. PMS is a portion of the command's 3-M Program that provides, in one authoritative system, the scheduling information and technical procedures governing planned maintenance. PMS provides a simple method for scheduling and documenting the execution of planned maintenance procedures.

NOTE: WHERE THE GOAL OF 100% ACCOMPLISHMENT CANNOT BE REACHED, THE UNIT'S COC MUST BE KEPT INFORMED OF THE CIRCUMSTANCES THAT PREVENT ACCOMPLISHMENT OF SCHEDULED MAINTENANCE.

a. Situational maintenance scheduling will be managed utilizing the tools provided by the computer-based PMS scheduling software employed by the activity. All event

driven situational requirements will be "triggered" when required and performed per reference (a).

b. A plus sign (+) on the MIP to the right or under the MRC indicates this procedure is primarily intended to be scheduled for accomplishment by off-ship maintenance personnel for those classes of ships (e.g. LCS, DDG 1000) that utilize off-ship personnel for PMS.

c. The MP will be assigned prior to commencing the week and must complete the maintenance as directed. If a different person is required, the WCS will reassign the PMS accordingly.

d. Pre-Deployment Global Triggers: Forward Deployed Naval Force ships are forward and continuously deployed with no clear definition of deployment. 3MCs will trigger the Pre-Deployment global trigger after successful completion of a TYCOM Light Off Assessment. For non-Forward Deployed Naval Force, a deployment is defined as any underway greater than 90 days.

e. H-coded MRCs will be listed as individual SKED equipment maintenance items. The instrument serial number must match the Calibration Requirements List system designator (i.e. AHP-100-GA-001). All "H" coded MRCs will be considered overdue based on the due date annotated on the calibration label regardless of MRC date ranges allowed by reference (b).

f. Standard entries will be utilized for all SKED 3.2 check note and alert note under the following circumstances.

(1) SKED 3.2 check note that defers maintenance will begin with out of periodicity, non-accomplished, lost, or Not Applicable (NA) for situational checks.

(a) Each MRC completed with tag-out flag will have check note containing the tag out serial number or no tag-out required.

(b) List the Petty Officer In Charge when more than one MP is assigned.

(c) Cent sign (¢) entries will begin with "Performed by" followed by detailed information of the organization completing the maintenance, Job Sequence Number (JSN), work order, or applicable documentation. Proof of completion will be maintained in the WC PMS File. The SMMO will utilize PIN in SKED 3.2 to document the completion MRs by outside activities after reviewing the check note ensuring the LCPO has annotated satisfactory completion of the installation and update. These Cent sign (¢) checks can be spot checked to ensure proof of Quality Assurance documentation and all work was completed.

(d) Check notes for completed checks can be used to document JSN if discrepancies noted or anything the command deems appropriate.

(e) Check note entry is required when rescheduling a PMS check to a later week outside of the week originally scheduled.

(2) SKED 3.2 alert note is required once a check is out of periodicity and will begin with out of periodicity and include a brief plan of action when the maintenance will be accomplished. This will be updated weekly until the maintenance is accomplished. The WCS or LCPO will add a brief description for each Alert Note for non-accomplished categories:

(a) System or Equipment Failure. System or equipment is not operational or in a reduced operational status thus preventing maintenance from being accomplished. CSMP JSN required in additional text description.

(b) Inadequate Maintenance Procedures. MRC procedure or steps cannot be accomplished to a point where the maintenance can be considered accomplished. FBR number required in additional text description.

(c) Ship Operational Requirements. Operations prevent the maintenance from being accomplished. Requires additional text description.

(d) System or Equipment Operational Requirements. Required operation of system or equipment prevents maintenance from being accomplished. Requires additional text description.

(e) Lack of Hazardous Material. Correct HAZMAT not available at the time maintenance was to be performed. CSMP JSN required in additional text description.

(f) Missing or Incorrect TPMTE. Correct or calibrated TPMTE was not available at the time maintenance was to be performed. CSMP JSN required in additional text description.

(g) Other requires additional text description.

(3) After the FR is approved, the 3MC will conduct "quarter" archival to maintain one completed quarter, one current quarter, and at least two future quarters. This permits the ability to review past records and forecasting of upcoming maintenance actions.

19-6.4.10 Accomplishing PMS. Maintenance personnel use MRCs to accomplish assigned planned maintenance as described below.

a. From SKED "My Task" view, review the 13-Week Report.

b. Determine maintenance task(s) assigned.

c. Determine when the maintenance task(s) are due.

d. Determine what TPMTE or supplies are needed. For MRCs that contain inspections and then maintenance actions based upon the inspection findings, the TPMTE needed to perform the follow-on maintenance caused by the inspection findings does not need to be obtained prior to performing the MRC but rather, may be obtained as needed.

e. Perform the maintenance on schedule.

f. Notify the WCS immediately whenever one or more of the following conditions exist:

(1) Anything on an MRC is not fully understood, appears to be incorrect or cannot be accomplished as written.

(2) TPMTE prescribed by the MRC is not available, is not correct or questions about substitutions arise.

(3) Any doubt exists about your capability, training, or experience to properly perform the maintenance requirement as prescribed.

(4) Factors exist which would make performance of the maintenance requirement unwise or dangerous (e.g., disassembly of equipment needed for operations, radiation when prohibited, situations causing safety hazard to exist, etc.).

(5) Equipment deficiencies or casualties are discovered.

(6) Any provisions or requirements on the MRC cannot be accomplished as prescribed.

g. If an MRC can be completed step by step as written, then the maintenance action can be signed off as completed. Report completed planned maintenance actions to the WCS, update the PMS schedule to reflect the completed maintenance, annotate and sign the 13-Week Report (if applicable). If multiple personnel are assigned to a single maintenance action, the most senior knowledgeable person assigned must update the PMS schedule, annotate, and sign the 13-Week Report or check note if using SKED 3.2 electronic accountability.

h. If inspection criteria or a threshold inspected by the MRC does not meet the intended criteria, then those maintenance actions cannot be signed off as completed until the discrepancies are corrected. The only allowable maintenance actions that can be signed off as complete are those discrepancies where the PMS documents (MRC or MIP) have an actual statement that directs a CSMP entry(s) to be made if there are discrepancies. The statement to inform the WCS of discrepancies, by itself, is not sufficient to sign the maintenance action as complete when discrepancies exist. Maintenance actions not fully completed will be reported to the WCS. However, if material deficiencies or casualties, which are unrelated to that MR, are discovered, the MR can be checked off (provided the MR was fully completed) but the discrepancy must be reported via the MDS.

19-6.4.11 Non-Accomplished Categories. The WCS or LCPO will add a brief description for each check note or alert for non-accomplished categories using subparagraphs below.

a. System or Equipment Failure. System or equipment is not operational or in a reduced operational status thus preventing maintenance from being accomplished. CSMP JSN required in additional text description.

b. Inadequate Maintenance Procedures. MRC procedure or steps cannot be accomplished to a point where the maintenance can be considered accomplished. FBR number required in additional text description.

c. Ship or Unit Operational Requirements. Operations prevent the maintenance from being accomplished. Requires additional text description.

d. System or Equipment Operational Requirements. Required operation of system or

equipment prevents maintenance from being accomplished. Requires additional text description.

e. Lack of Hazardous Material. Correct HAZMAT not available at the time maintenance was to be performed. CSMP JSN required in additional text description.

f. Missing or Incorrect TPMTE. Correct or calibrated TPMTE was not available at the time maintenance was to be performed. CSMP JSN required in additional text description.

g. Other requires additional text description.

19-6.4.12 Accountability. The credibility of the Navy PMS program relies heavily on the individual accomplishing the maintenance. The required dedication and integrity of that individual cannot be overstressed.

a. To maintain accountability, personnel are required to sign for the completion of assigned maintenance in an Accountability Log (if applicable). The WCS is required to review and sign the Accountability Log weekly to verify the accuracy and completeness of entries. Accountability sheets will be maintained in the WC PMS File for a period of not less than 13 weeks.

b. When outside activity completes PMS, the SMMO will utilize the SKED PIN feature to sign for the check. Prior to acknowledging competition, the SMMO will review all required Quality Assurance documentation and verify maintenance was complete. A check note will be entered stating, “Check performed by” followed by the activity that completed the maintenance.

c. Ships employing SKED 3.2 will utilize electronic accountability. When an individual updates the disposition of a check, this is the same as signing and dating a check completion on a 13-Week Accountability Sheet. The disposition of a check will become permanent when the weekly closeout is performed. All PMS maintenance assigned to a MP is presented to them immediately upon SKED 3.2 log-on and CoC review can be tracked on the Weekly Closeout Signature Sheet. Therefore, there is no need to print and sign the 13-Week Accountability Form.

19-6.4.13 Force Revision Implementation. In addition to the requirements of reference (a), the following steps ensure the most efficient and thorough implementation of an FR:

a. MRC deletions on MIPs must be marked to indicate the reason for deletion.

(1) Scheduling aids. Indicate applicable scheduling aid (e.g. SA-#).

(2) Split MIP. Indicate responsible WC (e.g. “EA01”) if the MRC is applicable to the ship, the responsible WC designation must be used versus a scheduling aid.

(3) “Other” to include approved responses to FBRs, ACNs (e.g. “NSWORK CENTERLTR SER 4790.005.”), Message Date Time Group (e.g. “NUWORK CENTER R124535Z AUG 05.”). Indicate guiding notation for deletion: “SA-1” or “Note 1”, configuration change number.

b. The FR will be completed on or before the first Monday of the new calendar quarter. Work centers no longer need to be approved on the same day, and can be approved

once Department Head has reviewed work center's revision. When operational schedules do not provide adequate time to implement the revision prior to the start of the quarter, the XO may direct an alternate implementation date with TYCOM N43 Force 3MC (via email) approval. This deferred FR will be reported to the Surface Force 3-M Representative. If two or more FRs were not available while the unit was deployed, only the most recent FR will be installed and implemented.

c. It is advisable to complete the FR process through DH approval before conducting quarterly audits by a Chief or more senior.

d. The 3MC will:

(1) Maintain copies of the current FR NAVY PMS DVD, LOEP for every WC, changes issued between FRs in their original format and Classified Maintenance Requirement Cards (MRC). Digital copies are allowed unless there have been changes between FRs.

(2) Review the Service Brief.

(3) Enter the FR number from the Automatic Library issued Document in the CSAL.

(4) Update PMS and TFR data into SKED prior to routing the change documentation to WCs.

(5) Route the TFR Guide to WCs for implementation.

e. The WCS, upon receipt of the change document from the 3MC, will:

(1) Apply changes to the WC PMS schedule utilizing SKED Revision Editor.

(2) Verify all MIPs are active in SKED by reviewing LOEP report.

(3) Verify all FBRs have been updated, notify 3MC if issues are discovered.

(4) Route revision changes to division LCPO for review and concurrence.

f. The LCPO will:

(1) Solely responsible for placing Work Center in Revision Mode.

(2) Review applied LOEP for streamline implementation.

(3) Verify that all PMS changes have been properly applied to the WC schedule utilizing SKED Revision Editor.

(4) Review lineouts on MIPs and MRCs. Electronically approve such lineouts to indicate concurrence.

(5) Review LOEP report and any MIPs listed "Not on LOEP, in WC" or "On LOEP, not in WC" needs to verify that FBRs have been submitted and approved for addition or removal from WC LOEP.

(6) Submit PMS schedule to DIVO for review and concurrence.

g. The DIVO will:

(1) Verify that all PMS changes have been properly applied to the WC schedule

utilizing SKED Revision Editor.

(2) Review LOEP report and any MIPs listed "Not on LOEP, in WC" or "On LOEP, not in WC" needs to verify that FBRs have been submitted and approved for addition or removal from WC LOEP.

(3) Review lineouts on MIPs and MRCs.

(4) Submit PMS schedule to DH for review and approval.

h. The DH will:

(1) Verify that all PMS changes have been properly applied to the WC schedule utilizing SKED Revision Editor.

(2) Review LOEP report and any MIPs listed "Not on LOEP, in WC" or "On LOEP, not in WC" needs to verify that FBRs have been submitted and approved for addition or removal from WC LOEP.

(3) Review and approve WC PMS Schedules.

i. The WCS completes the PMS Change Documentation Routing Memorandum and returns it to the 3MC.

j. The 3MC updates the CSAL and notifies the XO that the FR has been installed after receiving all FR PMS Change Documentation Routing Memorandums from the WCs.

19-6.4.14 Planned Maintenance System Feedback Reports. PMS FBRs are used to identify problems with PMS documentation or to request the addition or deletion of PMS coverage. Issues with the periodicity, rates, man-hours, TPMTE and procedure may all be reported via FBR. FBR is also used to request copies of classified MRCs, request the addition or deletion of an MRC (maintenance requirement) to or from a MIP, splitting a MIP between WCs when MIP is not reflected in perspective WC, shifting of maintenance responsibility or to request PMS coverage for newly installed systems or equipment. The following paragraphs provide amplifying information dealing with the issues that may prompt the submission of an FBR.

a. Periodicity. FBRs can be used to request the increase or decrease in the frequency of a maintenance action, i.e., MRC. However, the originator needs to keep in mind that the ship or unit has the prerogative to increase the frequency because of harsh weather, unusual operating conditions or corrective maintenance and associated testing requirements. (Example: "A DDG flight II submitted a FBR requesting the frequency of cleaning a specific electronics cabinet filter be increased from quarterly to monthly. Research revealed this MRC was applicable to all DDG Class units and no other ship had submitted a similar request. In fact, two other units had requested the frequency be decreased to semi-annual. It was determined that the submitting unit was in an extended upkeep period and increased foot traffic by shipyard personnel near the electronic cabinet was the most likely cause of the filter becoming clogged. The ship was authorized to increase the frequency to support the extended upkeep period and the periodicity of the MRC was not changed.)"

b. Rates. The Rates block on the MRC represents the developer's recommendation of the skill level (rate and rank) best suited to accomplish the maintenance action. The key word is recommendation. Qualified personnel other than the rate and ranking

specified may be assigned. When a Damage Control Petty Officer, Safety Petty Officer (SPO), or NEC is assigned, substitution of other personnel is not allowed other than those exceptions as noted in reference (a). An FBR requesting the rate on a MRC be changed from an ET2 to a FT2 will not pass TYCOM screening, yet a FBR requesting the addition or deletion of personnel will generally pass to the cognizant technical activity for review.

c. Man-hours. The MRC reflects the average time per equipment, per person. It does not reflect or account for gathering and putting away tools, tag-outs or time removing and replacing interferences. From a maintainer's perspective, this is not an accurate representation of the time required to accomplish the maintenance action. The Future of Sailor Maintenance (FoSM) initiative will attempt to do a better job of accounting for this additional time but until then, FBRs should be submitted only when the allotted time per equipment is significantly uncoordinated with the actual time required. (Example, an MRC calls out 0.5 man-hours per equipment, but it actually takes 1.0 man-hours.)

d. Tools, Parts, Material and Test Equipment. TPMTE FBRs should be submitted when the procedure calls for an item not listed in the TPMTE block or when the TPMTE block lists an item not called out in the procedure.

e. Procedure. Procedures are written at a level of detail based on the assumption maintenance personnel are trained, qualified, and supervised by experienced leadership to execute the maintenance consistently and expertly. MRCs exist to provide standardized proven procedures, specify consistent acceptance criteria and to communicate warnings and cautions relative to the specific maintenance action. They are not intended to specify every possible action of the maintainer. There may be instances where an obvious typographical error exists on the MRC (example: Turn switch to ON; however, switch may already be ON and the intent of the step is to turn unit off, the card should read Turn switch to OFF). This type of error should not prevent the scheduling or performance of maintenance. However, in this situation, the accomplishment of the MRC is not possible until the DIVO or LCPO reviews the error and concurs that it is safe to proceed. A temporary notation including the reason for the correction must be made on the MRC, initialed by the LCPO and an FBR submitted. Extreme caution will be taken when reviewing MRCs for this type of error. Errors must be obvious typographical errors and a PMS FBR must be submitted immediately upon discovered. Do not permanently alter the MRC until authorized by the applicable System Command (SYSCOM), ISEA or NAVSEALOGCEN Detachment. If a step is missing that is necessary to complete the task, and that step is not obvious to the MP, submit an FBR to have it added. FBRs submitted to request procedural changes should include the originators contact information and supporting rationale or justification. If, however, a step is missing that is clearly common sense (a ladder was used to install a fixture but steps were not provided to put the ladder back in stowage) an FBR only serves to overload a process that should be focused on more technical issues.

f. Duplicate MRCs. Unclassified MIPs and MRCs are now available from the DVD. Copies of classified MRCs still require an FBR request due to handling requirements.

g. Addition or Deletion of an MRC. During the life cycle of a system, equipment, or component it may become necessary to add a maintenance action to prevent an age-related functional failure or to delete a maintenance action due to inherent reliability not foreseen during maintenance development. An FBR submitted to request the addition or deletion of an MRC should include the originator's contact information and supporting rationale or justification.

h. Newly Installed or Removed Equipment. While an FBR request for PMS, coverage will provide initial maintenance coverage or deletion of MIP(s) because of equipment removal, submission of a Ship's Configuration Change Form, OPNAV 4790/CK (CK), is still required to initiate the rest of the logistic support change process. This point cannot be overstressed; the submission of the FBR does not relieve the ship or unit from initiating a CK. The CK initiates supply support, Configuration Data Managers Database – Open Architecture (CDMD-OA) changes; ship selected record drawing updates and class maintenance plan updates.

i. Splitting a MIP. There are instances in which a MIP includes MRCs for more than one WC to perform. When this occurs, a decision is required by the command as to whether the MIP will be split or will be scheduled singly by one WC. Only the XO can authorize the splitting of a MIP if an MRC requires another WC to perform the entire maintenance action. If the decision is made not to split the MIP, then the MRs will be accomplished through the coordination of WCs.

(1) If the MIP is split, the following procedures apply:

(a) Submit to the XO a non-technical PMS FBR requesting approval to split the maintenance responsibility.

(b) Upon receipt of the XO's concurrence, the 3MC will make an annotation in the remarks block of the FBR stating, "XO concurs with splitting MIP maintenance responsibility".

(c) For LCS class ships, LCS Squadron (LCSRON) N4 (vice the unit's XO) provides concurrence with the splitting of maintenance responsibility and the FBR must be so annotated.

(2) Upon receipt of the FBR approval:

(a) Utilizing the SKED Revision Editor, delete the MRC from the MIP and show the reason for deletion as the designation of the WC assuming responsibility (e.g., EE01).

(b) If the WC assuming responsibility does not reflect the MIP and maintenance items, utilize the SKED Revision Editor to add them. Schedule only the MRC(s) that pertain to the WC reflecting remaining as deleted with reason for deletion the designation of the parent (lead) WC (e.g., EA01).

(3) If the situation occurs where a WC removes a split MIP, the following procedures apply:

(a) Submit an XO approved, non-technical PMS FBR reporting the decision to remove the split maintenance responsibility. Upon receipt

of the XO's concurrence, the 3MC will make an annotation in the remarks block of the FBR "XO concurs with removing split MIP maintenance responsibility". For LCS class ships, LCSRON N4 (vice the unit's XO) approves the removal of splitting maintenance responsibility and the FBR must be so annotated.

(b) Upon receipt of FBR approval, utilize the SKED Revision Editor; remove the MIP, MRC(s) and maintenance item(s) from the WC no longer involved. Ensure that the lead WC assumes full responsibility for the MIP and MRC(s) and annotates their schedules accordingly.

j. Shift of Maintenance Responsibility. Individual ships or units sometimes consider it necessary to shift maintenance responsibility from one WC to another, to combine two or more existing WCs or to split an existing WC. These requests for changes of PMS maintenance responsibility require XO concurrence and may require final approval by the applicable TYCOM. Due to the considerable administrative burden, requests for this type of change should not be submitted to accommodate a temporary situation such as short-term assignment of two WCs to one supervisor.

(1) The following factors should be carefully considered before submitting such requests:

(a) Composition of WCs by size and ratings.

(b) Scope of maintenance responsibilities.

(c) WC workload.

(d) Ease of administration of a WC as a cohesive maintenance group.

(e) Importance of WC grouping to equipment maintenance responsibilities, PMS scheduling, MDS reporting and CSMP listings.

(2) When changes in maintenance responsibility are considered necessary, the following procedures apply:

(a) Submit a PMS FBR (non-technical). Indicate from which WC(s) equipment is to be deleted and to which it is to be transferred. Upon receipt of the XO's concurrence, the 3MC will make an annotation in the remarks block of the FBR "XO concurs with the shift of maintenance responsibility." For LCS class ships, LCSRON N4 (vice the unit's XO) provides concurrence with the shifting of maintenance responsibility and the FBR must be so annotated.

(b) WC or equipment changes will also be reported in the Organizational Maintenance Management System (OMMS) or AWN system via a configuration change request (4790/CK) through the CSMP up-line reporting process in OMMS or through Wrong in Model-Not in Model in AWN.

(3) Upon receipt of the FBR approval, perform the following actions:

(a) The PMS Master File is updated to reflect deletion of the MIP from one WC and addition to the WC receiving the responsibility. The

originating FBR serial number is annotated on the affected line item on the LOEP for both WCs. The PMS Master File must contain a record of deleted equipment until the change is reflected in a future FR.

(b) Utilizing the SKED Revision Editor, load the affected MIP(s) and MRC(s) to the WC receiving maintenance responsibility. Delete the MIP(s) and MRC(s) from WC shifting responsibility.

(c) Utilizing SKED, perform a revision to move the equipment from the original WC's current schedule to the WC receiving the maintenance responsibility. Data is exported from one and imported to the other maintaining equipment history.

k. MRC Changes Not Requiring Feedback Reports. The only MRC modifications shipboard or unit personnel may make without submitting a PMS feedback report are as listed in subparagraphs below.

(1) TPMTE.

(a) Common hand tools, administrative or office supplies and basic housekeeping items may be substituted or added by the WCS. The WCS may add notes to the MRC to reflect these substitutions. In the case where specific common tools are called out by description, substitutions are not authorized. For example, substitutions such as using synthetic fiber brushes in place of animal hairbrushes or rags and paper towels in place of lint free cloths are not allowed.

(b) Approved parts, materials and miscellaneous item substituted from the supply system, technical manual, or Military Specification (MIL-SPEC), etc., which meet or exceed the requirements may be used. Ensure that substitutions satisfy both the basic maintenance and safety requirements of the MRC. If there is any doubt, a PMS FBR should be submitted specifying substitution desired and reason.

(c) Test equipment or certified tools, which meet or exceed the Sub-Category (SCAT) code requirement, may be used.

(d) When an MRC pertains to multiple configurations of equipment and the TPMTE block contains tools, parts, test equipment and materials for each unique configuration, the TPMTE block may be tailored for the unit's specific configuration by lining out the items that do not pertain to equipment held.

1 Exception to TPMTE block change: If an item listed in the TPMTE block is not called for in the procedures block, submit an FBR explaining the circumstances.

2 Conversely, if a tool, piece of test equipment, part or material is called for in the procedure block and is not listed in the TPMTE block an FBR should be submitted.

(2) In the procedure block, WCSs may lineout the non-applicable line items

(alternate procedures) that do not pertain to current equipment or configuration when the step includes the words "if applicable" or a note identifies steps to be omitted. These items must be reviewed and approved by the division LCPO. As these changes are WC and maintenance item specific, submission of an FBR is not required. If a step or steps in the procedure block have been lined out and tools, parts, materials, or test equipment in the TPMTE block pertain only to that step or steps, then they will be lined out as well with a reference to the step or steps lined out and approved by the division LCPO. Warnings, Cautions and Notes associated with the lined out step or steps will also be lined out.

l. Delivery Methods for Feedback Reports. Feedback reports will be delivered to the ship in one of two methods:

(1) Internal. Feedback reports that originate from SKED. These feedback reports will be generated, tracked, and implemented within the SKED program within time limit set from 19-6.4.14.s. of this chapter.

(2) External. These feedback reports come from NAVSEALOGCEN for all MIP holders for review and implementation. The following steps are required upon receipt of an NAVSEALOGCEN feedback report:

(a) 3MC will review the validity (MIP/MRC) to the command.

(b) If applicable, 3MC will log TFBR serial number and origination into the Command Feedback report tracker.

(c) 3MC will notify affected Work Center.

(d) Work Center will implement Feedback report as directed within time limit set from 19-6.4.14.s. of this chapter.

(e) Command will generate TFBR implementation memo to 3MC.

(f) 3MC records TFBR implementation date into the command Feedback report tracker and maintains feedback report memo until the SKED database reflects the update via a Force Revision.

m. Types of Feedback Reports. There are two types of FBRs, technical and non-technical:

(1) Technical. These FBRs are used to report technical discrepancies inhibiting PMS performance. Technical feedbacks normally adjudicated by an ISEA responsible for the system or equipment covered by the PMS documentation require all the supporting information the originator can provide. The originator should identify the issue, providing as much supporting technical information (Allowance Parts List (APL), Reparable Identity Code (RIC), drawing or Hierarchical Structure Code (HSC)) as available and a proposed response or solution if known. Most importantly, provide point of contact information (Name and phone number) so that the ISEA can contact the originator should they have questions. Bottom line, the FBR must be accurate and complete to "stand alone", that is, the FBR will be understood without additional explanation. The better the FBR describes the problem, the more

likely the originator will receive a timely response. There are two sub-categories of technical FBRs:

(a) Routine. An FBR will be considered routine when it relates to the technical requirements of PMS. It is used to report technical discrepancies or request clarification of procedures.

(b) Urgent FBR. An FBR will be considered urgent when it relates to the technical requirements of PMS and involves safety of personnel, safety of ship or the potential for equipment damage. Urgent FBRs will be forwarded by naval message containing a PMS Feedback Serial Number, to both NAVSEALOGCEN Detachments Norfolk and San Diego, with info to the cognizant SYSCOM, TYCOM and the Naval Safety Center. The message must describe the unsafe procedure(s) or condition(s), must identify the MIP and MRC involved and reflect the serial number of the FBR generated in SKED or Planned Maintenance System-Management Information System (PMS-MIS). Once the message has been sent, include the date time group of the message in the FBR and submit.

(2) Non-technical. These FBRs are intended to support PMS requests that do not require technical review, including WC changes (shift of maintenance responsibility). Non-technical FBRs are submitted to request classified or other PMS documentation, which cannot be obtained locally, or to request clarification of issues not of a technical nature.

n. Feedback Report Submission. All SKED users will submit FBRs via SKED using the Feedback Report Wizard. Non-SKED users may submit FBRs via the PMS-MIS web site at https://pmsmis.navy.mil by selecting the Feedback Tab and Feedback Report Wizard from the drop-down tab. Non-SKED users accessing this web site for the first time will need to request an account. Click on File Manager and select New User Account Request. This displays options to select a form and readme file, which can be downloaded, filled out and sent via e-mail as directed in the readme file. An e-mail will be sent confirming your account and providing access to the main screen. The Anchor Desk web site can also be used to submit FBRs.

o. Feedback Report Screening (Shipboard or Activity).

(1) The originator accomplishes initial screening or WCS who is responsible for ensuring all data is accurate and complete.

(2) The division LCPO or DIVO accomplishes the second level screening and verifies the content and validity of the FBR within 3 days of origination.

(3) The DH, next to screen the FBR, is responsible for verifying the content and validity of the FBR and digitally signing FBRs within 4 days of origination.

(4) The 3MC is responsible for screening, serializing, and forwarding FBRs within 7 days of origination. The 3MC will also:

(a) Maintain accountability for all PMS FBRs submitted and actions taken until updated PMS documentation is received.

(b) Ensure that the originator and all applicable WCs are kept apprised of action taken and ensure the originating and other applicable WCs implement the changes or corrections when received.

(c) 3MC will maintain a PMS-MIS account.

p. Feedback Report Screening (External to Hull or Activity). FBRs are next processed by the TYCOM. The TYCOM will verify the content and validity of the FBR and either return the document to the originator or pass it on for further processing and resolution. Naval Surface Force FBRs are reviewed following TYCOM policy.

q. Feedback Processing Activities:

(1) The central control points for processing FBRs are the Planned Maintenance System Coordinating Activities (PMSCA). Depending on the type of FBR and level of technical authority necessary to answer the FBR, the PMSCA will either respond to the originator with a resolution or forward the FBR to the appropriate technical authority for action.

(2) ISEAs are those activities designated by NAVSEA as the technical experts for specific systems or equipment. Naval Surface Warfare Center, Philadelphia Detachment (NAVSURFWARCEN-PD) is the ISEA for the majority of non-nuclear hull, mechanical and electrical equipment installed on most ships. ISEAs under the direction of the NAVSEA Technical Warrant Holder adjudicate the FBR request and forward the response to the PMSCAs. The PMSCA provide the final response to the originator and update the PMS database to reflect ISEA changes. PMS changes are issued with the next available FR.

r. Feedback Processing. FBRs are processed per NAVSEA policy:

(1) Urgent FBRs.

(a) The PMSCA will provide a message response to all urgent FBRs within 1 working day of receipt. If the FBR is forwarded to a Design Activity or ISEA for resolution, then the Design Activity or ISEA will provide a message response informing the originator of specific actions or required changes because of the adjudication of the FBR within 1 working day of receipt. This message response must be addressed to the originator and distributed to all TYCOMs and units holding the affected documentation.

(b) The PMSCA will distribute revised PMS documentation to all affected users within 30 calendar days of receipt of the FBR, via special issue or ACN.

(2) Routine FBRs.

(a) The PMSCA will perform technical review, research, and provide a response to routine FBRs where resolution does not require technical authority action.

(b) FBRs that the PMSCA cannot resolve will be sent to the cognizant

Design Activity or ISEA. The cognizant Design Activity or ISEA will provide the response to the appropriate PMSCA describing the action taken. The PMSCA will provide the response to the originator by electronic means.

(c) Distribution of the revised MRC to the originator and other affected users will be accomplished via ACN or the next available FR.

(d) NAVSEA's existing policy calls for technical review activities and ISEAs to provide FBR responses in less than 21 working days from time of receipt. In addition, NAVSEA has established a goal of providing answers to FBRs in one day. While some FBRs will require extensive research and days, weeks or in some cases months to resolve, the vast majority of FBRs can and should be answered much sooner. One day may be overly optimistic, but the intent is to put the emphasis back on the timely resolution of FBRs.

(e) If no revision to PMS documentation is required, pertinent comments will be provided in the response to the PMSCA. When not concurring with the feedback report, the rationale for the non-concurrence must be provided to the PMSCA.

NOTE: IT IS POSSIBLE AN FBR RESPONSE MAY NOT MAKE A SPECIFIC FR BASED ON THE DATE THE RESPONSE WAS RECEIVED BY PMSCA. PROCESSING TIME AND HANDLING MAY CAUSE THE REVISED DOCUMENTATION TO MISS AN FR CUTOFF DATE. HOWEVER, SINCE ALL FRS ARE NOW RECEIVED QUARTERLY, IF A REVISION MISSES THE CURRENT FR CUTOFF WINDOW, THE REVISED DOCUMENTATION WILL BE AVAILABLE WITHIN THE NEXT THREE MONTHS.

s. Feedback Response Implementation. Work Center Supervisors will implement responses to FBRs based on the category and content as determined by the unit's 3MC. LCPOs will verify Feedback report implementation.

(1) Urgent FBR - within 24 hours of receipt of FBR response.

(2) Urgent FBR with an ACN - within 24 hours of receipt, the ship will implement an administrative change to incorporate the new PMS documentation. These revised documents will be utilized to conduct maintenance until the revised PMS document is incorporated into the next FR.

(3) Routine FBR:

(a) Technical - The response deals with content such as a revision to technical specifications, tolerances, test equipment, materials, acceptance criteria or the sequence of procedural steps. These changes need to be implemented within two weeks of receipt of the FBR response or prior to the next scheduled accomplishment date should that date fall within the two-week window.

(b) Administrative - The response deals with issues that do not affect the

technical content or procedural steps. Administrative changes might be added steps to provide a better degree of clarity, formatting revisions to tables or figures that do not change technical content, or updating of Notes, Warnings or Cautions that do not influence the performance of the MRC. These changes do not need to be implemented prior to receipt of the next FR. If the next FR does not reflect the revised documentation, implementation is required before the next scheduled accomplishment date of the MRC.

(4) Routine FBR with an ACN:

(a) Technical - These changes need to be implemented via an administrative change within two weeks of receipt of the FBR response or prior to the next scheduled accomplishment date should that date fall within the two-week window. These revised documents will be utilized to conduct maintenance until the revised PMS document is incorporated into the next FR.

(b) Administrative - These changes do not need to be implemented prior to receipt of the next FR. If the next FR does not reflect the revised documentation, implementation is required via an administrative change before the next scheduled accomplishment date of the MRC.

19-6.4.15 PMS Spot Check Program. Each unit is required to have an aggressive spot check program involving all levels of the chain of command from the LPO to the CO. Individual Maintenance Requirement (MR) will be spot checked periodically to determine the effectiveness of PMS accomplishment and to ensure the maintenance was completely and correctly performed. All CPO and above will conduct historical or monitored maintenance spot checks. All FCPO will only conduct monitored maintenance spot checks. Work Centers will only perform one Khaki and one FCPO spot check weekly, except ER09, which will have an additional historical spot check conducted by the 3MC and Command Master Chief. Detailed spot check criteria used to evaluate the completion of the MR is located at https://flankspeed.sharepoint-mil.us/sites/CPF-CNSP-HQ/engineering/3m.

a. Types of Spot Checks. There are three types of spot checks utilized by the Surface Fleet. While the standard operating procedure is that E-7 or above personnel will conduct Historical Spot Checks and E-6 and below will conduct Monitored maintenance, it is up to the 3MC to decide how to best run their program. (Example. If a 3MC decides to do more monitored checks when coming out of the shipyard to ensure maintenance is being done correctly, that is the command's decision.) The CO and XO will perform Spot Check Program effectiveness reviews by Spot Checking the Spot Checker defined below.

(1) Historical Spot Checks. This maintenance check has been accomplished and signed for in the 13-week accountability log. The spot checker will have the maintenance person walk through the check and ensure all steps were followed as per the intent of the step. The spot checker WILL NOT utilize a "verbatim compliance" methodology. Maintenance Cards were not written to cover every possible scenario.

(2) Monitored Maintenance Spot Checks. A real time evaluation of a maintenance check. A monitored maintenance spot check will always be graded at 100% as the spot checker is using the opportunity to train the Sailor while the check is being performed.

(3) Spot Check the Spot Checker. Conducting a spot check on a maintenance (historical or monitored maintenance) action that has previously been spot-checked. The purpose is to ensure the spot check program is effective at recognizing and correcting discrepancies identified during previously conducted spot checks. The primary focus of this inspection is the person that previously conducted the spot check, but the Sailor's performance will also be evaluated. Spot Check the Spot Checker forms cannot be documented in SKED. Paper copies will be retained for 13 weeks.

b. Spot Check Program Execution. The 3MC will generate weekly PMS spot check assignment matrix for Officers, CPOs, and FCPOs using the guidance listed in Table 19-6-2 and Table 19-6-3 of this chapter for work centers with maintenance completion. The spot check assignments can be assigned so that personnel are conducting spot checks within their respective departments, divisions, or cross departmentally. Cross-departmental spot checks are valuable in training maintenance personnel in the performance of a spot check by personnel they are not familiar with.

(1) LCS and DDG 1000 class Spot Check Guidance. Each unit is required to have an aggressive spot check program involving all levels of the CoC from the FCPO to the CO. Individual maintenance requirements will be spot checked periodically to determine the effectiveness of PMS accomplishment and to ensure the maintenance was completely and correctly performed. All CPO and above will conduct historical or maintenance validation spot checks. All FCPO will conduct monitored maintenance spot checks. WCs will only perform one Khaki and one FCPO spot check weekly. This requirement will be based on each command's manning, at no time will Khaki or FCPOs be doubled up on weekly spot checks. If a command does not have enough Khaki or FCPOs to cover each WC weekly, then those WCs will not have a spot check for that particular week. The intent of this is to have quality spot checks being performed, not quantity. Detailed spot check criteria used to evaluate the completion of the maintenance requirement is located at: https://flankspeed.sharepoint-mil.us/sites/CPF-CNSP-HQ/engineering/3m.

Periodicity	Date Range
Daily	None
2 Days	None
3 Days	None
Weekly	None
2 Weeks	9-19 Days
3 Weeks	14-28 Days
Monthly	21-41 Days

2 Months	41-83 Days
Quarterly	61-121 Days
4 Months	83-165 Days
Semi-Annually	121-243 Days
8 Months	165-331 Days
9 Months	+ or – 90 days from Scheduled Date
Annual	+ or – 90 days from Scheduled Date
Multi-Month after Annual	+ or – 90 days from Scheduled Date

Table 19-6-1

Management Level	# of Spot Checks	Spot Check Type
CO	One	Spot Check the Spot Checker
XO	One	Spot Check the Spot Checker
*CMC/SEA	One	Spot Check the Spot Checker
	One (ER09)	Historical
*3MC	One	Historical
	One (ER09)	Historical
E-7 and Above	One	Historical
E-6	One	Monitored
*CMC/SEA and 3MC will conduct a Spot Check the Spot Checker on one of the week's Spot Checks.		

Table 19-6-2 (Surface Force Spot Checks)

Management Level	# of Spot Checks	Interval	Spot Check Type
CO	One	Bi-Weekly	Spot Check the Spot Checker
XO	One	Bi-Weekly	Spot Check the Spot Checker
CMC or SEA	One	Bi-Weekly	Spot Check the Spot Checker
3MC	One	Weekly	Spot Check the Spot Checker
E-7 and Above	One	Weekly	Historical
E-6	One	Bi-Weekly	Monitored

Table 19-6-3 (DDG 1000 and LCS Spot Checks)

(2) Spot Check Scheduling Guidance.

(a) Utilize the Spot Check Randomizer located in the Weekly Virtual Snap-Shot Report. Use is mandated unless Sailor or equipment is unavailable in which 3MC will select another Spot Check to be conducted.

(b) Do not schedule spot checks in advance.

(c) Upon completion of spot checks document checks using the spot check function in SKED.

(d) Paper copies are not required to be retained when completed spot checks are entered in SKED 3.2 with exception of Spot Check the Spot Checker.

(e) Spot check discrepancies will be tracked to completion.

(f) Only the assessor is to enter the completed spot check results.

(3) Spot Check the Spot Checker Guidance.

(a) Spot Checks will be selected utilizing SKED, Spot Check - All Report, or the Virtual Snap-Shot Report.

(b) 3MC will collect completed spot check results and compare to previously recorded spot checks.

(c) Discrepancies between the spot checks will be adjudicated at the command level.

(d) A spot check the spot checker that results in a failed spot check not previously documented will be reported to the CO and XO as an attachment in the weekly report.

(e) Spot check the spot checker results cannot be entered in SKED and must be retained for a period of 13 weeks.

c. Spot Check Randomizer. The Spot Check Randomizer is the last section of the Virtual Snap-Shot Report. It produces a list of random spot checks based upon criteria such as periodicity, troubled systems, and when the check was accomplished. The program will reduce the number of times the same maintenance check is selected. The list of spot checks is for the next week. The program will choose a single check for each work center but will not assign a spot checker. 3MC will still create a list of spot checkers and assign the work center they are to inspect. The spot checker will then conduct a spot check on the maintenance action selected by the program. The 3MC will ensure that spot checkers are inspecting checks selected by the program.

d. Failed Spot Checks. All failed spot checks will be reported to the Executive Officer and Commanding Officer via the Virtual Snap-Shot. The 3MC will report the maintenance deficiency and corrective action needed or taken. If it was determined during the course of a spot check that the intent of the maintenance check was not achieved, the maintenance check will be rescheduled at the earliest convenience of the command.

19-6.4.16 Corrective Maintenance.

a. Maintenance Management Automated Information System (MMAIS) Management. As Navy MMAIS applications (MDS, AWN, Electronic Tag Out (eTagOut) and Electronic Shift Operations Management Solution programs) evolve into a connected group of systems, criteria for the management of unit, shipboard and ashore databases

and a process for submitting account requests for these MMAIS systems is hereby established.

b. Operating Policy for Unit or Shipboard Databases afloat.

(1) Will be managed locally by an assigned and designated administrator.

(2) Account structures and role or privileges will utilize the TYCOM approved Privilege Matrix which is maintained by the TYCOM.

(3) Systems settings will be set to local time not Zulu time for all processing.

(4) No outside activity will be allowed direct access to the databases. Database copies require prior written TYCOM N43 approval.

(5) All Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), work candidate, job, JSN, pre-2-Kilo to 2-Kilo review and approvals along with sending of parts requests to supply will be conducted by the ships force, no outside activities will approve work candidate, job, JSN, pre-2-Kilo to 2-Kilo or shipboard parts. No outside activity will write work candidates directly into a ships force MDS system. All outside activity reporting or finding discrepancies will produce the required "bulkload" per this manual.

c. Operating Policy for Unit or Shipboard Databases ashore.

(1) All user access levels and accounts will be tracked by the activity creating the account.

(2) Every TYCOM will have at a minimum a primary and secondary account manager. Account manager names will be provided to the Navy Enterprise Service Desk (NESD).

(3) Users with accounts missing the required forms will be deactivated until the required documentation is presented to the NESD, and the account is approved by the TYCOM.

d. Organizational Maintenance Management System - Next Generation (OMMS-NG). Organizational Maintenance Management System - Next Generation is the shipboard program used to document and track material deficiencies in the command. Only active jobs are maintained in the database and are tracked to completion. 3MC will upline a minimum of twice a week to VSB via the RADWEB service. While the OMMS database contains all active jobs for the ship, "L" and "Z" jobs will not display in the ships database. "L" jobs are work candidates the Port Engineer wrote for work to be completed on the ship. "Z" jobs are ICMP task to be accomplished by outside activities.

(1) Up-line Reporting. Up-line reporting via Revised Alternative Data Flow Website (RADWEB) is required at a minimum of twice per calendar week. Platforms on any other MDS, units will verify twice a week that automatic data transfer is occurring.

(2) Automated Shore Interface Processing. Automated Shore Interface (ASI) download and processing is required when the ASI record count in RADWEB is 3,000 records for Guided Missile Cruiser (CG), Guided-Missile Destroyer

(DDG), Mine Countermeasure Ship, Littoral Combat Ship (LCS), Amphibious Transport Dock, Dock Landing Ship, Patrol Craft (PC), or shore facilities. For Amphibious Assault Ships, Landing Helicopter Dock and Amphibious Command Ships class ASI download and processing is required when the ASI record count in RADWEB is 10,000 records. ASI download and processing for all MDS, of all available ASI records in RADWEB is required when the unit is getting underway for a period of two weeks or longer, monthly at a minimum, and as directed by the TYCOM. Ship's ASIs available in RADWEB will be downloaded and processed into the ship's MDS within seven days of ASI creation.

(3) Bulkloads and Database Transfer. A bulkload is a CSMP load (work candidate(s) provided as an external file to be loaded into the ship's CSMP) by the 3MC produced by any outside activity (any person not ships force, no activity will leave a list of material discrepancies or tell the ship to write the work candidate/jobs.). Bulkload files are sent to the 3MC by TYCOM N43. COMNAVSURFPAC or COMNAVSURFLANT N43 3-M is the only authorizing activity for bulkload reviews. Commands will not transfer, copy, or allow the direct access to or copying of the MDS and or supply database by any outside activity. COMNAVSURFPAC or COMNAVSURFLANT N43 3-M will direct via written permission for database copies. Upon completion of bulkload, the command must review all work candidates to ensure the recommended solution and type availability are accurate. If not accurate, the command should assign to the appropriate TA Code (1-Depot, 2-IMA, 3-Tech Assist) and update the recommended solution.

e. Automated Work Notification - AWN is the shipboard program used to document and track material deficiencies in the command. All active jobs and jobs closed within the last year are maintained in the database and are tracked to completion. Upline in AWN are not required as the program uplines automatically.

(1) Verifying AWN health. To ensure automatic replication from ship to shore in AWN, utilize TYCOM provided AWN health process guide. AWN health should be verified daily, a minimum of twice weekly, in the shore AWN (ATM) program.

(2) AWN Parts Approval for LCS Units. Although parts request, queue, and approval are conducted on the ship, parts will not be ordered until the Work Candidate is approved (changed from pre 2-Kilo to 2-Kilo) in the Shore ATM Database. Once the Work Candidate is made a 2-Kilo, material requisitions can be released to R-Supply Ashore.

(3) Automated Shore Interface Processing. Ship's ASIs available in RADWEB will be downloaded and processed into the ship's AWN and R-Supply within seven days of ASI creation. For LCS unit, ASI will be processed into the ship's AWN, shore AWN (ATM), and R-Supply within 7 days of ASI creation.

(4) AWN Bulkload process. TYCOM N43 will load Bulkload files directly to Ashore AWN (ATM). The uploaded jobs wills replicate to the AWN

database upon completion. Ship's 3MC is to monitor the AWN database to ensure the bulkloaded files are received on the ship.

f. Validation Screening and Brokering. The master CSMP database for all US Navy ships. The program utilized by Port Engineers to screen and broker or refer work as required. VSB is updated by OMMS and provides status updates to the Open Architecture and Retrieval System (OARS). All jobs TA 1 - 4 are reported to VSB although only TA 1 - 3 will be screened by the Port Engineer. The status of all jobs in VSB are annotated by the "WN Status" field.

g. Open Architecture and Retrieval System (OARS). The 3-M history file for all US Navy ships and shore commands. All jobs written by the ship or outside activity will be maintained within the OARS database from the time the command is commissioned until decommissioning. A weekly report from OARS is generated and disbursed to ship via a SPEAR file. The SPEAR file will contain a list of all active jobs and ICMP task assigned to the unit.

19-6.4.17 Life Cycle Of A Work Candidate. A Work candidate is created either on the ship by ship's force or by an outside maintenance activity. When a job is created by a maintenance activity or inspection team, they create a list of jobs and send them to TYCOM for review. After TYCOM review, the job will be sent to the ship via bulkload to update the ship's CSMP. A ship uploads the jobs to VSB via upline where the Port Engineer will screen and broker work to the maintenance activities during availabilities as shown in Figure 19-6-1 of this chapter.

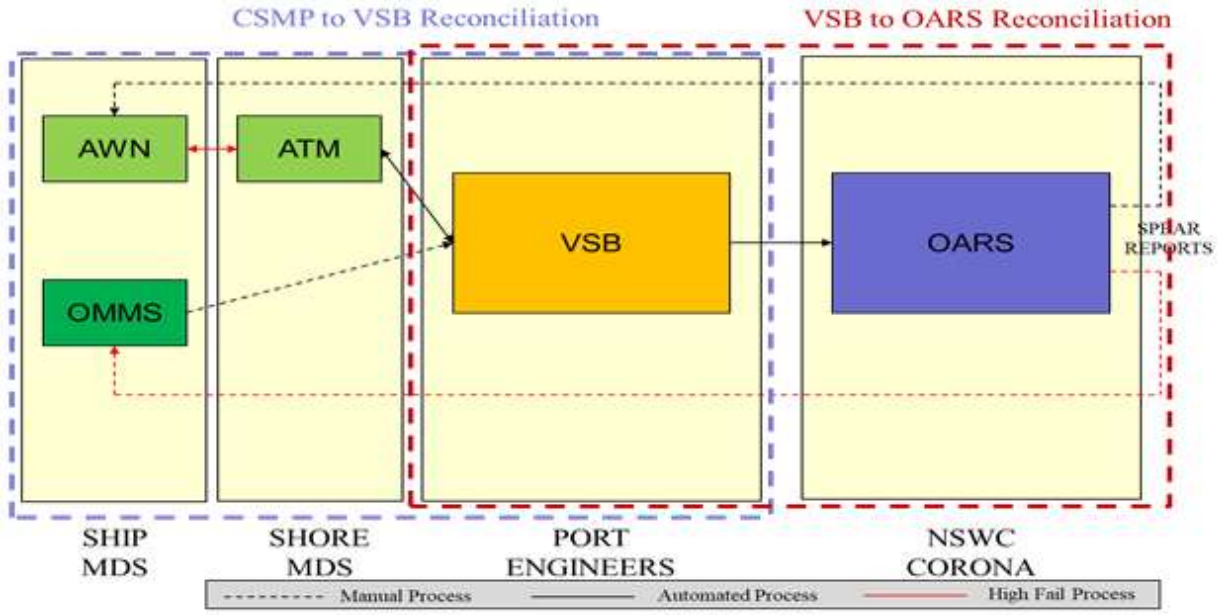

Figure 19-6-1

19-6.4.18 Key Component Of A Work Candidate.

a. Maintenance and Modernization Business Unit (MMBU) Code. A MMBU code (also known as Job Originator Values) is used to identify the outside activity that originated the job. It is identified by the first character in the job sequence number. For example, Job CA01-L001 has a MMBU code of "L" which identifies the Port Engineer as the originator of the job. CA01-R001 has a MMBU code of "R" which

identifies an INSURV inspection as being the originator of the job. A list of all MMBU code can be found in the NAVSEALOGCEN website https://oars.nslc.navy.mil/oars/docs/mmbu/index.html.

b. Type Availability Code (TA Code).

(1) TA Code 1. Depot level work candidate. When a unit receives or initiates a TA 1 job, the ship is accountable for ensuring the job is screened and brokered. The Port Engineer is responsible for the action of screening and brokering but the ship will track all TA 1 jobs to ensure they are scheduled for the next convenient availability. The status of all TA 1 jobs for the ship are identified in the Virtual Snap-Shot Report for commands visibility.

(2) TA Code 2. IMA level work. When a unit receives or initiates a TA 2 job, the ship is accountable for ensuring the job is screened and brokered. The Port Engineer is responsible for the action of screening and brokering but the ship will track all TA 2 jobs to ensure they are scheduled for the next convenient availability. The status of all TA 2 jobs for the ship are identified in the Virtual Snap-Shot Report for commands visibility.

(3) TA Code 3. Technical Assistance jobs. When a unit receives or initiates a TA 3 job, the ship is accountable for ensuring the job is screened and referred. The Port Engineer is responsible for the action of screening and referred but the ship will track all TA 3 jobs to ensure the jobs are brokered to a maintenance activity so the requested technical assistance can be provided. The status of all TA 3 jobs for the ship are identified in the Virtual Snap-Shot Report for commands visibility.

(4) TA Code 4. CSMP work notifications that are within ship's force capability to complete. A TA 4 job can originate from on the ship or an outside inspection team such as an INSURV or Total Ship's Readiness Assessment. TA 4 jobs will be sent to VSB via CSMP upline but the Port Engineer may not have visibility of the jobs. Additionally, a job may have been written by the ship as a TA 1 - 3 and the Port Engineer may screen the job as a TA 4. This will be reflected by the SPEAR Report or during the monthly CSMP Reconciliation Process. If a job is screened as a TA 4 the ship will change the TA Code of the job to 4. If the ship still desires an outside activity to perform the work, the Port Engineer should be notified.

c. Equipment Status Code (ESC) and Equipment Operational Code (EOC). The ESC and EOC will reflect the actual condition of the equipment at the time the Work Candidate is created. The ESC from OMMS-NG units is used to compute the EOC which is a major factor in determining the mission operational capabilities of the ship.

d. Safety Code. A safety Code will be added to all CSMP work candidates. If the job has no effect on the safety to personnel and/or equipment, a Safety Code of "0" will be utilized. The following safety codes are authorized for use:

(1) "X". Enter an "X" or applicable safety code if the maintenance action describes a problem or condition which has caused, or has the potential to cause serious injury to personnel or material. A brief explanation must be

included in the Remarks/Description field (Block 35). For example: "RE-INSPECTION OF SEPARATOR FOR PRESENCE OF OIL AFTER RINSE. MRC A-27 EVIDENTLY NOT DONE. PRESENCE OF OIL RESULTED IN FIRE IN HP AIR SYSTEM WHEN COMPRESSOR OPERATED UNDER LOAD. FIRE BADLY BURNED VALVE AHP-287, REQUIRING REPLACEMENT."

(2) "1". Critical safety or health deficiency. Correct Immediately.

(3) "2". Serious Safety or Health deficiency. Suspension of Equipment, System or Space use is required.

(4) "3". Moderate Safety or health deficiency. Waiver of Equipment, System or Space use is granted pending correction of the item.

(5) "4". Minor safety or health deficiency.

(6) "5". Negligible safety or health deficiency.

(7) "0". Maintenance action is not safety related.

e. Block 10. TYCOM directs units to utilize block 10 as an attribute for jobs that have one or more of the characteristics below. If a corrosion or environmental job is found during a zone inspection, the corrosion or environmental status takes precedence.

(1) "C". All Corrosion jobs will be annotated with a "C" in Block 10.

(2) "E". All jobs having an environmental impact will have a "E" in block 10.

(3) "Z". All jobs discovered during Zone Inspection will annotated with a "Z" in block 10.

f. Availability ID Code. A four-digit Alpha numeric code used to identify the availability a particular job has been assigned to. If the Availability ID Code is blank, it means the job has not yet been screened to an availability.

19-6.4.19 NTCSS Failure And Recovery.

a. NTCSS Failure. Report failure to Surface Force 3-M Representative and TYCOM 3MC.

b. NTCSS Recovery. Conduct recovery process per NIWC directive and guidance.

c. All ASIs and TYCOM bulkloads received during the outage will be installed per emailed files from TYCOM 3-M. If bulkloads cover a Total Ship's Readiness Assessment event, those must be loaded by daily sequence files.

19-6.4.20 Equipment Validations. The correct equipment configuration is the basis for all maintenance and supply support programs. Ship's Force is in the best position to identify and make corrections to inaccuracies in equipment records when compared to the actual installed equipment.

a. Each WC will perform equipment validations per the following priority and guidance. Corrective Maintenance. Prior to writing a work candidate, WCS will verify when the equipment was last validated. If not validated in the past 36 months, MP will validate the equipment record using validation aid provided by WCS. Ships that are

Pre-commission or in Service Life Extension Program will validate all equipment onboard to establish correct configuration until sail away for new construction or upon completion of Service Life Extension Program.

b. Shipboard personnel will conduct validations by printing a hard copy validation aid from the installed MDS system unless full electronic devices are available. Validation aids contain information about the equipment including the WC owning the equipment for maintenance purposes, location, serial number, or Positional Reference Identification number. In addition, APL header data is included. These copies, if required, will be kept for 13 weeks or until electronic MDS system is verified correct.

c. Paperless Equipment Validation process.

(1) WCSs will print Equipment Validation Aid from OMMS-NG. (If command has portable laptops or hand-held computers then this can be disregarded.)

(2) The MP will utilize the Equipment Validation Aid (if applicable) and conduct sight validation.

(a) MP will locate equipment and verify APL Header data and Component Characteristics information (RIC information located on the left-hand side of validation aid). Any disparity will require a change in configuration request or Wrong in Model-Not in Model request to add the correct APL for equipment. If unable to verify due to missing label plate information, inaccessible, lagged over etc. equipment validation code will be sight validated without RIC and select correct reason why. If APL or characteristic data is correct, the equipment record will be sight validated with RIC.

(b) MP will verify serial number is correct or annotate discrepancies. If serial number is not available, then utilize Positional Reference Identification.

(c) MP will verify that the correct WC is listed, annotate discrepancies.

(d) MP will verify the equipment is correctly associated to the correct PMS and the MIP and all associated MRCs will be annotated.

(e) MP will sign and date validation aid. (If using portable laptop or hand-held computer, disregard.)

(f) MP will return Equipment Validation Aid to WCS (if applicable). MP or WCS (if using portable laptop or hand-held computer MP will update the record) can update configuration record notes section to ensure all annotations on the validation aid are transcribed over to the MDS record, along with MP name who conducted sight verification and the date in which the sight validation was conducted. PMS MIP and all associated MRCs will be annotated in the notes section of record as well. If PMS is required but not assigned to unit, then submit an FBR requesting additional coverage and document the FBR number in the notes section of the record. If no PMS is required,

annotate No Maintenance Required in the notes section of the record.

(3) The WCS will take the validation aid (if applicable) and ensure all information on validation aid is entered correctly in the notes section of the configuration record. (If portable laptop or hand-held computers utilized, the WCS will verify record).

(4) CoC will review and approve all equipment configuration record changes.

(5) The 3MC will be able to view all completed validations from the MDS via reports or list function in the applicable MDS.

19-6.5 PLANNING BOARD FOR MAINTENANCE

19-6.5.1 PB4M Meeting. Each unit will have a formally structured PB4M which should meet twice per month at a minimum. This forum provides a review of open Casualty Reports, current planned off-ship and organizational maintenance, CSMP quality and accuracy, future maintenance and modernization planning, and fiscal concerns. The objective of PB4M is to ensure clarity of intent for both the ship's efforts and the shore infrastructure with respect to total ship maintenance, operational schedules, and other concerns affecting ship material readiness. The PB4M must include the CO (who will chair the meeting), XO, 3MC, all DH, SMMO, Port Engineer (PE), and additional personnel as desired (e.g., TYCOM Rep).

19-6.5.2 PE Responsibilities. Quarterly the PE will assist the ship's CO in conducting the PB4M meetings, including agenda development. The SMMO will prepare the ship input to the PB4M agenda in support of the PE to include COMNAVSURFOR reconciliation tool and self-Sufficiency report results.

19-6.5.3 PB4M Timing, Periodicity, And Agenda. Flexible to support the priorities of the individual ship and meet the unique maintenance requirements of each phase of the TYCOM Operational Fleet Response Plan. However, the Maintenance Team will have reviewed the CSMP in detail prior to PB4M, then discuss the CSMP during routine PB4Ms and prior to every maintenance availability.

19-6.6 3M 365 CONTINUOUS MONITORING

19-6.6.1 Pillars Of Performance. There are four Pillars of Performance within the 3-M program. While the pillars may affect one another, each pillar must be evaluated independently. For units with multiple crews, all 3-M 365 Pillars of Performance will be measured by hull.

a. Maintenance Accomplishment Rate (MAR). The Maintenance Accomplishment Rate is the amount of the scheduled or unscheduled maintenance that was accomplished. Scheduled maintenance is performed on a periodic basis while situational maintenance is performed based upon an event such as those identified in the Major Events Listing or when required while conducting a periodic check.

b. Spot Check Program. The Spot Check Program is the Quality Assurance program for the maintenance conducted at subordinate commands. The purpose is to ensure the right maintenance is conducted on the right equipment safely and effectively.

c. Consolidated Ship's Maintenance Program. The CSMP program is the Navy's process of documenting discrepancies to spaces and equipment. The program entails

Equipment configuration, discrepancy identification, screening or brokering work, and recording when deficiencies have been corrected.

d. Knowledge, Skills, and Experience. The KSE model is a way to gauge the knowledge, skills, and experience of the crew members that make up a work center, department, or command. This model creates a unit of measurement to ensure personnel have both the training and qualifications to execute the assigned duties. Additionally, the performance portion of the model identifies the "end result" of the KSE model. Although a Sailor may be trained and qualified, an evaluation of 3-M programs and activities will measure how well the responsibilities are executed. For units with multiple crews, a specific Multi-Crew KSE will be utilized. The multi-Crew KSE form will be identical to the single crew KSE except each 3-M position will have two names.

19-6.6.2 Periodic Reports.

a. Virtual Snap-Shot Report

(1) Overview. The Virtual Snap-Shot Report is a CNSF produced excel workbook that creates a 20-page graphical representation for the health of the MAR and Spot Check program pillars of performance. The report uses a drill down method to identify strengths and weaknesses with the two pillars.

(2) Periodicity. This report is to be conducted weekly by all commands.

(3) Required Documents.

(a) PMS Analysis Spreadsheet. The PMS Analysis Spreadsheet is an excel workbook that contains a list of all periodic checks, situational checks, and alerts the command has recorded in SKED for the past quarter. The report is generated from the SKED Admin tab. The period of report will be period of 13 weeks, beginning on a Monday and ending on a Sunday.

(b) Spot Check - All Report. The Spot Check - All Report from sked contains a list of all spot checks conducted during the last quarter with the associated grades for each of the spot checks. The report is generated from the Reports tab. The period of report will be period of 13 weeks, beginning on a Monday and ending on a Sunday.

(4) Virtual Snap-Shot Report Breakdown

(a) Cover Sheet. The cover sheet automatically fills in the ship's name and date. The user will enter the following information for the command's 3-M Program:

1 FR#. Enter the current Force Revision the SKED implemented at the commands. (Ex. 4-21, 1-22, 2-22)

2 3-M Cert Date. Enter the date for the last 3-M certification event. If the certification date is not known, contact your Fleet's Afloat Training Group unit to provide.

3 CSMP Reconciliation Date. Enter the date of your last CSMP

Reconciliation Report.

4 Number of Reconciliation Discrepancies. The total number of discrepancies identified during the last CSMP Reconciliation.

5 MAR Pillar. An automatically populated block that records the Maintenance Accomplishment Rate for the command.

6 Spot Check Pillar. An automatically populated block that records the Spot Check Accomplishment Rate for the command.

7 CSMP Pillar. A manually populated block to record the CSMP Management Score for the command. The CSMP Management Score can be found on the cover page of the CSMP Self-Sufficiency Report.

8 KSE. A Manually populated block to record the Knowledge, Skills, and Experience Score located on the Dashboard of the KSE Tool. This block is only applicable for commands that have transitioned from legacy 3-M Certification criteria to the 3-M 365 Continuously Monitored and Continuously Certified program.

9 Attachments. There are two mandatory attachments that must be submitted with the Virtual Snap-Shot Report:

a IEM Details Report

b Additional Attachments. Contains three empty spaces for voluntary attachments.

10 Acknowledgment blocks. Contains a place for the CO and XO to initial stating they have received the document and provides an area for comments if desired.

b. PMS Performance Rate (PPR). The PPR page provides an overview of both the command's MAR and Spot Check Average to create a PPR for the command and each of the departments within.

c. Maintenance Accomplishment Summary. The Maintenance Accomplishment Summary provides a three-page executive level evaluation of the MAR for the command. The major sections of the report as follows:

(1) Maintenance Accomplishment by Week Graph. A graphical representation of the MAR for the last 13 weeks. The graph provides a trend analysis for the command's maintenance accomplishment. The Fleet requirement of 80% is identified by a red dotted line on the graph.

(2) Departments for the Last Quarter. Each department at the command has the maintenance accomplishment number identified. The following metrics are used for evaluation:

(a) # COMPL. The number of checks the Department has completed

within the last 13 weeks.

(b) # ALERTS. The number of alerts represents the number of checks that were rescheduled due to non-accomplishment. Each alert signifies one check that was not accomplished.

(c) # LOST. Checks that were scheduled and lost due to the inability to reschedule. Daily checks, or situationally required checks are unable to be rescheduled.

(d) # NA. The number of checks that were scheduled and marked as Not Applicable. While NA checks do not affect the commands 3-M score, caution should be taken to ensure there actually were not applicable and not maintenance that should have been accomplished.

(e) TOTAL # CHKS. This number is the sum of all checks completed, lost, and alerted during the 13-week period.

(f) PAR%. The PAR Score is the Periodic Accomplishment Rate. The PAR Score represents the amount of periodically scheduled maintenance that was accomplished.

(g) SAR%. The SAR Score is the Situational Accomplishment Rate. The PAR Score represents the amount of situationally scheduled maintenance that was accomplished.

(h) WEIGHT%. The portion of overall command maintenance accomplished within a given Department. This weight is also used to determine the effect on the command MAR.

(i) MAR%. The departments Maintenance Accomplishment Rate for the last 13 weeks.

(3) Work Centers for the Last Quarter. This section is identical to the department section except data is for a specific Work Center over the last 13 weeks.

(4) Alerts Report. A two-page section that graphically displays the command's alerts over the last 13 weeks. It is important to understand that a check will not start alerting until the check is beyond its maximum scheduling range. For example, an A-1 check will not alert as soon as the check is due. The check can still be moved out 6 months. After 18 months the check will start alerting. The following sections are used to evaluate the command's alerts:

(a) Alerts by Week. A graphical representation for the number of alerts within the command over the last 13 weeks. This graph is used for trend analysis.

(b) Number of alerts per Work Center. This is the number of alerts by work center for the previous week only. If the cell next to the work center is blank, it means that work center had no alerts for the previous week. If the cell next to the work center has a number and another number in parenthesis, than the first number is the number of alerts for the previous week and the number in parenthesis represents the number

of alerts that have been out of periodicity for 13 weeks in a row. Adding up the number of alerts for each of the work centers will equal the number of alerts for the last week as identified in the alerts by week graph.

(c) Top 50 longest running alerts. This a list of alerts at the command that have been out of periodicity the longest. This may not be all of the alerts. Each alert has the following information:

1 # weeks alerted. This is the number of weeks in a row that the check has been out of periodicity. A 13 in the cell does not mean that the check has only been alerting for 13 weeks. Because the report only utilizes 13 weeks of data this is the maximum number that can be displayed.

2 WC. The Work Center that has responsibility for the maintenance check.

3 MIP. The Maintenance Index Page of the Check that is out of periodicity.

4 Periodicity. The periodicity of the check as identified by the maintenance card.

5 Equipment name. The equipment name as listed in the SKED equipment file. If equipment in SKED is properly associated to the CDMD-OA file, the equipment name will match between the two.

d. Lost Checks Report. A two-page section that graphically displays the command's lost checks over the last 13 weeks. The following sections are used to evaluate the command's lost checks:

(1) Lost Checks by Week. A graph displaying the number of lost checks per week for the last 13 weeks. This graph is utilized for trend analysis purposes.

(2) Lost Checks by Work Center. The number of lost checks by work center for the last 13 weeks. This data enables commands to identify which work centers are not able to complete daily and situational maintenance checks.

(3) Top 50 Equipment items with the most lost checks. This is a list of the top 50 lost checks based upon the equipment and work center. Some equipment has more than one daily check or situational check associated to it. Below is a description of what the list provides:

(a) WC. The work center that owns the piece of equipment that has lost checks associated to it.

(b) # times lost. The number of daily or situational checks that have been lost for the piece of equipment.

(c) Equipment. This is the equipment name as identified by the SKED equipment file. If the equipment is properly associated, the equipment name will be the same as the CDMD-OA database.

(4) NA Checks Report. A two-page section that graphically displays the command's Not Applicable checks over the last 13 weeks. Although NA checks are not counted against the command's Maintenance Accomplishment Rate, the command should be aware of the checks marked NA as it could indicate maintenance that should have been accomplished and was not. The following sections are used to evaluate the command's Not Applicable checks:

(a) NA Checks by Week. A graph displaying the number of checks marked as not applicable over the last 13 weeks. This graph is used to show trend analysis for the command.

(b) NA Checks by Work Center. The number of checks marked NA by work center over the last 13 weeks.

(5) Top 50 Equipment items with the most NA checks. This is a list of the top 50 NA checks based upon the equipment and work center. Below is a description of what the list provides:

(a) WC. The work center that owns the piece of equipment that has NA checks associated to it.

(b) # times NA. The number of checks that have been marked as Not Applicable for the piece of equipment.

(c) Equipment. This is the equipment name as identified by the SKED equipment file. If the equipment is properly associated, the equipment name will be the same as the CDMD-OA database.

e. Spot Check Analysis Report. A summary of the Spot Check Program health via actionable metrics. Below is a description for each section of the report.

(1) Number of Spot Checks per Week. A graph that displays the number of Spot Checks conducted at the command over the last 13 weeks. The number includes both historical Spot Checks and Monitored Maintenance Spot Checks.

(2) Department Spot Check Program Health. A list of each department and their respective Spot Check metrics. The fields are listed below:

(a) Department. The Department Name.

(b) # Spot Checks. The number of Spot Checks conducted within a given department for the last 13 weeks. This is a rollup metric for each of the work centers within a department.

(c) # Fail. The number of spot checks that were marked as failures in SKED in the last 13 weeks.

(d) Pass %. The percentage of Spot Checks that passed within a department. While commands may naturally desire a high pass percentage, a very high score may indicate Spot Checkers are not utilizing a critical eye.

(e) Weight %. Weighting is used to calculate the weight of a given department score on the commands overall Spot Check Average. Weighting is based upon the amount of spot checks conducted in that department.

(f) AVG Score %. The average spot check score achieved during the last 13 weeks.

(3) Work Center Spot Check Program Health. A list of each Work Center and their respective Spot Check metrics. The fields are listed below:

(a) Work Center. The Work Canter name.

(b) # Spot Checks. The number of Spot Checks conducted within a given Work Center for the last 13 weeks.

(c) # Fail. The number of spot checks that were marked as failures in SKED in the last 13 weeks.

(d) Pass %. The percentage of Spot Checks that passed within a Work Center.

(e) Weight %. Weighting is used to calculate the weight of a given Work Center score on the commands overall Spot Check Average. Weighting is based upon the amount of spot checks conducted in that Work Center.

(f) AVG Score %. The average spot check score achieved during the last 13 weeks.

(4) Top 10 Spot Checks Conducted. A list of the maintenance checks that were spot checked the most in the last 13 weeks. The "# of SCs" block indicates the number of times a spot check was completed. Line items highlighted in green indicate a troubled system check as specified by TYCOM. These are checks mostly identified as leading to INSURV inspection discrepancies.

(5) Toughest Spot Checkers. This list contains the names of the 10 personnel that have failed the most spot checks. The list will only contain the names of Spot Checkers that have conducted more than the average number of spot checks for the command and have failed at least one spot check.

(6) The 100% Club. A list of Spot Checkers that have conducted the over the average number of spot checks and have found zero discrepancies. While grading one or more spot checks at 100% may be legitimate, this list may indicate personnel that need to have a more critical eye during spot checks.

(7) Partial Spot Checkers. A list of personnel that have conducted one or more spot checks with a partial grade. CNSF does not authorize partial grading during spot checks. Each attribute on the Spot Check form is an all or nothing score. For Example, an attribute worth 10 points will either be 10, 0, or NA as applicable. A grade of 1 through 9 will not be used for any reason for this attribute.

f. List of Failed Spot Checks. This is a list of spot checks that failed during the last

week and the reason the check failed. Reason may be blank if the spot checker did not provide a comment. Because of the hard kill attributes on the spot check form, a person that partially grades a spot check may show up on this list even though they were unaware the spot check failed.

g. Spot Check Completion Report. A list of the command spot checkers and the number of spot checks the personnel conducted for each week for the last 13 weeks. Because this list is derived directly from SKED data, the personnel paygrade is unavailable. Due to this limitation, the list is sorted based upon the number of historical checks conducted in the last 13 weeks.

h. Spot Check Randomizer. A list of randomly selected checks to be spot checked for each work center that has conducted maintenance in the last 13 weeks. Checks are randomly selected based upon periodicity, troubled system status, when the check was accomplished, and how many times the spot check was previously conducted. All units are directed to utilize the Spot Check Randomizer to the maximum extent possible. If a maintenance person or equipment is unavailable and the randomly selected check cannot be performed, the spot checker will select another check within that work center with a moderate level of difficulty.

19-6.6.3 CSMP Reconciliation Report (OMMS).

a. Overview. This report is used to identify discrepancies between the alignment of the OMMS and VSB databases. Alignment of the databases is critical to CSMP management to ensure the command and Port Engineer have the same situational awareness for the status of on-ship and off-ship work candidates. The results of the CSMP Reconciliation will be forwarded to the Surface Force 3-M Representative upon completion.

b. Periodicity. The CSMP Reconciliation will be completed by all commands monthly by the fifth day of each month.

c. Required Documents:

(1) OMMS CSMP Export. A copy of active JSN residing on ship.

(2) VSB Export. An export of the global report in VSB named “CNSF CSMP Reconciliation Report”.

d. CSMP Reconciliation Report Breakdown:

(1) Cover Sheet. The cover sheet of the report provides an executive level overview for alignment between the units OMMS database and the VSB database utilized by the Port Engineer to screen and broker work. Below are the sections of the report:

(a) Total Number of Jobs in the Ship’s CSMP. The total number of active jobs in the ship’s CSMP.

(b) Total Number of Jobs in VSB. The total number of active jobs in VSB.

(c) CSMP Reconciliation Score. A calculation that represents how closely aligned the OMMS and VSB database are aligned.

(2) CSMP Reconciliation Summary. A summary of discrepancies identified during the reconciliation process. Each discrepancy type has a independent list of jobs by JSN and Work Center that fall into the category. Below is a list of the discrepancies effect, the cause, and the corrective action needed:

(a) Closed in VSB. The number of jobs separated by those generated on-ship and off-ship that are closed in VSB but active on the ship's CSMP. Jobs that show closed in VSB are no longer being updated by the Port Engineer.

1 Possible Cause. Jobs may have been reported to the Port Engineer and closed to reflect that status.

2 Corrective action. Ship's force should review the job validity. If the job has been completed, the job should be marked as complete in OMMS. If the job is still active and needs to be complete, the Port Engineer will need to resurrect the job so it can be screened and brokered as needed.

(b) Not in VSB. The number of jobs separated by those generated on-ship and off-ship that reside in the ship's CSMP but are not in VSB. If a job is not in VSB than the Port Engineer does not see the job and it will not be screened or brokered.

1 Possible Cause. The unit may have inactivated and archived prior to performing an upline via RADWEB to VSB. If this happens, jobs will be archived and any updates will not be reflected in VSB. Jobs may be awaiting approval and have not made it to the 3MC.

2 Corrective Action. Ship's Force should review the job for validity. If the job is still valid, the job will need to be "tickled" so the job will be sent to VSB during the next upline. "Tickling" the job means to make an update to the job.

(c) Mismatch. The number of jobs separated by those generated on-ship and off-ship that are listed as TA 1-3 on the ship but are listed as TA 4 in VSB. This type of error leads the unit to believe that an outside activity will complete the work but the Port Engineer has stated that ship's force will complete the work.

1 Possible Cause. Ship's force wrote the job as a TA 1-3 and the Port Engineer screened the job back to ship's force.

2 Corrective Action. Ship's force will need to change the TA code in OMMS to a TA 4 or communicate why the job is not within ship's force capability and have the Port Engineer rescreen the job back to a TA 1-3.

(d) TA 4 Not in OMMS. The number of TA 4 jobs separated by those generated on-ship and off-ship that reside in VSB but are not listed on the ship's CSMP.

1 Possible Cause. The unit may have inactivated and archived prior to performing an upline via RADWEB to VSB. If this happens, jobs will be archived and any updates will not be reflected in VSB. Another possible cause is that a bulkload was sent to the ship from CNSF and was not loaded into OMMS.

2 Corrective Action. The job will need to be reviewed for validity. If the job is still valid, the job will need to be rewritten. Additionally, the Port Engineer will need to close the job in VSB.

(e) TA 1-3 Not in OMMS. The number of TA 1-3 jobs separated by those generated on-ship and off-ship that reside in VSB but are not listed on the ship's CSMP.

1 Possible Cause. The unit may have inactivated and archived prior to performing an upline via RADWEB to VSB. If this happens, jobs will be archived and any updates will not be reflected in VSB. Another possible cause is that a bulkload was sent to the ship from CNSF and was not loaded into OMMS.

2 Corrective Action. The job will need to be reviewed for validity. If the job is still valid, a list of the job/jobs missing will need to be sent to TYCOM 3-M team to generate a bulkload containing the missing jobs.

(f) P.E. Action Needed. The number of jobs separated by those generated on-ship and off-ship that were reported to VSB as being customer completed and awaiting closure in VSB. TA 1-3 jobs are dual close jobs and require both the ship and the outside activity to report completion prior to the job closing in VSB.

1 Possible Cause. The ship has marked the job as complete and reported that status to VSB via an upline. The outside activity has not yet reported the job as complete.

2 Corrective Action. Notify the Port Engineer that the jobs have been closed by ship's force so they can get an updated status from the activity that completed the work. Port Engineer will need to close the job in VSB once activity reports status.

(g) P.E. No Screening Required. The number of jobs separated by those generated on-ship and off-ship that are listed as TA 1-3 but have a WN status of "No Screening Required". This means the job will not be screened or brokered by the Port Engineer.

1 Possible Cause. The job status was changed from "Screening Required" to "No Screening Required" in VSB.

2 Corrective Action. Notify the Port Engineer so they can

change the job WN status back to "Screening Required" and screen/broker as needed.

19-6.6.4 CSMP Reconciliation Report.

a. Overview. This report is used to identify discrepancies between the alignment of the AWN, ATM and VSB databases. Alignment of the databases is critical to CSMP management to ensure the command and Port Engineer have the same situational awareness for the status of on-ship and off-ship work candidates. The results of the CSMP Reconciliation will be forwarded to the Surface Force 3-M Representative upon completion.

b. Periodicity. The CSMP Reconciliation will be completed by all commands monthly by the fifth day of each month.

c. Required Documents:

(1) AWN CSMP Export. A copy of all JSNs residing on ship.

(2) ATM CSMP Export. A copy of all JSNs residing on ship.

(3) VSB Export. An export of the global report in VSB named "CNSF CSMP Reconciliation Report".

d. CSMP Reconciliation Report Breakdown.

(1) Cover Sheet. The cover sheet of the report provides an executive level overview for alignment between the units AWN database, the shore ATM database, and the VSB database utilized by the Port Engineer to screen and broker work. Below are the sections of the report:

(a) Total Number of Jobs in the AWN. The total number of active jobs in the ship's CSMP.

(b) Total Number of Jobs in the ATM. The total number of active jobs in the AWN ashore CSMP.

(c) Total Number of Jobs in VSB. The total number of active jobs in VSB.

(d) Number of CSMP Discrepancies. A summation of the total number of discrepancies between all three CSMP databases.

(2) CSMP Reconciliation Summary. A summary of discrepancies identified during the reconciliation process. Each discrepancy type has an independent list of jobs by JSN and Work Center that fall into the category. Below is a list of the discrepancies effect, cause, and corrective action needed:

(a) Duplicate Jobs Same Problem. This is a list of jobs that are duplicated in the ATM database and have the same job description. Only one of these jobs' statuses are being reflected in VSB.

1 Possible Cause. The most common cause is the Maintenance Figure of Merit system created a new job after ship's force updates the status of a job. For example, a job gets closed by

ship's force but ATN creates a new duplicate job with the status of closed versus changing the status of an existing job.

2 Corrective action. Ship's force should review the job validity. If the job has been completed, the job should be marked as complete in ATM.

(b) Duplicate Jobs Different Description. A list of JSNs in ATM that have been duplicated by represent different corrective actions. Because there is a delay in transferring data between AWN and ATM, if jobs are being written directly to ATM there is a chance that ship's force is writing a job in AWN at approximately the same time. This will create two jobs with the same JSN that have different corrective actions.

(c) In AWN Missing from VSB and ATM. A job that resides on the ship in the AWN database but has not replicated in ATM.

1 Possible Cause. AWN Health was not monitored and connectivity loss led to data not being replicated off ship.

2 Corrective Action. Updating the job in AWN will allow the job to attempt replication off-ship.

(d) In ATM missing from VSB and AWN. These are typically bulkloaded (Off-Ship) jobs that did not replicate from the ATM database.

1 Possible Cause. Not maintaining AWN health and connectivity will prevent ATM from replicating to AWN.

2 Corrective Action. The job will need to be updated in ATM to force replication to AWN and VSB.

(e) In ATM and AWN missing from VSB. Jobs from ATM did not replicate to VSB

1 Possible Cause. ATM may have loss connectivity or servers were down when upload was attempted.

2 Corrective Action. The job will need to be updated in either AWN or ATM to force replication to VSB.

(f) In VSB missing from ATM and AWN. Jobs that reside in VSB but are not contained in either the AWN or ATM databases.

1 Possible Cause. Jobs may have been closed in AWN or ATM but the information did not reflect in VSB. Jobs may show as "Customer Completed" in VSB. TA 1-3 jobs require dual closure from both the command and maintenance activity.

2 Corrective Action. Notify the Port Engineer that the jobs have been closed by ship's force so they can get an updated status from the activity that completed the work. Port Engineer will need to close the job in VSB once activity reports status.

(g) In VSB and AWN missing from ATM. A job that is still active in AWN and VSB but not in ATM.

1 Possible Cause. The job was somehow closed in ATM but did not replicate to AWN or VSB.

2 Corrective Action. Modify the job in AWN to force replication to ATM. If the job still does not replicate than the existing job will need to be closed and rewritten. If the job is TA 1-3 and brokered by the Port Engineer to an active availability, the job can be bulkloaded back from VSB by TYCOM.

(h) In VSB and ATM missing from AWN. A job that is still active in both VSB and ATM that does not reside in the command's CSMP.

1 Possible Cause. AWN health prevented the ship from receiving updates from ATM.

2 Corrective Action. Check AWN Health and modify the job in ATM. This will force the job to replicate back to AWN.

(i) Active in AWN closed in ATM. A job that is still active in AWN but shows closed or canceled in ATM.

1 Possible Cause. The job was closed in ATM but the job status did not replicate to AWN.

2 Corrective Action. If the job is verified to be complete, close the job in AWN. If the job is verified to still be open, close the job in AWN and rewrite the job.

(j) Active in ATM closed in AWN. A job that was closed in AWN but the information did not replicate to ATM.

1 Possible Cause. AWN health prevented ATM from receiving AWN updates.

2 Corrective Action. If the job is verified to be complete, close the job in ATM.

(k) Active in AWN closed in VSB. A job that is still active in the command's CSMP but has been closed or canceled in VSB.

1 Possible Cause. The job was closed in VSB. This job will no longer receive updates in VSB.

2 Corrective Action. If the job is still open and valid than a new work candidate will need to be rewritten for the job.

(l) Active in VSB closed in AWN. A job that is still active in the Port Engineer's CSMP but has been closed or canceled by the command.

1 Possible Cause. A command not verifying AWN health may have led to AWN not replicating off ship and VSB not receiving updates.

2 Corrective Action. The command will need to verify the work has been completed and work with the Port Engineer to close the job in VSB.

(m) Active in ATM closed in VSB. A job that still shows open and active in the AWN Ashore CSMP but has been closed or canceled by the Port Engineer in VSB.

1 Possible Cause. The job was closed in VSB. This job will no longer receive updates in VSB.

2 Corrective Action. If the job is still open and valid, the job will need to be closed in ATM and rewritten in AWN.

(n) Active in VSB closed in ATM. A job that is still active in the Port Engineer's CSMP but has been closed or canceled by the command.

1 Possible Cause. A command not verifying AWN health may have led to ATM not reporting to VSB that the job was complete.

2 Corrective Action. The command will need to verify the work has been completed and work with the Port Engineer to close the job in VSB.

(o) TA 4 in VSB, TA1-3 in ATM and TA 4 in VSB, TA1-3 in AWN. A job that the command is expecting outside assistance with but the Port Engineer believes that the command will correct.

1 Possible Cause. Although the command requested outside assistance, the Port Engineer changed the job status to being within the command's capability.

2 Corrective Action. The command will need to communicate with the Port Engineer to identify the reason the job was changed to a TA 4. If the job is determined to not be within the command's capability the Port Engineer will need to change the WN Status Code to "Screening Required" and broker as needed. If determined that the command will correct the discrepancy, the command will need to update the TA Code to 4 in AWN and take corrective action as needed.

(p) TA 1-3 with No Screening Required. A job that has a TA Code of 1-3 in VSB but displays "No Screening Required" as the WN Status.

1 Possible Cause. Multiple updates to a job led to a discrepancy between the TA Code and WN Status. The Port Engineer may not see this job and corrective action will not occur.

2 Corrective Action. The Port Engineer will need to update the WN Status to "Screening Required" and screen/broker as needed.

19-6.6.5 CSMP Self-Sufficiency Report.

a. Overview. This Report provides an executive level understanding of the unit's CSMP management. This report evaluates the CSMP Management Team as whole, to include the Port Engineer. The report is separated into two sections off-ship and on-ship CSMP management.

b. Periodicity. This report is required monthly for all units.

c. VSB Export. The VSB export for this report utilizes the same export as the CSMP Reconciliation tool. VSB is the only data used for this report making the reconciliation process critical for the accuracy of this report.

d. CSMP Self-Sufficiency Report Breakdown.

(1) Cover page. The top of the page is dedicated to providing overall assessment scores for CSMP Management.

(a) CSMP Self-Sufficiency Score. A percentage that combines the off-ship self-sufficiency score and on-ship self-sufficiency score with a weight of 30% and 70% respectively. On-ship CSMP management is held with a higher weight due to ship's force being solely responsible for the TA 4 jobs within the CSMP.

(b) Off-Ship CSMP Score. This score represents the management of TA 1-3 work candidates. The ability for a unit to ensure off-ship work is screened by the Port Engineer and brokered or referred to an active availability.

(c) On-Ship CSMP Score. This score represents a unit's ability to efficiently manage TA 4 work candidates. A heavy focus is placed on the length of time between when a TA 4 job is written to when the job is accomplished. Additional weighting is placed on jobs identified as safety related.

(d) Departments CSMP Scores. Each department is independently evaluated for their respective ability to manage off-ship and on-ship work candidates.

(2) Off-ship CSMP Self-Sufficiency Scores. The first page of this section evaluates each of the department's ability to manage off-ship CSMP work candidates. From left to right TA 1, 2, and 3 codes are separately analyzed. Each TA code has the same categories for evaluation:

(a) Actively Screened. This is the number of active TA 1, 2, or 3 work candidates within a department.

(b) Awaiting screening. This is the number of active TA 1, 2, or 3 work candidates within a department that are waiting for screening by the Port Engineer. Only jobs that have been waiting for screening over 30 days are counted. Commands should use this to initiate discussion with the Port Engineer to find out why jobs in the CSMP are still needing to be screened.

(c) Assigned to Past Avails. This is the number of active TA 1, 2, or 3

work candidates within a department that are assigned to availabilities that have ended over 90 days from when the report was generated. A 90-day buffer was added to provide time for the Port Engineer to collect financials and close out the avail. Before the 90-day mark, the Port Engineer should move the job to another availability so the work can be completed.

(d) Unfunded avail. An unfunded availability is a temporary availability created in VSB to provide port engineers a place to store jobs until they can be assigned to an active availability. This is an approved procedure and the number of jobs in unfunded availabilities will not be held against the command. The number is displayed to allow a unit visibility into unfunded availability process. Jobs placed in an unfunded availability are not actively being worked. If a unit believes that the work should be assigned to an active availability, the Port Engineer should be notified for action.

(e) Availabilities that have ended and still have active jobs assigned. This list provides a list of availabilities that have ended over 90 days from the date of report generation and the number of active jobs assigned to them. Commands with jobs assigned to availabilities that have ended should coordinate with the Port Engineer to move the jobs to active availabilities. Each availability has the following information:

1 Avail ID. The availability ID number is a unique identifier for that availability.

2 Start Date. The day the Availability started.

3 End Date. The day the availability ended.

4 Location. The location the availability was conducted.

5 L and Z jobs. This is the number of ICMP tasks and Port Engineer created jobs that are active and assigned to the availability. These jobs do not penalize the command as they do not reside in the OMMS database. This is called out for situational awareness only.

6 TA 1. The number of TA 1 jobs still assigned to the availability.

7 TA 2. The number of TA 2 jobs still assigned to the availability.

8 TA 3. The number of TA 3 jobs still assigned to the availability.

(f) On-Ship CSMP Self-Sufficiency Score. An evaluation of all TA 4 jobs in a unit's CSMP. The score represents the commands ability to create, plan, and execute discrepancies documented in the CSMP.

1 # TA 4 Jobs. The number of active TA 4 jobs residing in VSB.

2 # TA 4 Jobs Closed. The number of TA 4 jobs that have been closed within the last 90 days since the report was generated.

3 # > 90 Days Old. The number of active TA 4 jobs that are between 90 and 179 days old.

4 # > 180 days old. The number of active TA 4 jobs that are between 180 and 364 days old.

5 # > 12 Months Old. The number of active TA 4 jobs that have been in the CSMP 12 months or longer.

6 # Safety Jobs. The number of active TA 4 jobs that have a safety code of 1, 2, 3, or 4.

7 # Safety > 90 Days. The number of active TA 4 jobs that have a safety code of 1, 2, 3, or 4 and have been in the CSMP for 90 days or longer.

8 Avg Job Age. The Average age of active TA 4 jobs.

9 Avg Comp Job Age. The average age of TA 4 jobs that have been completed within the last 90 days from when the report was generated.

10 Weight %. The weight for grading that a department or work center has on the command.

11 Grade. A final score that represents a department or Work Center's ability to manage their CSMP. Each Department or Work Center will use the following calculation to determine the score.

(g) Command Level Effectiveness Review (CLER). The Surface Force 3-M Representative will conduct a CLER quarterly and submit to TYCOM for each assigned command. CLER can be found on the COMNAVSURFPAC 3-M SharePoint Site at https://flankspeed.sharepoint-mil.us/sites/CPF-CNSP-HQ/engineering/3M.

19-6.6.6 3-M 365 Program Validation. A program validation will occur on all newly commissioned units that have completed Obligated Work Limiting Date (OWLD) or units that have 6 consecutive months below TYCOM standards on any of the four pillars of performance. A program validation is a more detailed look and validation of the 3-M 365 reports provided to a chain of command on a weekly or monthly basis. The program validation will constitute a "Truth in Reporting" evaluation. All Pillars of Performance are evaluated utilizing the 3-M Assessment Tool. The Command Total Score is a weighted average of the four Pillars of Performance and each of the pillars grading criteria is defined Table 19-6-4 of this chapter.

a. Command Total Score. The Command Total Score is calculated utilizing the weighted score of the four Pillars of Performance. Weighting is described in the Table 19-6-4 of this chapter.

Pillar of Performance	Weight
MAR	35%
CSMP	35%
Spot Check Program	20%
KSE	10%

Table 19-6-4

b. Maintenance Accomplishment Rate (MAR). The MAR is displayed in the Virtual Snap-Shot Report. During an assessment omitted checks will be reviewed and an Omitted Check Penalty Score is created. The MAR will be reduced by the Omitted Check Penalty Score (represents the amount of maintenance the command failed to schedule) to create the final MAR%. All omitted checks will be categorized into one of the categories identified in Table 19-6-5 of this chapter and weighted according to the category. Omitted Check Penalty Score = Σ ((omitted checks/total number of checks) * Penalty Score).

Omitted Category	Penalty
Check Not Triggered (Globally)	1.4
Check Not Triggered (Local)	1.4
Equipment Not in SKED	0.5
Check Not Tied to State	0.8
Check Marked "N/A"	2.0
Mandatory Related Maintenance	2.0
Active Equipment in IEM	3.0
LU/PM/OT/SU Not Scheduled	1.0
Unauthorized Line-out (MIP)	2.0
Unauthorized Line-out (MRC)	2.0
Unauthorized Line-out (Split-MIP)	2.0
On LOEP but not in Work Center	2.0

Table 19-6-5

19-6.6.7 Spot Check Program. The Spot Check Program score is based on three metrics, identified as ensuring the command is conducting the minimum number of spot checks, the commands spot check average, and the Spot Check Effectiveness Score. The weight for each metric and scoring methodology is defined in Table 19-6-6 of this chapter.

Spot Check Program Metric	Weight %
Minimum Number of Spot Checks	25%
Spot Check Average Score	30%
Spot Check Efficiency Score	45%

Table 19-6-6

a. Minimum Number of Spot Checks. The Virtual Snap-Shot Report provides a summary of the number of Spot Checks conducted per week for the unit. The Score is calculated by using the number of weeks the minimum number of spot checks met divided by 13 (number of weeks in the report). For example, a unit that meets the minimum number of spot checks for 12 of the 13 weeks will receive a score of 92.3%.

b. Command Spot Check Average. The average grade for each spot c heck conducted at the command over the last 13 weeks.

c. Spot Check Effectiveness Score. The assessor will use the 3-M Assessment Tool to randomly select 50% of the command spot checkers. A spot check that the spot checker previously conducted will be chosen and the same spot check reassessed. The Spot Check Delta will be calculated based upon the number of attribute differences between the first spot check and the one reassessed. The total number of attribute discrepancies divided by total number attributes assessed will create the command Spot Check Effectiveness Score.

19-6.6.8 CSMP Management Pillar. The CSMP Pillar measures the command's ability to manage and maintain a CSMP that accurate reflects the material condition of the ship or unit. There are four metrics used to evaluate the CSMP, identified in Table 19-6-7 of this chapter as Off-Ship CSMP Self-Sufficiency Score, On-Ship CSMP Self-Sufficiency Score, Active TA 4 Work Notification Review, and Completed TA 4 Work Notification Review.

CSMP Management Metric	Weight %
Off-Ship CSMP Self-Sufficiency Score	30%
On-Ship CSMP Self-Sufficiency Score	30%
Active TA 4 Work Candidate Review	30%
Completed TA 4 Work Candidate Review	10%

Table 19-6-7

a. Off-Ship CSMP Self-Sufficiency Score. The score reflects the management of all active TA 1-3 work candidates. This score can be found on the cover page of the CSMP Self-Sufficiency Report generated monthly.

b. On-Ship CSMP Self-Sufficiency Score. The score reflects the management of all active TA 4 work candidates. This score can be found on the cover page of the CSMP Self-Sufficiency Report generated monthly.

c. Active TA 4 Work Candidate Review. A validation of work candidates within the CSMP. Four Percent of the active TA 4 jobs will be randomly selected to be assessed for accuracy and management. If any block has a "N" result that job is annotated as fail. The Active TA 4 Work Candidate Review score is calculated using (number of jobs that pass / total number jobs inspected). Each job will be evaluated on the following criteria:

(1) Job listed in MDS. If the job is listed on the ship in either OMMS or AWN, enter "Y" in the block. Otherwise enter "N".

(2) Validated in the last 36 months. If the ship's equipment validation file shows

the equipment was validated 36 months prior to job being entered or later than enter a “Y” in the block. If the job was written by an outside activity, enter “NA”. Otherwise enter “N”.

(3) Correct parts on order with a valid status. If the job does not require parts, enter “NA”. If the correct parts are on order and the parts status is valid, enter “Y”. Otherwise enter “N”.

(4) Job still valid. This block determines if the work candidate reflects a material condition that still needs to be corrected. If the job was completed or is written in a way that the job will not be completed, enter a “N”. Otherwise enter “Y”.

d. Completed TA 4 Work Candidate Review. A validation of work candidates completed in the last 90 days within the CSMP. Four Percent of the completed TA 4 jobs will be randomly selected to be assessed for accuracy and management. If any block has a “N” result that job is annotated as fail. The Completed TA 4 Work Candidate Review score is calculated using (number of jobs that pass / total number jobs inspected). Each job will be evaluated on the following criteria:

(1) Job Completed or another job written to supersede. Used to determine if the job that was closed reflects work that has been completed. If the work the job was written for was complete or another job written to cover the scope of work can be produced, enter a “Y”. Otherwise enter “N”.

(2) Parts on Order. If the job was closed and there are active parts on order for the job, enter “Y”, Otherwise enter “N”.

e. The KSE provides a numerical value to PQS accomplishments, Training, amount of experience in a 3-M position, and unique events for individual sailors. This numerical value is combined at the Work Center, Division, Department, and Command. The KSE model will develop over time and currently consist of PQS and Maintenance University training events. There are two measurements for the KSE with each being equal:

(1) PQS Qualifications. A percentage that represents the number of 3-M positions at a command and the number of those positions that are held by a Sailor qualified for the appropriate level. Each 3-M position is weighted depending upon the amount of maintenance performed by a Work Center or Department.

(2) Maintenance University Attendance. A percentage that represents the number of 3-M positions and at a command and the number of those positions that are held by a Sailor that has attended the appropriate level of Maintenance University Training. Additionally, an evaluation is conducted based upon the amount of maintenance performed by a Work Center or Department.

f. 3-M Surface Force Representative Training. Training conducted by the Surface Force 3-M Representative will satisfy the Maintenance University attendance requirements.

19-7.1 PURPOSE. The Maintenance Data System (MDS), per the requirements of reference (a), provides maintenance and material managers throughout the Navy with the means to plan, acquire, organize, direct, control and evaluate man-power and material resources expended or planned for expenditure in support of maintenance. It allows for information collected by maintenance personnel to be recorded only once, and thereafter, the maintenance database will provide information to all who have a need for it. Organizational (O-level) MDS requirements require the reporting of maintenance actions and configuration changes on all categories of equipment. Reference (b) provides specific guidelines for aircraft carriers.

19-7.2 SPECIFIC REQUIREMENTS AND POLICY.

a. Standard Force Work Center Numbering System. The production of automated products in support of the Ships' Maintenance and Material Management (3-M) system, as well as the various automated maintenance information systems, dictate that a standard force work center (WC) organization be maintained. Commanding

Officers (CO) will designate their command organization and applicable WC codes as reflected on the Joint Fleet Maintenance Manual (JFMM) website at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/TYCOM/ under TYPE Commander (TYCOM) Documents and Forms. Additionally:

(1) Commands must not allow the use of any WC codes not authorized by this manual.

(2) Requests to change WC designation codes will not be approved unless they are applicable to all ships of a class and supported by detailed justification. WC change requests are routed to and approved by the U.S. Fleet Forces 3-M Requirements Management Board. This does not affect the re-assignment of a Maintenance Index Page (MIP) to another WC to affect shift of maintenance responsibility. Reference (a) and the feedback section of each TYCOM 3-M subchapter provide guidance for the shift of maintenance responsibility.

(3) Small boat, tug, receiver, and service craft managers will use the specific WCs identified on the JFMM website at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/TYCOM/ for MDS documentation. However, for Planned Maintenance System (PMS) management they may assign a "**00" WC to consolidate Periodic Force Revisions, MIPs, scheduling, etc., (e.g., PY30 through PY84 may consolidate PMS under WC PY00 or PY01-Mechanical, PY02-Electrical, etc.). The Unit Identification Code (UIC) will be that of the parent command.

(4) Standard Master Job Catalog (MJC) assigned WC codes (Surface Force ships and submarines only) are reflected in appendix A of this subchapter.

b. Job Control Number. The Job Control Number (JCN) is the key identifier for maintenance actions and related supply documents. The JCN is used to identify a maintenance action and to relate all parts used when a ship reports a maintenance action complete. The JCN allows for consolidated reporting of all associated actions taken for the specific maintenance action. The JCN is comprised of three blocks as defined by the ship's 3-M Manual.

(1) Block 1 is the ship's UIC (5 numeric characters).

(2) Block 2 is the WC (4 alphanumeric characters, left justified).

(3) Block 3 is the Job Sequence Number (JSN), usually 4 numeric characters.

c. Job Sequence Number. The first position of the JSN is used to identify the tool or organization that created the Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo). If an outside activity creates a job for a ship, e.g., an Intermediate Maintenance Activity (IMA) creates an I-level repair action for a ship, the first character of the JSN will be an "Alpha" character. The control over which organizations or tools "OWN" which "ALPHA" character(s) is provided by the job originator values, appendix B of this subchapter, defined within the Maintenance and Modernization Business Unit and is available through the Naval Sea Logistics Center (NAVSEALOGCEN) web site under Maintenance and Modernization Business Unit look up tables. The

specific value contained within the first position of the JSN provides enhanced data mining capabilities and facilitates data aggregation and analysis.

19-7.3 CONFIGURATION DATA MANAGER.

a. A Configuration Data Manager (CDM) for legacy UNNPI platforms, and Configuration Status Manager (CSM) for all platforms that have moved to Model Based Product Support (MBPS) is designated as the control authority for accuracy and completeness of the configuration information for each unit. A CDM may perform this function for multiple ships, submarines, and shore activities. Prior to MDS delivery, the System Command (SYSCOM) and the delivering activity are responsible for reviewing and ensuring the initial accuracy and completeness of configuration data provided to the CDM. After delivery, which is the initial CDM validation, each CDM will maintain, update and modify its configuration data in MBPS. Navy Product Lifecycle Management (N-PLM) is the overarching Logistics Information Technology (LOG IT) solution replacing legacy applications including the Configuration Data Manager's Database – Open Architecture and Revised Alternative Dataflow WEB (RADWEB) under digital transformation. MBPS is the maritime component of N-PLM and is comprised of three primary capabilities:

(1) Navy Product Data Management (NPDM),

(2) Navy Common Readiness Model (NCRM)

(3) Navy Data Acquisition Requirements Tool (NDART) .

b. NPDM's role is to manage configuration, sustain and provide enterprise access to all components of legacy and future standards-based Navy Weapon System Technical Data Packages to include both weapon system configuration and technical data integrated and management within a singular N-PLM environment. Accordingly, NPDM supports the Ship Configuration and Logistic Support Information System (SCLSIS) process and data requirements in the same fashion as the legacy applications. However, it accomplishes this using an integrated data architecture with ties configuration and supporting technical data together holistically within a single NPLM solution.

19-7.4 CONFIGURATION WORTHY ITEM. SCLSIS data requirements include documenting and maintaining all records associated with the design, supportability analysis, installation, test, certification, operation, assessment, inspection, maintenance, modernization and support of shipboard and shore-based equipment. Data requirements also include material, services and manpower associated with acquisition and sustainment. All identified Configuration Worthy Item (CWI) must be organized within the standard top-down breakdown hierarchically structured functional tiers approved for the ship or shore site in accordance with reference (f). An object is considered to be a CWI if it meets one or more of the following criteria:

a. Any object that supports or requires any one of the following elements of logistics:

(1) Supply support (APL or AEL worthy).

(2) Test and repair equipment, technical manuals and, or repair standards, Master Job Catalog (MJC) Routines, Periodic Maintenance Requirements (PMR), Software Programs (SWP), Software Control Manuals, Computer Program

Packages, Maintenance Assistance Modules, Pack-up Kits, Deep Submergence System Hull Integrity Procedure Unrestricted Operations, intermediate or depot level maintenance plans, class maintenance plans or drawings (e.g., installation or configuration control drawings and ship selected records).

(3) Objects associated with Training Requirements (shore test plants, ashore training units and ashore or afloat simulators).

(4) Bill of Material on Ship Installation Drawings (SID), Weight and Moment Data, Ship Selected Record Data, Interface Control Data, Ship System Status Program (SSSP) Report Data and objects associated with Engineering Calculations, Logistics Supportability Analysis Record/Logistics Product Data. May also include Reliability Centered Maintenance (RCM), Failure Mode and Effects Analysis / Failure Mode, Effects and Criticality Analysis, Fault Tree Analysis.

(5) PMS Maintenance Requirement Cards (MRC). Item's that have an MRC but would not be considered configuration worthy for any other reason, may or may not be configuration worthy. Appendix J addresses the process for identifying maintenance and an item's configuration worthiness.

b. Any hardware, software or firmware item required to describe a ship's or shore's functional hierarchy. This results in a top-down breakdown hierarchical identification of all configuration items that are significant from a ship's or shore maintenance or logistics perspective. Further guidance for software or firmware is included in Appendix H of reference (f).

c. Any clearly identifiable functional assemblies such as pump and motor combination (e.g., "Lube Oil Service Pump Assembly" composed of pump, coupling, motor, and controller), hydraulic manifolds, and air pressure reducing manifolds, etc.

d. Any functional groups such as fitting groups, radio transmitter groups, network enclave etc.

e. Any system or equipment that interfaces with an existing system or equipment already considered a CWI.

f. Any system or equipment requiring "corrective" maintenance submitted via Maintenance Figure of Merit (MFOM) Automated Work Notification (AWN).

g. Any object (structure, system, equipment, component, sub-component, part, etc) requiring a Danger or Caution Tag Out or an object that supports a tag out (i.e., tag hung on it).

h. Any device or object having maintenance information (e.g., material history, meter readings, parametric data taken in support of testing, operation and reporting material condition) recorded on it (e.g., Selected Equipment Records).

NOTE: SOME OF THE ASPECTS ABOVE MAY LOSE RELEVANCE ONCE THE HULL OR OBJECT IS DELIVERED TO THE NAVY AND ENTERS SERVICE, BUT THAT DOES NOT NECESSARILY MEAN THAT

LOWER-LEVEL DETAILED CONFIGURATION ITEMS SHOULD BE EXCLUDED FROM IN-SERVICE CONFIGURATION TRACKING. IN-SERVICE CONFIGURATION OBJECT DESIGNATION WILL IN PART DEPEND ON THE LEVEL OF AGGREGATION AT WHICH THE OBJECT WILL BE MAINTAINED AND SUPPORTED AT THE ORGANIZATIONAL, INTERMEDIATE, AND DEPOT LEVELS. CONFIGURATION ITEM DESIGNATION IS ALSO DRIVEN BY THE IMPORTANCE OF STRIKE FORCE INTEROPERABILITY REQUIREMENTS IN ACCORDANCE WITH REFERENCE (F) APPENDIX H (SOFTWARE POLICY).

i. Any embarkable such as CCOP equipment being installed and removed between ship, submarine and shore stations, is the responsibility of the installing NAVIFOR entity, this allows for tracking of the readiness to of the installation entity for systems available to install, and the ship or submarines ability report readiness of these embarkables.

j. In addition to the valid CWI criteria listed above, the following items should be considered when identifying and documenting CWI:

(1) Underwater hull areas

(2) Sea chests or sea suctions

(3) Bilge bottoms or tank tops

(4) Waster spools

(5) Sacrificial anodes

(6) Bunks

(7) Lockers

(8) Furniture

(9) Underway replenishment fittings, straps, pendants, and accessories

(10) Weight handling equipment

(11) Anything with a separate manufacturer's serial number, or Navy or Government serial number

NOTE: ALL IDENTIFIED CONFIGURATION WORTHY ITEMS MUST BE ORGANIZED WITHIN THE STANDARD TOP-DOWN BREAKDOWN HIERARCHICALLY STRUCTURED FUNCTIONAL TIERS APPROVED FOR THE SHIP OR SHORE STATION.

19-7.5 DATABASES. Automated systems have been developed to reduce the administrative workload associated with shipboard reporting of maintenance. These databases provide users with responsive and flexible systems for on-line management of maintenance and to improve the accuracy and timeliness of existing up-line reporting**.** The following provides a high-level overview of the process. For a more detailed in-depth explanation, refer to reference (f), part A and Appendix A

a. 3-M System Historical Database. The NSLC 3-M System Database is the focal point for receipt and distribution of unclassified maintenance and material data. Each reporting activity must ensure that narrative data sent up-line to this database does not contain any classified or Navy Nuclear Propulsion Information (NNPI).

b. Model Based Product Support Navy Product Data Management (MBPS – NPDM). The MBPS-NPDM will ultimately replace the Legacy CDMD-OA, and non-authoritative configuration systems as the authoritative configuration status accounting system, to improve configuration and logistics management and control processes for Navy ships, submarines, and shore activities. Initially, MBPS-NPDM does not currently support those activities having U-NNPI data. Those activities will be maintained in CDMD-OA until such time NAVSEA 08 approves a MBPS U-NNPI solution. Through the implementation of Windchill, a Product Life Cycle Management application, NPDM integrates logistics data, processes, workflows, and people across the Navy enterprise and the Navy to support the management of information through the life cycle of systems and equipment in the fleet. This will provide enterprise access to all components of legacy with supported capabilities that include Configuration Management.

c. The Process for an OMMS-NG or Non-Automated Work Notification afloat unit is initiated when the activity submits Current Ship's Maintenance Plan (CSMP) up-line reports with equipment and configuration change transactions via Joint Technical Data Integration (JTDI) in accordance with their TYCOM schedule. The CSMP flows to the MFOM data center, where the Ship's Configuration Change Form, OPNAV 4790/CK (CK)is then forwarded to MBPS via the MBPS enhanced SDIF UI file import utility provided by Enterprise Service Bus (ESB). MBPS receives the data from ESB, reformats into a Standard Data Interface Format (SDIF-750) and then disseminates it to the appropriate CDM as a Work File Change Notice for review and processing in MBPS by the CDM. After the data has been reviewed and processed by the CDM, it then becomes available as an Automated Shore Interface (ASI) file made available to the unit via their JTDI mailbox.

d. AWN activities do not generate CSMP files. Rather, they generate a "Not In Model (NIM)-Wrong In Model (WIM)" file and a separate file containing OPNAV 4790-2 Kilo data. The NIM-WIM data is replicated from the activity's AWN database to the MFOM data center's AWN database, reformatted, and passed to MBPS via the MBPS enhanced SDIF UI file import utility provided by ESB. MBPS receives the data from ESB, reformats it into a Standard Data Interface Format (SDIF-750) and then disseminates it to the appropriate CDM as a Work File Change Notice for review and processing in MBPS by the CDM. Once the NIM-WIM data is processed in MBPS, it then becomes available for MFOM (via the SDIF outbound process) to pull the data for the purposes of updating the MFOM model editor and AWN database at the MFOM data center and subsequent replication to the activity's AWN database. Non-MFOM shore sites will use DPAS to track as until merged into MFOM and MBPS, all NAVIFOR sites will use MFOM or MBPS for tracking CWI equipment.

NOTE: ONLY THOSE RECORDS WITH A VALID ALLOWANCE PARTS LIST (APL) OR AN ALLOWANCE EQUIPAGE LIST (AEL) ARE QUERIED BY

REMAD. RECORDS WITH A PSEUDO–REPAIRABLE IDENTIFICATION CODE (X-RIC) ARE NOT QUERIED BY REMAD

e. REMAD receives all installed and confirmed planned installed systems and equipment by a specific configuration (end item) from MBPS via ESB generated file output to JTDI on a set frequency for download.

19-7.6 SHIP CONFIGURATION AND LOGISTICS SUPPORT INFORMATION SYSTEM.

a. The SCLSIS process enables ships to maintain an on-line source of their configuration information allowing them to locate and determine configuration, logistics and supply data associated with all installed equipment. This information can then be used to fill in 2-Kilo and CK forms without having to refer to a series of manuals or offline reference books and files. The on-line system also allows maintenance personnel to identify the repair parts associated with the equipment and systems that they are maintaining and to order these parts on-line. Since the configuration data in the OMMS-NG database is provided, shipboard or unit personnel need only select the correct equipment and report the information relevant to the actual maintenance of the equipment.

b. OMMS-NG and Propulsion Organizational Maintenance Management System (P-OMMS) have been established as the CVN 3-M Reporting Data System for both topside OMMS-NG and P-OMMS systems. Naval Supply Systems Command, Weapons System Support Bechtel Plant Machinery Inc. and the P-OMMS Carrier Application Administrator Guide Insert 1 as per reference (c), govern operation of P-OMMS.

(1) The OMMS-NG program will be used as a tool to assist in the management of all shipboard availabilities.

(a) Chief of Naval Operations (CNO) availabilities will be planned and executed as per reference (a) and this manual.

(b) Non-CNO availabilities and Ship's Force self-repair availabilities will be planned and executed as per references (d) and (e).

(2) Reference (a) contains detailed listings and descriptions of reports available. Depending on the overall maintenance schedule of the ship, reports will be generated as required for usage within the ship.

(3) Propulsion Organizational Maintenance Management System. Ships equipped with P-OMMS should use reference (c) for P-OMMS operating requirements.

(4) Air Traffic Control Community Website (ATC Web). Per reference (h), all Commander Naval Installations Command (CNIC) Airfield Operations Department maintenance organizations will use the CDM tools for configuration management provided on the ATC Web at: https://atc.navy.mil/atc/home.aspx.

19-7.7 REPORTING. Reference (a) requires all afloat activities to report deferred and completed maintenance actions, configuration changes and configuration file corrections. Ashore 3-M WCs are to report corrective maintenance and configuration changes on all installed

shipboard-identical equipment and equipment installed in service crafts and boats. One work candidate (2-Kilo or equivalent) will be submitted for each job action. Do not bundle multiple pieces of equipment on one work candidate. Reporting methods are as described in paragraph 19-7.7.a. and b. of this chapter.

NOTE: THE MAINTENANCE PLANNING AND ESTIMATING FORM IS USED ALONG WITH THE 2-KILO FOR DEFERRING MAINTENANCE TO BE DONE BY AN IMA. AS THIS DOCUMENT IS PRIMARILY USED BY THE IMA TO SCREEN AND PLAN THE JOB IN DETAIL, REFER TO REFERENCE (A) IF FURTHER INFORMATION IS REQUIRED.

a. Non-Automated. Appendix C provides preparation guidelines for documenting configuration changes (CKs), Appendix D provides preparation guidelines for documenting maintenance actions (2-Kilos), and Appendix E provides preparation guidelines for providing supplemental information (2-Limas). The configuration and maintenance forms used for manual reporting are:

(1) Configuration Change Form OPNAV 4790/CK (CK)

(2) Maintenance Action Form OPNAV 4790/2K (2-Kilo)

(3) Supplemental Form OPNAV 4790/2L (2-Lima)

(4) Maintenance Planning and Estimation Form OPNAV 4790/2P (2-Papa)

b. Automated

(1) MDS automated data reporting is basically the same as in the non-automated 3-M Program. The terms "2-Kilo", "CK" and "Work Candidate" are perpetuated in supporting software even though the paper forms are not filled out (the exception being the 2-Lima). Transactions are entered into the computer and up-line reported using applicable software.

(2) Software instructions are developed and distributed by the 3-M Central Design Activities. Commander Naval Air Forces Atlantic developed an OMMS-NG user guide, reference (b). In the past, this guide has been provided to the other TYCOMs to use and distribute at their discretion. Options are available in the system to print simulated 2-Kilos, CKs or work candidates when desired. Check the applicable system's user manual or ON-LINE HELP for additional information.

(3) With an automated information system, the computer will provide on-line access to the data for identifying equipment and ordering parts. When documenting requirements, many of the data elements required for corrective maintenance and configuration change reporting such as the Allowance Parts List (APL), Equipment Identification Code (EIC), equipment name and location, are pre-filled and displayed when the subject equipment is identified. Reference (a), Appendix C provides the data elements and allowed values for each type of reporting.

c. Data. Reported maintenance action information is used for material history purposes and is the basis for the material and logistics support necessary to maintain

equipment. Maintenance and material information in numerous reports and formats is available through the 3-M system database. These reports yield critical information concerning equipment maintainability, reliability, man-hour expenditures, material usage, costs, and material condition. The accuracy of this information is critical for Equipment Pillar readiness across all facets of the Navy. Inaccurate data will result in the ship or shore station being supplied with incorrect component parts or technical documents necessary for the operation and maintenance of equipment. This will ultimately hinder battle damage repair efforts.

19-7.8 CONFIGURATION CHANGE FORM OPNAV 4790/CK.

a. Ship or Unit Responsibility. To ensure timely receipt of accurate configuration logistics support, COSAL, and supply support data, ship and activity personnel must:

(1) Promptly report equipment installed, removed, or modified using a CK. Navy Expeditionary Combat Command (NECC) commands will use OMMS-NG to process CKs. Per reference (h), all CNIC Airfield Operations Department maintenance organizations will use the method developed by Naval Information Warfare Center Atlantic and provided on the ATC Web to process automated CKs. CNIC Port Operations and Security Department maintenance organizations will utilize non-automated process in accordance with this instruction. For temporary issue of equipment to include embarkable's exceeding six consecutive months, a CK will be processed by the releasing and gaining commands, for example from a Commander Naval Surface Force Pacific unit getting CCOP equipment from a Naval Information Force unit.

(2) Review all configuration change maintenance actions, equipment file corrections and logistics support transactions in a timely manner and transmit them for processing.

(3) Process all ASI data promptly by following the SCLSIS Technical Specification and as described in 19-7.8.a.(3)(a) and (b) of this chapter.

(a) Surface Force. Surface force ship ASI download, and processing is required when the ASI record count in Revised Alternative Dataflow Website (RADWEB) is 4,500 records for Guided Missile Cruisers, Guided-Missile Destroyers (DDG and DDG 1000), Mine Countermeasure ships, Amphibious Transport Dock ships, Dock Landing Ships, Patrol Craft, or shore facilities. Download and processing for Landing Helicopter Assault, Landing Helicopter Dock, and Amphibious Command ships is required when the ASI record count in RADWEB reaches 10,000 records. Littoral Combat Ships will download and process ASI records monthly, at a minimum. Download and processing of all available ASI records in RADWEB is required when the unit is getting underway for a period of two weeks or longer, monthly at a minimum, or as directed by the TYCOM. Ship's ASI data, available in RADWEB, will be downloaded and processed into the ship's MDS within seven days of ASI creation.

(b) NECC. NECC requires processing of all ASI data into their automated system promptly following the SCLSIS technical specification. Units must report configuration changes to COMNECC via the respective Immediate Superior in Command (ISIC) in the form of a completed CK Configuration Change form. Units will conduct up-line reporting at a minimum of twice per month and ASI processing within seven working days of the ASI posting to RADWEB.

(c) COMNAVAIRFOR. ASI processing and equipment validation requirements are being conducted by Maintenance Support Center (MSC) personnel only per reference (i). All additional validations conducted by work centers will be coordinated with the MSC for OMMS-NG data updates.

(4) Report equipment or component changes detected or accomplished by Ship's Force, unit personnel, and IMAs. While the equipment technical authority is responsible for reporting Alteration Installation Team installations, the ship or unit is ultimately responsible for its own configuration accuracy. If Alteration Installation Team configuration changes have not been properly reported by the technical authority, the ship or unit is responsible for reporting them.

b. Shipyard Installed Alterations. A certification of alteration accomplishment is provided by the Navy Supervising Activity to the recipient ship and the appropriate CDM when the shipyard accomplished the installation. This certification includes the WC JSN assigned to the alteration and the final action taken. The certification will be in the format shown in Appendix F. The ship will endorse the shipyard's certification letter and forward to the support activity managing the unit's master CSMP. The endorsement provides authorization for information transmitted to be processed as completed deferrals in the master CSMP. Refer to Appendix G. This eliminates the need for documenting multiple configuration changes to close the CSMP deferral.

c. Alteration or Configuration Change Related Completed Maintenance Action

(1) For the purpose of reporting configuration changes, all alterations, deletions, turn-ins, modifications, additions, installations or replacement of equipment are included in the term "maintenance action" whether the corrective maintenance is performed or not.

(2) The responsibility for identifying and reporting configuration changes exists at all levels of the command. For emergent requirements, when an Integrated Logistics Support requirements waiver has been granted by higher authority, and the installing activity has not pre-loaded the data in MBPS or CDMD-OA, the installing activity will provide the ship or unit with properly filled out and complete CKs and will promptly report the completion of the installation to the CDM.

(3) During depot availabilities, the installing activity must ensure that configuration changes are promptly and properly reported. Alteration certification letters must be provided to the ship by the depot-level activity. Reporting is required for the:

(a) Addition, installation, or ownership changes of any equipment.

(b) Deletion, removal or turn-in of any installed equipment.

(c) Replacement or exchange of any equipment. Non-serialized exact replacements do not change configuration records or logistics support and do not require a configuration change to be reported unless required by an alteration directive. Emphasis must be placed on "form, fit, function" equipment. Replacements such as any change in manufacturer, model or part number or serial number requires configuration change reporting.

(4) Modification of any installed or in-use equipment. A modification occurs when a maintenance action alters the design or operating characteristics of the equipment. Equipment is considered modified, and reporting is required when non-standard replacement parts (not identified on the APL or in the technical manual) are used in the accomplishment of the maintenance. A Departure from Specification (DFS) may be required as specified in Volume V, Part I, Chapter 8 of this manual.

(5) Relocation of any equipment to a different deck, frame, compartment, room, building or, if it affects drawings or other logistic support data. Any other relocation of equipment is considered a maintenance action and requires a completed maintenance action to be reported (for non-automated ships or commands, use the 2-Kilo form).

(6) Re-designation of any space or compartment.

(7) Accomplishment of any alteration.

NOTE: FOR NON-AUTOMATED ACTIVITIES, THE CK CONFIGURATION CHANGE FORM IS USED TO REPORT THE ACCOMPLISHMENT OF MAINTENANCE ACTIONS THAT ARE RELATED TO AN ALTERATION OR RESULT IN A CONFIGURATION CHANGE. REFER TO REFERENCE (A), APPENDIX A FOR THE DATA ELEMENTS AND ALLOWED VALUES AND APPENDIX C FOR THE INSTRUCTIONS FOR MANUALLY COMPLETING THE CK.

NOTE: REPORTING OF REACTOR PLANT CONFIGURATION CHANGES AND MODIFICATIONS PERFORMED TO EQUIPMENT OR COMPONENTS UNDER NAVSEA (SEA 08) COGNIZANCE ARE REPORTED PER REFERENCES (C) AND (D), AND VOLUME VI, CHAPTER 3 OF THIS MANUAL.

d. Configuration File Corrections. In addition to reporting configuration changes because of accomplishment of a maintenance action, it is necessary to correct deficiencies in the configuration file to obtain support for equipment that is onboard but is not identified in the COSAL, or to delete from the COSAL equipment that is not onboard but is supported. There are six categories of actions that must be reported. A configuration change record is submitted to:

(1) Correct ship-controlled data elements in an existing record of the ship's configuration baseline. For additional information concerning the data elements, refer to reference (f), part B.

(2) Correct erroneous data previously submitted.

(3) Obtain support for equipment that is onboard, but not identified as such.

(4) Identify equipment that is supported but is not onboard.

(5) Report the turn-in or receipt of Portable Electrical and Electronic Test Equipment.

(6) Report the completion of Ship's Force equipment configuration validations.

NOTE: FOR NON-AUTOMATED SITES, THE CK IS USED. IF USING THIS FORM REFER TO APPENDIX C FOR FORM PREPARATION INSTRUCTIONS. FOR AUTOMATED SITES, REFER TO THE APPLICABLE SYSTEM'S USER MANUALS OR GUIDES FOR THE PROCEDURES USED TO CHANGE, ADD, OR DELETE FILE INFORMATION.

19-7.9 SHIP's MAINTENANCE ACTION FORM OPNAV 4790/2K OR WORK CANDIDATE.

a. When Required. A 2-Kilo or fleet approved equivalent is required:

(1) To document a material deficiency.

(2) For a class maintenance plan maintenance action.

(3) When ordering parts or materials.

(4) For Selected Level Reporting (SLR).

(5) When requesting special support or test equipment (hydrostatic pumps, rigging equipment, etc.).

(6) For documenting a completed maintenance action (corrective or planned).

(7) When submitting a Casualty Report (CASREP).

(8) When submitting a temporary DFS.

(9) For documenting the results of an inspection or assessment.

(10) For installation of a Ship Alteration (SA).

(11) For support services during a maintenance availability.

(12) When requesting help from outside activities (technical assistance, repair, calibration, etc.).

b. Work Candidate Documentation

(1) Generic Requirements

(a) Problem Description and Recommended Solution. Problem description must give a detailed description of what the problem is and why it is being deferred. The recommended solution will describe, in

detail, what and who will be required to correct the deferred maintenance. For CVN ships, the noun name, serial number, Positional Reference Identification, and location of the equipment should be included in the problem description block for all jobs written for outside activity maintenance level to ease the TYCOM's screening, validation and brokering process.

(b) Maintenance Level Assignment. The maintenance level assigned to the work candidate will match the maintenance activity requirements of the problem description and recommended solution. Maintenance level assignment is sometimes referred to as the "level of effort".

(c) First and Second Contact. The first contact field will contain the name of the senior person engaged in the maintenance action. The second contact field will contain the name of the supervisor of the first contact or maintenance person.

(d) Work Candidate or CSMP Summary. The work candidate summary is a condensed summary of the problem. It will not contain the recommended solution, the equipment name, identification or serial number, or compartment location.

(e) Deadline Date. All work candidates which require assistance from a type 2 or 3 maintenance activity will have a valid deadline date assigned. If a deadline date is used on a Type 1 Or Type 4 work candidate, the deadline date will be a valid date.

(f) Priority Code. Reference (a), appendix C contains guidance for assigning appropriate priority codes.

(g) Configuration. Work candidates must be written against the correct ship's configuration item.

(h) Equipment Status Code. The Equipment Status Code and Equipment Operational Code (EOC) will reflect the actual condition of the equipment at the time the work candidate is created. The Equipment Status Code from OMMS-NG units is used to compute the EOC, which is a major factor in determining the mission operational capabilities of the ship.

(i) Safety Hazard Code. When used, the Safety Hazard Code must have a supporting write up in the Problem Description field. The Safety Hazard Code is used in determining the mission operational capabilities of the ship, as reported off ship to Defense Readiness Reporting System-Navy.

(j) Deferral Reason Code. The Deferral Reason Code must have a supporting write up in the Recommended Solution field. For CVN ships, use the local TYCOM guidance during selecting the correct deferral reason to use.

(k) For CVN ships, all Ship's Force written JSNs with originating work center maintenance level should be resolved within 180 days of creation with the exemption of JSNs when awaiting for outstanding parts.

(2) Submarine Specific Requirements. Classified information or NNPI is not to be included on any work candidate entered in OMMS-NG. P-OMMS will be utilized for NNPI work candidates. Should classified information be required to adequately document a material deficiency, the following action will be taken:

(a) Create a job in OMMS-NG.

(b) For the Block 35 narrative (problem description), indicate the unclassified summary and Date Time Group of a classified message that fully describes the problem.

(c) Transmit a classified message to the appropriate activities to supplement the work candidate.

(3) Naval Air Force Specific Requirements. Certain work candidates will be submitted to be accomplished by the ship's repair work centers. Those work candidates will initially be entered by the parent Reactor Department work center into P-OMMS using the correct configuration item and assigned as O-Level (type 4B). Once the work candidate has been approved at ship level in P-OMMS:

(a) The P-OMMS coordinator will manually enter jobs into TOPSIDE OMMS-NG using APL or XRIC (XCOMPARTMNT, XSYSTEMITEM, XSERVICEITM, etc.) as appropriate for the Reactor Department work center requesting the work.

(b) The P-OMMS coordinator will document the TOPSIDE OMMS-NG JSN at the beginning of the work candidate problem description field in P-OMMS in following format: OMMS: JSN.

Example: OMMS:RC011324. (A "blank space" must be placed after the JSN).

(c) The P-OMMS coordinator will document the P-OMMS JSN at the beginning of the work candidate problem description field in Hull Mechanical and Electrical (TOPSIDE OMMS in the following format: P-OMMS:JSN.

Example: P-OMMS:RC01002A. (A "blank space" must be placed after the JSN).

(d) Upon completion of repairs, the repair WC will document their man-hours and close the work candidate in TOPSIDE OMMS-NG.

(e) The P-OMMS coordinator will approve the completed job in TOPSIDE OMMS-NG at the Department Head level.

(f) The P-OMMS coordinator or originating WC will close the job in P-OMMS.

(g) The P-OMMS coordinator will send status of the Repair Department work candidates in TOPSIDE OMMS-NG to Reactor Department at least weekly.

(h) Only the P-OMMS coordinator and assistants will write Reactor Department jobs for repair WCs in TOPSIDE OMMS-NG.

(i) Those work candidates written for Ship's Force Organizational level requires Repair Officer's screening and approval prior to assignment of shop responsible as lead and assist work center. Ships Force will follow reference (j) for the execution of JSN screening and approval.

(j) When generating work candidate for galley and laundry equipment, the repair work center responsible for the corrective and planned maintenance of the equipment will be responsible in documenting the JSN under the repair work center. The galley watch captains and laundry supervisors can contact the repair work center via ship's Trouble Call program to submit the trouble calls.

(4) Nuclear Command, Control, and Communication Specific Requirements. Nuclear Command, Control, and Communication Navy system information is classified, and requires protection not afforded by unclassified maintenance data systems. Classified information documenting failure or status of Nuclear Command, Control, and Communication Navy equipment or NNPI is not to be included on any work candidate entered in MDS. Should this information be required to adequately document a material deficiency, the following action will be taken:

(a) Create a work candidate in MDS.

(b) For the Block 35 narrative (problem description), indicate the unclassified summary and Date Time Group of a classified message that fully describes the problem.

(c) Transmit a classified message to the appropriate activities to supplement the work candidate.

(5) CNIC Specific Requirements. Per reference (h), Airfield Operations Department work candidates will be submitted and tracked using the Maintenance Data Analysis Tool (MDAT) provided on the ATC Web. Port operations and security department work candidates will utilize the non-automated process in accordance with this instruction.

c. Deferred Maintenance Action.

(1) Criteria. A deferred maintenance action is a maintenance requirement that meets one or more of the following criteria:

(a) Requires assistance from an activity external to the ship to accomplish (for example, IMA, depot, technical support unit, etc.), or is a Ship's

Force job requiring assistance from outside the originating WC (for example parts required).

(b) Is not expected to be accomplished by Ship's Force within seven days.

(c) Is an uncorrected deficiency reported by Board of Inspection and Survey (INSURV); refer to Section II Chapter 1 of reference (a) or other inspecting activity (CMAT, C5RA, TSRA, OSAR, MRA etc.).

(d) Is required to correct a condition that has caused or has the potential to cause injury to personnel or damage to material.

(e) Repair Parts are required.

NOTE: FOR NON-AUTOMATED SITES, THE 2-KILO IS USED TO REPORT A DEFERRED MAINTENANCE ACTION. REFER TO APPENDIX D FOR MANUALLY COMPLETING THE 2-KILO. FOR AUTOMATED SITES, REFER TO THE APPLICABLE SYSTEM'S USER MANUALS AND GUIDES.

(2) NECC Unique Requirements and Policy. Whenever creating a deferred maintenance action ensure the blocks listed in paragraph 19-7.9.c.(5)(a) through (c) of this chapter contain the following information.

(a) Block 6: The When Discovered Code identifies when the need for maintenance was discovered. Typically, deferred maintenance actions are written to document defects or failures on the command's equipment. However, deferred maintenance actions are also required to procure materials in support of PMS. To assist in data collection, all deferred maintenance actions generated in support of PMS will use option code "9 -No Failure, PMS Accomplishment Only". The correct use of this field will greatly enhance NECC's ability to distinguish between maintenance actions that are written due to equipment defects or failures and those written to procure materials in support of PMS.

(b) Block 35: Will begin with the serial number of the equipment and a complete description of the malfunction. Next a detailed statement stating the required actions to correct the malfunction. For Civil Engineering Support Equipment, an additional entry of miles or hours of the equipment at the time of failure will be documented.

(c) Block 37: Will be a short description of the problem.

(3) CNIC Unique Requirements and Policy. All deferred maintenance actions be accurately documented, in MDAT by Airfield Operations Department, by approved non-automated means by Port Operations and Security departments and reported with a CASREP when applicable per reference (a).

d. Completed Maintenance Action. The ship is responsible for submitting a completed maintenance action to report:

(1) Completion of maintenance actions previously deferred. If no further work is required by Ship's Force, higher authority may allow an outside activity to report its completion. This is referred to as an "automatic close-out".

(2) Completion of maintenance actions not previously deferred.

(3) Completion of maintenance actions for SLR equipment. See reference (a) for the definition of SLR.

(4) Accomplishment of an alteration, i.e., SA, Ordnance Alteration (OA), Field Change (FC), etc. Policy and implementation are provided in reference (g).

(5) Addition of any new equipment or system.

(6) Reporting the relocation of any equipment.

(7) Reporting the replacement or exchange of any equipment.

(8) Deletion, removal or turn-in of any installed equipment.

(9) Completion of maintenance actions considered significant for material history purposes such as:

(a) Maintenance actions that alter the design or operating characteristics of an equipment or system.

(b) Other maintenance actions or conditions that are considered significant for future reference purposes.

(10) Accomplishment of maintenance that required parts.

NOTE: FOR NON-AUTOMATED SITES, THE 2-KILO IS USED TO REPORT A COMPLETED MAINTENANCE ACTION. REFER TO REFERENCE (A), APPENDIX C FOR THE DATA ELEMENTS AND ALLOWED VALUES AND APPENDIX D FOR THE INSTRUCTIONS FOR MANUALLY COMPLETING AN 2-KILO.

e. Documenting Changes. Documenting changes, additions, or deletions to previously reported maintenance actions. Any information previously reported on a deferred maintenance action, except for the JCN and the deferral date, can be added, deleted, or changed. Care should be taken not to make changes to jobs that have already been reported up-line. This will require additional screening by outside activities. Automated sites may have additional fields that cannot be modified. Deletion once a JCN or JSN is created is forbidden. Once a JSN is created, completion, cancelation, or pass to history is the only option. Closing or cancelling a JSN using a closure or cancel codes of 4, 5 or 6 will freeze Validation, Screening and Brokering (VSB). Do not use those 4, 5 or 6 codes when closing or canceling jobs.

NOTE: ONCE A JCN DEFERRAL HAS BEEN PROCESSED, IT REMAINS ON EACH PROCESSING ACTIVITY'S CSMP (I.E., SHIP'S FORCE OMMS, THE ISIC, SUBMARINE SQUADRON SUPPORT UNIT OR REGIONAL SUPPORT GROUP MAINTENANCE RESOURCE MANAGEMENT SYSTEM (MRMS) OR VSB), THE TYCOM MASTER CSMP AND THE OPEN ARCHITECTURAL RETRIEVAL SYSTEM (OARS) DATABASE)

UNTIL THE COMPLETED DEFERRAL IS PROCESSED. WHEN THE 3-M COORDINATOR (3MC), ISIC, REGIONAL MAINTENANCE CENTER (RMC) MAINTENANCE DOCUMENT CONTROL OFFICE, OR AFLOAT READINESS REPORTING SYSTEM SHIP SUPERVISOR PERSONNEL "DELETE OR PURGE", THE JCN WILL REMAIN ON ALL OTHER AFFECTED CSMPS IF THE REPORTING COMPLETION OR CANCELLATION IS NOT REPORTED UP-LINE.

19-7.10 CURRENT SHIP'S AND STATION'S MAINTENANCE PROJECT. The purpose of the CSMP is to provide shipboard and ashore maintenance managers with a consolidated listing of deferred maintenance that reflects the material condition of the ship or station. Each WC is to maintain a current paper CSMP and Repair Parts Petty Officer Log, ensuring it reflects the actual condition of a WC's spaces and outstanding maintenance, if the data is not available in OMMS or AWN. The master CSMP is held in the shore MDS (i.e., VSB). For CNIC CSMP management, Airfield Operations department will utilize MDAT per reference (h), Port Operations and Security departments will utilize approved non-automated means.

a. CSMP Content. The CSMP includes, but is not limited to:

(1) The "automated CSMP" is the computer-produced listing of deferred maintenance and alterations that have been identified through the submission of OPNAV 4790 documents. In addition to the maintenance actions added by Ship's Force, outside activities may request that they be allowed to add items to the CSMP.

(2) The suspense file documents maintenance items that have been submitted but are not reflected in CSMP reports or have not appeared in the MDS Transaction and Error Identification Report as having been accepted.

(3) The work candidate or JSN Log which is the WC's list of all material discrepancies to be corrected either by Ship's Force or an outside activity. All non-automated units or ships use work candidate or JSN logs. The Work Center Supervisor (WCS) will maintain a work candidate or JSN Log using the format as shown in appendix H. The UIC and WC Code must be entered on each page of the log. A separate JSN for each maintenance action reported from that WC must be assigned. The JSNs must be in sequential order. The WCS will ensure that the JCN assigned to a specific maintenance action is reflected on any material request associated with that maintenance action.

b. Surface Force Unique Requirements.

(1) Surface Force ship unique requirements and policy for bulk loads and database transfer are as follows. A bulk load is a CSMP load (work candidate(s) provided as an external file to be loaded into the ship's CSMP) produced by any outside activity (e.g., Combat Systems, Command, Control, Communication, Computer Readiness Assessment (CSRA), INSURV, SURFPAC Enhanced Capability to Assess Programs (SECAP), or Total Ship Readiness Assessment (TSRA). COMNAVSURFPAC or COMNAVSURFLANT N43 3-M will review and approve all bulk loads prior to being loaded into any afloat or ashore database. COMNAVSURFPAC or

COMNAVSURFLANT N43 3-M is the only authorizing activity for bulk load reviews. Commands will not transfer, copy, or allow the direct access to or copying of the MDS database by any outside activity without COMNAVSURFPAC or COMNAVSURFLANT N43 3-M written permission.

(2) CSMP management. CSMP is the primary source for documenting material discrepancies, ordering repair parts, and planning maintenance for the unit, whether it is being accomplished by Ship's Force or by an outside agency. CSMP fundamentals are delineated below:

(a) Priority for the work candidate will be determined based upon the material condition and current situation of the command vice casualty reporting requirements. All priority level changes or any updates to the work candidates will be documented in block 35 "recommended solution" of the work candidate. Every work candidate starts with a priority level of four "DESIRABLE". Priority of work candidates will be determined using the guidance in Figure A-1 of reference (c). During the review and approval process, the Division Officer (DIVO) or Leading Chief Petty Officer (LCPO) may raise the priority to a three "HIGHLY DESIRABLE" but no higher. The next level of review and approval is the Department Head (DH) who may raise the priority level to two "ESSENTIAL" but no higher. Priority level one "MANDATORY" is assignable by the 3MC upon direction of the unit CO.

(b) Work Candidate Review. The DH will ensure all work candidates in the departmental CSMP are reviewed and have an updated status of current actions being taken in block 35 or comment section of AWN (examples: availability brokered to, parts status, troubleshooting efforts, date scheduled for organizational work or any detail that will inform Chain Of Command (CoC) with the current status) on or before 90 days and every 90 days thereafter; utilize the weekly 3MC CSMP Ad Hoc query to identify JSNs that have not been updated. The specific detailed update can be entered by the LCPO or DIVO and normal approval of the updates is required. If any Type Availability (TA) TA-4 work candidates exceed unit's capability or capacity, the TA code will be changed to TA-2. Enter "Exceeds unit's capability or capacity" into block 35.

(c) CSMP will reflect the actual material condition and workload of the unit.

(d) CSMP quality control is the daily responsibility of the Leading Petty Officer, LCPO, DIVO, and DH via the review and approval process.

(e) Do not close or cancel jobs based on age. If valid, jobs will remain on CSMP.

(f) The CoC must review work candidates before the Planning Board for Maintenance. Incorporate departmental work and maintenance plans into CNO availabilities and Continuous Maintenance Availability planning.

(g) Commands will review the CSMP to ensure work candidates written for corrosion control, environmental, or zone or space inspections contain "C", "E", or "Z" in Block 10, respectively.

(h) Up-line Reporting. Up-line reporting via revised alternative data flow website (RADWEB) is required at a minimum of twice per calendar week. Platforms on Automated Work Network (AWN), units will verify twice a week that automatic data transfer is occurring and "RSupply" batch jobs (JSL341/340) are running and executed.

c. Naval Air Force Unique Requirements. Aircraft Carrier unique requirements and policy for bulk loads and database transfer are as follows.

(1) A bulk load is a CSMP load (work candidate(s) provided as an external file to be loaded into the ship's CSMP) produced by any outside activity (e.g., CSRA, INSURV, or Inspections, Certifications, Assessments and Assist Visits.

(2) COMNAVAIRLANT or COMNAVAIRPAC N432 MDS managers will review and approve all bulk loads prior to being loaded into any afloat or ashore database.

(3) COMNAVAIRLANT or COMNAVAIRPAC N432 MDS managers are the only authorizing activities for bulk load reviews.

(4) CSMP management. CSMP is the primary source for documenting material discrepancies, ordering repair parts, and planning maintenance for the unit, whether it is being accomplished by Ship's Force or by an outside agency. CSMP fundamentals are delineated below:

(a) Priority for the work candidate will be determined based upon the material condition and current situation of the command vice casualty reporting requirements. All priority level changes or any updates to the work candidates will be documented in block 35 "recommended solution" of the work candidate. Every work candidate starts with a priority level of four "DESIRABLE". Priority of work candidates will be determined using the guidance in reference (c), figure A-1. During the review and approval process, the DIVO or LCPO may raise the priority to a three "HIGHLY DESIRABLE" but no higher. The next level of review and approval is the DH who may raise the priority level to two "ESSENTIAL" but no higher. Priority level one "MANDATORY" is assignable by the 3MC upon direction of the unit CO. The verbiage "CASREP" will be annotated at the beginning of the recommended solution block when priority is raised to HIGHLY DESIRABLE or above.

(b) Work Candidate Review. The DH will ensure all work candidates in the departmental CSMP are reviewed on or before 90 days and every 90 days thereafter; utilize the weekly 3MC CSMP Ad Hoc query to identify JSNs that have not been updated. All ship's force written JSNs with "Originating Work Center" maintenance level should be resolved within 180 days of creation with the exemption of JSNs that are awaiting for outstanding parts.

(c) Review and Approval Process. The DH will ensure newly written candidates are approved at DH level within four days of creation. All JSN intended for Organizational level will need to be screened and approved by Repair Officer prior to upline off-ship. All JSN intended for Outside Activity repairs will need to be screened and approved by Ship's Maintenance Manager prior to SHIP level of approval and upline. Ship's force will not make any changes any JSN that were already brokered by TYCOM to a certain availabilities. If needed, changes need to be coordinated with the assigned Automated Work Package manager Maintenance Project Manager. Refer to reference (j) for details.

(d) Completion of Work Candidates. WCS will continuously monitor all work candidates until they are all completed or resolve. All completed JSN under Ship's Force "Originating Work Center" or "Organizational" maintenance level must be reviewed, approved and up-lined within 30 days of completion date. For work candidates assigned to SRA or CNO availabilities, SF have 60 days to close out and removed from ship's CSMP. All past availabilities must be deleted from availability listing within 60 days after completion.

(5) Repair Officer is responsible in maintaining the ship repair availability scheduling. Repair Officer should ensure all Ship's Force written JSNs for Organizational Level jobs will be resolved or closed out within 365 days of creation unless awaiting outstanding parts or already scheduled for upcoming availabilities.

(6) Commands will not transfer, copy, or allow the direct access to or copying of the MDS database by any outside activity without COMNAVAIRLANT or COMNAVAIRPAC N432 MDS manager written permission.

(7) There will be no paper Automated Work Requests given to the ship by any external source for entry into the CSMP.

(8) 3-M PQS qualified maintenance personnel will be granted OMMS-NG access for the purpose of adding, modifying, and completing a work candidate within the respective WCs.

d. Submarine Force Unique Requirements. Submarines operate in varied environments and circumstances, which may result in a ship's inability to comply with reference (a) and certain paragraphs of this subchapter. Paragraphs 19-7.10.d.(1) through (6) of this chapter provides amplifying direction.

(1) The 3MC will perform CSMP up-lines as follows:

(a) Whenever a CASREP is transmitted, the corresponding CSMP JSN must be up-lined at the same time.

(b) Whenever a job is walked-through during an availability, the corresponding CSMP JSN must be up-lined at the same time.

(c) OMMS-NG up-lines will be performed a minimum of once a week regardless of availability or operational status, this includes running the “inactivate” and “archive” functions.

(d) P-OMMS-NG up-lines will be performed a minimum of monthly regardless of availability or operational status, this includes running the inactivate and archive functions.

(2) For OMMS-NG only, CSMP up-line files (.uru) must be accompanied by the corresponding parts utilization files (.pts). The Maintenance Document Control Office will reject any .uru up-line file that does not include the corresponding .pts file.

(3) The CSMP will not be replaced with any software required for use by a repair activity to track material condition of the ship or ongoing work. When use of these systems is required, the CSMP will be maintained parallel to the other required system.

(4) As the Master CSMP resides ashore and is maintained by the local maintenance support activity, the shipboard CSMP and shore CSMP must be reconciled quarterly.

(5) The 3MC will ensure all documented material or sound discrepancies or work candidates are assigned to a PMS WC and tracked to completion.

(6) To ensure proper documentation of material deficiencies that are within the Submarine Safety (SS), Fly-by-Wire (FBW), or Scope of Certification (SOC) boundaries, the following guidance is provided. Annotate all material deficiencies that are within the SS, FBW or SOC boundaries in the CSMP using the Special Requirements Tab in OMMS-NG or VSB as appropriate. Additionally, SS, FBW or SOC must be entered into the beginning of the CSMP Summary.

(a) The maintenance brokers will ensure the SS, FBW and SOC work candidates are appropriately marked in VSB following up-lines.

(b) ISICs will verify the ships are appropriately using the Special Requirements Tab to annotate the SS, FBW and SOC deficiencies in the CSMP during the 3-M Inspection using Subchapter 19F, Appendix B, Section IV-A2, CSMP Validity Factor form.

(7) A bulk load is a CSMP load (work candidate(s) provided as an external file to be loaded into the ship’s CSMP) produced by any outside activity (e.g., TSRA, INSURV, Sail or Diesel Inspections, OSARS, MAPAI).

(a) The 3MC is required to process the bulk load into the ships CSMP for adjudication.

(b) Work center will review and manage associated jobs until completion.

(c) Verify import correction queue after processing bulkload.

(8) All jobs returned to originator by the ISIC must be adjudicated within 30 days.

(9) All Ship's Force written JSNs with originating work center maintenance level (TA-4) should be resolved within 180 days of creation. Jobs greater than the 180-day requirement must be updated in OMMS problem description or recommended solution monthly until adjudicated.

(10) The following will be adhered to when a JSN has an associated DFS.

(a) TA-4 tracking a DFS for ships force work is correct, all other tracking needs to be original TA-1 or TA-2 JSN.

(b) If an original job had a temporary repair performed, the ship submits a new job for permanent repair.

(c) When entering a JSN associated with a DFS, the DFS Function must be used to ensure proper tracking of DFSs and associated Work Candidates. To utilize, open the work candidate that is written for a DFS and click on the button that is labeled "DFS" and fill in the required fields. This function will ensure proper tracking of all DFSs and associated Work Candidates by anyone who creates a new list by selecting the "Departure from Specs" option in OMMS. This does not alleviate the requirement to document the DFS in the Special Requirements and Characteristics tabs in OMMS.

e. Unit or Ship Use. The CSMP is utilized as follows:

(1) The ship's CO and Executive Officer use CSMP reports to:

(a) Determine the effects of deferred maintenance that limit the ship's capability.

(b) Evaluate potential CASREP situations.

(c) Evaluate the material condition of each individual WC.

(d) Determine what kind and how much outside assistance is needed to complete the deferred maintenance.

(e) Evaluate weaknesses or shortages in skill levels or resources required to do the deferred maintenance.

(f) Determine the type of upkeep and propulsion plant shutdown requirements needed for the accomplishment of maintenance.

(2) The DH or DIVO uses the CSMP reports for the same information as the CO and Executive Officer but are primarily interested in their specific department or division rather than the entire ship. CSMP reports can assist them in

determining plans of action for accomplishing the deferred maintenance and evaluating the performance of WCSs in the management of their WCs.

(3) The WCS uses the CSMP reports for managing WC maintenance. Each WCS is responsible for ensuring that the CSMP accurately describes the material condition of the WC. NECC WCSs are responsible for the review of their CSMP on a weekly basis, ensuring that completed jobs are closed, new equipment failures are properly documented and that materials required to repair or maintain equipment are on order.

(4) NECC requires that any open job in the CSMP that exceeds six months must be researched by the CoC. The appropriate actions will be taken to expedite the repair or replacement of the equipment. Any job that exceeds six months and cannot be resolved at the command level will be forwarded to the ISIC for assistance and direction.

(5) CNIC requires any open corrective action item exceeding six months that impacts mission capability and cannot be resolved at the command level, or supported by CASREP, be reported to the appropriate ISIC or regional commander for assistance and direction to expedite resolution.

f. CSMP Reports. Current automated systems produce both summary and detail printed CSMP reports. Since software applications may differ, check the applicable system's user manuals and guides for available report formats. CSMP reports are produced in a variety of options with selected sequences and totals. Summary reports are single-line summaries of the uncompleted deferred maintenance actions in the CSMP and are available by type of availability, WC, INSURV number, safety-related deficiencies and EIC. Detail reports show the complete record for these actions. CSMP detail reports can be sorted by JCN, EIC or Ship(s) Work Authorization Boundary (SWAB).

(1) Summary Reports. CSMP Report 1 (produced in seven options). Each option presents a single line summary of each non-completed deferred maintenance action:

(a) Summary by Type Availability is provided on an as requested basis. This report provides a single-line description of each deferred maintenance action sequenced by ship, WC, type availability and JSN. A WC summary line on the CSMP provides the number of man-hours by IMA, depot, and Ship's Force. At the end of the report is a summary of estimated man-hours by type availability for each WC and department and a line for the ship total.

(b) Summary by WC, available on an as requested basis, contains the same information as option (a), but sorted by ship, WC and JSN.

(c) Summary by INSURV Number is provided routinely to the ship as directed by TYCOM after an INSURV inspection. It is restricted to only those items on the CSMP that have been assigned an INSURV number. Sequenced by ship, INSURV number, WC and JSN. It

contains similar information to option (a). Man-hour estimates and summaries are not shown.

(d) Summary by Safety Related Deficiencies, available on an as requested basis, is restricted to only those actions listed on the CSMP which have been assigned a safety hazard code. Sequenced by ship, WC, type availability and JSN, it contains the same information as option (a) for safety related deferred maintenance actions. No man-hour estimates, summaries or list of additions and deletions are shown.

(e) Summary by EIC, available on an as requested basis, is sequenced by ship, EIC, WC, JSN and contains the same information as option (a). This report includes man-hour estimates summarized in EIC sequence at the system level.

(f) Summary by INSURV Number and Type Availability, available on an as requested basis, contains the same information as option (c) sorted in ship, INSURV number and type of availability sequence.

(g) Summary by SWAB or Ships Work List Item Number (SWLIN), available on an as requested basis, contains the same information as option (a) including only those JCNs that have a SWAB or SWLIN assigned. The information is sorted by ship, SWAB or SWLIN and WC or JSN.

(2) Detailed Reports. CSMP Report 2 (produced in three options). Each option presents detailed information regarding the ship's deferred maintenance.

(a) Detail Listing by JCN displays a detailed record of the ship's deferred maintenance by JSN within the WC. If a deferred maintenance action has been documented as a safety hazard, "SAF HAZ" appears in the comment column. If the maintenance action has been assigned an INSURV Number, this number will appear in the "comment" column.

(b) Detail Listing by SWAB displays a detailed record of the ship's deferred maintenance by SWAB. If a deferred maintenance action has been documented as a safety hazard, the words "SAF HAZ" appear in the "comment" column. If the maintenance action has been assigned an INSURV Number, this number will appear in the "comment" column.

(c) Detail Listing by EIC is sequenced by JSN within a WC within an EIC.

APPENDIX A

STANDARD WORK CENTER CODES FOR MASTER JOB CATALOG ITEMS

Submarine Forces:

Description	Code
Overhaul, SRA, Baseline Routines	EXSY
NAVSEA Issued Ship Alterations	*XSA
NSWCPD Machinery Alteration	*XMA
NAVSEA Issued Field Changes	*XFC
NAVSEA Issued Engineering Changes	*XEC
NAVSEA Issued (TYCOM Managed) Temporary Alterations	**TA
TYCOM Issued Alterations	*XTY
DIRSSP Issued Strategic Systems Program Alterations (SSBN, SSGN)	**SP
TYCOM Directed and Funded Grooms and Certifications	**TY
Submarine Extended Operating Cycle PMRs	**JC
Test and Measurement System Repair Routines	**CR
MJC Service Routines	**MC

*=Department

**=Department or Division

Surface Forces:

Description	Code
Overhaul, SRA, Baseline Routines	EXSY
NAVSEA and TYCOM Issued Alterations	EXSA
Engineering Cycle	**EC

First character identifies the requesting Department.
Second character identifies the Administrative Procedure (“X”).
Third character indicates catalog routine (“C”).
Last character denotes the maintenance source code as:

- A - Planned Maintenance Subsystem
- B - Unassigned
- C - Corrective
- D - Upkeep
- E - Miscellaneous

APPENDIX C

PREPARATION INSTRUCTIONS SHIP'S CONFIGURATION CHANGE FORM (OPNAV 4790/CK)

1. SHIP'S CONFIGURATION CHANGE FORM (OPNAV 4790/CK)

   a. The OPNAV 4790/CK Form is used to report completion (or partial completion) of alterations, maintenance actions that resulted in a configuration change and to correct discrepancies and errors in the configuration files.

   b. Three blocks at the top of the form are used to specify what type of action is being reported (a configuration file correction "CONFIG FILE CORR" a completed maintenance action that had no prior deferral "COMP M/A NO DEFL" and a completed deferred maintenance action "COMP DEFL"). The rest of the form is separated into four sections.

   c. The OPNAV 4790/CK Form and OPNAV 4790/CK Continuation Form are available to download in PDF format at: https://forms.documentservices.dla.mil/order/ by searching for Form Number "4790/CK".

1.1 Section I - Job Identification: This section identifies the system or equipment involved in the configuration action. If a component or sub-unit is being reported, the Job Identification in this section must be that of the highest assembly. Components and sub-units are reported in Section III.

1.2 Section II - Job Description and Remarks: This section contains remarks relating to the accomplishment of the action. In some cases, an alteration directive will specify that certain information be documented.

1.3 Section III - Component Configuration Change Identification: This section contains information on the component(s) affected by the maintenance (configuration change) action. The Job Identification Level (section I) will be completed to the highest assembly directly affected by the change. The sub-units (components) are reported to the individual Allowance Parts List (APL) level in Section III. A CK allows only one component (sub-unit) to be reported per form. When multiple sub-units need to be reported, Continuation Sheet(s), OPNAV 4790/CK(C), that can report up to four components per Form can be attached. The same JCN as assigned to the higher level assembly maintenance action recorded in SECTION I is to be continued on each component reported.

1.4 Section IV - Special Purpose: This section is filled in onboard, with the exception of Block 30 (is no longer applicable).

NOTE: EXAMPLES OF COMPLETED CK FORMS FOR VARIOUS REPORTING SITUATIONS CAN BE FOUND AT THE END OF THIS APPENDIX AS FIGURES G1 THROUGH G8.

2. PROCEDURES FOR REPORTING CONFIGURATION CHANGE (OPNAV 4790/CK FORM) - Place an "X" in the appropriate block at top of form to indicate the type of action being reported, "COMP M/A NO DEFL" or "COMP DEFL".

2.1 Section I - Job Identification.

2.1.1 Job Control Number (Blocks 1 - 3):

a. Block 1 - UIC: Enter the Unit Identification Code (UIC) of the activity receiving the maintenance action.

b. Block 2 - WORK CENTER: Enter the code of the Work Center responsible for the equipment. For Ships, a four-position Work Center code will be entered. For repair departments of IMAs, RMCs and other IMAs, a three-digit code will be entered. The three-digit code is entered left-to-right leaving the right most position blank. Appendix C of this chapter provides a listing of authorized Work Center codes (Submarine Tenders have been converted to a four position Work Center code).

c. Block 3 - JOB SEQ. NO. (JSN): Enter the four character JSN assigned by the Work Center Supervisor. This is an entry assigned sequentially from the SFWL or JSN Log.

NOTE: (BLOCKS 1, 2, 3): IF THE CONFIGURATION CHANGE BEING REPORTED IS NOT AN ALTERATION AND CLOSES A JOB PREVIOUSLY DEFERRED AND ON CSMP, ENTER THE JCN OF THE OPENING DEFERRAL. IF THE MAINTENANCE ACTION IS THE ACCOMPLISHMENT OF AN ALTERATION, ENTER THE JCN FROM THE ALTERATION RECORD (E.G., EXSA2134, OXTY1016, WXSP1124).

2.1.2 Alteration Identification.

a. Block 4 - ALTERATIONS (Ship Alterations (SHIPALTs), Field Changes (FCs), Etc.): If applicable, enter the alteration number from the authorizing directive.

(1) For SHIPALTs, enter the alteration identification exactly as it appears on the SHIPALT Record. Record the alteration type “SA” in the first two positions, ship type starting in position three, and the alteration number starting in the 7th position of the block (e.g., SASSBNf342130). Enter the title code from the alteration record in the last right-hand position of the block.

(2) For all other alteration types, enter the alteration type character code in the first two positions of the block. Enter the alteration number starting in position four (e.g., OAf96999, FC 29, TY 0132). If an alteration identification number is not provided with the alteration record, leave blank. Table 1 reflects the authorized alteration prefix codes:

Table 1 - Alteration Prefix Codes

Code	Descriptions
SA	Ship Alteration
OA	Ordnance Alteration
BA	Boat Alteration
FC	Field Change
MA	Machinery Alteration
SI	SYSCOM Command Instruction
EC	Engineering Change
HI	Habitability
TY	TYCOM Direction
TD	Technical Directive
SP	Strategic Systems Project Office Alteration
SC	Service Change
TR	Trident Alteration
EP	Engineering Change Proposal
MO	Crypto Equipment Modification
AR	Alteration Request May be originated by a ship to request an alteration design. Enter and left justify the authorized prefix "AR" followed by a blank space, any number the ship assigns for its own control.

2.1.3 Block A - Enter Command's Name.

2.1.4 Block B - Enter Ship's Hull Number (if applicable).

2.1.5 Block 5 - EIC: Enter the Equipment Identity Code (EIC) for the equipment identified in the Equipment Noun Name field (Block 7). EICs are listed in the Ship Configuration Logistic Support Information System (SCLSIS) Index Report or Ship's 3-M Reference CD or DVD.

NOTE: WHEN DOCUMENTING 3-M REQUESTS FOR FLEET AND DEPOT ASSISTANCE, A SPECIAL EIC OF "ZOZZ" FOR NAVSEA 08 AND "ZOYY" FOR DIRSSP MUST BE USED AND THE REMAINING DATA MUST BE UNCLASSIFIED.

2.1.6 Block 6 - ACT: Enter the appropriate Action Taken code from the lower section of the CK form or from the list provided in Table 2.

NOTE: THE LIST OF "ACTION TAKEN" CODES CHANGES OCCASIONALLY. VERIFY CURRENT "ACTION TAKEN" CODES AT THE FOLLOWING WEB SITE: HTTPS://OARS.NSLC.NAVY.MIL/OARS/DOCS/SHIPS3M.HTML AND SELECTECT MMBU REFERENCE LISTING

Table 2 - Action Taken Code

Code	Descriptions
5A	Partially Completed Alteration. The IMA must describe in the Job Description/Remarks section what was done and the O-level that remains to be done.
5B	Fully Completed Alteration.
5C	Fully Completed Equivalent to Alteration.
5D	Alteration Directive Not Applicable.
NOTE:	**USE OF A NUMBER 5( ) CODE REQUIRES AN ENTRY IN BLOCK 4 "ALTERATION IDENTIFICATION".**
1	Maintenance Action Completed; Parts Drawn from Supply.
2	Maintenance Action Completed; Required Parts Not Drawn from Supply (local manufacture, pre-expended bins, etc.).
3	Maintenance Action Completed; No Parts Required.
NOTE:	**THE FOLLOWING SECOND CHARACTER CODES CAN BE USED WITH THE ACTION TAKEN CODES 1, 2, OR 3 AS DIRECTED BY THE TYCOM:**
A	Maintenance Requirement Could Have Been Deferred.
B	Maintenance Requirement Was Necessary.
C	Maintenance Requirement Should Have Been Done Sooner.
M	High Cost Repairs.
T	The Equipment Being Reported Had a Time Meter.

2.1.7 Block 7 - EQUIPMENT NOUN NAME: If the maintenance action is as the result of the accomplishment of a SHIPALT, enter the equipment Noun Name from the SHIPALT record. Otherwise, enter the equipment nomenclature and description of the equipment or system on which the maintenance was performed. If the maintenance action affects several components, enter the name and designator of the highest assembly. For HM&E equipment, enter the noun name. For electronics equipment, enter the Army-Navy type designator or commercial model number. For ordnance equipment, enter the system or equipment nomenclature, followed by the Mark and Mod numbers, e.g., Launch System 36/1.

2.1.8 Block 8 - MHRS EXP: Enter the total number of man-hours expended by Ship's Force, not previously reported,) in completing and documenting the maintenance action.

Man-hours expended by others tasked to perform equipment maintenance are to be documented separately.

2.1.9 Block 9 - ACT: Actual Maintenance Time used for Selected Equipment List (SEL) equipment only. Enter the total number of clock hours expended to complete the maintenance.

2.1.10 Block 10 - COMP. DATE: Enter the Julian date the maintenance action was completed.

2.1.11 Block 11 - M/R (Meter Reading): Enter an "X" if the equipment or any of the equipment components or sub-units to be identified in Section III have time meters installed.

2.2 Section II - Job Description/Remarks Block 12: Enter any information and remarks relating to the accomplishment of the action. In some cases, an alteration directive will specify that

certain information be documented. If an "X" is entered in Block 11, identify in Block 12 each equipment followed by "M/R" and the time meter reading.

2.3 Section III - Component Configuration Change Identification.

2.3.1 Block 13 - COMPONENT NOUN NAME: Enter the noun name of the component removed, installed, or modified. For HM&E equipment, enter the noun name. For electronics equipment, enter the "AN" type designator or commercial model number. For ordnance equipment, enter the system or equipment nomenclature, followed by the Mark and Mod numbers, e.g., Launch System 36/1.

2.3.2 Block 14 - QUANTITY: Enter the number of like components or sub-units identified in Block 13 that were, removed, installed, or modified. The quantity must be "001" if a component identification number is entered in Block 16, or a serial number is entered in Block 17 (see 2.3.5.).

2.3.3 Block 15 - CA (Component Action): Enter the code identifying whether the equipment in Block 13 was, removed (R), installed (I) or modified (M). When reporting a configuration file action vice a maintenance action, enter (A) for an Add, (D) for a Delete or (C) for a Correction.

2.3.4 Block 16 - COMPONENT IDENTIFICATION: Enter the local identification number(s) such as station number or valve mark of the equipment identified in Block 13. This information must be consistent with the quantity entered in Block 14. For electronic (ELEX) equipment, enter the model number, and if available, enter the serial number in Block 17.

2.3.5 Block 17 - COMPONENT SERIAL NUMBER: Enter the manufacturer's serial number of the equipment identified in Block 13. If the serial number is not available, enter "NONE".

2.3.6 Block 18 - COMPONENT APL/AEL: Enter the Component Allowance Parts List or Allowance Equipage List (APL/AEL) of the component identified in Block 13. If not available, the unit's supply department should assign a temporary APL.

2.3.7 Block 19 - LOCATION (DECK/FRAME/SIDE): Enter the location (compartment number, deck, frame, or side notation), that best describes the location of the equipment identified in Block 13. If none of the mentioned location identifications are appropriate, enter a descriptive term of the onboard location (e.g., FANTAIL, FLIGHT DECK, etc.).

2.3.8 Block 20 - EIC: Enter the Equipment Identity Code (EIC) that best describes the component identified in Block 13.

2.3.9 Block 21 - NEXT HIGHER ASSEMBLY: Enter the nomenclature and serial number of the next higher assembly. No entry is required when the component identified in Block 13 is the highest assembly.

2.3.10 Block 22 - SAC: Enter the Service Application Code (SAC) of the component identified in Block 13. SAC codes can be obtained from the supply department.

2.3.11 Block 23 - WORK CENTER: Enter the code (Work Center Responsible for Equipment (WCRE)) of the Work Center having primary maintenance responsibility for the component identified in Block 13.

2.3.12 Block 24 - NAMEPLATE DATA: Enter the Contract Number or Procurement Document Number, Part Number or Model Number or Drawing Number, and if available, the

Commercial and Government Entity, formerly called Federal Supply Code for Manufacturers. Additional information, if available, such as physical characteristics and manufacturer's identification is useful. No entry is required for modifications and deletions if an APL is listed in Block 13.

2.3.13 Block 25 - MIP: Enter the Maintenance Index Page (MIP) covering the component identified in Block 13 for removals, modifications, changes, and deletions. If not available, enter "N/A".

2.3.14 Block 26 - EOSS: (Engineering Operation Space Sequence) For HM&E equipment, enter the Engineering Operation Space Sequence (EOSS) Document Code and Control Number of the primary EOSS procedure affected. If more than a component level document is affected, enter only the EOSS component procedure.

NOTE: ENTRY NOT REQUIRED WHEN REPORTING ELECTRONIC OR ORDNANCE CONFIGURATION CHANGE ACTIONS.

2.3.15 Block 27 - TM: For removal and modifications, enter the Technical Manual (TM) covering the affected component. For like equipment installations, enter the TM covering the equipment. For new installations, enter the TM when available; if not available, enter N/A.

2.4 Section IV - Special Purpose.

2.4.1 Block 28 - RIN: Enter the Record Identification Number (RIN) as listed in part I, section C of the COSAL, for deletions, removals, and modifications. For installations and additions, leave blank.

2.4.2 Block 29 - Automated Integrated Language System Identification Number: Enter the Automated Integrated Language System Identification Number assigned by the CDM, Platform Manager or Item Manager. For Electronic equipment, no entry is required unless directed by TYCOM. (Commander Naval Installations Command, Commander Naval Surface Pacific, Commander Naval Surface Atlantic, Commander Naval Information Forces, Commander Submarine Force Atlantic And Commander Submarine Force Pacific have no requirement.)

2.4.3 Block 30 - SECAS OFFICE USE: Block is no longer used.

3. PROCEDURES FOR USING CK CONTINUATION PAGES: The JCN entry must be per paragraph 2.2.1 of this Appendix. Up to four components can be reported on the same continuation form, with each separate component block considered a separate continuation page with its own page number. Assign page numbers consecutively. If applicable, check the block at the top of each component identification section to indicate that all data to be entered per paragraph 2.2.1 of this Appendix, except for that data entered in the component identification section. An arrow* pointing up should be placed in the first block of each blank field to indicate that it is per paragraph 2.2.1 of this Appendix. For each component reported, the required entries on the continuation pages are the JCN, page number, equipment alteration number (if applicable) and those component identification data elements which differ from Section III (original CK).

* On the electronic form this is accomplished by holding down the "Alt" key and on the number key-pad typing in 2 and then 4. This will produce an up arrow in the block selected.

4. PROCEDURES FOR REPORTING CONFIGURATION FILE CORRECTIONS AND UPDATING THE COORDINATED SHIPBOARD ALLOWANCE LIST.

4.1 Correct errors in a previous submission: Check the block "CONFIG FILE CORR" at the top right portion of the CK form. Enter the exact JCN (Blocks 1, 2, and 3) and page number of the CK which was submitted in error. Enter action code "C", which indicates "correction" in Block 15. If the entire configuration data submitted on the previous CK is in error, fill in ALL the blocks with the corrected data. Otherwise, fill in only the applicable blocks with the correct data.

4.2 Correct a Data Element Error in the Ship's COSAL or COSAL Indexes, or Other Such Documents: Check the block (CONFIG FILE CORR) at the top right portion of the CK form. In SECTION I, enter a new JCN in Blocks 1, 2 and 3. In SECTION II, Block 12 for "JOB DESCRIPTION" insert the words "CORRECTION OF COSAL", or a description of the type of correction. If the APL is to be corrected, enter the words "CHANGE APL FROM _____" and enter the incorrect APL number. In Section III, enter in Block 13 the component noun name from the SCLSIS Index report, COSAL, etc. Enter in Block 15 code "C" for "correction". Enter the EIC of the component in Block 20. If the correction is for HM&E equipment, also enter the APL in Block 18. Enter the applicable RIN in Block 28. In addition to the corrected data these are the only required data elements that need to be reported.

5. REPORT AN EQUIPMENT RECORD ADDITION/DELETION: Complete the CK as described for "CORRECTING A DATA ELEMENT IN THE SHIP'S COSAL" in the previous paragraph, with the following exceptions: In SECTION II, Block 13 enter the words "ONBOARD - NOT COSAL SUPPORTED" or "NOT ONBOARD - COSAL SUPPORTED", as appropriate. In Section III Block 15, enter action code "A" for equipment onboard but not COSAL supported, or action code "D" for equipment that is not onboard but is COSAL supported. For an equipment "ADD", also provide as much additional information as possible (e.g., Serial Number, Next Higher Assembly, if applicable, Location, Work Center, EIC, Nameplate Data, MIP, TMs, etc.). For equipment DELETE, provide the RIN in Block 28 if applicable.

6. REPORT THE TURN-IN OR RECEIPT OF PORTABLE ELECTRICAL/ELECTRONIC TEST EQUIPMENT (PEETE): Check the CK Block for "CONFIG FILE CORR" and then follow standard procedures described for "CORRECTING A DATA ELEMENT IN THE SHIP'S COSAL" in the previous paragraph.

7. HANDLING PROCEDURES: The completed CK form is submitted to the Work Center Supervisor and then to the Division Officer, each of whom reviews the form for completeness and accuracy and initials in the appropriate blocks at the bottom of the form. The Division Officer then forwards the CK to the supply department. Supply department personnel verify or enter data such as APL/AEL, SAC and RIN and will resolve any discrepancies noted with the Work Center Supervisor prior to further routing. Supply department personnel will initial the appropriate block at the bottom of the form and ensure the sequence number first digit is the last digit of the current calendar year. The remaining four digits indicate the chronological sequence of CK forms being submitted by the ship or activity for the year. Supply department personnel will ensure the Work Center entered in Block 23 as the correct Work Center having primary maintenance responsibility for the equipment (not the supply department Work Center). The Supply Department should then forward the CK to the 3-M Coordinator. After reviewing for completeness, initialing, and dating in the appropriate block, the 3-M Coordinator submits the

CK to the 3-M ADP facility serving the activity. A copy is to be maintained in the Work Center as a suspense copy.

The following figures are provided:

APPENDIX D

PREPARATION INSTRUCTIONS SHIP'S MAINTENANCE ACTION FORM (OPNAV 4790/2K)

1. SHIP'S MAINTENANCE ACTION FORM (OPNAV 4790/2K). The 2-Kilo Form is used for reporting deferred maintenance actions, and the completion of maintenance actions that do not result in a configuration change. Two blocks at the top of the form are used to specify what type of maintenance action is being reported, a deferral "DEFL" or a completion "COMP". The rest of the form is separated into six sections. A partially completed maintenance action which results in a configuration change or a complete or partially accomplished alteration should be reported using the CK Form. Refer to the instructions for using the CK Form, appendix C.

1.1 Section I - IDENTIFICATION: This section is used to identify the equipment or system on which maintenance actions are being reported.

1.2 Section II - DEFERRAL ACTION: This section, filled in when reporting a deferral of a maintenance action, indicates man-hours expended up to the time of deferral, the date of deferral, man-hours remaining and required completion date (if necessary).

1.3 Section III - COMPLETED ACTION: This section is filled in when reporting the completion of a maintenance action and contains blocks used when reporting maintenance actions on selected equipment.

1.4 Section IV - REMARKS/DESCRIPTION: This section is filled in when reporting the deferral of a maintenance action. The type of information recorded includes remarks that describe what is wrong, what caused the failure or malfunction, maintenance to be performed, the names of personnel involved in the maintenance action, a priority and availability assignment and signatures by management personnel who screened the maintenance action.

1.5 Section V - SUPPLEMENTARY INFORMATION: This section completed by the reporting activity provides information pertaining to required maintenance actions or onboard reference material (e.g., technical manuals, blueprints, etc.). This section is also used by the repair activity in planning, scheduling and controlling the repair activity work.

1.6 Section VI - REPAIR ACTIVITY PLANNING/ACTION: This section is used by the repair activity for planning, estimating and scheduling purposes and can be used to report work accomplished by an internal department Work Center or by an external activity not under an ADP system.

NOTE: EXAMPLES OF COMPLETED 2-KILO FORMS FOR VARIOUS REPORTING SITUATIONS CAN BE FOUND AT THE END OF THIS APPENDIX:

Figure 1 Maintenance Action Form for a Deferred Maintenance Action

Figure 2 Maintenance Action Form for a Completed Maintenance Action without Prior Deferral

Figure 3 Maintenance Action Form for Changes to a Previously Submitted Deferred Maintenance Action

Figure 4 Maintenance Action Form for Add-on Remarks to a Previously Submitted Deferred Maintenance Action

2. PROCEDURES FOR DOCUMENTING A DEFERRED MAINTENANCE ACTION - PLACE AN "X" IN THE BLOCK TITLED "DEFL" AT TOP OF FORM.

2.1 Section I - IDENTIFICATION

a. JOB CONTROL NUMBER (Blocks 1 - 3):

(1) Block 1 - UIC: Enter the UIC of the activity initiating the maintenance action.

(2) Block 2 - WORK CENTER: Enter the Work Center code of the Work Center initiating the maintenance action. For Ships, a four-position Work Center code will be entered. For repair departments of, IMAs, RMCs and other IMAs, a three-digit code will be entered. The three-digit code is entered left-to-right leaving the right most position blank. Appendix C of this chapter provides a listing of authorized Work Center codes. (Submarine Tender Repair Work Centers have been converted to four position work center codes)

(3) Block 3 - JOB SEQ. NO.: Enter the job sequence number assigned by the Work Center Supervisor. This is an entry assigned sequentially from the SFWL/JSN Log.

b. Block 4 - APL/AEL (Allowance Parts List/Allowance Equipment List): Enter the APL/AEL of the equipment being reported. These numbers are found in the COSAL or SCLSIS Index Report. An example of an APL would be "882170236" and an AEL would be "2-260034096."

c. Block A - Enter COMMAND'S NAME

d. Block 5 - EQUIPMENT NOUN NAME: Enter the equipment nomenclature and description on which maintenance is being reported. The equipment nomenclature and description should be the same as that identified by the EIC and is limited to 16 positions. Standard abbreviations can be used if clarity is retained. For electronic equipment having an Army-Navy (AN) designation, it will be substituted for the equipment nomenclature.

e. Block B - Enter SHIP'S HULL NUMBER (if applicable).

f. Block 6 - WHEN DISCOVERED (WND): Enter the code (Table 1) that best identifies when the need for maintenance was discovered.

Table 1 - When Discovered Codes

Code	Description
1	Lighting Off or Starting
2	Normal Operation
3	During Operability Test
4	During Inspection
5	Shifting Operational Modes
6	During PMS
7	Securing
8	During AEC (Assessment of Equipment) Program
9	No Failure, PMS Accomplishment Only
0	Not Applicable (use when reporting printing services, etc.)

g. Block 7 - STATUS (STA): Enter the code (Table 2) that most accurately describes the effect of the failure or malfunction on the operational performance capability of the equipment when the need for maintenance was first discovered.

Table 2 – Status Codes

Code	Description
1	Operational
2	Non-Operational
3	Reduced Capability
0	Not Applicable (use if reporting printing services, etc.)

(1) OPERATIONAL must be selected when the system or equipment is operational with only minor discrepancies that do not impact performance. (Similar to EOC 0.8 – 1.0: See chapter 5, appendix A of this volume)

(2) NON-OPERATIONAL must be selected when the system or equipment is totally inoperative or is severely degraded with major operation restrictions and may be a threat to personnel safety. (Similar to EOC 0.0 - 0.4: See chapter 5, appendix A, of this volume)

(3) REDUCED CAPABILITY must be selected when the system or equipment is operational with discrepancies that could potentially impact performance or has minor operational restrictions that are not a threat to personnel safety. (Similar to EOC 0.5 - 0.7: See chapter 5, Appendix A, of this Volume)

(4) NOT APPLICABLE (Equivalent to EOC 1.0: See chapter 5, Appendix A, of this Volume) must be selected:

(a) When ordering parts for PMS.

(b) When updating a 2-Kilo and the object has been repaired but the JCN cannot be closed due to awaiting parts.

(c) When requesting services such as printing, plaques, special support equipment, test equipment, etc.

(d) For data reporting.

(e) For SHIPALTs/Ship Change Documents.

(f) For system or equipment configuration changes (CK).

(g) When requesting support services in a maintenance availability.

(h) For future time directed CMP and PMS maintenance tasks.

h. Block 8 - CAUSE (CAS): Enter the code (Table 3) that best describes the cause of the failure or malfunction when the need for maintenance was first discovered. (Refer to reference (a), Appendix A, Table A-6 data element "CAUSE" for an expanded definition of the allowable codes or values).

Table 3 - Cause Codes

Code	Description
1	Abnormal Environment
2	Manufacturer or Installation Defects
3	Lack of Knowledge or Skill
4	Communication Problem
5	Inadequate Instruction or Procedure
6	Inadequate Design
7	Normal Wear and Tear
0	Other or No Malfunction

i. Block 9 - DEFERRAL REASON (DFR): Enter the deferral reason code (Table 4) which best describes the reason the maintenance cannot be done at the time of deferral. (Refer to reference (a), Appendix A, Table A-7 data element "DEFERRAL REASON" for an expanded definition of the allowable codes or values).

Table 4 – Deferral Codes

Code	Deferral Reason
1	Due to Ship's Force, Unit's Work Backlog or Operational Priority
2	Lack of Material
3	No Formal Training on this Equipment
4	Formal Training Inadequate for this Equipment

Code	Deferral Reason
5	Inadequate School Practical Training
6	Lack of Facilities or Capabilities
7	Not Authorized for Ship's Force or Unit Accomplishment
8	For Ship's Force or Unit Overhaul of Availability Work List
9	Lack of Technical Documentation
0	Other - or Not Applicable (explain in block 35)

j. Block 10 - This Block is reserved for TYCOM directed applications. Refer to TYCOM instruction for use.

k. Block 11 - This Block is reserved for TYCOM directed applications. Refer to TYCOM instruction for use.

l. Block 12 - This Block is reserved for TYCOM directed applications. Refer to TYCOM instruction for use.

m. Block 13 - IDENT/EQUIPMENT SERIAL NUMBER: Enter the identification or serial number of the equipment or system on which maintenance is being deferred. For HM&E equipment, enter the Valve Mark or Electric Symbol Number (ESN) or Primary Identification Number. For electronic equipment, enter the manufacturer's serial number of the equipment or system on which maintenance is being deferred.

n. Block 14 - EIC: Enter the Equipment Identification Code of the component, equipment, subsystem, or system for which the maintenance is being reported.

o. Block 15 - SAFETY HAZARD: Enter an "X" or applicable safety code (Table 5) if the maintenance action describes a problem or condition which has caused or has the potential to cause serious injury to personnel or material. A brief explanation must be included in the Remarks/Description field (Block 35).

For example: "Reinspection of separator for presence of oil after rinse. MRC A-27 evidently not done. Presence of oil resulted in fire in HP air system when compressor operated under load. Fire badly burned valve AHP-287, requiring replacement."

NOTE: THE SHIP'S OR UNIT'S 3-M COORDINATOR WILL FORWARD A COPY OF ALL 2-KILO DOCUMENTATION HAVING AN ENTRY IN THIS FIELD TO THE SAFETY OFFICER FOR REVIEW. (REFER TO REFERENCE (A), APPENDIX A, TABLE A-14, DATA ELEMENT "SAFETY HAZARD" FOR AN EXPANDED DEFINITION OF THE ALLOWABLE CODES OR VALUES).

Table 5 - Safety Hazard Codes	
Code	Description
1	Critical Safety or Health Deficiency-Correct Immediately
2	Serious Safety or Health Deficiency-Suspension of Equipment, System or Space Use is required
3	Moderate Safety or Health Deficiency-Waiver of Equipment, System or Space Use is granted Pending Correction of the Item
4	Minor Safety or Health Deficiency
5	Negligible Safety or Health Deficiency
0	Maintenance Action is Not Safety Related
NOTE: CODES "6" THROUGH "9" MAY BE LOCALLY ASSIGNED BY TYCOMS IF ADDITIONAL SAFETY CODES ARE REQUIRED.	

p. Block 16 - LOCATION: Enter the location (compartment number, deck, frame, or side notation), that best describes the location of the equipment requiring maintenance as identified in Block 13. If none of the mentioned location identifications are appropriate, enter description of the location (e.g., FANTAIL, FLIGHT DECK, etc.).

q. Block 17 - WHEN DISCOVERED DATE: Enter the Julian date when the equipment or system failure or malfunction was discovered.

r. Block 18 - ALTERATIONS (SHIPALT, ORDALT, Fld. Chg., etc.): If reporting the deferral of an alteration:

(1) SHIPALT - Enter the alteration identification exactly as it appears on the SHIPALT Record. Record the alteration type "SA" in the first two positions, ship type starting in position three, and the alteration number starting in the 7th position of the block (i.e., SASSBNf342130). Enter the title code from the alteration record in the last right-hand position of the block.

(2) OTHER Alteration Types - Enter the alteration type character code (Table 6) in the first two positions of the block. Leave the third position blank and enter the alteration number starting in position four (i.e., OA f96999, FC 29, TY 0132). If an alteration identification number is not provided with the alteration record, leave blank.

Table 6 - Alteration Type Codes

SA	Ship Alteration
OA	Ordnance Alteration
BA	Boat Alteration
FC	Field Change
MA	Machinery Alteration
SI	SYSCOM Command Instruction
EC	Engineering Change
HI	Habitability
TY	TYCOM Direction
TD	Technical Directive
SP	Strategic Systems Project Office Alteration
SC	Service Change
TR	Trident Alteration
EP	Engineering Change Proposal
MO	Crypto Equipment Modification
AR	Alteration Request May be originated by a ship to request an alteration design. Enter and left-justify the authorized prefix "AR" followed by a blank space any number the ship assigns for its own control.

s. Blocks 19 through 24 - FOR INSURV USE - no entries required. See Section 2 of NAVSEAINST 4790.8C for specifications.

2.2 Section II - DEFERRAL ACTION.

a. Block 25 - MAN-HOURS EXPENDED (MHRS. EXP.): Enter the total man-hours (to the nearest whole hour) expended by personnel of all Work Centers involved in the maintenance action up to the time of deferral (include documentation time which should not exceed one hour).

b. Block 26 - DEFER. DATE: Enter the Julian date when the maintenance action was deferred. An example of a deferral on 11 January 1994 would be "4011".

c. Block 27 - MAN-HOURS REMAINING (MHRS. REM.): Enter the estimated number of man-hours remaining to complete the maintenance action. Round off to the nearest whole hour. If the TYCOM allows an automated close out of the deferral by the IMA, the letters "AUTO" will be entered. This is a request to the IMA to complete the maintenance action with no further documentation from the shop after the job has been accepted by the originator (authorized signature). If the originating

command does not receive CSMP support from the IMA doing the work, do not use the "AUTO" close out feature.

d. Block 28 - DEADLINE DATE:

(1) Depot (shipyard or ship repair facility) (T/A-1) the Deadline Date is required. The date entered is the end of the scheduled maintenance availability.

(2) Intermediate Maintenance Activity (tender, repair ship, etc.) (T/A-2) the Deadline Date is required. The date entered is the end of the scheduled maintenance availability.

(3) TYCOM Support Unit (floating dry dock, etc. or technical assistance from Systems Command, organic technical agents, or contractor representative) (T/A-3) is required. Date entered is the entry date plus a realistic estimated time to repair. Update to the Deadline Date is required if the estimate changes.

(4) Ship's Force or Unit (T/A-4) is required. Date entered is the entry date plus a realistic estimated time to repair. Updates to Deadline Date are required if the estimate changes.

2.3 Section III - COMPLETED ACTION.

a. Blocks 29 through 33 - USED FOR REPORTING THE COMPLETION OF A MAINTENANCE ACTION.

b. Block 34 - METER READING: If the equipment has a time meter and is on the Selected Equipment List (SEL), the reading (to the nearest whole hour) at the time of failure is entered in this block. If the equipment has more than one meter, designate the meter being recorded in Block 35 "REMARKS" using the letters "METRED" followed by the meter designator. An asterisk (*) must precede and follow the meter designation. Example: *METRED-1A2M1*.

2.4 Section IV - REMARKS/DESCRIPTION.

a. Block 35 - REMARKS/DESCRIPTION: Enter remarks relating to the maintenance action. These remarks should be brief, but complete and meaningful. Remarks should state what is wrong, what caused the failure (if known) and what must be done to correct the problem. Separate the two statements with "XXX". For example, "HIGH PITCHED SQUEAL OF PUMP SHAFT, GAUGE READING ABOVE RED LINE ON #2 PUMP, SSG CASING IS EXTREMELY HOT. XXX INVESTIGATE AND REPAIR AS NECESSARY." If more space is needed, check Block 36 "CONT. SHEET" and continue the remarks on a second form using the same JCN. Include the statement "2L USED" if Supplemental Form 2-Lima is used for drawings or other supplemental information. The remarks should not include statements explaining what has been coded in another place of the form; i.e., "DEFERRAL REASON 2 = LACK OF MATERIAL". Classified or Navy Nuclear Power Information is prohibited from being entered into the Work Candidate. If a full description of the material deficiency requires the use of classified information, a separate message should be generated with the required data and the message referred to in Block 35 by message Date Time Group. The following are minimum requirements for Block 35:

(1) Depot (shipyard or ship repair facility) (T/A-1):

(a) Concisely describe the failure or malfunction and what caused it. Include how and when the casualty was discovered. Provide description of the casualty to include information on operating configuration symptoms and indications.

(b) Concisely describe the actions taken by Ship's Force or Unit personnel and outside activities to troubleshoot and correct the failure or malfunction. Include initial follow-up and troubleshooting, Ship's Force or Unit repair efforts or technical assistance received.

(c) Include any test results from troubleshooting.

(d) Include the reason for deferral to an off ship maintenance activity.

(2) Intermediate Maintenance Activity (tender, repair ship, etc.) (T/A-2):

(a) Concisely describe the failure or malfunction and what caused it. Include how and when the casualty was discovered. Provide description of the casualty to include information on operating configuration symptoms and indications.

(b) Concisely describe the actions taken by the command and outside activities to troubleshoot and correct the failure or malfunction. Include initial follow-up and troubleshooting, command repair efforts or technical assistance received.

(c) Include any test results from troubleshooting.

(d) Include the reason for deferral to an off ship maintenance activity.

(3) Technical Assistance in troubleshooting (T/A-3):

(a) Concisely describe the failure or malfunction and what caused it. Include how and when the casualty was discovered. Provide description of the casualty to include information on operating configuration symptoms and indications.

(b) Concisely describe the actions taken by command personnel to troubleshoot and correct the failure or malfunction. Include initial follow-up and troubleshooting, command's repair efforts or previous technical assistance.

(c) Include any test results from troubleshooting.

(d) Clearly specify the type of outside assistance and the time frame desired by the activity.

(4) Technical Assistance in obtaining special support or test equipment (T/A-3):

(a) Describe the special support or test equipment required by the activity.

(b) Describe the maintenance action for which the equipment will be used.

(c) Include any assistance the activity may need from the requesting activity (e.g., training, assistance in operating the equipment, etc.).

(d) Clearly specify the dates the equipment is needed and estimated time the equipment will be returned.

(5) Technical Assistance documenting the results of an inspection or assessment (T/A-3):

(a) The inspection or assessment activity must provide the activity with a maintenance ready 2-Kilo.

(b) Documentation of assessment results by the equipment Subject Matter Expert will include all the technical data needed to complete a 2-Kilo as specified in chapter 42 of this volume.

(6) Technical Assistance in obtaining support services during a maintenance availability (T/A-3):

(a) Describe the support service required by the activity.

(b) Describe the maintenance action for which the support services will be used.

(c) Include any assistance the activity may need from the requesting activity (e.g., training, assistance in operating the equipment, etc.).

(d) Clearly specify the dates the support services are needed and estimated time the support services will no longer be required.

(7) Ship's Force and Unit maintenance action (T/A-4):

(a) Concisely describe the failure or malfunction and what caused it. Include how and when the deficiency was discovered. Provide description of the deficiency to include information on operating configuration symptoms and indications.

(b) Concisely describe the actions taken by command personnel to correct the failure or malfunction. Include initial follow-up and troubleshooting, command personnel repair efforts or previous technical assistance.

(c) Include any test results from either troubleshooting or post repair testing.

b. Block 36 - CONT. SHEET: Enter an "X" in this block if the "REMARKS" are continued on additional 2-Kilo forms. No more than three additional 2-Kilo forms can be used.

NOTE: WHEN USING 2-KILO CONTINUATION PAGES FOR THE CONTINUATION OF "REMARKS", ENTER THE JCN OF THE FIRST FORM AND CONTINUE WITH THE REMARKS IN SECTION IV. IN THE TOP MARGIN OF EACH CONTINUATION PAGE, INSERT THE WORDS "PAGE 2", "PAGE 3", ETC.

c. Block 37 – CSMP SUMMARY: Enter a condensed description of the problem. The Work Center Supervisor is to ensure the summary succinctly captures the meaning of the Block 35 REMARKS/DESCRIPTION narrative. The CSMP summary conveys to management the significance of the JCN (maintenance action). The CSMP summary is displayed on management reports, as opposed to the entire narrative of the REMARKS blocks.

d. Block 38 - FIRST CONTACT/MAINT. MAN: Printed name of the senior person knowledgeable in the specifics of the JCN (maintenance action).

e. Block 39 - RATE: Enter the rate of the first contact or maintenance person. Examples are:

Table 7 – Rank or Rate Codes	
Rank or Rate Code	Entry
Officers	OFF
ET1	ET1
Civilian	CIV
GMG2	GMG2
FTGSN	FTGN
FN	FN

f. Block 40 - SECOND CONTACT/SUPERVISOR: Printed name of the supervisor (LCPO) of the first contact or maintenance person after screening the maintenance action for completeness and accuracy.

g. Block 41 - PRI: Enter the appropriate priority code (Table 8). Refer to reference (a) Appendix C, Table A-14 for an expanded definition of the allowable codes or values.

Table 8 – Priority Codes	
Code	Description
1	Mandatory
2	Essential
3	Highly Desirable
4	Desirable

h. Block 42 - TA: Enter the Type Availability (T/A) code (Table 9) for the type availability recommended for performance of the deferral.

Table 9 - Type Availability Codes	
Code	Description
1	Depot (shipyard or ship repair facility)
2	Intermediate Maintenance Activity (tender, repair ship, etc.)
3	Fleet Technical Support. TYCOM Support Unit (floating dry dock, etc., or technical assistance from NAVSEA or Regional Maintenance Centers or contractor representative)
4	Ship's Force or Unit (Originating Work Center, Organizational Level)
0	Not Applicable (Not applicable to Submarine Force)
U	(Mission Degrading) (entered on 2-Kilo) Used by INSURV. Field identifies certain deficiencies which are considered as preventing the activity from carrying out some part of its mission.

NOTE: TABLE 10 PROVIDES GUIDANCE ON USING AVAILABILITY CODES.

Table 10 – Type Availability Codes	
Scenario or Issue	Use T/A Code
When requesting technical assistance from off-hull activities.	3
When requesting repair (industrial) from outside activities.	1 or 2
When requesting calibration from outside activities.	1 or 2
When ordering parts or materials for Ship's Force or Unit use.	4
For data reporting.	3
When requesting special support or test equipment (hydrostatic pumps, rigging equipment, etc.).	3
Completed without prior deferral.	4
When submitting a CASREP.	1, 2, 3 or 4
When submitting a temporary DFS.	1, 2 or 4
For any change in system or equipment configuration.	3
For documenting the results of an inspection or assessment.	3
For installation of a SHIPALT or Ship Change Document.	1, 2 or 4
For support services during a maintenance availability.	3
For a CMP maintenance action.	1 , 2, 3 or 4

i. Block 43 - INTEGRATED PRIORITY: If the maintenance is to be done by an outside activity, the Command's Engineer may rank departmental deferrals by integrated priority. A sequential number may be placed in this block to indicate its priority relative to other deferred work for a given availability.

(1) Block C - DIV. INIT: Initialed by the Division Officer after screening the document.

(2) Block D - DEPT. INIT: Initialed by the Department Head after screening the document.

(3) Block E - COMMANDING OFFICER'S SIGNATURE: Required on all deferrals for outside assistance, the Commanding Officer or authorized representative must sign the deferral.

(4) Block F - TYCOM AUTHORIZATION: This block is reserved for the signature of the TYCOM representative screening the deferral. This is usually applicable when direct routing from command to TYCOM for Depot emergent work is employed.

j. Blocks 44 through 46 are not completed at the time of deferral. Entries are made by the next level of management after leaving the command (IUC and TYCOM during the screening process).

2.5 Section V - SUPPLEMENTARY INFORMATION. Block 47 - BLUEPRINTS, TECH. MANUALS, PLANS, ETC.: Enter any TMs, blueprints, etc., which might be of use to a repair activity providing assistance. Indicate with an "X" in the "AVAILABLE ON BOARD" – "YES/NO" block if the TM is onboard or not.

3. PROCEDURES FOR DOCUMENTING INTERNAL WORK REQUESTS - When it is necessary to obtain assistance from other departments within the organizational level, the 2-Kilo Form can be used as an internal work request. If more than a single assisting Work Center is required, multiple copies will be prepared using the same JCN on each request. The requesting Work Center prepares the number of copies required for internal control. The words "INTERNAL WORK REQUEST" is written at the top of each copy to be sent to the assisting Work Center(s). The following blocks are used:

3.1 Section I - IDENTIFICATION: Document all of this section. See "Procedures for Documenting a Deferred Maintenance Action" paragraph 4.1.

3.2 Section IV - REMARKS/DESCRIPTION. Block 35 - REMARKS/DESCRIPTION: Describe the tasks required of the Assisting Work Center (AWC).

3.3 Section VI - REPAIR ACTIVITY PLANNING/ACTION.

a. Block 49 - REPAIR WORK CENTER (W/C): Enter the AWC's code.

b. Block 55 - REPAIR ACTIVITY UIC: Enter the organization unit's UIC. This will be the same as Block 1 except when the ship is being assisted by a non-reporting outside activity, in this case, the outside activity's UIC will be entered.

c. Block 56 - WORK REQ. ROUTINE: Enter the appropriate Expanded Ship Work Breakdown Structure, SWAB, SWLIN, etc., as directed by the TYCOM.

4. PROCEDURES FOR DOCUMENTING SCREENING INFORMATION ON DEFERRED MAINTENANCE ACTIONS - Used by other activities, such as IUCs, TYCOM representatives and IMAs for screening, planning, and scheduling.

4.1 Section IV - REMARKS/DESCRIPTION.

a. Block F - TYCOM AUTHORIZATION: This block is reserved for the signature of the TYCOM representative screening the deferral.

b. Block 44 - IUC: The IUC or designated representative screening the deferral enters the recommendation as to the action to be taken. See the allowable codes (Table 11).

Table 11 - Action to be Taken Codes

Code	Description
1	Depot (shipyard or ship repair facility) Accomplish
1A	Depot Assisted by Ship's Force or Unit Personnel
1S	Ship to Shop
1M	Accomplish with Modification
2	IMA (tender or repair ship, etc.) Accomplish
2A	IMA Assisted by Ship's Force or Unit Personnel
2S	Ship to Shop
2M	Accomplish with Modification
3	Fleet Technical Support. TYCOM Support Unit (floating dry dock, etc.) accomplished or Technical Assistance from NAVSEA, Regional Maintenance Center or Contractor Representative.
3A	TYCOM Support Un Assisted by Ship's Force or Unit Personnel
3S	Ship to Shop
3M	Accomplish with Modification
4	Ship's Force or Unit Personnel Accomplish
5	Deferred
5A	Insufficient Time in the Availability to Complete the Task
5B	Lack of Shipyard Capability
5C	Lack of Material
5D	Lack of Funds
5E	Not Required During this Availability
5F	General
6	Not Authorized

Code	Description
6A	Not Technically Justified
6B	Covered by an Existing Ship Alteration
6C	Duplicate of Another JCN
6D	Not Cost Effective
6E	General
8*	Disapproved. * This screening code disapproves the accomplishment of a work item by an outside activity. It does not prevent entry of the deferral into the CSMP, which is the decision of the Commanding Officer
9**	Remove from CSMP. Pass to history (to be assigned by TYCOM only). ** This screening code is restricted to the removal of INSURV items from the CSMP for which, in the opinion of the Ship's or Unit's IUC and TYCOM, the ship has no responsibility for accomplishment.
NOTE:	**THE FIRST CHARACTER OF THE UIC OR TYCOM SCREENING CODE SHOULD BE ENTERED IN THE APPROPRIATE FIELD. THE SECOND CHARACTER, WHEN USED, SHOULD BE ENTERED IN THE SPACE JUST BELOW IT.**

c. Block 45 - TYCOM: The TYCOM or designated representative screening the deferral will enter the action to be taken. See the allowable codes (Table 11).

d. Block 46 (A-L) - SPECIAL PURPOSE: Use of these codes are optional and indicates that quality control and quality assurance standards may be required. Special purpose blocks 46A through 46H and 46K will be used when directed by TYCOM.

(1) Block 46A - The Department Head may enter the KEY EVENT code from the ISIC provided Key Event Schedule.

(2) Block 46B – Optional, if used Submarines will enter code "SS" if the job requires work within SUBSAFE boundaries or involves SUBSAFE materials. Surface Ships may enter S1 for "PARTS ON HAND or PARTS NOT REQD," S2 for "PARTS ON ORDER-DEF DEL DT," S3 for "CONT PROCURE PARTS," S4 for "WORK COMPL PREVIOUSLY."

(3) Block 46C – Optional, if used, enter the code "LI" if the job requires work within Level I boundaries or involves Level I material.

(4) Block 46D – Optional, if used, enter the code "08" if the job is associated with nuclear equipment. Refer to NAVSEAINST 9210.4A (NOTAL).

(5) Block 46E - Optional, if used, enter the code "RC" if the job requires radiological controls (RADCON). (Refer to NAVSEA Technical Publication S9213- 33-MMA-000/(V).

(6) Block 46F - Optional, if used, enter the code "DD" if the job requires Dry Docking to accomplish.

(7) Block 46G - Optional, if used, enter the code "NC" for critical noise deficiencies or "NP" for potential radiated noise deficiencies.

(8) Block 46H - The following codes are used in MFOM VSB for work screening: GC (Contract), IC (Indefinite Delivery, Indefinite Quantity), CC (Commercial Industrial Services), RC (Regional Maintenance Center Contracting Officer), TC (Type Commander Contracting), BC (Blanket Purchase Agreement/Basic Ordering Agreement), TV (Tanks & Voids), CS (Crane Services), NS (NAVSEA), DV (Diver Services) or AC (AVCERT).

(9) Block 46I - Reserved for future use.

(10) Block 46J - Reserved for future use.

(11) Block 46K - Optional, if used, enter the appropriate code: FB for Fly-By-Wire Certification Boundary (FBW Certification Blue Boundary), SF for Submarine Flight Critical Component (SFCC Red Boundary) or DSS for Deep Submergence System-Scope of Certification (DSS-SOC).

(12) Block 46L - Enter the code assigned to the visiting activity. This will identify the visiting activity as the originator of the deferral.

4.2 Section V - SUPPLEMENTARY INFORMATION.

a. Block 47 - BLUEPRINTS, TECHNICAL MANUALS, PLANS, ETC: The repair activity can use this block during the work request planning in much the same manner as the originator. Information that might be of use in the accomplishment of the maintenance can be entered (e.g., TMs, blueprints, etc.).

b. Block 48 - PREARRIVAL/ARRIVAL CONFERENCE ACTION/REMARKS: The repair activity may enter any remarks considered necessary to facilitate repairs.

4.3 Section VI - REPAIR ACTIVITY PLANNING/ACTION.

a. Block 49 - REPAIR W/C: Enter the character code of the lead Work Center assigned to the job. Refer to reference (a) appendix A, Table A-10 data element "IMA REPAIR WORK CENTER" for a listing of IMA Work Center codes.

b. Block 50 - EST. MHRS.: Enter the total number of estimated man-hours required by the lead Work Center to complete the job.

c. Block 51 - ASST. REPAIR W/C: Enter the three or four character code of the first Work Center assigned to assist the lead Work Center on the job being planned. If more than one assist Work Center is required, check Block 36 to indicate a continuation page is being used. On the continuation page (new 2-Kilo form), fill in Blocks 1, 2, 3 with the same JCN of the original 2-Kilo. In Block 51, enter the second

assist repair Work Center's code. No more than two assist Work Centers (two supplemental 2-Kilo forms) can be submitted.

d. Block 52 - ASST. EST. MHRS: Enter the total number of estimated man-hours required by the assist Work Center to complete its portion of the job.

e. Block 53 - SCHED. START DATE: Enter the Julian date that work on the job is to begin.

f. Block 54 - SCHED. COMP. DATE: Enter the Julian date that all work on the job is scheduled to be completed by the repair activity.

g. Block 55 - REPAIR ACTIVITY UIC: Enter the UIC of the repair activity performing the work for the originating command.

h. Block 56 - WORK REQ. ROUTINE: Enter the appropriate Expanded Ship Work Breakdown Structure, Ship Work Authorization Boundary (SWAB), Ship Work Line Item Number (SWLIN), etc., as directed by the TYCOM.

i. Blocks 57 through 63: - Used to identify Depot estimates on individual CSMP items from the Master Job Catalog. These blocks may also be used as directed by TYCOM instruction.

(1) Block 57 - EST. MAN-DAYS: Enter an estimate of the total number of man-days required to complete the job. If the estimate is less than one, enter 1.

(2) Block 58 - EST. MAN-DAY COSTS: Enter an estimate of the total man-day costs required to complete the job.

(3) Block 59 - EST. MATERIAL COSTS: Enter an estimate of the total material costs required to complete the job.

(4) Block 60 - EST. TOTAL COST: Enter an estimate of the total cost required to complete the job (Add Blocks 58 and 59).

(5) Block 61 - JOB ORDER NUMBER: Enter Job Order Number assigned by the activity performing the work.

(6) Block 62 - LEAD P&E CODE: Enter the code assigned to the lead planning and scheduling organization.

(7) Block 63 - DATE OF EST: Enter the date that the repair activity's planning action was completed.

5. PROCEDURES FOR DOCUMENTING A COMPLETED MAINTENANCE ACTION PREVIOUSLY DEFERRED: Blocks A, B, and applicable Blocks 1 through 47 have previously been filled. The maintenance person must report completion of a previously deferred maintenance action by using the copy of the 2-Kilo retained onboard when the maintenance action was deferred. If there is no record (paper) copy of the original 2-Kilo and the maintenance action is on the CSMP, enter the JCN on a blank 2-Kilo form, and without providing all the deferred maintenance information, enter the completion data in Section III. If the word "AUTO" has been entered in Block 27 as directed by the TYCOM, submission of a completed maintenance action by the originating ship may not be necessary.

5.1 Section III - COMPLETED ACTION. Block 29 - ACT. TKN: Enter the code (Table 12) that best describes the action taken to complete the maintenance.

NOTE: THE LIST OF "ACTION TAKEN" CODES CHANGES OCCASIONALLY. VERIFY CURRENT "ACTION TAKEN" CODES AT THE FOLLOWING WEB SITE: HTTPS://OARS.NSLC.NAVY.MIL/OARS/DOCS/SHIPS3M.HTML AND SELECT MMBU REFERENCE LISTING.

Table 12 - Action Taken Codes	
Code	Description
1	Maintenance Action Completed; Parts Drawn from Supply
2	Maintenance Action Completed; Required Parts Not Drawn from Supply (local manufacture, pre-expended bins, etc.)
3	Maintenance Action Completed; No Parts Required

NOTE: THE FOLLOWING SECOND CHARACTER CODES CAN BE USED WITH THE ACTION TAKEN CODES 1, 2, OR 3 AS DIRECTED BY THE TYCOM:

	A	Maintenance Requirement Could Have Been Deferred
	B	Maintenance Requirement Was Necessary
	C	Maintenance Requirement Should Have Been Done Sooner
	M	High Cost Repairs
	T	The Equipment Being Reported Had a Time Meter
4	Canceled (When this code is used, the deferral will be removed from the CSMP). This code is not to be used with INSURV, Safety, or Priority 1 or 2 deferrals screened for accomplishment by the TYCOM or IUC.	
7	Maintenance Action Completed; 2-M (Miniature and Micro-Miniature Electronic Modules) Capability Utilized.	

NOTE: THE FOLLOWING SECOND CHARACTER CODES CAN BE USED WITH ACTION TAKEN CODE 7 TO BETTER DESCRIBE THE ACTION TAKEN:

	A	Parts Drawn from Supply Utilized
	B	Parts Not Drawn from Supply Utilized
	C	Automatic Test Equipment (ATE) Utilized
	D	ATE and Parts Drawn from Supply Utilized
	E	ATE and Parts Not Drawn from Supply Utilized
8	Periodic Time Meter or Cycle Counter reporting. (This code is not applicable to the "FINAL ACTION" code reported by the repair activity.)	
9	Maintenance Action Completed; 3-M Fiber Optic Repair	

NOTE: THE FOLLOWING SECOND CHARACTER CODES CAN BE USED WITH ACTION TAKEN CODE 9 TO BETTER DESCRIBE THE ACTION TAKEN:

Table 12 - Action Taken Codes		
Code	Description	
	A	FOTE, multimode ST MQJs utilized
	B	FOTE, multimode heavy duty MQJs utilized
	C	FOTE, multimode rotary mechanical splice MQJs utilized
	D	FOTE, single mode ST MQJs utilized
	E	FOTE, single mode heavy duty MQJs utilized
	F	FOTE, multimode specialty MQJs utilized
	G	FOTE, single mode specialty MQJs utilized
	H	FOTE, not available
	I	Standard MQJs not available
	J	Specialty MQJs not available
0	None of the Above	

b. Block 30 - MHRS: Enter the total man-hours (to the nearest whole hour) that was expended doing the maintenance after submitting the deferral. This includes man-hours expended for reinstallation, witnessing of tests, etc. (include documentation time which should not exceed 1 hour).

c. Block 31 - COMPLETION DATE: Enter the Julian date the maintenance action was completed.

d. Block 32 - ACT. MAINT. TIME: Enter the total clock hours (to the nearest whole hour) during which maintenance was performed. This should the include time for troubleshooting, but not delays.

e. Block 33 - TI: Enter a single numeral (1 through 9) to indicate, to the nearest 10%, the percentage of active maintenance expended in troubleshooting. For example, if no troubleshooting is involved, enter “f”, “2” for 20%, “3” for 30%, “7” for 70%, etc.

f. Block 34 - METER READING: There is no entry required on the completed deferral action. (Refer to Block 34 instructions for DOCUMENTING A DEFERRED MAINTENANCE ACTION).

g. Block 35 - REMARKS/DESCRIPTION: When the “what must be done” statement on the original deferral accurately describes the work which was done, no further entries are required. If remarks in addition to the original remarks entered are needed to describe the work done, refer to paragraph 7 of this appendix for “Documenting Changes, Additions and Deletions to Previously Submitted Maintenance Actions.” Describe what was done and any additional information considered significant. If additional space is needed for the completed action description, use up to three continuation pages.

5.2 Section IV - REMARKS/DESCRIPTION - (Used by the Repair Activity when Reporting a Completed Maintenance Action): This type of completed work request is to be provided to the ship for 3-M processing.

Block 64 - FINAL ACT.: Enter the code that best describes the final action taken to complete the maintenance. (Refer to Block 29 for "ACTION TAKEN" allowable codes or values). In addition, the following codes (Table 13) can be used:

NOTE: THE LIST OF "ACTION TAKEN" CODES CHANGES OCCASIONALLY. VERIFY CURRENT "ACTION TAKEN" CODES AT THE FOLLOWING WEB SITE: HTTPS://OARS.NSLC.NAVY.MIL/OARS/DOCS/SHIPS3M.HTML AND SELECT MMBU REFERENCE LISTING.

Table 13 - Action Taken Codes

Code	Description
5A	Partially Completed Alteration
5B	Fully Completed Alteration
5C	Fully Completed Equivalent to Alteration
5D	Alteration Directive Not Applicable
6	Rejected Work Request

NOTE: ADD THE FOLLOWING SECOND CHARACTER CODE WITH ACTION TAKEN CODE 6 TO BETTER DESCRIBE THE ACTION TAKEN:

A	Ship's Force or Unit Standard Stock Item
B	Excessive Ship Workload or Insufficient Availability
C	Lack of Skills
D	Lack of Facilities
E	Lack of Test or Calibration Equipment
F	Lack of Parts or Material
G	Lack of Documentation
H	Lack of Funds
I	Other (record the explanation in "Remarks")

b. Block 65 - MHRS. EXPENDED: Enter the man-hours expended on the last day the Repair Work Center is involved in the Work Request, not the total man-hours of the work request.

c. Block 66 - DATE COMPLETED: Enter the Julian date the work request is completed and signed off by the requesting command.

(1) Block G - COMPLETED BY: The signature and rank and rate of the individual authorized by the repair activity to verify the acceptability of work performed is entered in this block.

(2) Block H - ACCEPTED BY: The signature and rank and rate of the individual authorized by the command to verify the acceptability of work performed. Completion of this block is mandatory when a 2-Kilo is used to report completion of a previously deferred maintenance action.

6. PROCEDURES FOR DOCUMENTING A COMPLETED MAINTENANCE ACTION WITHOUT PRIOR DEFERRAL: Place an "X" in the block titled "COMP" at top of form.

6.1 Section I – IDENTIFICATION.

a. JOB CONTROL NUMBER (Blocks 1 - 3):

(1) Block 1 - UIC: Enter the Unit Identification Code (UIC) of the activity initiating the maintenance action.

(2) Block 2 - WORK CENTER: Enter the code of the Work Center initiating the maintenance action. For Ships, a four-position Work Center code will be entered. For repair departments of IMAs, RMCs and other IMAs, a three-digit code will be entered. The three-digit code is entered left-to-right leaving the right most position blank. Appendix C of this chapter provides a listing of authorized Work Center codes (Submarine Tenders have been converted to a four position Work Center code).

(3) Block 3 - JOB SEQ. NO. (JSN): Enter the four character JSN assigned by the Work Center Supervisor. This is an entry assigned sequentially from the SFWL/JSN Log.

b. Block 4 - APL/AEL (Allowance Parts List/Allowance Equipment List): Enter the APL/AEL of the equipment being reported. These numbers are found in the COSAL or SCLSIS Index Report. An example of an APL would be "882170236" and an AEL would be "2-260034096."

c. Block A - Enter COMMAND'S NAME.

d. Block 5 - EQUIPMENT NOUN NAME: Enter the equipment nomenclature and description on which maintenance is being reported. The equipment nomenclature and description should be the same as that identified by the EIC and is limited to 16 positions. Standard abbreviations can be used if clarity is retained. For electronic equipment having an Army-Navy (AN) designation, it will be substituted for the equipment nomenclature.

e. Block B: - Enter SHIP'S HULL NUMBER (if applicable).

f. Block 6 - WHEN DISCOVERED (WND): Enter the code (Table 14) that best identifies when the need for maintenance was discovered.

Table 14 - When Discovered Codes	
Code	Description
1	Lighting Off or Starting
2	Normal Operation
3	During Operability Test
4	During Inspection
5	Shifting Operational Modes
6	During PMS
7	Securing
8	During AEC (Assessment of Equipment) Program
9	No Failure, PMS Accomplishment Only
0	Not Applicable (use when reporting printing services, etc.)

g. Block 7 - STATUS (STA): Enter the code (Table 15) that most accurately describes the effect of the failure or malfunction on the operational performance capability of the equipment when the need for maintenance was first discovered.

Table 15 - Status Codes	
Code	Description
1	Operational
2	Non-Operational
3	Reduced Capability
0	Not Applicable (use if reporting printing services, etc.)

h. Block 8 - CAUSE (CAS): Enter the code (Table 16) that best describes the cause of the failure or malfunction when the need for maintenance was first discovered. (Refer to reference (a), Appendix A, Table A-6 data element “CAUSE” for an expanded definition of the allowable codes or values).

Table 16 - Cause Codes	
Code	Description
1	Abnormal Environment
2	Manufacturer or Installation Defects
3	Lack of Knowledge or Skill
4	Communication Problem
5	Inadequate Instruction or Procedure
6	Inadequate Design
7	Normal Wear and Tear
0	Other or No Malfunction

i. Block 9 - DEFERRAL REASON (DFR): Leave blank.

j. Block 10: - Block is reserved for TYCOM directed applications. Refer to TYCOM instruction for use.

k. Block 11: - Block is reserved for TYCOM directed applications. Refer to TYCOM instruction for use.

l. Block 12: - Block is reserved for TYCOM directed applications. Refer to TYCOM instruction for use.

m. Block 13 - IDENT./EQUIPMENT SERIAL NUMBER: Enter the identification or serial number of the equipment or system on which maintenance is being deferred. For Hull, Mechanical & Electrical (HM&E) equipment, enter the Valve Mark or Electric Symbol Number (ESN) or Primary Identification Number. For electronic equipment, enter the manufacturer's serial number of the equipment or system on which maintenance is being deferred.

n. Block 14 - EIC: Enter the Equipment Identification Code of the component, equipment, subsystem, or system for which the maintenance is being reported.

o. Block 15 - SAFETY HAZARD: Enter an "X" or applicable safety code (Table 17) if the maintenance action describes a problem or condition which has caused, or has the potential to cause, serious injury to personnel or material. A brief explanation must be included in the REMARKS/DESCRIPTION field (Block 35). For example:

"Reinspection of separator for presence of oil after rinse. MRC A-27 evidently not done. Presence of oil resulted in fire in HP air system when compressor operated under load. Fire badly burned valve AHP-287, requiring replacement."

NOTE: THE SHIP'S OR UNIT'S 3-M COORDINATOR WILL FORWARD A COPY OF ALL 2-KILO DOCUMENTATION HAVING AN ENTRY IN THIS FIELD TO THE SAFETY OFFICER FOR REVIEW. (REFER TO REFERENCE (A), APPENDIX A, TABLE A-14, DATA ELEMENT

"SAFETY HAZARD" FOR AN EXPANDED DEFINITION OF THE ALLOWABLE CODES OR VALUES).

Table 17 - Safety Hazard Codes	
Code	Description
1	Critical Safety or Health Deficiency-Correct Immediately
2	Serious Safety or Health Deficiency-Suspension of Equipment, System or Space Use is required
3	Moderate Safety or Health Deficiency-Waiver of Equipment, System or Space Use is granted Pending Correction of the Item
4	Minor Safety or Health Deficiency
5	Negligible Safety or Health Deficiency
0	Maintenance Action is Not Safety Related

NOTE: CODES "6" THROUGH "9" MAY BE LOCALLY ASSIGNED BY TYCOMS IF ADDITIONAL SAFETY CODES ARE REQUIRED.

p. Block 16 - LOCATION: Enter the location (compartment number, deck, frame, or side notation), that best describes the location of the equipment requiring maintenance as identified in Block 13. If none of the mentioned location identifications are appropriate, enter description of the location (e.g., FANTAIL, FLIGHT DECK, etc.).

q. Block 17 - WHEN DISCOVERED DATE: Enter the Julian date when the equipment or system failure or malfunction was discovered.

r. Block 18 - ALTERATIONS: Leave blank. If the completed maintenance action resulted in a configuration change or alteration, refer to the instructions for submitting an CK form Appendix C.

s. Blocks 19 through 24 - FOR INSURV USE: No entries required. See Section 2 for details.

6.2 Section II - DEFERRAL ACTION (Block 25 - 28): Leave blank.

6.3 Section III - COMPLETED ACTION.

a. Block 29 - ACT. TKN: Enter the code (Table 18) that best describes the action taken to complete the maintenance.

NOTE: THE LIST OF "ACTION TAKEN" CODES CHANGES OCCASIONALLY. VERIFY CURRENT "ACTION TAKEN" CODES AT THE FOLLOWING WEB SITE: HTTPS://OARS.NSLC.NAVY.MIL/OARS/DOCS/SHIPS3M.HTML AND SELECT MMBU REFERENCE LISTING.

Table 18 - Action Taken Codes	
Code	Description
1	Maintenance Action Completed; Parts Drawn from Supply
2	Maintenance Action Completed; Required Parts Not Drawn from Supply (local manufacture, pre-expended bins, etc.)
3	Maintenance Action Completed; No Parts Required

NOTE: THE FOLLOWING SECOND CHARACTER CODES CAN BE USED WITH THE ACTION TAKEN CODES 1, 2, OR 3 AS DIRECTED BY THE TYCOM:

A	Maintenance Requirement Could Have Been Deferred
B	Maintenance Requirement Was Necessary
C	Maintenance Requirement Should Have Been Done Sooner
M	High Cost Repairs
T	The Equipment Being Reported Had a Time Meter

4	Canceled (When this code is used, the deferral will be removed from the CSMP). This code is not to be used with INSURV, safety, or priority 1 or 2 deferrals screened for accomplishment by the TYCOM or IUC.
7	Maintenance Action Completed; 2-M (Miniature and Micro-Miniature Electronic Modules) Capability Utilized.

NOTE: THE FOLLOWING SECOND CHARACTER CODES CAN BE USED WITH ACTION TAKEN CODE 7 TO BETTER DESCRIBE THE ACTION TAKEN:

A	Parts Drawn from Supply Utilized
B	Parts Not Drawn from Supply Utilized
C	Automatic Test Equipment (ATE) Utilized
D	ATE and Parts Drawn from Supply Utilized
E	ATE and Parts Not Drawn from Supply Utilized

8	Periodic Time Meter or Cycle Counter reporting. (This code is not applicable to the "FINAL ACTION" code reported by the repair activity.)
9	Maintenance Action Completed; 3-M Fiber Optic Repair

NOTE: THE FOLLOWING SECOND CHARACTER CODES CAN BE USED WITH ACTION TAKEN CODE 9 TO BETTER DESCRIBE THE ACTION TAKEN:

A	FOTE, multimode ST MQJs utilized
B	FOTE, multimode heavy duty MQJs utilized

	C	FOTE, multimode rotary mechanical splice MQJs utilized
	D	FOTE, single mode ST MQJs utilized
	E	FOTE, single mode heavy duty MQJs utilized
	F	FOTE, multimode specialty MQJs utilized
	G	FOTE, single mode specialty MQJs utilized
	H	FOTE, not available
	I	Standard MQJs not available
	J	Specialty MQJs not available
0	None of the Above	

b. Block 30 - MHRS: Enter the total man-hours (to the nearest whole hour) that were expended completing the maintenance. This includes man-hours expended for reinstallation, witnessing of tests, etc. (include documentation time, which should not exceed 1 hour).

NOTE: BLOCKS 32, 33, AND 34 ARE ONLY TO BE REPORTED, IF THE EQUIPMENT HAS BEEN SEL DESIGNATED.

c. Block 31 - COMPLETION DATE: Enter the Julian date the maintenance action was completed.

d. Block 32 - ACT. MAINT. TIME: Enter the total clock hours (to the nearest whole hour) during which maintenance was performed. This should include time for troubleshooting, but not delays.

e. Block 33 - TI: Enter a single numeral (1 through 9) to indicate, to the nearest 10 percent, the percentage of active maintenance expended in troubleshooting. For example, if no troubleshooting is involved, enter “f”, “2” for 20%, “3” for 30%, “7” for 70%, etc.

f. Block 34 - METER READING: Enter the time meter reading (to the nearest whole hour) at the time of failure. If the equipment has more than one meter, designate the meter being recorded in Block 35 “REMARKS” using the letters “METRED” followed by the meter designator. An asterisk (*) must precede and follow the meter designation. Example: *METRED-1A2M1*.

g. Block 35 - REMARKS/DESCRIPTION: Enter remarks relating to the maintenance action. These remarks should be brief, but complete and meaningful. Remarks should state what was wrong, what caused the failure (if known) and what was done to correct the problem. If “SAFETY HAZARD” (Block 15) is checked, a description of the condition creating the hazard should be inserted in “REMARKS”. If more space is needed, check Block 36 “CONT. SHEET” and continue the remarks on a second form using the same JCN.

7. PROCEDURES FOR DOCUMENTING CHANGES, ADDITIONS, AND DELETIONS TO PREVIOUSLY SUBMITTED MAINTENANCE ACTIONS: Place an "X" in the block titled "CORRECTION" at the top of the form. Enter the exact JCN (Blocks 1, 2, and 3) of the original 2-Kilo previously processed. Enter only the information to be added, deleted, or changed in the applicable blocks. If the selected data elements are to be deleted, without deleting the entire document, enter dashes (one dash per tic mark) within the data block to be deleted. When changing Block 35, REMARKS/DESCRIPTION, the entire narrative must be entered so that the correct information is included. It is not possible to change just a word or two.

8. PROCEDURES TO ADD-ON REMARKS TO THE CSMP: To add to the remarks as originally submitted, place an "X" in the block titled "ADD-ON REMARKS" at the top of a new 2-Kilo Form. Place an "X" in the "DEFL" block at the top of the form and enter in Blocks 1, 2 and 3 the JCN of the original 2-Kilo. In Block 35 "REMARKS/DESCRIPTION", enter the initials of the activity adding on to the remarks followed by a dash (-). For example, CINCPACFLT would be entered as "CPF-". Following the dash (-) enter the additional information. If it is necessary to rewrite, or change the narrative as originally submitted, use the procedures for "DOCUMENTING CHANGES, ADDITIONS, and DELETIONS" in paragraph 7.

9. HANDLING PROCEDURES: The 2-Kilo is required for documenting a maintenance action that did not result in a configuration change. The 2-Kilo must be forwarded to the automated data processing facility serving the command. A copy is submitted when reporting the completion of that maintenance action. A second copy is retained until completion of the maintenance action results in its removal from the CSMP; then it may be destroyed.

APPENDIX E

PREPARATION INSTRUCTIONS SUPPLEMENTAL FORM

(OPNAV 4790/2L)

1. SUPPLEMENTAL FORM (OPNAV 4790/2L).

   a. This form is used to provide amplifying information (such as drawings and listings) related to a maintenance action, reported on an 2-Lima form. The 2-Lima may be used to list multiple item serial numbers and locations for which identical maintenance requirements exist from an outside activity; or to provide a list of drawings and sketches that would be helpful in the accomplishment of the maintenance.

   b. The 2-Lima form is retained with the suspense copy of the corresponding 2-Kilo form that deferred the maintenance action. The 2-Lima is never submitted to the ADP facility servicing the activity, as the data on the 2-Lima will never be entered into the computer. However, the 2-Lima can be attached to the original 2-Kilo or computer produced (simulated) 2-Kilo when submitted to an assisting activity.

2. SPECIAL APPLICATION.

   a. If a MJC routine has been added to the CSMP for service routines or for IMA manufacturing of sheet metal enclosures, structures or flex hoses, multiple 2-Limas may be used for the same JCN. Each 2-Lima would result in an additional task being added to the JCN, thus accounting for man-hour expenditure for each task. Similarly, the 2-Lima could be used to request critical hose manufacturing by referencing the MJC number and using the activity's own JCN, thus precluding the necessity to submit multiple complete 2-Kilos.

   b. The form is separated into three sections:

      (1) SECTION I "IDENTIFICATION"

      (2) SECTION II "REMARKS/SKETCHES"

(3) SECTION III "AUTHENTICATION"

NOTE: WHEN USING THE 2-LIMA, ALL SECTIONS OF THE FORM ARE TO BE FILLED OUT. ON THE 2-KILO FORM, BE SURE TO ENTER THE NOTATION "2L USED" IN THE "REMARKS/DESCRIPTION" SECTION, BLOCK 35.

NOTE: FIGURES 1 AND 2 PROVIDE AN EXAMPLE OF COMPLETED 2-LIMA FORMS.

Figure 1 Supplemental Form Containing an Equipment Listing.

Figure 2 Supplemental Form Containing a Sketch or Drawing.

3. PROCEDURES FOR PROVIDING ADDITIONAL INFORMATION USING THE 2-LIMA.

3.1 Section I – Identification.

a. Block A: - Enter the Command's Name.

b. Block B: - Enter the Ship's Hull Number (if applicable).

c. JOB CONTROL NUMBER: - Enter the same JCN (Command's UIC, Work Center, and Job Sequence Number) assigned to the original maintenance action (2-Kilo or equivalent) in Blocks C, D and E.

d. Block F - CONTINUATION FOR: Enter an "X" in one of the blocks to indicate that this 2-Lima is a continuation of either an 2-Kilo, 2-Lima or a 2-Papa Form.

3.2 Section II - Remarks/Sketches. Block G: - Enter the information that is desired to be provided such as a list of serial numbers and locations for which identical maintenance requirements exist or sketches or drawings that may be useful in the accomplishment of the maintenance action.

3.3 Section III – Authentication.

a. Block H - FIRST CONTACT/MAINTENANCE MAN: The maintenance person preparing the form prints their name in this block.

b. Block I - DATE (YR/DAY): Enter the Julian date the document is prepared.

c. Block J - SECOND CONTACT/SUPERVISOR: The Work Center Supervisor prints their name following their review of the document in the block.

d. Block K - DATE: The Work Center Supervisor enters the Julian date the document was reviewed.

WEIGHT AND MOMENT CONTROL FOR SUBMARINES

REFERENCES.

(a) NAVSEA S9086-C6-STM-010 - NSTM Chapter 096 (Weights and Stability)
(b) NAVSEA T9096-AA-INS-010 - Weight and Stability Requirements for Active Submarines

LISTING OF APPENDICES.

A Sample Ship Message to ISIC Concerning Removal or Reinstallation of Cargo Ballast
B Sample Ship Message to ISIC Concerning Audit of Cargo Ballast Documentation

20.1 PURPOSE. This chapter provides basic information and guidance concerning submarine ballast changes, including mandatory authorization and reporting requirements.

a. The use of solid ballast is important for submarine stability and the ability to maintain submerged equilibrium for all design conditions. Ballast lead typically, is installed in submarines for the following purposes:

   (1) To maintain adequate stability.

   (2) To correct for inherent transverse moments that would otherwise create list.

   (3) To permit submarines to submerge with neutral buoyancy and zero trim for all design equilibrium conditions.

   (4) To compensate for future installed alterations.

b. An inclining experiment and all-stop trim dive are performed per the requirements of reference (a). These experiments provide the basic data concerning weight and center of gravity for use in all considerations of stability, reserve buoyancy, equilibrium and in determining compliance with the requirements of the weight control program. An inclining experiment is the only satisfactory method of accurately determining the location of the vertical center of gravity of the submarine. The trim dive is the only satisfactory method of determining the load to submerge and the final ballasting solution. Inclining experiments are conducted on each submarine in new construction, after the Post Shakedown Availability, unless waived by Naval Sea Systems Command (NAVSEA), and when authorized by NAVSEA for some Chief of Naval Operations (CNO) availabilities. Trim dives are performed during delivery sea trials, prior to each CNO availability, after each CNO availability with a duration of 18 months or longer and under specific circumstances to address ballasting issues reported by Ship's Force. Trim dives are also performed periodically prior to smaller availabilities to identify weight growth.

c. Initial ship design provides for adequate stability and equilibrium for all expected loading conditions. Service life margin, in the form of permanent lead ballast in

excess of that needed to maintain stability and equilibrium, allows for growth, but historically the margin is quickly consumed for several reasons:

(1) The on-going process of modernization over the life of the ship.

(2) Unknown weight growth due to the accumulation of personal gear and equipment, undocumented alterations, spare parts and stores.

(3) Weight removal or margin recovery measures being accorded a low priority.

20.2 BALLAST CHANGES. NAVSEA maintains a record of the solid ballast installed in each submarine. These records are required for evaluating and tracking the ship's stability and equilibrium. Any permanent alteration to a submarine that changes weight, moment or displacement may require compensation by the removal or installation of lead ballast.

20.2.1 Naval Sea Systems Command Notification. Any activity performing this alteration is required by reference (b) to submit a reballasting proposal to NAVSEA for approval. NAVSEA approval is required for all permanent ballast changes. Copies of the reballasting proposal must be sent to the Type Commander (TYCOM), Immediate Superior In Command (ISIC) and the Commanding Officer.

20.2.2 Ballast Types. Submarines of the active fleet must be maintained within stability and buoyancy limits for a state of war readiness. Deviations from this principle are generally unauthorized. Some ships are authorized to carry other types of lead ballast:

a. Cargo Ballast: Ships have cargo ballast (cargo lead) loaded at various times to compensate for loads or loading configurations. This cargo ballast can become undocumented weight over time due to crew turnover and loss of corporate knowledge. To that end, the following is required for loading and off-loading of cargo ballast:

(1) Cargo ballast, unless part of the original ship’s design, is approved by NAVSEA on a ship-by-ship basis. Requests for cargo ballast, and requests for increased amount of cargo ballast, must be submitted by the ship, in writing, to NAVSEA for approval. All such requests must have ISIC and TYCOM endorsement and include the specific weight amount, location and method for securing the lead.

(2) Once cargo ballast is approved, either as part of the ship’s original design or on a ship by ship basis, Ship’s Force is responsible for managing the ballast. The ship shall add a line item for cargo ballast to the ship’s set of dive cards or compensation spreadsheet, and the cargo ballast’s weight and location shall be kept current by the Diving Officer. If cargo ballast is carried and a heavier load out occurs, which would put any calculated variable ballast point outside the equilibrium polygon, some or all of this ballast must be removed. All cargo ballast shall be removed prior to an Arctic deployment.

(3) The ship shall obtain TYCOM concurrence via the ISIC prior to removing or reinstalling previously approved cargo ballast, and shall inform the ISIC, TYCOM, NAVSEA PMS392, NAVSEA 05U7, NAVSEA Surface Warfare

Center, Carderock Division Code 844 and the planning yard of the removal or reinstallation of cargo ballast using the format of Appendix A.

(4) With the exception of 774 Class Vertical Lost System and Payload System Cargo Lead ballast, changes to cargo ballast should normally be accomplished by a nuclear qualified shipyard. With the exception of 774 Class Vertical Lost System and Payload System Cargo Lead ballast, approval by the ISIC and TYCOM is required in the event a situation requires an organization other than a nuclear qualified shipyard to add, remove or relocate cargo lead.

(5) Any cargo lead load that results in a calculated mission equilibrium point outside the equilibrium polygon requires a NAVSEA approved Departure From Specifications (DFS). Additional guidance and procedures concerning the installation or removal of cargo ballast is available in reference (b).

(6) Cargo ballast documentation shall be audited by Ship's Force during each Major Maintenance Period, Docking Selected Restricted Availability, Depot Modernization Period, Engineered Overhaul, or Pre-Inactivation Restricted Availability to ensure the cargo ballast is being properly tracked. The ISIC is responsible for ensuring that Ship's Force is using the latest shipyard documentation for the cargo ballast. A report of the audit findings will be made using the format of Appendix B.

b. Permanent Ballast: Changes in permanent ballast, which includes adding, removing or relocating, must not be accomplished by Ship's Force, Fleet Maintenance Activities or any industrial activity without prior TYCOM concurrence and NAVSEA written approval.

c. Sea Trial Lead. Temporary ballast may be added as necessary to assure that the ship is capable of diving and trimming out when lightly loaded during sea trials following initial delivery and following a CNO availabilities (Depot Modernization Period, Docking Selected Restricted Availability, Pre-Inactivation Restricted Availability, etc.). NAVSEA must review and approve temporary ballast used for trials. The TYCOM must approve the use of any temporary lead retained or added after sea trials for transit to homeport. All temporary lead ballast must be removed prior to load-out and deployment. A temporary DFS must be opened upon installation of temporary sea trial ballast and closed upon removal of that ballast. The forwarding letter for the post-availability stability report must reference the DFS and provide the current status of the temporary lead ballast.

20.3 UNUSUAL CONDITIONS. NAVSEA requires reports to be submitted of any unusual conditions which are considered dangerous or seriously affect the operation of the ship. Ship's Force will report the following situations to NAVSEA, via the ISIC and TYCOM, per the requirements of reference (a).

a. Excessive rolling.

b. Heeling due to rudder action.

c. Excessive pounding.

d. Inadequate propeller immersion.

e. Difficulty in maintaining neutral buoyancy. If so, document loads, density of water and depth. Also indicate whether or not the ship was hovering or if additional variable ballast was loaded due to sea state.

LISTING OF APPENDICES.

A Availability Milestones
B Availability Completion Report Template
C Fleet Readiness Certification Board Flowchart

21.1 SCOPE. This chapter is applicable to all shore Navy activities involved in Command, Control, Communications, Computers, Intelligence, Surveillance and Reconnaissance (C4ISR) and Naval Information Forces (NAVIFOR) Managed Personnel Property modernization. The provisions of this chapter have been developed in collaboration with Naval Operations (OPNAV). This chapter is issued to bridge and provide current overarching policies and guidance beyond references (a) and (b). References (b) and (c) govern the management of ashore Combat Systems and Command, Control, Communications, Computers, Collaboration and Intelligence (C5I) installations and improvements, and Initial Adversary Vulnerability Assessment policies and remain in effect as written. Type Commander (TYCOM) Maintenance Directorates must be the lead for ensuring implementation. Shore platform will continue the current practice of forwarding change requests to the Immediate Superior In Command, who will forward the change request to the respective TYCOM for entry into the Navy Data Environment (NDE). Only alterations entered in NDE will be considered for inclusion in Modernization Programs, until such time the Engineering Change Process merges with Model Based Product Support (MBPS). The Navy is in the midst of a logistics information technology

(IT) portfolio update, and every means will be utilized to support, and transition with this overarching plan.

21.2 PURPOSE. The purpose of this chapter is to document the designated Command, Control and Communication (C3) Shore Fleet unit, and non-C3 shore activities Modernization Programs within the C4ISR and NAVIFOR managed personal property, which emphasizes early decisions under the control of United States Fleet Forces Command (USFLTFORCOM), United States Command Pacific Fleet, and NAVIFOR, and expands on the decision process for deciding which alterations and modifications will be developed, procured, certified and installed on all C3 and non-C3 Shore platforms. The objectives of this chapter are to provide the process, and framework to ensure successful delivery to these platforms. Shore Modernization objectives are based on reference (b) as follows:

a. Provides a standard process for all ashore Navy Command, Control, Communications, Computer, Combat Systems, Intelligence, Surveillance and Reconnaissance (C5ISR) modernization, and NAVIFOR equitable Hull, Mechanical and Engineering and Facility installations.

b. Ensures ashore units receive mature, fleet interoperable, and certified war fighting capabilities that are cyber compliant.

c. Ensures C5ISR Capabilities are delivered with approved integrated logistics support (ILS).

d. Ensure C5ISR modernization support unit level training and surge readiness.

NOTE: THE USE OF REGIONAL MAINTENANCE AND MODERNIZATION COORDINATION OFFICE (RMMCO) AND ILS CERTIFICATION POWER APPLICATIONS WILL BE UTILIZED UNTIL SUCH TIME THE TRANSITION TO NDE FOR THESE MODULES.

21.3 BACKGROUND. The End-to-End Ship Maintenance and Modernization (previously SHIPMAIN) was developed to concentrate on the early decision process regarding which alterations are to be accomplished. This process provides timely Fleet involvement and the assurance that changes are driven by current fleet requirements. The Modernization Program itself was implemented to modify the Entitled Process (formerly the Fleet Modernization Program) due to Fleet concerns which included alterations developed and hardware procured but never installed. It was to also alleviate concerns over significant changes to availability work packages after authorization letter issuance, and alteration installation problems caused by failure to satisfy planning milestones. While these issues are often driven by overall funding instability in Navy budgets and changing priorities, the associated costs consume modernization funding minimizing the ability to modernize. The Navy Modernization Process (NMP) has replaced the Fleet Modernization Program and is documented in reference (a). The NMP provides a structure for the orderly identification, approval, design, planning, programming, budgeting, installation, life cycle support and configuration control of technical and survivability improvements to all shore platforms of the active and reserve fleets. This chapter also provides overall prioritization in the alterations to be accomplished and discipline and accountability in the adherence to NMP processes. Fleet Review Certification Board (FRCB) was put into place for shore commands after a series of installations in 2002 caused cascading communication outages Navy wide. The intent of this process is to prevent this happening in the future by

assessing the readiness of the systems intended for installation at Navy shore activities.

21.4 APPLICABILITY FOR C3 ASHORE SITES.

a. C3 Shore Platforms were outlined in 2021 as critical platforms across Naval Computer and Telecommunications Area Master Station, Naval Computer and Telecommunications Station, Maritime Operation Centers that provide Command and Control, and Services. This chapter is to ensure installations coming into these platforms are considered with the right level of rigor.

b. C3 Shore Platforms under Military Construction (MILCON) or special project will follow the MILCON process in reference (d), but the installations themselves will follow the C3 installation process of this manual for the system installations if at the time of the MILCON the platform has started the C3 NMP Process.

c. C3 Shore Platforms Program office acquisition to NMP integration workflow is per reference (e).

d. C3 Shore platforms under Overmatch Software Armory (OSA) reviews are reviewed at three levels Shore Program manager, TYCOM, and Fleet. This is currently completed in a Jira® workflow, but follows reference (f) for required deliverables.

e. C3 Shore platform designation and listing is per reference (g).

f. C3 Shore platforms will follow the C3 FRCB process while both the platforms and systems are moved over and integrated into the C3 Navy Modernization Process Management and Operations Manual (NMP-MOM) process. C3 FRCB uses the FRCB processes that include availability management and NMP-MOM rigor.

21.5 APPLICABILITY FOR NON-C3 ASHORE SITES.

21.5.1 Non-C3 Ashore Sites. Reference (b) directs all C4ISR modernization and installation projects and services that are being planned at all Navy Shore activities to go through the FRCB Process. C4ISR includes both connected and disconnected shore systems in support of both operational and training platforms. This also applies to C3 Shore platforms prior to their transition to the C3 NMP-MOM processes. There will be a time when C3 Shore Platforms conduct a dual modernization process effort between C3 FRCB and C3 NMP processes.

21.5.1.1 FRCB authorization is required for the following:

a. All Navy Shore sites and training activities.

b. All Agencies and resource sponsors, including but not limited to: Navy Commands, Joint Service and Department of War commands, government. Agencies, and supporting contractors conducting C4ISR installations at Navy Shore sites.

c. All systems, sub-systems, or components at a Navy Shore site that interface with a Navy C4ISR, IT system or network to include stand-alone networks or systems that are C4ISR systems.

d. Joint or other government agency C4ISR or IT systems located at a Joint site that resides in U.S. Navy compound, facility, or structure, or requires Navy Operations and Maintenance resources. Navy Operations and Maintenance supported teleport sites to include Naval Satellite Communications Facility Northwest, Naval Satellite

Communications Facility Lago di Patria, and Naval Computer and Telecommunications Area Master Station Pacific also require adherence to FRCB policy and procedures.

e. Acquisition sponsored labs, centers, or activities only when activated for operational purposes (e.g., Trident Warrior, Fleet exercises, or as a fail over or back up circuit for operations). Only the demonstrated capability requires FRCB approval.

f. OCONUS Navy Enterprise and Navy-Marine Corps Intranet Projects.

g. Anti-Terrorism and Force Protection projects that include C4ISR IT Components.

h. Corrective actions that require modernization in lieu of repair.

i. Any item that requires ILS updates within a Navy shore site that effects readiness to include temporary installations.

j. Fixed site installs for Research, Development, Test and Evaluation (RDTE) sites, that support the development of new RDTE products. The products being developed themselves do not require FRCB.

k. Cloud based installations in which Navy entities regardless of Military, Civilian, or Contractor are still responsible for the remote Cyber Hygiene, training, Navy Contracted Managed.

l. Personal Property, such as property which is used for power generation and cooling to include generators, uninterruptible power supply, and heating, ventilation, and cooling systems.

m. Alteration projects as Fixed Submarine Broadcast System or Take Charge And Move Out shore sites.

n. Corrective action of a Casualty Report, where the action is for a modernization in lieu of repair resulting in a change of original hardware or software configurations.

21.5.1.2 FRCB not required for the following:

a. Routine pre-production efforts such as a site survey, drawing development, or routine coordination to develop necessary site agreements and installation documents, there should already be a Job Identification number assigned when conducting these items.

b. Maintenance and corrective actions to include casualty reports for repairs that restore a system, with no change to hardware or software.

c. Cyber Security vulnerability management, alert or bulletin installations. Class A through C software, which is minor in nature, Class D through F are required to go through FRCB as described within reference (f).

d. RDTE laboratories developed items. The Fixed RDTE site still requires FRCB for fixed installations.

e. Administrative, non-tactical workstations (software or hardware) refresh efforts (i.e., NGEN, ONE-NET.)

f. Outside Cable Plant or Inside Cable Plant Projects where there is no change to the ILS.

g. Real property not owned by shore sites for power generation and cooling.

h. Qualified Development, Security, and Operations deliveries through Naval Information Warfare Systems' (NAVWAR) OSA (see reference (h)).

i. Shore C3 sites when transferred to NMP.

21.5.1.3 FRCB applicability form is the installation work scope form, submitted under the FRCB Tracking Number, and uploaded to SPIDER or RIPTIDE , to verify the scope of the installation.

21.5.2 MILCON for Non-C3 Shore Platforms. These platforms will follow reference (h) and installations will follow the non-C3 process of this manual for the system installation approvals.

21.5.3 Acquisition. Non-C3 Shore platforms program office acquisition policy to FRCB is per reference (h).

21.5.4 Overmatch Software Armory. For non-C3 Shore platforms, no platforms today utilize OSA as an installation process, when that begins the process will follow the C3 Shore Process for OSA per reference (f).

21.6 RESPONSIBILITIES.

21.6.1 C3 Shore Site Organization Responsibilities.

21.6.1.1 TYCOM N43

a. Initiate the budgetary actions for funding material condition assessment tasks (I-tasks), corrective repairs, mandatory technical requirements (MTR), or Fleet alterations.

b. Recommend to USFLTFORCOM and numbered fleets any high priority fleet modernization desired to be accomplished.

c. Issue fleet alteration Letters of Authorization (LOA), and FRCB Letters of authorization for C3 Shore Sites still going through C3 FRCB processes.

d. Ensure all authorized alterations are identified by priority based on material availability.

e. Assume the lead roles in managing Availability Work Packages (AWP) developed by Shore Maintenance Engineering, Planning and Procurement (SHOREMEPP).

f. Assist SHOREMEPP in preparation of AWPs as required.

g. Coordinate with SHOREMEPP to update the AWP when Class Maintenance Plans (CMP) changes alter the Baseline Availability Work Package (BAWP) after A-360.

h. Identify the routine package to be accomplished based on Master Specification Catalog (MSC) or Master Job Catalog (MJC) review (as appropriate).

i. Plan for and monitor availability execution to stay within cost and schedule for the scope of work authorized. Ensure any growth in the scope of work authorized is necessary to reasonably assure safe, reliable operation.

j. Authorize new items and industrial growth work items.

k. Issue direction when the quality or completeness of industrial activity work is in

question.

l. Seek resolution of all mission set and major technical problems and coordinate industrial requirements for modernization and repair.

m. Exercise all work candidate screening and follow up actions relating to availability directly with the unit concerned.

n. Participate in key milestones as required to support resolution of issues.

o. Schedule and conduct inspections of C3 Shore forces.

p. Preparing budget submissions and managing budget execution in support of modernization, repair, and maintenance availabilities as well as the material readiness and training of their assigned units. The basis of the TYCOM budget should be the historical cost incurred for similar efforts. These historical costs are generated, but the Naval Supervisory Activity (NSA) is based on direct versus indirect maintenance cost identification. TYCOM is responsible for providing advanced planning funds to the respective Maintenance Team for availability planning. After the AWP has been identified and commented the TYCOM provides a level of funding to accomplish necessary. Depending on the availability of funds, the funds provided may not be sufficient to accomplish the entire work package with will result in deferred work.

21.6.1.2 TYCOM Maintenance Team. Fleet units must have a formally structured maintenance team consisting of the TYCOM maintenance manager, NSA Project Manager, the unit's Commanding Officer, and Maintenance and Material Management Coordinator (3MC) or 3-M Representative. Chapter 41 of this volume explains the detailed responsibilities of each team member.

21.6.1.3 C3 Shore's Program Manager (SPM) Office:

a. Recommend updates and enforce C3 Shore availability execution policy.

b. Plan and budget for SHOREMEPP and NSA operations.

c. Facilitate Modernization Risk Assessments.

d. Issue LOA for program alterations through the NMP-MOM processes. As Platforms and equipment responsibilities transition over, the C3 SPM LOA will increase as Ship Change Document (SCD) usage is completed for more systems, and commands during their brief transition.

e. Support SHOREMEPP in the conduct of programmatic review of maintenance and budget submission, Mission Module based CMPs, Technical Foundation Papers (TFP), and Shore sheets.

f. Facilitate continuous improvement efforts.

g. Mandatorily participate in Maintenance Cycle Planning Conference (MCPC). Participate in all other planning conferences, as necessary.

h. Program Objective Memorandum (POM) and fund the operation of the Shore Planning Activity (SPA), Shore Planning Yard (SPY), and NSA.

21.6.1.4 Shore Maintenance Engineering, Planning and Procurement. The shore planning activity will conduct advance planning actions to provide centralized Life Cycle Engineering,

Class Maintenance, and Modernization management.

a. Build and maintain Mission based CMP.

b Identify, track, and process all mandatory Mission Module based CMP requirements.

c. Branding resides in the Mission Module based CMP and Current Shore Maintenance Project (CSMP), as applicable.

d. Develop, track, and process the BAWP to reflect changes in the CMP.

e. Integrate Modernization tasks into the BAWP per issued LOAs. After BAWP or AWP turnover, enter authorized modernization tasks into the CSMP following the Navy Modernization Process (NMP).

f. Issue the Availability advance planning schedule.

g. Prepare and issue all phases of Availability Work Packages (AWP) and AWP supplements (as applicable).

h. Build TFP for each class and shore sheets for each site.

i. Ensure the Mission Module based CMP configuration data, Last Maintenance Accomplished dates as designated in the Mission Module based CMP management program, Next Due Dates and associated periodicities remain current using historical technical data to correct deficiencies when necessary.

j. Enter alteration in the CSMP as 2-Kilos.

k. Upload a data file (MM0001 file) with all mandatory requirements and expected services into the CSMP in support of site-specific maintenance Team screening and brokering requirements.

l. Develop a mandatory material list and provide to the NSA for the purpose of ordering materials needed for the availability prior to 100% package lock.

m. Review change deferral letters and cancellation deferral notification system (CDNS) requests for sufficient supporting documentation and mitigating actions. Determine the impact of the request.

n. Provide recommendations to deferral letters and forward to appropriate technical warrant holders (TWH) for approval. Final responses will be forward to the TYCOM for wariness within 10 calendar days of receipt.

o. Review and forward recommended actions for CDNS requests to the responsible TWH with justification and recommendation for approval or disapproval within 14 calendar days of receipt.

p. Attend TYCOM and NSA planning conferences for each site.

q. Coordinate the MCPC, monitor the CSMP, and Departures from Specifications (DFS), and summarize all Deferral letters, Change Notifications, and resulting actions for the current Fleet Readiness Plan (FRP) cycle. C3 Commands stay within a constant Sustainment FRP plan as per reference (g).

r. Capture all mandatory maintenance close out or return costs at the Job Control Number (JCN) and Ship Work list Item Number (SWLIN) levels.

21.6.1.5 In-Service Engineering Agents.

a. Provide recommendations for system MTRs in support of CMP Technical Foundation Paper development.

b. Support TWHs in review of any deferral requests and risk assessments.

21.6.1.6 System Level TWH.

a. Review system-level maintenance plans and TFP supporting requirements.

b. Evaluate Deferral Letters and CDNS deferral requests submitted by NAVIFOR via SHOREMEPP. Submit recommendations to the Platform TWH.

21.6.1.7 Platform TWH.

a. Approve CMPs and TFPs.

b. Review, adjudicate, and provide approval or disapproval for all Deferral Letters and CDNS Deferral Requests to SHOREMEPP within 10 business days of receipt.

c. For Deferral Letters requiring other agency approvals (e.g., Naval Air Systems Command, NAVFAC), NAVWAR 5.0 will coordinate with the appropriate Technical Authority for adjudication.

21.6.1.8 Naval Supervisory Authority. The NSA is the Naval activity responsible for integration of all maintenance and modernization for fleet units and shore sites, oversight and verification that all work accomplished during the availabilities is authorized in compliance with applicable technical requirements and policy, and that all work meets schedule, quality, environmental, and safety requirements. The NSA must have a NAVWAR technical warrant holder available to support NSA requirements.

a. Participate in all work definition, planning, and completion conferences, including conducting the Work Package Execution Review (WPER). During the avail, conduct daily production, and weekly execution schedule review meetings.

b. Manage the Integrated Master Schedule for all availabilities, sites, and executing activities. The schedule for each availability must address work definition, key events, site visits, job summary, material preparation as, and strategy preparations.

c. Request availability funding.

d. Update AWPs.

e. Solicit bids, award contract and oversee contract execution per volume VII of this manual. For work performed by contractors, ensure all provisions of the contract have been fully executed.

f. Monitor Alteration Installation Team (AIT) Quality Assurance by conducting Quality Sampling and request Qualification Records as needed in support of spot checks.

g. Coordinate work and testing controls to include Work Authorization Forms (WAF), tag-outs, and test sequencing per chapter 10 of this volume.

h. Conduct site visits, plan work candidates, and order material as required, including Long Lead Time Material (LLTM).

i. Maintain a list of activities authorized to work on site. Ensure activities have the proper credentials, work schedule and pedigree (authorized maintenance activity) prior to being added on the work authorization list.

j. Ensure third party executing activities (i.e., work not being executed by NAVWAR) have a proper Memorandum of Agreement (MOA), Standard Work Practices, or standard items and that those items address required support for work authorizations and work control. NSA representative must sign MOA(s) as assurance that any civilian contractor requirements detailed in the MOA are contained within applicable contracts.

k. Ensure in briefings or out briefings and training are conducted as necessary so that personnel understand applicable processes and requirements and appropriate points of contact.

l. Identify and resolve coordination problems and work conflicts. Advice the appropriate maintenance sponsors of significant quality, cost and schedule impacts and problems.

m. Develop strategy using the guidance found in chapter 9 of this volume to accomplish calibration of systems, gauges, instruments and tools that will be turned over to the site with the installation.

n. Provide a copy of all DFSs to the site's designated Shore Maintenance Management Officer (SMMO) and the TYCOM Force 3MC Team.

o. Ensure Availability Completion Report (ACR) (see Appendix B) are issued for any work not accomplished, assure a CSMP JCN is issued.

p. Receive copies of ILS products from the AIT and verify they were properly distributed.

q. Coordinate Regional Maintenance and Modernization Coordination Office (RMMCO) Check-in or out.

r. Certify the availability per NSA procedures based on volume II, part I, chapter 3 of this manual.

s. The NSA will be responsible for auditing, evaluating, and assessing expenditures per volume II, part IV, chapter 5 of this manual.

t. The NSA will have a quality Management program per volume V of this manual that will include a designated Quality Assurance Officer, an audit and surveillance program, training and qualification programs, and technical review requirements for work packages and DFSs at a minimum. The NSA is responsible for developing QA procedures to implement the provision of volume V, part I of this manual.

u. Perform inspections of installations, on a sampling basis, and use the sampling evidence to indicate conformance or non-conformance with NAVWAR requirements.

v. Provide detailed guidance regarding identifying, charging, classifying, collecting and reporting expenditures related to maintenance costs with the exception of organic depot level maintenance.

w. Prepare budget submissions concerning funds required to perform NSA functions, with appropriate supporting documentation, for submission to the SPM.

21.6.1.9 Site Commanding Officer, Officer in Charge, or Technical Director is the TYCOM representative for monitoring the progress and quality of work. As such, they should review availability progress during weekly conferences with Department Heads and others as necessary. The representative should be prepared to discuss and assist in the resolution of schedule, design, material, and production problems. Additionally, this representative must:

a. Understand the maturity of new installations.

b. Accept or reject any Risks associated with the work.

c. Ensure that assigned personnel are recording material deficiencies in the CSMP.

d. Make personnel available for System Operability Verification Test (SOVT) participation and training; ensure only site approved site personnel operate all equipment.

e. Ensure only approved personnel are allowed on site.

f. Ensure only approved work is executed. No parties shall be allowed to execute work that is not part of the approved AWP.

21.6.1.10 Site.

a. Site personnel shall ensure that the CSMP is current and accurate, following chapters 2, 5, 19-3, and 19-7, of this volume.

b. Develop a concurrent Work Package that includes all major maintenance actions such as Planned Maintenance System (PMS), repairs, and. Testing to be conducted by site personnel during the availability, as applicable.

c. Site personnel must establish a strategy for calibration of gauges, instruments, and tools based on the Calibration Recall List, and Calibration Support Plan per chapter 9 of this volume.

d. The 3MC or 3-M Representative will serve as the Availability Coordinator, responsible for coordinating the completion of all pre-availability and availability milestones.

21.6.1.11 Participating Acquisition Resource Managers (PARM).

a. Will continue to fund modernization material and labor costs.

b. Follow the reference (e), when combined the NAVWAR Installation Process Handbook for meeting fleet policy SCD approval process.

c. Ensure ILS elements are delivered to support fleet policies.

21.6.2 Non-C3 Shore Site Organization Responsibilities and C3 Shore Sites Not Transitioned to Full NMP Processes.

21.6.2.1 NAVIFOR.

a. Act as the Policy owner of the FRCB as designated per reference (b).

b. Execute FRCB roles and responsibilities per this policy, reference (i) and reference

(d).

c. For C3 Shore FRCB processes, the FRCB panel will utilize to the maximum extent possible the checks and balances that are found within the NMP-MOM. To ensure fleet operability, this includes Hull readiness assessment, and Installation Readiness Reviews within the Shore Maintenance and Modernization Voting Tool. This ensures a combined integrated availability with SCD installations and partnerships with both the shore SPM, NSA, SHOREMEPP, or SPY.

21.6.2.2 TYCOM.

a. Ensure shore sites under their cognizance are up to date with the latest Fiscal Year Fielding Plans.

b. Ensure any modernization on shore sites under their cognizance are trained on, and utilize the FRCB process for any shore site self-installation or Other than Command Funded (OCF) installation.

c. Issue LOA for all FRCB installations. C3 Shore FRCB will have its own TYCOM LOA issued until program alterations are transitioned to SCDs for the SPM LOA.

d. NAVIFOR Force 3MC is responsible for ILS review processes, and owner of the ILS review process for FRCB installation. The Force 3MC is the certifier for all ILS Certifications.

21.6.2.3 NAVWAR 5.0. Conduct all NAVWAR program office modernization and OCF Reviews per reference (d).

21.6.2.4 Shore site. Ensure a designated in writing FRCB Site point of contact (POC) is identified and understands their role and responsibility per reference (d).

21.6.2.5 Participating Acquisition Resource Manager.

a. Will continue to fund modernization material and labor costs.

b. Follow the reference (h), when combined with NAVWAR Installation Process Handbook for meeting fleet policy SCD approval process.

c. Ensure ILS elements are delivered to support fleet policies.

21.7 PROCESS. Appendix C provides a flowchart of the non-C3 modernization process decision and prioritization.

21.7.1 Key Elements. Key elements of the shore modernization process are:

a. A single process to identify, evaluate and approve all hardware and computer software modifications to all shore platforms sites and site's systems. The Entitled Modernization Process is owned by the Fleet and executed through System Commands (SYSCOM) and TYCOMs. The Commander, Naval Sea Systems Command (COMNAVSEASYSCOM) acts as the executive agent for the Chief of Naval Operations (CNO) in the execution of Navy Modernization. Following the "Virtual SYSCOM Engineering and Technical Authority Policy", the SYSCOMs execute technical authority within their areas of responsibility, technical integrity and expertise. The process operates in concert with Acquisition Program processes of reference (c).

b. The Entitled Process is comprised of five distinct phases and three Decision Points to take a proposed change from conception to completion. This process is executed using the SCD. Senior Fleet, SPM, and OPNAV personnel comprise the Decision Boards identified in paragraph 21.9 and further explained in reference (a). SPM is utilized as a Situational Awareness Voter, until such time that it has fully transitioned to the NMP-MOM. Provisions exist to combine Phases II and III for less complex changes as delineated in paragraph 21.7.8.

c. FRCB for non-C3 and not yet transitioned C3 shore site's is comprised of 5 primary phases for PEO and other than command funded installations, and 3 phases for 3rd Party. The database utilized for FRCB is housed within NAVWAR's SPIDER or RIPTIDE program for the workflow. The review is conducted in the Shore Maintenance and Modernization Voting Tool.

d. Both C3 and non-C3 shore uses the term "availability" as the timeframe utilized to encapsulate installations. C3 Shore sites have availabilities that are separated into Extended Continuous Maintenance Availabilities (XCMAV), and Windows of Opportunities (WOO), these periods are defined in reference (g).

e. The Fleet and TYCOMs collaborate with OPNAV, SYSCOMS and PEOs in the decision-making process, utilizing three boards of stakeholders at the 0-6, One and Two-Star Admiral, and three-star Admiral level. Voting members of the boards represent appropriate Fleet and OPNAV organizations. SYSCOM and PEO representation are included to validate the readiness of the alteration to proceed to the next step. Paragraph 21.8 addresses the business rules associated with the voting process. Depending on cost and impact thresholds, decisions are made by one of the three boards.

21.7.2 Decision Points. There are three main decision points exercised by the review boards and all three are supported by Technical Assessment Teams (TAT), Cost Benefit Analysis (CBA), and Resource Sponsor reviews.

a. Decision Point 1: The purpose of Decision Point 1 is to approve the entry of the concept design.

b. Decision Point 2: The purpose of Decision Point 2 is to validate or update the SCD and to proceed with design development.

c. Decision Point 3: The purpose of Decision Point 3 is to validate or update the Modernization Plan and to proceed with material procurement and scheduling installations with Resource Sponsor confirmation that funds exist in the budget to fully execute the Ship Change.

21.7.3 Change Document. The principal document used in the Technical Assessments is the SCD. The SCD is prepared by any activity and must meet specific minimum requirements addressed in paragraph 21.4. After the SCD is initiated, it is forwarded to an authorized submitting activity for submission into the review process.

21.7.3.1 Phase I steps consist of:

a. The initiator must provide data for all SCD Phase I fields at a minimum prior to submission to the submitter.

b. Minimum header data required uniquely defining the Configuration Change (functional definition, class affectivity, functional areas).

c. Fleet requirement, description of change, and impact to the Fleet if not accomplished.

d. The submitter will ensure there are no duplicate SCDs.

e. The submitter must be able to request expedited review by setting an "Expedite" flag in SCD. Expedited SCDs are considered first in any process work queue.

NOTE: THE PROCESS ENABLES LESS COMPLEX CHANGES TO PROCEES TO PHASE II(A) WHICH COMBINES PHASES II AND III, AS DETERMINED IN THE INITIAL TECHNICAL ASSESSMENT TEAM REVIEW.

21.7.3.2 Phase II steps consist of:

a. The Submitter receives approval of SCD Phase I and notification to complete SCD Phase II.

b. The submitter will utilize internal processes to complete preliminary engineering, update the SCD, and submit the SCD into the Phase II review process.

21.7.3.3 Phase III steps consist of:

a. Submitter receives approved SCD Phase II.

b. The submitter will utilize internal processes to complete engineering and design development, update the SCD, and submit the SCD into Phase IIA or III.

21.7.3.4 Phase IV. The purpose of Phase IV is to accomplish ship and site-specific advanced planning and achieve maturity of the SC. The attention is redirected from overall SC design to specific requirements for installation on a specific ship or site. This phase includes availability work package integration, finalized ship or site design (including ship check, site survey and development of drawings, technical installation instructions, etc.), initiation of procurement, and installation readiness reviews.

21.7.3.4.1 Fielding Plans. When an SCD is initiated at any phase, the submitter will provide a FP using the CBA Installation FP Tab that reflects the planned number of units, by ship or site, per Fiscal Year. Once the FP change has been approved in NDE-EP, ship-specific installation information will be scheduled by the PARM in Navy Data Environment-Navy Modernization (NDE-NM). The PARM and submitter must coordinate data entry to ensure that the applicable ships or sites and the total number of production units (e.g., quantity per Fiscal Year in the CBA) match the ships or sites numbers scheduled in NDE-NM at each DP and reflects any changes.

21.7.3.4.2 Ship Change Scheduling. SC Scheduling provides visibility to authorization activities for inclusion into the SPM or TYCOM authorization documents. SC Scheduling in NDE NM.NET must match the approved SCD FP.

a. Incremented Ship Changes. An increment of an SC is a finite, definable, bounded portion of the total scope of work required to fully accomplish a single SC. Increments are not to denote different versions of the same hardware or software system. If it is known during the development of an SCD that incremental installation is necessary and appropriate, the increments will be fully defined as part of the Description of Change and evaluated during the TAT review of the SCD.

b. If it is necessary to increment the installation post DP3 and before Start of Installation for the affected ship, a LAR approved by the SPM can be utilized to define the scope of each increment. The PARM should update the FP after approval of the LAR to show the newly defined increments and submit the revised SCD for approval via the DP Boards. The LAR should be attached to the SCD as a permanent record of the incremental decision. In cases when SID development has started, a LAR is required to the Planning Yard (PY) to identify changes required to the SIDs.

c. To increment an SC after the Start of Installation during a maintenance availability and the remaining production work needs to be scheduled in a subsequent CNO availability, an informational Electronic LAR (eLAR) should be developed by the PARM to define the scope of each increment for the affected ship. The eLAR should be attached to the SCD, SCD updated (including FP change), and forwarded to the NMP DB for approval. The PARM should update NDE-EP, NDE-NM, and NDE Afloat Master Planning System (AMPS) modules after approval of the eLAR to show the newly defined increments for the affected ship(s). The PARM has the responsibility to take all appropriate actions to address all increments including coordination with the PY to address SIDs for each increment, RMMCO to address status of the increments in RMMCO.NET, SPM to address status of ILS certification, and C5IMP stakeholders to address impacts to the baseline.

d. Some incremented installs may also require a Departure from Specification (DFS) to document the resulting ship's condition based on the incrementation. In those cases, the PARM should be responsible for generating the required DFS.

21.7.3.4.3 Ship Change Planning. The PARM should plan to accomplish all maturity requirements and modernization milestones paragraph below. The PARM should ensure all technical documentation is complete; all material has been procured and is available for installation; pre-installation testing has been accomplished per the appropriate installation and testing plans; all conjunctive SCs are either installed or mature; all certifications and qualifications have been completed.

a. Ship Installation Drawings. Drawings, change instructions, material procurement and logistics required for SC installation will be developed or accomplished as necessary utilizing internal processes. If the scope of the SC affects only internals to the equipment, SIDs are not required. Equipment level drawings will be developed to ensure that all technical requirements are identified. SIDs should be accomplished per reference (l). The PARM should task and fund ship checks and SID development per milestones paragraph below. SID approval is delegated by the SPM to the PY. Installation Control Drawings and Installation Requirements Drawings are used to provide supplemental guidance in support of SID development per reference (l).

b. Liaison Action Records. LARs are the formal documentation tool for communication among Availability Planning Activities, PYs, SUPSHIPs, Executing Yards, SYSCOMs, PARMs, AITs, SPMs, In Service Engineering Agents (ISEAs), and other organizations involved in planning and executing ship modernization. LARs should be used to facilitate the resolution of design questions and change requests regarding drawings, technical documentation, and tasking assignments; requirements for departures; identification of increments not specified at the time of SC approval; and

transmittal of drawings for approval or archiving. Policy for LARs is defined in reference (m).

c. Milestones. SC maturity and availability contractual requirements are subject to planning milestones to ensure timely planning and execution of availabilities. Enterprise specific milestones are identified in reference (a), formal SPM correspondence (e.g., Naval Messages, Memorandums, etc.) and volume II, part II, chapter 3, Appendix A and chapter 5, Appendix D, or volume II, part I, chapter 5, Appendix E of this manual. Failure to comply with JFMM volume II part II chapter 5 of this manual can result in deferral of a SC from SPM or TYCOM authorization documentation or additional requirements to be added or remain on a SPM Letter of Authorization (LOA) or TYCOM authorization documentation (e.g., Risk Assessment Approval, Late Add Approval, etc.).

d. Certifications and Qualifications. All required certifications and qualifications should be documented in the SCD and accomplished prior to installation. Certifications include, but are not limited to:

(1) Warfare System or Element (System) level Certifications

(2) Warfare System Installation Assessment

(3) ILS Certification

(4) Application Integration Certification

(5) Cybersecurity Accreditation and Certification

(6) Weapons Systems Explosive Safety Review Board non-firing concurrence for installation

(7) Electromagnetic Interference Impact Assessment and System Electromagnetic Capability Certification

(8) Shock Qualification or Submitted Shock Deficiency Plan

e. Fleet Commander C5I Baseline. The C5I Modernization Process is governed by reference (b). All SCs with a SFI CAT of 1 or 2 require authorization in the FLTCDR C5I Baseline. Authorization in the FLTCDR C5I baseline is critical maturity requirement for SPM or TYCOM authorization. SFI CAT determinations are made during SCD TAT Reviews.

(1) SCs can be added to the FLTCDR C5I Baseline through two different methods. SCs that are scheduled prior to the Baseline Lock Event (BLE) for a ship will be reviewed at the BLE and the FLTCDR will determine if the SC is authorized, planned not authorized, or will not be included in the baseline. Any SCs that were not added to the baseline during the BLE will require the PARM submission of an eCCB Risk Form and FLTCDR approval.

(2) Any SCs being removed from the baseline after BLE will require PARM submission of an electronic Removal eCCB Removal Risk Form and FLTCDR approval. Depending on the SC maturity and scheduling timeframe, Risk Assessment Requests and TCD Waivers may be required.

f. Risk Assessments. SCs that are immature require an approved Risk Assessment Request to remain on the SPM LOA after the LOA Late Add milestone in reference (a). Additionally, if a SC is scheduled after the Late Add milestone and immature, an approved Risk Assessment Request, in addition to a Late Add message, is required to be added to the SPM LOA. Immature SCs scheduled outside of CNO availabilities will require an approved Risk Assessment Request for FLTCDR or TYCOM authorization. Risk Assessment Requests are submitted to the FLTCDR or TYCOM per the Ao message templates in reference (b). FLTCDR approval is required for SFI Category I and II SCs, and TYCOM approval is required for SFI CAT III and IV SCs.

g. Target Configuration Date Waivers. The TCD is established by the FLTCDR for each ship to minimize configuration changes during the Basic, Integrated, Advanced, and Sustainment phases. Changes to the C5I baseline outside the Modernization Window adversely affect an operational unit's ability to train, and therefore, require TCD Waiver approval from the appropriate FLTCDR. TCD Waiver requests must be submitted for any SFI CAT I, II, or III SCs per reference (b).

h. Late Adds. SCs that are not authorized for a CNO Availability prior to the Enterprise specific LOA Late Add milestones paragraph above will require Late Add approval. Depending on the Enterprise, Late Add milestones may vary based on SC scope and impact to the availability. Late Add requests must be submitted by the cognizant PARM. The TYCOM is the activity responsible for reviewing and approval or disapproval of Late Add requests.

21.7.3.4.4 Ship Program Manager or TYCOM Authorization. SPMs and TYCOMs are the activities responsible for reviewing SC maturity and authorizing SCs for installation.

a. Ship Program Manager or TYCOM Authorization (CNO Availabilities). The SPM (Program Alterations) and TYCOM (Fleet Alterations) will evaluate the maturity of each SC scheduled to occur in a CNO Availability based on their Enterprise specific processes, using the Installation Readiness Assessment, per the applicable milestones. The SPM or TYCOM will document the decision to authorize or defer each individual SC via a LOA or a LOA Change message. Any SC that is not mature per the milestones will require Risk Assessment Request approval from the FLTCDR or TYCOM. Any SC that is not authorized in accordance with the LOA milestones will require an approved Late Add request.

b. Type Commander Authorization (Outside CNO Availabilities). The TYCOM will evaluate the maturity of each SC scheduled outside of a CNO Availability. Any SC that is immature requires Risk Assessment Request approval from the FLTCDR or TYCOM. For Carriers, SCs identified in the Modernization Readiness Assessment as mature are authorized for installation. For Surface Force Ships, the TYCOM will document authorized SCs via a Quarterly Installation Scheduling Message.

21.7.3.4.5 Pre-Installation Check-Out. Pre-Installation Check-Out (PICO) is a test designed to evaluate and baseline the operational status and performance of the equipment, systems, and interfaces. PICO completion is of vital importance to both the maintenance and modernization communities to ensure corrective actions and responsibility for discrepancy resolution is effectively and timely identified and completed. PICO must be conducted for all scheduled modernization installations during CNO availabilities when SCs or alterations modify or relocate

existing equipment or systems, including modifications that affect existing interfaces between systems. The purpose is to identify pre-existing discrepancies, which if uncorrected, could delay or prevent the successful completion of the SC. The PARM or ISEA will ensure that PICO testing requirements are submitted to the coordinating activity per the Enterprise specific coordination method identified in references (a) and (n). Regardless of coordination method, all required PICO(s) will be targeted for completion 90 to 30 days prior to the Start of Availability based on the ship's operational schedule. For installations accomplished outside of CNO Availabilities, PARMs or ISEAs will coordinate with TYCOMs to accomplish the PICO.

a. For all installations (AIT and Non-AIT), Ship's Force will ensure discrepancies are documented in the ship's Current Ship Maintenance Project (CSMP) and coordinate new work with the Naval Supervisory Authority (NSA) and Lead Maintenance Activity (LMA).

b. The PARM or ISEA will provide a draft PICO Completion Naval Message using the suggested format in reference (c). All PICO discrepancies will have a Ship's Force CSMP entry, assigned Job Control Number, and be included in the PICO Completion Naval Message. Ship's Force will review and release the PICO Completion Naval Message. Ship's Force will continue to track CSMP items identified during the PICO and coordinate required maintenance actions (e.g., equipment repair and parts requisition) to support post installation testing. In the event a PICO can't be accomplished or completed, the PARM or ISEA will document via a Naval Message.

NOTE: THE AIT INSTALLATION COORDINATOR SHOULD BRIEF THE PICO STATUS AT THE SHIP'S IN-BRIEF PRIOR TO START OF INSTALLTION. SHIP'S FORCE WILL PROVIDE STATUS OF PICO DISCREPANCIES UNDER THEIR COGNIZANCE.

21.7.3.5 Phase V. The purpose of Phase V is to execute the SC and document completion and delivery of all installation requirements. SCs must be authorized in Phase IV to proceed to installation phase (Phase V). Once all planned installations for applicable ships have been completed and documented in NDE, the SCD is closed out.

21.7.4 Technical Assessment Teams. TAT are assigned via the Platform C3 Type Desk Officer.

21.7.4.1 Technical Assessments. Technical Assessments are performed at three separate stages in the process to support decisions to complete preliminary engineering, design development and detail specifications.

21.7.4.2 Phase I Technical Assessment Rules. The following Phase I Technical Assessment Business Rules apply:

a. SPM cannot send a change idea to history.

b. TAT review process will take no longer than 5 days.

c. Any negative recommendation must include a justification.

d. Due to limited engineering requirements and limited impacts to existing equipment and the shore platforms, some changes may be permitted to have Phase II and Phase III combined. In order to determine if there is sufficient reason to combine these two phases for a particular change, the TAT must consider the scope of the change.

21.7.4.3 Technical Assessment Teams. TATs will review the SCD and make recommendations to correct data.

21.7.4.4 Phase II Technical Assessment Rules. Should the SPM require additional clarification, endorsement will not be forwarded prior to attempting issue resolution via TAT Lead. Unresolved issues will be noted in the Technical Assessment comments and forwarded. TAT will take no longer than 45 days to complete.

21.7.4.5 Phase IIA Update Technical Assessment. In this phase, complete technical data will be available for review in Phase IIA SCD. Phase IIA will combine Phases II and III to streamline the process. The same basic tenets of the process described for Phases II and III will apply. The TAT will complete their review within 60 days.

21.7.4.6 Phase III Technical Assessment Rules. In this phase, complete technical data will be available for review in Phase III SCD, but the basic tenets of the process described for Phases I and II will apply. TAT will complete their review in this phase in no more than 60 days.

21.7.5 Cost Benefit Analysis Review. A CBA Review is conducted to ensure cost and budget data in the SCD is correct prior to forwarding to the Resource Sponsor for review. A CBA Review is conducted for each phase.

21.7.6 Combining of Phases. Guidelines for combining Phases II and III:

a. The following criteria must be met for the SCD to qualify for Phase IIA:

(1) The Ship Change (SC) Alteration is an internal equipment modification.

(2) The change does not put additional requirements on shore platform distributive systems.

(3) The change does not impact Ship Selected Records (SSR), compartmental arrangement records, or control records.

(4) The change does not impact roof stability (weight and load balance).

(5) The change does not impact manning levels.

c. If all of the guidelines listed are met, the technical assessment team may recommend Phases II and III be combined.

d. If the Phase I 0-6 Board determines Phases II and III can be combined, then both Phases II and III of the SCD must be completed before going to Decision Point 3 0-6 Board.

21.7.7 Non-Permanent Changes (NPC). Duration of Alteration is designated as a Non-Permanent Installation. This type of change will adhere to the following guidance:

a. NPCs shall include a Technical Data Package per reference (a).

b. Approval at Decision Point 2 constitutes approval to install the NPC. At the completion of the authorized install period the change will either be:

(1) Removed to its original configuration.

(2) Make install permanent by forwarding results and Phase III SCD reflecting the need to make the change permanent and to install on other platforms.

c. Installation will be onboard for pre-specified amount of time not to exceed one deployment cycle or one year.

21.8 VOTING RULES.

21.8.1 Voting Database Rules. The principal document in the voting process is the Resource Sponsor Review of Recommended Change Package (RCP). The RCP is prepared electronically in NDE, and presents information from the TAT, CBA, and Resource Sponsor reviews. While the RCP provides summary information, the capability exists to drill down to view more detail from the SCD Header, TAT, and CBA. The three Decision Boards mentioned in paragraph 21.9 will be in place to approve RCPs and authorize SCDs to proceed to the next phase of the process.

21.8.2 Initiate Change Document Business Rules. The SCD will initially capture the basic idea, associated cost and mission capability information, but will be updated with more detailed information as the change matures through the process. The initiator of the change will prepare the SCD and forward to the organization, in their chain of command, authorized to submit the SCD into NDE (e.g., TYCOMs, PEO, PARM and Life Cycle Managers). The SCD can be initiated and Phase I, II, or III following the applicable Technology Readiness Levels.

21.9 DECISION BOARDS.

21.9.1 Decision Board Process. The three decision points in the process (i.e., Authorize and Fund Preliminary Engineering, Design Development and Procurement or Installation) are accomplished through the three Decision Boards (0-6, 1 or 2 Star, 3 Star). While the boards will operate in a hierarchical mode where decisions made at a lower-level board will be validated by the senior board, the following thresholds are established for approval authority:

0-6 Board	< $75M Total Cost
1 or 2 Star Board	$75-250M Total Cost
3 Star Board	> $250M Total Cost

21.9.2 Board Specific Rules. The following specific rules apply to each Board:

a. 0-6 Review Board.

(1) Must meet continuously on a virtual basis and consider all RCPs. For items that are outside their fiscal threshold (above $75M total program value) they make recommendations to higher boards.

(2) All members have the opportunity to vote on all RCPs.

(3) Voting process will be achieved within five working days.

b. 1-2 Star Review Board.

(1) Will vote as required for SCDs that fall within their monetary threshold ($75M and $250M total program cost).

(2) Voting process will be achieved within ten working days.

c. 3 Star Review Board.

(1) Will meet quarterly to review Modernization Plan and to consider forwarded

RCPs that fall within their monetary threshold (above $250M total program costs).

(2) Approve or disapprove 1-2 Star Board recommendations.

(3) Voting process will be achieved within ten days working days.

21.10 MILESTONES. The milestones for development of the BAWP that covers the Shore FRP cycle and the milestones of the individual AWP's can be found in Appendix A.

21.11 C3 SHORE ORGANIZATION. NAVWAR 4.8 office has been designated as the C3 Shore Program Manager and serves as the SPM as per the roles outlined in the NMP-MOM and this manual. Three other organizations stood up to support these shore fleet units are SPA, SPY, and NSA or Lead Maintenance Activity.

21.12 C3 SHORE INTEGRATED AVAILABILITIES. C3 Shore Integrated Availabilities are scheduled periods set aside for execution of corrective maintenance, planned maintenance, MTRs, and modernization. The schedule for availabilities is assigned within the FRP cycle by NAVIFOR per reference (g). Depending on the size of the site, there are two different counts of XCMAVs, and WOOs per 36-month cycle. There will be a time period in which the integrated availabilities will have both SCD and FRCB packages in the integrations. The purpose of the availabilities are not to bring a shore site down but to plan maintenance or modernization of certain mission threads and planned mitigations during that period.

a. XCMAV are three to ten weeks in duration (one per site annually).

b. WOO will be less than three weeks in duration (two per site annually).

c. The term "availability" is used to identify both XCMAVs and WOOs.

d. If there is not sufficient work to be brokered to all availabilities or for "small" sites with fewer systems. SPM and SPA will recommend when to omit a periodic availability.

e. In the event that planned work will exceed a ten-week XCMAV duration, the SPM will gain concurrence from NAVIFOR to provide an extended window for the availability.

21.13 MEETINGS, REVIEWS, AND CONFERENCES.

21.13.1 Maintenance Cycle Planning Conference. SHOREMEPP will plan and conduct MCPC that will be attended by representatives from the TYCOM, NSA, and Program Management Office. The Maintenance Manager, NSA Program Manager, and cognizant Platform TWH attendance is mandatory. The MCPC will be held annually to review upcoming work for all sites in the assigned region.

a. For sites at the beginning or end of their maintenance cycle, the conference will review the schedule, organizational responsibilities, CSMP's, active DFSs, active temporary standing orders, mission thread advisories, routines, and the availability duration. All items will be reviewed for branding.

b. For sites at the end of the FRP cycle, the BAWP close out portion of the meeting will review mandatory work that was completed, not completed or deferred, establish requirements for the next FRP maintenance cycle, and determine the stats of all "A"

branded BAWP items. All non-accomplished-not authorized for deferral JCNs will require adjudication via the Deferral Letter process. The next years' worth of work will be pushed following the MCPC. Outcomes from the close out will be recorded in the close out letter.

21.13.2 Work Package Integration Conference. The NSA will induct a Work Package Integration Conference (WPIC) at A-120 for early identification of work requirements that must be integrated to avoid conflicts without work during execution. The NSA must develop an inclusive, detailed, integrated, and resource-loaded schedule of all participating activities. All participants must meet and review the proposed plan and make necessary adjustments to render a balanced and optimized integrated schedule. All integrated schedule conflicts must be resolved by the NSA by the Work Package Execution Review (WPER).

21.13.3 Work Package Execution Review. The WPER, per volume II, part I, of this manual, is held to review the integrated work production schedule that has been prepared by the Executing Activity (EA) and is the final opportunity to resolve any work interface or production support issues between the different activities before actual production work begins. This meeting may be conducted in conjunction with the Planning Board for Maintenance (PB4M) at A-30.

a. Assemble the proposed work package and screen to a designated availability.

b. Prioritize the proposed work packages.

c. Identify other outside activities participating in the CMAV and associated support requirements. The result of the CMAV WPER should be an executable work package within CMAV time frame, budget, and EA capacity.

21.13.4 Planning Board for Maintenance. PB4M is a formally structured monthly meeting executed in accordance with chapter 19-3 of this volume. The PB4M will be chaired by the unit's Commanding Officer or designated representative such as the platforms Officer in Charge, or Technical Director, using an agenda prepared by the Maintenance Manager. This forum provides a review of current planned depot, intermediate, and organizational maintenance, CSMP quality and accuracy, future maintenance and modernization planning, and fiscal concerns. The objective is to ensure clarity of intent for both the unit's efforts and the C3 Shore infrastructure it's respect to total site maintenance, operational schedules, and other concerns affecting material readiness. Due to C3 Shore sites not following traditional FRP phases, the PB4M should be conducted every month as well as prior to each availability to ensure the maintenance plan is on track. The PB4M should deconflict operational requirements for each availability.

21.14 WORK PACKAGE PLANNING SOURCES. The AWP will include all work for modernization and maintenance during an availability.

a. The CSMP contains information regarding all known material discrepancies that require corrective maintenance. This may include tasks pulled from the CMP, work items deferred during previous maintenance availabilities, newly identified corrective repairs, and outstanding DFSs. To ensure the CSMP accurately reflects the required maintenance, the TYCOM will routinely review each site's CSMP. Only work that is documented in the CSMP will be authorized for accomplishment and is the basis for all funding.

b. Mandatory Technical Requirements from the CMP.

c. Assessments and grooms may result in the identification of material deficiencies. The TYCOM Maintenance Manager must ensure that all such deficiencies are loaded into the CSMP for a specific availability.

d. Approved alterations found on the LOA.

21.15 SUBMISSION OF WORK CANDIDATES.

a. Requests by site personnel for corrective maintenance assistance or support equipment from outside activities will be appropriately documented via a Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo). The work candidate must be promptly reviewed by the 3MC for processing. The description of the deficiency or support requested and the action desired must be complete, clear ,and in sufficient detail to allow NSA personnel to plan, obtain parts, and assembly the correct tools.

b. The site 3MC will ensure 2-Kilos are provided for deficiencies identified during assessments per this volume. These will be written in a manner that identifies the assessment that led to the discovery.

c. Alterations will not be entered into the CSMP until they are configured to be on an issued LOA, SHOREMEPP is responsible for entering the modernization work into the CSMP as 2-Kilos.

21.16 SITE VISITS. The NSA may conduct site visits as required to support process milestones, verify the scope of work, identify interference, obtain equipment technical data, identify shipping paths, verify system and equipment configuration, and obtain additional problem identification data from site personnel. Site visits must be conducted as early in the planning phase as possible.

21.17 AVAILABILITY WORK PACKAGE DEVELOPMENT.

a. SHOREMEPP develops and maintains BAWPs for each C3 Shore site. The BAWP contains all NAVWAR requirements due during the three-year FRP Maintenance Cycle and is comprised of:

(1) Mandatory Assessment and maintenance requirements from the CMP.

(2) Other programmatic mandatory requirements.

(3) Services and routines in support of MTRs or availability execution.

b. The BAWP is reviewed during the MCPC.

c. After BAWP review, the Maintenance Team will screen work to an availability within 60 days.

d. All work that has been screened to an individual CMAV or WOO becomes the AWP following the first MCPC of the FRP maintenance cycle. The AWP will continue to be updated as work is added until the task order is awarded.

e. Any activity may submit new work candidates for consideration by the SYSCOM, TYCOM, and NSA Chief Engineer (CHENG.) The TYCOM will authorize or reject each new work candidate submitted and provide the reason for the rejection.

f. Within 60-days following the completion of the availability, NSA will close all actions in Navy Maintenance Database (NMD) for the AWP.

21.18 UPDATING THE BAWP.

a. SHOREMEPP will update the BAWP with lifecycle critical repair tasks resulting from assessment requirements in addition to the results (i.e., deferral or technical challenges) from the CSMP, DFS, or MCPC.

b. Further changes to the BAWP must be submitted using a Change Request Deferral Letter or the maintenance screening and brokering system.

c. CMP work completion, configuration updates and new CMP additions will require SHOREMEPP to upload more CMP requirements into the BAWP the next due date for which may fall within the current FRP Maintenance cycle. These updates will be coordinated with the Maintenance Manager.

d. SHOREMEPP must approve the delay of new CMP requirements if those requirements will be due prior to the end of the current FRP Maintenance Cycle.

e. Updates will cease after 100 percent D-Level Maintenance lock.

21.19 CHANGE MANAGEMENT PROCESS.

21.19.1 Change Requests and Change Notification. Changes to the BAWP are identified in one of the following four ways:

a. Reprogram. Includes requirements due during the current FRP Maintenance Cycle that will be moved to a future FRP Maintenance Cycle. These requests must be submitted through the Deferral Letter Process.

b. Deferral. Includes requirements due during the current FRP Maintenance cycle that will be moved within the same FRP Maintenance Cycle. This request shall be made using CDNS.

c. Cancel. For requirements that are neither applicable nor due during the current FRP Maintenance Cycle. Not applicable status may include items for which the configuration or requirement has changed. If a planned alteration on the LOA alters equipment that already has mandatory maintenance actions in the BAWP, the Maintenance Team must follow the deferral and adjudication process.

d. De-scope. Requirements that experienced a reduction in the original scope of work, where the portion of the work not accomplished is reprogrammed.

21.19.2 Cancellation Deferral Notification System. The CDNS is embedded in the maintenance screening and brokering system and provides an automated auditable process for monitoring the status of all CMP mandatory maintenance in a site's CSMP. All CDNS Requests will be requested by the Maintenance Team, routed to SHOREMEPP for awareness, adjudicated or approved by the TWH and returned to SHOREMEPP for tracking.

a. If a particular maintenance requirement is screened to a maintenance period that starts greater than 90 days before and after the due date or if the requirement is screened by the Maintenance Manager to an "unfunded availability" a series of e-mails are automatically sent from CDNS to a key Maintenance stakeholders who will adjudicate the situation. Deferrals using this system will be routed through SHOREMEPP to the tech warrant holders.

b. The Maintenance Team will also use CDNS to request deferral or cancellation of mandatory CMP requirements within the current FRP. Requests for deferrals outside the FRP must be submitted using the Deferral Letter process.

c. CMP requirements may be identified by the Maintenance Team as requiring deferral or correction based on errant configuration data, substitution JCNs or an inability to accomplish the requirement by the due date. When the Maintenance Team identifies such a condition, it must contact SHOREMEPP to review the situation. If both parties agree this item should be addressed by higher technical authority, the Maintenance Team will screen the item to an "Unfunded" availability to initiate the CDNS process.

21.19.3 Technical Deferral and Adjudication Process for Post-Award. The NSA CHENG is empowered as prescribed in this manual to provide final technical deferral authority mandatory ("A" branded) tasks from Award through the end of the avail. In the event the NSA CHENG Exercises this deferral authority, a signed letter with the following information must be provided to both TYCOM and SHOREMEPP no later than ten business days after the availability.

a. Reason for non-accomplishment.

b. DFS Number if required.

c. Any further information that may help future completion or scheduling integration.

d. JCN, Job summary.

21.19.4 Deferral Letters. TYCOM will submit a Deferral Letter to SHOREMEPP which will include a list of mandatory tasks in the current FRP Maintenance Cycle to be reprogrammed to a follow-on FRP cycle. The Deferral Letter shall be submitted in the SHOREMEPP Flank Speed Environment using the digital form. The Information provided in the Deferral Letter form should have a sufficient level of detail to enable a complete evaluation by the TWH. The form will automatically be routed for review by SHOREMPP to the System and Platform TWHs for technical resolution and approval.

21.19.5 Subsequent Reprogramming. If the task cannot be accomplished in the second FRP, then the site should initiate a request for a Major DFS per volume V, part I, chapter 8 of this manual. If the review results in a recommendation not to defer, then a two Flag Panel review will be conducted between the TYCOM and SYSCOM. The two Flag Panel will make the final adjudication. If disapproved by the two Flag Panel, then the task will be completed in the current FRP.

21.20 PLANNING.

21.20.1 Work Item Development. The NSA will develop work items using Class Standard Work Templates managed in the Master Specification Catalog. If maintenance procedures do not exist for the required action, a Formal Work Package (FWP) must be developed, reviewed, and approved per volume V, chapter 2 of the manual.

21.20.2 Late Work. The NSA will develop work items using Class Standard Work Templates managed in the Master Specification Catalog. If maintenance procedures do not exist for the required action, a FWP must be developed, reviewed, and approved per volume V, chapter 2 of the manual.

21.20.3 New Work. The NSA will develop work items using Class Standard Work Templates managed in the Master Specification Catalog. If maintenance procedures do not exist for the required action, a FWP must be developed, reviewed, and approved per volume V, part I, chapter 2 of the manual.

a. The NSA will develop work items using Class Standard Work Templates managed in the Master Specification Catalog. If maintenance procedures do not exist for the required action, a FWP must be developed, reviewed, and approved per volume V part I, chapter 2 of the manual.

b. The NSA will develop work items using Class Standard Work Templates managed in the Master Specification Catalog. If maintenance procedures do not exist for the required action, a FWP must be developed, reviewed, and approved per volume V, part I, chapter 2 of the manual.

21.20.4 Growth Work. Growth work is an increase in the scope of any work that is already on contract. Contracts will have a pre-definite due excess in the budget for such circumstances. Any growth work that exceeds funds available must first be approved via the TYCOM.

21.20.5 Adjudication. The TYCOM, Contractor, and NSA should consider Work Certification Requirements and the definition of "Availability Completion" when adjudicating New or Growth work in any availability. If scope, time and cost are impacted by New or Growth work, the impact should be addressed and documented in writing by the NSA Project Manager to the TYCOM.

21.20.6 Emergent Availability. The TYCOM, Contractor, and NSA should consider Work Certification Requirements and the definition of "Availability Completion" when adjudicating New or Growth work in any availability. If scope, time and cost are impacted by New or Growth work, the impact should be addressed and documented in writing by the NSA Project Manager to the TYCOM.

21.20.7 Material Delivery. All materials required for work must be available (whether in hand or at the site) no later than 30 days before the start of the availability. It is incumbent on the NSA to ensure that the materials are ordered in time to meet this requirement based on the situation, e.g., LLTM, overseas shipping requirements, etc. The NSA will monitor delivery to confirm compliance.

21.21 AVAILABILITY EXECUTION.

NOTE: THE USE OF RMMCO AND ILS CERTIFICATION POWER APPLICATIONS WILL BE UTILIZED UNTIL SUCH TIME THE TRANSITION TO NDE FOR THESE MODULES.

21.21.1 Regional Maintenance and Modernization Coordination Office. C3 Shore avails will utilize the electronic RMMCO function for check-in or out per reference (f). The RMMCO Gatekeeper will validate that all deliverables are available and acceptable before allowing production to begin. Deliverables that are not ready at the time of check-in will cause work in the availability to be delayed. RMMCO will act as Virtual RMMCO for C3 Shore sites, with regional personnel on both the east and west coast.

21.21.2 In-Brief. This conference is conducted by NSA. The in-brief's purpose is to provide an executive level brief to the site's leadership on the total scope of the availability effort.

a. Introduce Key personnel.

b. Discuss planned alterations.

c. Discuss Maintenance actions.

d. Review the schedule.

e. Present de-confliction requirements for integrated work.

21.21.3 Departures from Specification. DFSs are used for reporting, requesting approval and clearance for a lack of compliance with an authoritative document, plan, procedure, or instruction. The DFS program is administered by the TYCOM using eDFS as the primary tool, and message traffic as secondary. DFS should be reported as early as possible. DFS present risks that are immediately levied on the command and should be closed out as soon as feasibly possible. Situations warranting a DFS include, but are not limited to:

a. Non-compliance with drawings.

b. As-found conditions that prevent executing according to documentation.

c. Failure to provide all required logistics documents.

d. Failure to update configuration.

21.21.4 Out-brief. The NSA project Manager will coordinate the out-brief at the end the availability with the same personnel who attended the in-brief.

a. Review of the availably work package to establish status of each item included DFS, and any temporary standing orders.

b. Review incomplete work candidates that will remain open from this availability and identify the plan of action to complete these items.

c. Review ILS documents provided and identified any deficiencies.

d. Review training report.

e. Solicit Feedback on the coordination and execution of the availability.

f. Obtain signatures on the ACR (see Appendix B).

21.21.5 Availability Work Certification. C3 Shore avails will utilize the electronic RMMCO function for check-ins or outs per reference (f). The RMMCO Gatekeeper will validate that all deliverables are available and acceptable before allowing production to begin. Deliverables that are not ready at the time of check-in will cause work in the availability to be delayed.

21.21.6 Availability Completion Report. The ACR C3 Shore avails will utilize the electronic RMMCO function for check-ins or outs per reference (f). The RMMCO Gatekeeper will validate that all deliverables are available and acceptable before allowing production to begin. Deliverables that are not ready at the time of check-in will cause work in the availability to be delayed.

a. All alterations, installations, and removal.

b. Repairs or MTRs.

c. The status of all JCNs.

d. Discrepancies.

e. Logistics Products provided.

f. Copies of Requisition and Invoice/Shipping Document (DD Form 1149s) signed to confirm receipt or transfer of material.

21.22 CLOSEOUT ADMINISTRATION.

21.22.1 Closeout Procedures.

21.22.1.1 The NSA will present a list of completed JCNs with the applicable final action codes to the site to obtain concurrence that the described work was completed.

21.22.1.2 Site personnel will complete 2-Kilos C3 Shore avails will utilize the electronic RMMCO function for check-in or out per reference (f). The RMMCO Gatekeeper will validate that all deliverables are available and acceptable before allowing production to begin. Deliverables that are not ready at the time of check-in will cause work in the availability to be delayed.

21.22.1.3 On the third working day after the completion of an availability, the Maintenance Team will ensure the CSMP reflects the current status of the site's JCNs. This can be doubled up as that month's PB4M.

21.22.1.4 All 2-Kilos must be closed within 60 days after completion.

21.22.1.5 Within 2 weeks of the completion, the Execution Activities who have performed any configuration change must submit the final Change Code (G) or obsolete the configuration item in MBPS, or provide the last Ship's Configuration Change Form, OPNAV 4790/CK, to the site for any final changes.

21.22.1.6 Within seven days following the completion of the availability, the RMMCO coordinator will validate that all deliverables were provided and the associated tasks are complete in their relative IT systems.

21.22.1.7 Submission of cost C3 Shore avails will utilize the electronic RMMCO function for check-in or out per reference (f). The RMMCO Gatekeeper will validate that all deliverables are available and acceptable before allowing production to begin. Deliverables that are not ready at the time of check-in will cause work in the availability to be delayed.

21.22.1.8 C3 Shore avails will utilize the electronic RMMCO function for check-in or out per reference (f). The RMMCO Gatekeeper will validate that all deliverables are available and acceptable before allowing production to begin. Deliverables that are not ready at the time of check-in will cause work in the availability to be delayed.

21.22.2 Closeout Conference. C3 Shore avails will utilize the electronic RMMCO function.

21.22.3 Check In or Check Out. For check-in or out per reference (f), the RMMCO Gatekeeper will validate that all deliverables are available and acceptable before allowing production to begin. Deliverables that are not ready at the time of check-in will cause work in the availability to be delayed.

a. The status of outstanding DFSs.

b. Any reprogrammed or deferred work.

c. An assessment of the scheduling, execution and quality of work accomplished by each activity.

d. Assess lost time that prevented or delayed execution of scheduled work (e.g., waiting for transportation, awaiting access, ragout, other site support.)

e. Review recommendations for process improvements and lessons learned.

21.23 NON-C3 SHORE SITE DECISION POINT.

a. The primary document that goes out for review within the Navy's Tasking system is the FY Fielding Plan for Navy shore platforms. This will go out for input across PEO, Navy, and OCF input beginning April of every fiscal year, and out for Fleet numbered fleet, and Shore Activity Review in June of every FY. This is the primary driver of the following FY shore installations to align to Fleet requirements.

b. Every Quarter within the execution year a Quarterly Work Package will go out for the next quarters installations to ensure tracking of all approved, deferred, or status of installation practices for Navy shore activities.

c. A LOA will be generated for Navy Shore installations will be generated out 45 days from the start of an execution months authorized installations, with two sections authorized to installations, and non-authorized. Non-Authorized installations will be pushed to the next month for install. A late add request will need to be generated via an installation conditional form and signed by the N4 Assistant Chief of Staff (ACOS) or Deputy for approval to move forward, any items that are deficient of products at that time will utilize the DFS process within volume V, part I, chapter 8 of this manual.

d. For C3 Shore commands that have not yet transitioned fully to C3 NMP-MOM processes the LOA issuance for all FRCB installations will be through the TYCOM LOA or Quarterly Installation Status Message (QISM). This will be a rolling LOA issued quarterly, with updates issued for Late adds. The NAVIFOR Type Desk in the maintenance division leads the C3 Shore FRCB efforts.

e. Processing of installation reviews are per reference (d).

21.24 FRCB PROCESS FOR PEO AND OCF ALTERATIONS.

21.24.1 Entry Point Review. Entry point of review is the first entrance for a submitter to ensure all documents are present, the NAVWAR 5.0 team conducts these reviews. This is conducted per reference (d) section 1.4.3. The timeframe is to have all documents submitted at this stage, 90-days prior to installation. A mature package is expected at this stage with a minimum of the following documents:

a. Installation Work Scope. The purpose of the Installation Work Scope is to define the installation effort to be performed, and the deliverables that will be delivered to the site. This document helps to determine the size of the programmatic review of the installation, for example a software alteration will not require a drawing review.

b. System Test Reports. The purpose of the system test reports is to provide assurance that newly developed, altered, or upgraded systems are fully tested before they are fielding for operations. System testing provides a level of confidence in the delivered

system will not result in performance degradation when connecting to associated interfaces. This gives the site a document of reference when troubleshooting.

c. Installation Test Plan. The Installation Test Plan or System Operational Verification Test, is to demonstrate to the site that the newly installed system or modification has been properly installed, operates as intended, and is ready for site acceptance. This is to include systems that are connecting to a platform systems to ensure connected systems properly operate with the equipment.

d. Cyber Security required documents such ask the Authorization Decision Document, previously known as the Authority to Operate, Pre-Installation Testing Risk Assessment, SCI and TEMPEST requirements allow for the Authorizing Officer a residual risk review and statement to ensure boundaries, proper Plan of Actions and Milestones (POAM) to meet today's cyber requirements.

21.24.2 System and Shore Reviews. These reviews are conducted per reference (d).

21.24.3 NAVIFOR ILS Artifact Review. Once the Shore Installation Process (SIP) Reviewer, System Readiness Review (SRR), and System Testing Review (STR) are completed, the NAVIFOR FRCB team will validate the package to ensure the artifacts are present whether in SPIDER or RIPTIDE, or within the authoritative databases the product resides in. All artifacts need to reside in the authoritative source, but can reside in SPIDER or RIPTIDE while the PARM are able to upload their items.

21.24.4 Parallel ILS Review. This review can be conducted in parallel of the SIP, SRR, and STR once the NAVIFOR Artifact Review is completed. This review will be conducted every week led by the NAVIFOR Force 3MC. This review conducted by the NAVIFOR Maintenance Team, and ensures compliance across the 12 Integrated Product Support elements for Logistics rigor for the following:

a. Configuration files are provided as requirements per chapter 19-7 of this volume. This ensures an accurate platform for the site's digital twin, and the capability for the site to report issues properly. The technical specification for Configuration Management is NAVSEA TECH SPEC 9090-700. All Configuration Technical Data Managers need to review reference (j) for latest shore site configuration requirements.

b. Preventive Maintenance will be provided as per that TYCOMs requirements per chapters 19 through 19-6 of this volume. Preventive maintenance is encompassed whether touch labor requirements for assessment procedures, cyber hygiene procedures, or hardware procedures.

c. Test equipment requirements will be provided as per chapter 9 of this volume. The purpose is to ensure test equipment requirements are clearly outlined by model and test equipment to ensure support ability by authorized test equipment calibration labs, and allowances can be updated for site test equipment allowance listings.

d. Supply and Spare Parts. Parts provisioning information is included within Interactive Computer Aided Program Systems, and added into the Configuration record with MBPS via Repair Identification Code, previously known as Allowance Part List. Warranty information is to be provided and given to the Maintenance Manager of the platform to upload to the Maintenance Figure of Merit - Validation, Screening and

Brokering system to put against the configuration record.

e. Technical Documentation. Having appropriate technical documentation, whether operation and maintenance manuals, or cyber hygiene guides, these are key for Platform self-sufficiency, and updated within MBPS.

f. Power and Data Drawings. Installation drawings are used to provide design details, equipment to be installed, drawings are required for every hardware install, and drawing updates are required for hardware de-installations. The authoritative source for drawings is MBPS. For high side drawings the drawings will be stored in the interlink SIPR repository, link to be provided by the installation activities FRCB representative, until such time the MBPS IL6 environment is online, at that time drawings will be populated into the authoritative database.

g. Life Cycle Support Plans. While User Logistics Support Summaries, are not a required document itself, it is an integrated Logistics summary of all the IPS elements, until such time the ILS certification is released. For 3rd Party this document is a Logistics support summary, and follows the ILS checklist outline in the Shore installation Process Handbook.

h. Memorandum of Understandings, MOA, or Site Concurrence Letters are to be given with enough time to ensure the ability to train or allocate resources. This is to follow TYCOMs policy for MOA and Memorandum of Understanding.

i. Informal Training. If no formal training available, all installs in which the site has a responsibility of the equipment there should be an informal curriculum plan for training post installation, to ensure the site has the requisite knowledge for platform self-sufficiency.

j. Formal Training. This will be encased in the Navy Training System Plan, to ensure a formal training plan is outlined per reference (k).

k. Deficiency reporting requirements, are outlined in chapters 2, 5, 19-3, and 19-7 of this volume, any other trouble ticketing systems created are secondary in nature, and need to be able to take Work Notification exports to reduce duplication of effort for platforms.

l. Manning Impacts. Manpower impacts should list out Navy Enlisted Classification and equivalent training with the number of personnel required to perform tasks with the system whether operator or maintainer, this includes both hardware and cyber hygiene, this helps ensure the platform has the requisite personnel to take on the requirements of the system. Navy Training System Plans will usually dictate manning impacts for Program of Record equipment.

21.24.5 Site Concurrence.

This review is completed only when the above reviews are completed, and the package is mature. The Site POC responsibilities are outlined in reference (d). This is a designated person by the Commanding Officer, Officer in Charge, or Technical Director. The ultimate risk is upon the physical location of the site, the Immediate Superior In Command may provide comments, and elevation of risk, but the file concurrence comes from the actual site of the occurring installation. If any items are at a risk level that cannot be mitigated by the start of the

installation a DFS, will be conducted. C3 Shore FRCB site POCs will utilize the Shore Maintenance and Modernization Voting Tool for site concurrence approval, and comments. The designated Site POC or SMMO will be the Site 3MC or equivalent representative as per chapter 41 of this volume.

21.24.6 NAVIFOR Board Authorization. Members are per reference (i).

a. The NAVIFOR FRCB Board governs the final installation authorization through an assessment of all identified artifacts.

b. The boards will convene once a week, and process of the board shall be outlined per reference (i). Shore Maintenance and Modernization Voting Board will utilize NMP-MOM elements for its review.

c. Any board findings for a conditional install will be presented to the Board Chair, N4 Deputy or ACOS, for review prior to NAVIFOR N4 signature. Conditional installations will include all risks associated to including impacts of ILS implications.

d. The Lead FRCB Officer will prepare agenda items and packages for the board's review. When this position is gapped, the lead Civilian FRCB support will conduct the agenda and package.

e. This board will go through all installations for that time period, and work towards meeting reference (b) objectives.

f. This board will review the LOA for installations under the board's purview that fall under FRCB. This review will include recommended deferment of installations.

21.25 THIRD PARTY ALTERATION PROCESS.

a. Entry Point for third (3rd) Party is verification of artifacts to begin the review process and request any documents from the 3rd Party submitter that may be gapped.

b. NAVIFOR equivalent SIP, SRR and STR review process as per reference (d), for any artifacts that are not placed in the authoritative database, the FRCB team will place the Drawings, Technical manuals, or configuration records in the authoritative source MBPS. The NAVIFOR Maintenance Team will work on any PMS items into PMS-MIS.

c. Parallel Integrated Logistics Support Review will be conducted following paragraph 21.24.4.

d. Site Concurrence is the same. Process as PEO and OCF and shall be conducted following paragraph 21.24.5.

e. NAVIFOR Board Authorization will be conducted per paragraph 21.24.6.

21.26 DEPARTURE FROM SPECIFICATIONS. DFS are a key tracking mechanism for risk development, tracking, and close-outs of any departures. These departures may include but not limited to drawings, integrated logistics support elements or closeout documents. The primary process for tracking the DFS is through eDFS, secondary being Naval message, this process follows volume V, part 1, chapter 8, of this manual. Conditionals that become operational require an off-ramp to a DFS, the DFS TYCOM POC is the NAVIFOR Force 3MC.

APPENDIX A

AVAILABILITY MILESTONES

Task or Milestone	Responsible Activity	Description	Due
Establish Procurement Plan for LLTM	NSA, PARM	Communicate plan to SPY	A-700
Submit Funding Request for work assigned	SPY	SPYs request funding from the alteration sponsors for what they know they are going to be tasked to perform.	A-480
SC Design or Planning Funds provided	PARM, SPM, TYCOM	Funding is requested by the SPY and the Alt sponsor is to provide the funding. The purpose is to accomplish site-specific advanced planning of the SC. This includes finalized design, initiation of procurement, pre-installation certification and testing, installation readiness reviews and risk assessments.	A-425
Installation Control Drawings (ICD), Installation Requirements Drawings (IRD) delivered to alteration developer or SPY	PARM	ICDs and IRDs are equipment specific drawings and should be used as general guidance to develop site specific or class Specific Installation Drawings (SID). ICDs or IRDs should be used as supplemental information where SIDs are deficient in specific guidance, and should be accompanied by a Liaison Action Record (LAR) prior to their use. Alteration Sponsors provide the ICD for SID development to the appropriate party (SPY or Third Party).	A-420
Obtain concurrence for 3rd Party drawing development assignment, if applicable	SPY TWH	When planning yard resources and or workload cannot support SID development, third-party designers may be used with SPM authorization. The SPM may authorize the use of recently completed SIDS for the same class and similar configuration.	A-405
Issue Initial LOA	SPM	The SPM LOA specifies to the NSA the SCs approved to be accomplished during a specific shore platform availability. This list will be reviewed at each BAWP Milestone Meeting. Items from this list will not be entered into the	A-360

Task or Milestone	Responsible Activity	Description	Due
		command's CSMP until they have been reconciled with an issued LOA.	
Establish availability in the appropriate IT system	Maintenance Manager	Availabilities will be established in the applicable planning database when known or work is ready to be screened.	A-360
Begin submission of digitized COP data	SPY	Production of COP data	A-300
Third Party SIDs delivered to SPY for review	PARM		A-300
Provide incremental funds for ordering LLTM for both repair and alt or mod work to meet required dates	SYSCOM, TYCOM	This is an iterative process as LLTM is identified and funding is requested and authorized based on the lead time. It is incumbent on the Execution Planning Activity or MT to identify LLTM as soon as possible. LLTM is defined as any material with a delivery date in excess of 30 days. LLTM jobs should be screened first and identified as such in the CMP.	A-270
Provide the Support Service Requirements, Notional POAM, and system SOVT or TP, or Draft or Notional platform SOVT or TP	PARM	POAM, SOVT, TP need to be integrated in the IMS. These artifacts are relevant to the IRA.	A-270
Site Survey Report	Installation Activity	The Site Survey Report shall be uploaded and distributed within 30 days of the completion of the Site Survey for a single system installation and within 60 days for integrated installations of multiple systems. This report is part of the IRA.	A-240
Finalize Method of	PARM or SPM	MOI changes after this milestone require SPM concurrence and shall be subject to deferral, late	A-240

Task or Milestone	Responsible Activity	Description	Due
Install (MOI) for modernization		add process and, in certain instances, the new work process. Part of the IRA process.	
Late Add Process required (except for Low Impact SCs)	PARM	The PARM must submit a formal late add message request to the TYCOM after this point.	A-240
Base Electronic Systems Engineering Plan (BESEP) (Draft)	Installation Activity	The coordinated BESEP should be released by a designated release authority at the IA within 60 days of the completion of the Site Survey for a single system installation and within 90 days for integrated installations of multiple systems. If no site survey will be performed, the coordinated BESEP should be released within 90 days of the receipt of funding by the IA. The draft BESEP is part of the IRA.	A-240
C5IMP Baseline Lock Event	PARM, TYCOM, or FLEET	Electronic Configuration Change Review Board (eCCB) Risk Form required for SFI Cat 1 or 2 SC Alterations added to the availability after C5I Baseline Lock.	A-240
LOA Change 1 Issued	SPM	After LOA Change 1 is issued, any change to the Fielding Plan in NDE-NM requires the sponsoring activity to submit a late add impact assessment	A-240
Issue or Deliver SIDs to NSA for contractors and AITs	Planning Yard	All SIDs must be issued to the NSA to ensure planning milestones can be met.	A-240
100% of D-level maintenance work package 2-Kilos locked based on target control.	Maintenance Manager	Intent is that 100% of the expected AWRs have been screened to the availability. The planning activity continually develops specs in the most cost-effective manner and does not batch this work in front of the next package development milestone.	A-240
100% of D-level maintenance work package	NSA	The requirement is that all work brokered by the 100% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with	A-225

Task or Milestone	Responsible Activity	Description	Due
2-Kilos planned, estimated.		the minimum quality, described as a "Class C" estimate.	
IGE Submitted in support of 100% lock	NSA Project Manager	The requirement is that all work planned in support of the 100% lock milestone must be estimated by the government with the minimum quality described as a "Class C" estimate.	A-220
Request Availability Execution Funding for Repair	NSA	Submit Funding Requests to Funding Sponsors.	A-219
Final Work Item Review and Approval	NSA Project Manager	This will include the final quality, technical and contractual review of the work items.	A-210
Issue Maintenance Request For Proposal	NSA Contracts	Solicitation to the contractor for locked package.	A-210
Maintenance Site Visit	NSA	Intent is that all maintenance related site visits will be completed as early as possible within the planning process however, no later than this milestone.	A-200
Submit ILS Certification to SPM	PARM		A-180
100% Modernization Lock	SPM	The LOA will identify any planned SCs identified in the A-360 letter that have reached maturity. All SCs that have not reached maturity or do not have an approved impact assessment will be deferred from the availability.	XCM AV A-180 WOO A-45
LOA Change 2	SPM		A-180
Configuration Upload in the Authoritative Database	CSM	Preload the site's configuration and SC and Alteration records (ISC code J).	A-180

Task or Milestone	Responsible Activity	Description	Due
ILS Certification approved	SPM		A-150
Contractor submits final package cost proposal	Contractor	This is the date that the Prime contract holder must submit their valid and complete cost proposal. It must be in compliance with the DCAA's "CRITERIA FOR ADEQUATE CONTRACT PRICING PROPOSALS" associated with an option within the contract in support of a defined scope of work. The proposal must include an integrated schedule based upon the proposed work package.	A-150
Provide Availability Funding for Repair to the NSA	TYCOM	Availability funding is required prior to definitization. To assure that the correct amount and type of funding is available; it should be received at the NSA NLT 10 days prior to the scheduled definitization date. Receipt of funding later than that may cause the work to be deleted from the work package or may delay definitization.	A-130
Conduct WPIC	NSA	If applicable based on work complexity as determined by NAVIFOR Maintenance Manager, NSA Project Manager, and Regional Shore Installation Manager (RSIM). Provides a forum for early identification of work requirements that require integration to avoid conflicts with other work during execution.	A-120 (If applicable)
Award Task Order	NSA Contracts		A-120
Planning Activity "publish" package in the appropriate IT system	NSA	This is the act of issuing a final specification package for the availability that will be used to formulate a proposal. All work after this date will be handled as supplemental or new work.	A-95
Submit Execution Risk Letter	NSA	Risk letter will be submitted to SPM for review and endorsement (to be sent to TYCOM) to specifically address Execution Risk along with Planning Risk.	A-90 (XCM AV only)

Task or Milestone	Responsible Activity	Description	Due
I-level work package fully brokered	Maintenance Manager	Intent is to fully broker all known Intermediate Level work by this date.	A-90
Issue LOA Change 3	SPM		A-75
CDM Work Files Submitted	Alteration Sponsor		A-60
Submit Final COP and Planning Data	SPY or PARM	Work Change Notice planning data (ISC P) 99% configuration record completion with exception of minor changes, a finalizing installation.	A-60
Complete Documentation required to obtain Contractor Installation Performance Services	PE	Whenever possible, the PR Package needs to be complete and accurate (and preferably approved) 150 days to no less than 60 days before the installation start date.	A-60
I-level work package fully accepted	Intermediate level activity responsible for the work	Intent is for I-level to accept or reject all work brokered to it up to this point in time, work entering later in the process will be subject to normal Business Case Analysis and will likely need to be inducted into the work package as new work.	A-60
Definitize Work Package	NSA Project Manager	The culmination of the contractual planning efforts resulting in a negotiated price for the availability that has been funded via a supplemental agreement. This step contractually obligates both the government and contractor to the requirements of the Work Package.	A-35 XCM AV A-18 WOO
Conduct WPER	NSA		A-30 (XCM AV only)
Deliver Material (LLTM and Kitted Materials) to	Planning Yards, PARM	LLTM is any material that will take in excess of 30 days to procure. The government may elect to provide LLTM or prefabricated assemblies generally kitted via a planning yard. This material procured through sources other than the executing	A-30

Task or Milestone	Responsible Activity	Description	Due
Executing Activity		activity should be delivered 30 days prior to start of the availability to ensure that there is no disruption to production.	
Pre-Installation Deliverables Uploaded to SPIDER or RIPTIDE	PE & PARM	Pre-Installation deliverables shall be uploaded to the SPIDER or RIPTIDE repository for RSIM validation at least 30 days in advance of on-site production work, and preferably between 35 and 45 days in advance.	A-30
Submit I-level work package and schedule for integration	Intermediate level activity responsible for the work	The NSA must develop an inclusive, detailed, integrated and resource-loaded schedule of all participating activities. This formal schedule review must occur after the WPIC, but no later than the WPER. The NSA must serve as the final arbiter of conflicts. I-level work will be executed by government SMEs for shore sites designated as fleet units.	A-30
Submit Final Configuration Database Update	CSM	Updated database (pre-installation).	A-15
RMMCO Check-In	AIT	Electronic check in only.	A-15
Avail Execution PB4M	NSA Site Maintenance Team	Combined planning session, adjust monthly schedule if necessary.	A-15
Validation of Installation and ILS Delivery	NSA	The NSA is responsible for validating that ILS products have been delivered to the site using the End of Availability (EOA) ILS Verification Report.	EOA or RMMCO check out
SRMMCO Checkout	AIT		C+7
Completion Report	NSA	The NSA is also responsible for developing the Completion Report at the end of the availability. The SC sponsor is responsible for AIT installations to provide the NSA with data required for the Completion Report and 2K Closeout.	C+15

Task or Milestone	Responsible Activity	Description	Due
Verify Installed Configuration Data	NSA & PARM	Configuration Error Reports, ISC Status code G, and any final Configuration error changes.	C+30
Verify TM Delivery	NSA	Verify all TMs Applicable to the Availability are in the site's library or in MBPS the site's configuration.	C+30
Departure From Specification	NSA CHENG	In instances where partial accomplishment results in a deviation from a formally promulgated specification, a DFS shall be submitted for approval.	C+30
2K Information Update	NSA	The NSA is responsible for coordinating with the applicable Maintenance Manager to enter in the brokering IT system the man-days, labor costs, material cost, total cost, date completed, and the Final Action code for each 2-Kilo. Additionally, if the 2-Kilo was a scheduled task generated by the CMP, the NSA must report the "As Found Condition."	C+45
2-Kilo Closeout	Site	As applicable, a 2-Kilo associated with a particular site and SCD Alteration can be closed out once all feedback information required by the 2-Kilo is received and the SCD Alteration can be considered complete.	C+60
Schedule Status Update	Alteration Sponsor	The SCD and Alteration sponsor shall ensure that the actual completion date of the SC is entered into the appropriate field(s) in NDE-NM. When a Completion Report for a SC is received, the SPM or designated activity will place the SC in status "R" (Installed – ILS or Testing Not Complete) or status "C" (Complete) in NDE-NM.	C+60
As-Built drawings delivered to the site, IA, and IMA	PE	If Master As-Built drawings are available, they shall be updated and this update shall constitute the As-Built deliverable. As-Builts should be uploaded to MBPS.	C+60
Final documentation	IA	As-Builts, signed SOVT, ICR, DD-1149s, and any installation deliverables. The appropriate repository is dependent on the deliverable.	C+60

Task or Milestone	Responsible Activity	Description	Due
upload to the repository			
Close Avail in NMD	NSA Project Manager		C+60
Submit Deferral Letter with Maintenance Team Assist	TYCOM	TYCOM will submit a Change Deferral Request Letter to SHOREMEPP, which will include a list of Change Deferral Requests for subject FRP Maintenance Cycle. NAVWAR 4.8 and 5.0, or SHOREMEPP review for risk.	End of the FRP cycle (If applicable)

APPENDIX B
AVAILABILITY COMPLETION REPORT TEMPLATE

Avail #: _____ **Date:** _____ **Sheet 1 of :** ____

Site: _____ **Location:** _____

The completion of this form and associated signatures acknowledge receipt of deliverables, resolution and documentation of discrepancies, and full or conditional acceptance of the work performed. This form shall be signed by the Project Engineer and the site SMMO. For installations, this report documents that installations were completed, successfully tested and transitioned to operational status, training was conducted, and all Information Assurance and logistics support products were turned over to the site, or that discrepancies exist and are documented in the report. For maintenance actions, the report indicates that maintenance requirements were completed in accordance with the work package.

List of all Job Control Numbers and status:

JCN	Brief Description	Status

List of discrepancies (if applicable):

JCN	Discrepancy	Corrective Action	ECD

Departures from Specification (if applicable):

JCN	Brief Description	Departure #

Did you receive the following?

Deliverable	Received (yes or no)
In-Brief by a Government Rep	
Pre-Installation Baseline Test	
SOVT	
Out-Brief by a Government Rep	
Red lined drawings	
Cybersecurity documentation	
Configuration Validation Aid	
Tech Manuals	
Spares	
Test Equipment	
MIP and MRCs	
Warranty Information	
User Logistics Support Summaries	

DD Form 1149s

DD Form 1149s are the Navy's official custody transfer document and must be signed by both parties for all items delivered to the site, to include hardware, software, ILS products, and drawings. Serial numbers must be recorded on the DD form 1149, if applicable. All signed DD Form 1149s **must** be attached to this report and submitted to the RMMCO Gatekeeper for checkout.

Acceptance:

1. Unconditional acceptance – There are no discrepancies or they are resolved or acknowledged as the site's responsibility.

2. Conditional acceptance – There are remaining discrepancies that need to be resolved as listed above. SITREPS will continue for this task to track all discrepancies till task completion.

VOLUME VI

CHAPTER 22

TRIDENT SYSTEM AND EQUIPMENT MAINTENANCE PLANS

REFERENCES.

(a) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval Ships
(b) SUBMEPP 9086-008-814 - TRIPER Information Notebook

LISTING OF APPENDICES.

A TRIPER Information Sheet

22.1 PURPOSE. To provide information and guidance concerning TRIDENT submarine system and equipment maintenance plans and associated programs.

22.2 TRIDENT SYSTEM AND EQUIPMENT MAINTENANCE PLANS. Maintenance plans have been prepared for all maintenance worthy configuration items onboard 726 Class and 826 Class (SSBN or SSGN platform) Submarines. These maintenance plans are written to the system, equipment or component and list all of the planned maintenance required by a configuration item during its life cycle. These Maintenance Requirements are derived through the conduct of a maintenance engineering and a logistics support analysis process. Maintenance plans list the job description, periodicity, maintenance level (organization, intermediate, or industrial) and the applicable maintenance procedures. Unrestricted Operation (URO), TRIDENT Planned Equipment Replacement (TRIPER), Major Shore Spares (MSS), Submarine Maintenance Standards (SMS) and Performance Monitoring applications are included in maintenance plans as appropriate. Technical management of these plans is assigned to the Submarine Maintenance Engineering, Planning and Procurement Activity. A SSBN or SSGN 726 Class and 826 Class Submarine Maintenance Plan comprising all individual maintenance plans is issued periodically by NAVSEA. Per reference (a), the Type Commander will identify and prioritize corrective maintenance actions for 726 Class and 826 Class Submarine emergent repairs. Programs and requirements supporting the 726 Class and 826 Class operating cycle are discussed in the following paragraphs.

22.2.1 TRIDENT Planned Equipment Replacement. The purpose of the TRIPER program is to accomplish an incremental overhaul of a submarine over several refit periods in the case of SSBNs and during Major Maintenance Periods (MMP) in the case of SSGNs.

a. Shipboard equipment which requires significant maintenance during the planned operating cycle between overhauls, which is beyond the capability of Ship's Force, and which cannot be accomplished during the refit period or MMP (without unacceptable impact on other refit or MMP requirements), will be supported by this program. TRIPER equipment will be removed from the ship for refurbishment ashore, replaced with pre-tested, ready for issue units and the affected system restored to full operational condition prior to completion of the refit period or MMP. Replacement will be accomplished on a planned basis at intervals designed to preclude the failure of the equipment or significant degradation of its associated system. Deviations of greater or less than one refit or MMP from established TRIPER change-out

periodicities must require Type Commander concurrence. A planned change to shelf stock TRIPER equipment will be accomplished only when sufficient change kits are available to effect the change in all units of a given model of the equipment held in shelf stock. Shelf stock TRIPER equipment is represented in configuration status accounting databases maintained by Submarine Maintenance Engineering, Planning and Procurement Activity Hull, Mechanical, Electrical, Ordnance and Electronic and Naval Underwater Warfare Center Division Newport and transitions to the configuration database of the receiving ship upon installation.

b. The Type Commander must manage emergent repairs requiring use of TRIPER assets. Per reference (a), the Type Commander will identify and prioritize corrective maintenance actions for 726 Class and 826 Class Submarine emergent repairs. Support of the Strategic Platform (SSBN) generally has the highest priority.

22.2.2 Deployed SSGN Unplanned TRIPER Change Out. An unplanned change out is not to be used as a substitute for accomplishing repairs. An unplanned change out is only to be accomplished if the deficient condition cannot be repaired or if the repair time required is unacceptable.

22.2.2.1 TRIPER Asset Segregation. TRIPER assets are segregated from normal supply process instructions and additional controls are in effect to manage these assets. Additional actions beyond normal supply procedures are required to obtain a TRIPER asset for corrective maintenance. Stakeholders in the maintenance process for SSGNs must understand the TRIPER process and how to quickly identify a TRIPER asset from normal stock numbered items to ensure timely release of material from the TRIPER Program. The supply system will cancel requisitions that have not been pre-alerted to the TRIPER Program Management.

22.2.2.2 TRIPER Information Notebook. Reference (b), maintained by SUBMEPP, provides identification, location, Comp ID, technical data, boundary drawings and configuration change records for all components in the TRIPER Program. All TRIPER assets have a TRIPER Tag with a unique TRIPER Serial Number (TSN) engraved on it. Location of the TRIPER Tag is shown on the component boundary drawing. TRIPER assets have a "4Y" COG national stock number. When requesting a "4Y" COG asset, Appendix A must be submitted by the Fleet Maintenance Activity (FMA) to the homeport SSGN Project Team. The homeport SSGN Project Team will interact with TRIPER Program Management to ship the requested asset to the needed location.

22.2.2.3 Responsibilities.

a. SSGN: Identify the deficient component TSN via the Casualty Report message reporting system and submit work request to their Immediate Superior In Command.

b. Immediate Superior In Command: Assign job to an FMA.

c. FMA:

(1) Fill out Appendix A and forward to the homeport SSGN Project Team.

(2) Upon confirmation of receipt of delivery of Appendix A, the FMA will order the TRIPER asset via normal supply means.

(3) Receive shipped TRIPER asset, carefully uncrate and save the shipping container for use as a shipping container for the off-loaded asset carcass.

(4) Ship back the TRIPER carcass to an address provided by the SSGN Project Team in the same shipping container the received asset was shipped in.

d. Naval Submarine Support Center: Induct a separate job from the actual maintenance action Job Sequence Number for the homeport SSGN Project Team to ship the TRIPER asset to and from job location. This will allow for closing of the maintenance action Job Control Number (JCN) for work certification and maintain a separate JCN for disposition of the shipped asset to and from the deployed maintenance site.

e. SSGN Project Team:

(1) Use Appendix A, fill out the appropriate forms and deliver to the TRIPER Manager. Forms are: "REQUEST FOR UNSCHEDULED REPLACEMENT OF TRIPER ASSET" and "REQUEST FOR CANNIBALIZATION OF TRIPER PROGRAM ASSET". Appropriate forms can be found on the internet under Navy Forms on Line.

(2) Act as liaison between the FMA and the TRIPER Manager.

(3) Ship the TRIPER asset to desired location when released by the TRIPER Manager.

(4) Coordinate the return shipment of the TRIPER carcass to the TRIPER Manager.

(5) Close out Naval Submarine Support Center inducted job once the TRIPER Manager has received the carcass.

f. TRIPER Manager:

(1) Evaluate request priorities of the requested asset from a total TRIPER Program support position. Approve the release of the requested asset.

(2) Ensure appropriate Pre-Installation Testing and material condition assessments are conducted prior to the release of the asset to the SSGN Project Team.

(3) Release asset to the SSGN Project Team for subsequent shipping to desired location.

22.2.3 Major Shore Spares. The purpose of the TRIDENT MSS Program is to maintain a supply of designated major equipment candidates in a certified, tested, ready-for-issue condition to effect replacement of equipment experiencing catastrophic failure, without jeopardizing refit completion. The employment of MSS assets must require Type Commander authorization. Typically, MSS equipment includes ship's propeller, Ship's Service Turbine Generators, towed arrays, towed buoys, Integrated Radio Room cabinets, etc. Like TRIPER, MSS equipment is managed by NAVSEA (PMS 396 OHIO Class or PMS 397 COLUMBIA Class). Configuration tracking is under the cognizance of the applicable Participating Manager and is identified in the TRIDENT MSS Catalog published by NAVSEA (PMS 396 or PMS 397). Equipment under the cognizance of the Strategic System Project Office and Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) is not included in the TRIPER or MSS programs.

22.2.4 Fleet Logistics Agent. The function of the fleet logistics agent for 726 Class and 826 Class Submarines has been assigned to the TRIDENT Refit Facility (TRIREFFAC) Kings Bay for the Atlantic Southeast and TRIREFFAC Bangor for the Pacific Northwest. TRIREFFAC Kings Bay and TRIREFFAC Bangor provides refit, MMP and configuration management support. These functions involve:

a. Staging and delivering updated Logistics Technical Data (LTD) applicable to the ship's current configuration.

b. Providing available interim technical documentation and logistic support elements for emergent changes installed during refit or MMP.

c. Assessing the logistic impact and reporting of, configuration changes effected by all sources in 726 Class and 826 Class Submarines.

22.2.5 Updating of Submarine Logistics Technical Data. TRIREFFACs will stage and deliver LTD Advance Change Notices and revisions to 726 Class and 826 Class Submarines during refit or MMP and must assist Ship's Force in the removal and disposal of LTD that is no longer applicable to the ship's current configuration. Upon request, TRIREFFACs will also provide training to Ship's Force in the proper techniques for identification, procurement and maintenance of TRIDENT LTD.

22.2.6 Planned Refit Work Lists. Planned Refit Work Lists (PRWL) define all the planned work required for each 726 Class and 826 Class ship for a one-year period or four refits. The PRWL includes scheduled TRIPER replacements, URO and Performance Monitoring requirements. In addition, alterations approved for accomplishment will be incorporated into the PRWL. The PRWL will be issued periodically, each for a one-year period. Subsequent PRWLs will include rescheduling of requirements identified on previous work lists which were not reported complete. Each PRWL will allocate specific work items to a proposed refit based on the Class Maintenance Plan scheduled requirements and projected manpower requirements.

APPENDIX A

TRIPER INFORMATION SHEET

FMA will fill out this form and forward to SSGN Project Team

23.1 PURPOSE. This chapter provides the requirements for an effective onboard noise reduction program during the ship's operating cycle. It identifies the acoustic surveys required to assess the radiated noise signature of a ship and summarizes the responsibilities and requirements for the onboard surveys necessary to be performed on a regular basis to maintain the submarine in its most quiet configuration.

23.1.1 Scope. Reference (a) discusses the various acoustic surveys to be conducted on ships in order to establish their baseline noise signatures and to monitor those signatures throughout the operating cycle. Surveys discussed in reference (a) are briefly summarized, as well as several

additional survey techniques available and essential to an effective noise reduction program. In addition, a discussion of the model shipboard noise reduction program and available training programs are presented. References (b) and (c) provide class specific and comprehensive documentation on submarine noise reductions, including discussion of acoustic surveys, shipboard noise reduction program, acquisition systems, and procedures, data analysis and trending, and detailed write-ups with photographs and audio clips of typical noise sources. In addition, the manual contains an extensive library of documents and training aids.

23.1.2 Background. Reduction of the radiated noise signature of a submarine platform is a key element to the tactical employment of the ship. As a ship begins its operating cycle, a series of acoustic surveys are conducted to characterize the baseline noise signature. Then, throughout the remainder of its operating cycle, the ship requires the tools and procedures necessary to monitor its signature against the baseline. As deficiencies are identified, Ship's Force needs to have an understanding of the extent to which an identified deficiency can affect the ship's radiated noise signature and the procedures required to effect corrective action. It should be kept in mind that although the implications of a degraded noise signature are fundamentally tactical in nature, the primary method of preserving a ship's acoustic advantage is through an aggressive and effective planned and corrective noise reduction maintenance program. Because of an increased emphasis in recent years, a number of new initiatives are being pursued within the technical community to develop new and improved measurement procedures and equipment that will assist Ship's Force in more effectively assessing the effects of noise deficiencies on their radiated noise signature. These efforts should lead to improved survey procedures and will be incorporated into future changes to this chapter.

23.2 NOISE REDUCTION PROGRAM ELEMENTS.

23.2.1 Radiated Noise Surveys.

23.2.1.1 Naval Sea Systems Command Acoustic Trials. These trials are conducted at the beginning of and at various times throughout each ship's operating cycle per reference (d) and provide a broad range of baseline measurements for the ship. In particular, the radiated noise signature of the ship is measured under various operating conditions. A determination is made of the controlling radiated noise offenders including those which are speed and depth dependent. While the principal objective of these trials is to assess the radiated noise signature of the submarine, platform, machinery and hull vibration, measurements are also made to provide baseline and supporting data in these areas for continued ship monitoring.

23.2.1.2 Coordinated Submarine Radiated Noise Analysis Exercise. This test must be conducted per reference (e), for Commander Submarine Force Atlantic (COMSUBLANT) units and Commander Submarine Force Pacific (COMSUBPAC) units. The primary objective of these submarine-versus-submarine exercises is to collect and analyze data to assess current acoustic vulnerabilities. These tests can be used during Pre-Overseas Movement (POM) or Deployment Preparation Period (DPP) work-ups to indicate that the deploying unit's acoustic signature is free of any unusual or highly detectable noise characteristics.

23.2.1.3 Coordinated Submarine Exercises (KILOEX, JTFEX, INT-2, TRACKEX, GUNSLINGER). While acoustic trials and surveys are the principal means to evaluate a submarine's acoustic profile, coordinated exercises provide another opportunity for the submarine force to monitor itself for noise deficiencies. Although the primary purpose of these

exercises is generally tactically oriented, the noise signature obtained can and should also serve to monitor submarine radiated noise. It is incumbent upon exercise participants to note and record any unusual or excessive radiated noise being emitted by submarine exercise participants. Discrepancies noted should be reported to the cognizant Immediate Superior In Command (ISIC) for evaluation and corrective action. Initial message reports should be followed by supporting documentation including tape recordings, annotated low frequency analysis and recording (LOFAR) grams, and annotated frequency spectrum plots. The message report should contain the following information:

a. Description of noise signature problem.

b. Date and time of detection.

c. Range at detection.

d. Sensor or processor used for detection.

e. Own ship depth and speed.

f. Acoustic sea state.

g. Water depth.

h. Water temperature.

i. Layer depth.

23.2.1.4 Beartrap Acoustic Radiated Trials. The primary objective of these trials is to provide a cost-effective means to detect and identify radiated noise sources that have caused signature degradations. Coordinated trial events are conducted with Marine Patrol Aircraft. Detected narrowband tones in the radiated noise signature are provided by naval message. Parent ISICs are responsible for requesting these trials. Specific information, including message requests and scheduling requirements, as well as Ship's Force and Type Commander (TYCOM) responsibility is provided in Appendix B.

23.2.2 Onboard Noise Surveys. The noise surveys discussed in this section do not provide conclusive information on the actual radiated noise signature of the ship. However, when these surveys are analyzed for developing trends, they can be effective tools for monitoring overall ship effectiveness in noise reduction.

23.2.2.1 Platform Noise Survey. This survey is conducted to define own ship's noise environment and is the best means available to Ship's Force to assess the radiated noise signature of the ship using only onboard equipment. Surveys are conducted by taking periodic measurements under various ship's operating conditions using the applicable Planned Maintenance System (PMS) Maintenance Requirement Cards (MRC). In addition, at-sea watch-to-watch aural monitoring is also conducted. Analysis of this data determines the platform noise signature and also identifies the noise offenders which affect this signature. When changes in the ship's signature occur, the diagnostic procedures of the class specific platform noise manual are used to isolate the noise source. Platform Noise Surveys should be conducted per enclosure (2a) of Appendix C. Propeller cavitation surveys, a separate survey from the Platform Noise Survey but considered an important part of platform noise monitoring analysis, should be conducted per enclosure (2b) of Appendix C.

23.2.2.2 Topside and Housekeeping Survey. The most common and preventable sources of submarine noise are rattles emanating from improperly secured topside equipment, discontinuities in the hull, and machinery noise sound shorted to the hull due to improper stowage.

23.2.2.2.1 Topside Survey. The topside survey consists of a thorough inspection to identify and eliminate potential noise sources external to the pressure hull. Particular attention should be given to ensure that rattles are not installed, built in, or created by repairs, alterations, or stowage. Topside Surveys should be conducted per enclosure (2c) of Appendix C.

23.2.2.2.2 Housekeeping Survey. The housekeeping survey consists of a thorough visual inspection to identify and eliminate these potential noise sources internal to the pressure hull. Particular attention should be given to ensure that sound shorts are not installed, built in, or created by repairs, alterations, or stowage. Housekeeping Surveys should be conducted per enclosure (2d) of Appendix C.

23.2.2.3 Machinery Vibration Survey. A vibration survey conducted quarterly for both machinery health assessment and noise reduction purposes. Performance of this survey alone does not provide reliable information on radiated noise. Machinery Vibration Surveys should be conducted per enclosure (2e) of Appendix C.

23.2.2.4 Hull Vibration Survey. A shipboard hull vibration survey is conducted semi-annually or as required for the purpose of noise diagnostics by Ship's Force. The purpose is to assess acoustic deficiencies related to noise sources and transmission paths, and to estimate certain slow-speed, low frequency radiated noise levels. Hull Vibration Surveys should be conducted per enclosure (2e) of Appendix C.

23.2.2.5 Isolation System Survey. This survey consists of a visual inspection of sound isolation components throughout the ship per applicable road maps and reference (f). These components include resilient mounts, pipe hangers, ground straps, and flexible piping. This visual inspection ensures that these devices are properly installed, undamaged and not sound shorted. Improper installation or failure of any of these devices will contribute to increasing the radiated noise signature of the ship. Isolation System Surveys should be conducted per enclosure (2f) of Appendix C.

23.2.2.6 Damping Material Survey. This is a visual inspection of sound damping material installed in the vicinity of sonar arrays, sail, free flood spaces, and on machinery foundations. Like the isolation system survey, this inspection is designed to detect deficiencies in materials installed to limit the radiated noise signature of the ship. Damping Material Surveys should be conducted per enclosure (2g) of Appendix C.

23.2.2.7 Predeployment Noise Inspections. Requirements and forms are contained in references (g) and (h) and Appendix D.

23.2.2.8 Technical Onboard Monitoring Assist. This survey consists of at sea analysis by acoustic technical experts to evaluate the acoustic signature of the ship. The survey consists of a towed array, platform noise hydrophones and machinery and hull vibration measurements taken simultaneously to identify and localize major acoustic degradation. Emphasis is placed on training the submarine's crew on own ship noise data acquisition and analysis using their available sensors. Technical Onboard Monitoring Assists should be conducted per Appendix A.

23.2.2.9 Sound Absorption Material Survey. This is a thorough visual inspection of interior sound absorption material and sound transmission loss material conducted in all spaces. These materials are installed to assist in habitability of the ship by absorbing vibration. Sound Absorption Material Surveys should be conducted per enclosure (2h) of Appendix C.

23.2.2.10 Airborne Noise Survey. The airborne noise survey exists to identify shipboard areas whose airborne noise levels have increased or are possibly high enough to cause hearing damage. Airborne Noise Surveys should be conducted per paragraph 5.c.(6) of Appendix C.

23.2.3 Shipboard Noise Reduction Program. The key to a successful shipboard noise reduction program will be the ability of the ship to identify potential noise deficiencies and to initiate prompt corrective action. References listed in Appendix E should be a part of the ship's onboard library of submarine silencing publications. Several elements of the noise reduction program are discussed in the following paragraphs.

23.2.3.1 Noise Reduction Officer. To ensure a coordinated and aggressive approach to noise reduction, each ship will assign one of its senior Department Heads, as designated by the Commanding Officer, to serve as Noise Reduction Officer. The Noise Reduction Officer will coordinate the activities of all personnel assigned to support the ship's Noise Reduction Program. This officer will ensure that all required surveys are conducted, that identified deficiencies are documented, and that corrective action is initiated. A Noise Reduction Board, chaired by the Noise Reduction Officer, will convene at regular intervals to review the status of the Noise Reduction Program. Following each meeting, formal written reports will be made to the Commanding Officer.

23.2.3.2 Noise Deficiency Log. The ship's Equipment Status Log (ESL) will be used to record and track all noise deficiencies. Deficiencies will be entered in the section for the Work Center (WC) responsible for the equipment concerned. The Critical Noise Deficiencies (NC) or Potential Noise Deficiencies (NP) code (per paragraph 23.2.3.3) in the deficiency description block will tag the entry as a noise deficiency. The Noise Reduction Officer will ensure the ESL is properly maintained and accurately reflects the latest status of all noise deficiencies. Items to be entered in the ESL include noise deficiencies reported during radiated noise acoustic trials as well as those discovered during onboard surveys. Ship's logs must be maintained in a manner where all diagnostics, repairs or other evaluations performed are documented. The logs need to be maintained until noise issues are verified to be repaired by associated acoustic or vibration measurements.

23.2.3.3 Noise Related Maintenance Records. The Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo),will be used to document all deferred and completed noise related maintenance actions. Block 46-G will be used to further classify noise deficiencies in one of two categories; NC and NP.

NOTE: INFORMATION CONTAINED IN WORK CANDIDATES MUST BE UNCLASSIFIED. IF CLASSIFIED DATA IS REQUIRED TO FULLY DESCRIBE THE NATURE OF THE PROBLEM BEING REPORTED, REFER TO TYCOM REPORTING REQUIREMENTS TO FULLY DESCRIBE THE NATURE OF THE PROBLEM.

a. The NC code will be used to identify deficiencies of a critical nature identified during one of the following:

(1) Naval Sea Systems Command (NAVSEA) Acoustic Trials.

(2) Supplemental Radiated Noise Measurements.

(3) Technical Onboard Monitoring Assist.

(4) Platform Noise Monitoring Surveys.

b. The NP code will be used to identify deficiencies that could potentially be radiated noise problems identified during one of the following:

(1) Topside and Housekeeping Surveys.

(2) Machinery and Hull Vibration Surveys.

(3) Isolation System Surveys.

(4) Damping Material Surveys.

(5) Airborne Sound Absorption Material Surveys.

(6) Routine Ship Operations.

23.2.4 Training. Formal training course prerequisites and descriptions are listed in reference (i). Specific training requirements are contained in references (j) through (n).

23.3 RESPONSIBILITIES.

23.3.1 Immediate Superior In Command.

a. Assign a Staff Noise Reduction Officer as a specific point of contact for all matters relating to noise reduction within the Squadron.

b. Oversee and supervise the Noise Reduction Program within the Squadron, ensuring that assigned units aggressively identify and correct noise deficiencies.

c. Submit requests for Beartrap Acoustic Radiated Trials (BART) to COMSUBLANT N454, or COMSUBPAC N42N, as appropriate.

d. Schedule acoustic surveys during the operating cycle of submarines per reference (d).

e. Recommend, authorize, or both, corrective actions based on the findings of the surveys conducted.

f. Review Noise Reduction Program records, survey results, procedures and monitoring equipment during material readiness inspections, Tactical Readiness Evaluations and POM or DPP certification.

g. Schedule divers to conduct underwater hull and propeller surveys for noise deficiencies prior to undocking, pre-deployment, post-deployment, and during upkeep.

h. Report propeller replacements using the message format of Appendix F.

i. Ensure that personnel tasked to support assigned submarines are adequately trained in submarine noise reduction.

23.3.2 Industrial Activity.

a. Ensure proper handling and repair of noise critical machinery.

b. Conduct in-shop and in-place balancing of all rotating equipment, both motors and coupled units, repaired by the industrial activity.

c. Conduct in-place balancing as authorized by work requests.

d. Assist ships in identifying and correcting noise problems and in conducting noise surveys following approved work requests.

e. Establish new baseline machinery and hull vibration measurement data for repaired units.

f. Ensure that all applicable personnel are adequately trained in submarine noise reduction.

g. Conduct underwater hull and propeller surveys for noise deficiencies per reference (g).

23.3.3 Submarine Commanding Officer.

a. Establish and maintain a ship's Noise Reduction Program consistent with this chapter. Appendix C provides the basis for a shipboard instruction to meet this requirement.

b. Appoint a senior Department Head as Noise Reduction Officer and establish a Ship's Noise Reduction Board.

APPENDIX A

SUPPLEMENTAL NOISE MEASUREMENTS

This Appendix provides a brief discussion of the TYCOM sponsored, noise measurements that may periodically be conducted on submarines during their operating cycle.

TECHNICAL ONBOARD MONITORING ASSIST (TOMA)

1. Purpose. TOMAs are conducted on submarines to maintain their acoustic signatures between scheduled radiated noise trials. Major acoustic degradations and their corrective actions are identified, and training is provided to Ship's Force.

2. Procedure. TOMA schedules are coordinated by the TYCOMs and the Squadrons. TOMAs are conducted by Naval Surface Warfare Center Carderock Division (NAVSEAWARCEN CD), with assistance from on-site Performance Monitoring Team (PMT) and Ship's Force personnel. TOMAs need 18 to 30 hours of data acquisition time. Normally, TOMAs are conducted on three to seven-day underways and can be scheduled concurrently with other operations. Tests consist of a series of runs in various machinery line-ups to collect data required to assess the acoustic signature of the submarine. Data is collected using onboard sensors and compared to baseline signatures from previous acoustic trials. A TOMA will serve as the quarterly hull, machinery, and platform noise surveys.

3. Frequency. TOMAs are to be conducted prior to, or early in the POM or DPP cycle when no radiated noise trial is scheduled to occur within one year of the deployment date.

NOTE: A TOMA IS NOT A SUBSTITUTE FOR THE NAVAL SEA SYSTEMS COMMAND ACOUSTIC TRIAL. A TOMA MAY ALSO BE REQUESTED BY THE SUBMARINE'S ISIC.

4. Reports. NAVSEAWARCEN CD will issue a "quick look" message from the submarine at the completion of the TOMA. This message will detail significant findings and recommended corrective actions, as well as the status of previous corrective actions. A separate message will be sent by NAVSEAWARCEN CD detailing hull and machinery vibration data.

5. Action. Ship's Force and the submarine's ISIC should use the results and recommendations of the TOMA "quick look" message to schedule and implement corrective action. Ship's Force should use the 3-M Maintenance Data System to document deficiencies and corrective actions. For deferred items, the Noise Reduction Officer should develop and implement appropriate corrective action.

APPENDIX B

BEARTRAP ACOUSTIC RADIATED TRIALS (BART)

1. Purpose. BARTs provide submarines with the opportunity to measure and assess their narrowband radiated noise signatures, identify problems, and provide an opportunity to correct deficiencies and evaluate their acoustic health prior to certain deployments.

2. Procedure. BARTs are initially scheduled by TYCOM prior to major deployments or upon request by the submarine's ISIC. The ISIC is then responsible for updating the TYCOM on schedule changes. BARTs are a structured Beartrap in a designated quiet ocean area following the BART agenda. The objective is to collect sufficient data to determine the radiated noise signature and mission readiness of the ship. Data collection on station is accomplished by Commander Patrol Reconnaissance Forces Pacific (COMPATRECONFORPAC) or Commander Patrol Reconnaissance Forces Atlantic (COMPATRECONFORLANT) Anti-Submarine Warfare patrol aircraft and is restricted to a single eight-hour period during ship operations in a designated ocean area.

3. Frequency. For COMSUBPAC units, ISICs should coordinate BART scheduling for their submarines such that each ship will be tested prior, or early in the DPP. The schedule should allow sufficient time for corrective action on noise deficiencies detected during the BART to be planned and accomplished during a DPP upkeep period. For COMSUBLANT units, ISICs should coordinate BART scheduling for their submarines as required.

4. Reports. For Pacific Fleet submarines, COMPATRECONFORPAC will issue a message within 60 days of completion of a BART. For Atlantic Fleet submarines, "quick look" message will be issued following Local Operating Instructions.

5. Action. Ship's Force and the submarine's ISIC should use the results of the BART messages to schedule and implement corrective action for noise deficiencies detected during the trial. For deferred items, the Noise Reduction Officer should develop and implement appropriate corrective action.

APPENDIX C

SHIPBOARD NOISE REDUCTION INSTRUCTION

USS (Ship's Name and Hull No.)

Subj: SHIP'S NOISE REDUCTION PROGRAM

Ref: (a) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume VI, Chapter 23

Encl: (1) Quarterly Noise Reduction Program Status Report
(2) Noise Reduction Surveys
(3) Control Surface Noise Questionnaire

1. Purpose. To establish a ship's Noise Reduction Program to include: a Noise Reduction Board to advise the Commanding Officer concerning appropriate noise reduction procedures; a set of noise surveys to characterize the ship's noise signature; and procedures to ensure proper coordination of efforts in the ship's noise reduction program.

2. Discussion. A great deal of emphasis has been placed on upgrading noise reduction awareness within the submarine force. As required by reference (a), (Ship's Name) must devote continued attention to the detection, correction and prevention of increases in its radiated noise signature. Significant mission degrading radiated noise problems could not be tolerated in wartime. (Ship's Name) must minimize noise to maximize the ships detection range of threats and targets and to reduce the possibility of hostile ships detecting (Ship's Name). Quietness is absolutely essential to the ships primary mission and a continuous, aggressive effort must be made in acoustic housekeeping and noise reduction to ensure a quiet ship. The acoustic surveys considered mandatory for effectively maintaining a quiet ship and improving the ship's acoustic signature during the operating cycle are discussed in this instruction. While these surveys serve as a formal means of noise reduction, each crew member's actions play an equally important role in the noise reduction consciousness of the entire ship. A quiet ship requires involvement of the whole crew. THINK QUIET!

3. Program Organization.

a. A ship's Noise Reduction Board must be established to assist the Commanding Officer in the development and execution of long and short range plans for maintaining and enhancing the acoustic posture of the ship. The board will recommend appropriate shipboard noise reduction procedures and monitor their execution. The board will consist of the following personnel:

(1) Executive Officer.

(2) Combat Systems Officer.

(3) Engineer Officer.

(4) Sonar Officer.

(5) Electrical Officer.

(6) First Lieutenant.

(7) Sonar Division Leading Petty Officer.

(8) Electrical Division Noise Reduction Petty Officer (NRPO).

(9) Chief of the Boat.

(10) Sail Coordinator.

b. To assist the board in carrying out their responsibilities, experienced Petty Officers and non-rated personnel who have completed qualification in submarines must be assigned in the ship's collateral duties notice as NRPO. Each division will have at least one formally designated NRPO.

4. Program Management.

a. The Noise Reduction Officer will coordinate all noise reduction activities within the ship. The Noise Reduction Board will meet quarterly and discuss actions completed and further action required to correct outstanding noise deficiencies. Special quarterly noise reduction boards should be held prior to the initial work definition conference for depot availabilities (initial planning meetings are typically scheduled; Selected Restricted Availability and Interim Drydocking A-43 weeks, Depot Modernization Period and Engineered Refueling Overhaul A-12 months) and prior to POM1 upkeep periods. The Noise Reduction Officer will chair these meetings. The Noise Reduction Officer will ensure that the noise reduction portion of the ESL contains updated entries on all outstanding noise deficiencies. Each of the significant noise deficiencies will be discussed at every meeting. The Commanding Officer will be apprised of the results of the meeting and any unresolved problems shortly after the meeting. Formal written reports summarizing the status of the Noise Reduction Program will be submitted following each meeting to the Commanding Officer using the format of enclosure (1).

b. Onboard surveys will be conducted per this instruction. Noise deficiencies discovered during these surveys or detected during routine ship's operations will be reported to the Noise Reduction Officer. At sea, these reports will be made to the Officer Of the Deck (OOD) who will, in turn, inform both the Noise Reduction Officer and the Commanding Officer. The OOD will initiate corrective action for all significant noise deficiencies and ensure that these items are included in the watch turnover. All deficiencies that are not immediately correctable will be entered in the noise deficiency section of the ESL.

c. The Noise Reduction Officer must ask the following questions during each Noise Reduction Board meeting.

(1) Have Ship's Force effected all corrective action recommendations from the latest acoustic trials? Have on board measurement surveys conclusively proven that outstanding noise deficiencies were corrected? Report all unresolved items to the Commanding Officer using the format of enclosure (1).

(2) Have any noise sources, especially rattles or control surface transients, been aurally detected during the conduct of the platform noise survey of enclosure (2a)? If rattles or transients are present, have tape recordings or data packages been accomplished following platform noise or maintenance manual guidance for submission?

(3) Have Ship's Force conducted a propeller tip cavitation survey per enclosure (2b)? Are the measured tip cavitation points acceptable? If cavitation is not acceptable, has a tape package been prepared per reference (a)?

(4) Have any signature degradations been identified from the latest set of towed array, platform noise hydrophone or machinery and hull vibration measurements? If so, have the noise sources been identified? Report unresolved items to the Commanding Officer using the format of enclosure (1).

5. Action.

a. The Executive Officer must:

(1) Attend all Noise Reduction Board meetings.

(2) Implement a comprehensive, all hands training program to elevate the awareness of Ship's Force personnel to the importance of noise reduction.

b. The Noise Reduction Officer must:

(1) Coordinate and administer the ship's Noise Reduction Program.

(2) Schedule Noise Reduction Board meetings and chair their meetings.

(3) Report the status of noise deficiencies to the Commanding Officer following meetings of the Noise Reduction Board. Submit written summary reports to the Commanding Officer using the format of enclosure (1).

(4) Ensure that cognizant divisions enter all noise reduction deficiencies in the ESL, that prompt corrective action is taken by responsible divisions and that work requests are submitted for deficiencies beyond the capability of Ship's Force.

(5) Ensure that acoustic trial deficiencies are entered in the ESL and that appropriate corrective action is initiated.

(6) Assess the tactical implications of noise deficiencies detected during underway operations and make recommendations to the Commanding Officer as to tactical limitations and required corrective action.

(7) Ensure that cognizant divisions have personnel properly trained in Ship's Force acoustic surveys, noise reduction equipment, proper bearing replacement and in-place balancing of rotating equipment.

(8) Ensure that surveys are being conducted by cognizant divisions and that deficiencies are reported to the Commanding Officer.

(9) Conduct spot reviews of acoustic survey results.

(10) Be inventory manager of all publications required by reference (a), to support the Noise Reduction Program and ensure that divisions have applicable MRCs.

(11) Assist the Engineer Officer with the implementation and maintenance of the ship's quiet bills.

(12) Ensure action is taken, to the maximum extent possible, to complete enclosure (3) for all identified control surface noises.

c. The Sonar Officer must:

(1) Ensure that the Platform Noise Survey is accomplished, recorded, and analyzed per enclosure (2a).

(2) Perform Propeller Cavitation Noise Surveys as required per enclosure (2b).

(3) Develop propeller cavitation curves per enclosure (2b) and forward results to the Commanding Officer via the Noise Reduction Officer.

(4) Direct the use of the installed sonar systems to assist in the identification and isolation of noise related material deficiencies detected in Topside, Housekeeping, Machinery and Hull Vibration, and Isolation System Surveys. (Enclosures 2c, 2d, 2e, and 2f respectively refer).

(5) Ensure that Damping Material Surveys are accomplished, recorded, and analyzed per enclosure (2g).

(6) Ensure the Airborne Noise Surveys are accomplished, recorded, and analyzed following the applicable Maintenance Index Page (MIP). The Sonar Officer must ensure that airborne noise levels in all shipboard areas remain within permissible limits. An Airborne Noise survey must be conducted when increased airborne noise levels are suspected of exceeding permissible limits. A written report in memorandum form must be submitted for each watch station and must include, as a minimum, the date of inspection, names of personnel conducting the survey, and the discrepancies noted in the ESL. Review the status of noise level measurements and any affected watch station and report this information to the Commanding Officer and the ship’s corpsman.

(7) Report immediately any abnormal increase in own ship’s noise to the OOD and the Noise Reduction Officer.

(8) Ensure that all survey deficiencies are entered in the noise reduction section of the ESL and reported to the Noise Reduction Officer. Ensure that prompt corrective action is taken and that work requests are submitted for deficiencies beyond the capability of Ship's Force.

(9) Ensure that personnel assigned to conduct noise reduction surveys under his cognizance are properly trained.

d. The Electrical Officer must:

(1) Ensure that the Machinery and Hull Vibration Surveys are accomplished, recorded, and analyzed per enclosure (2e).

(2) Ensure that in-place balancing is conducted on an assembled unit at any time that repairs are made by Forces Afloat that would affect the balance of the equipment.

(3) Determine the cause of out of specification machinery and hull vibration readings and initiate corrective action.

(4) Ensure that prompt corrective action is taken and that work requests are submitted for deficiencies beyond the capability of Ship's Force.

(5) Ensure that personnel under his cognizance assigned to conduct noise reduction surveys are properly trained.

e. The First Lieutenant must:

(1) Ensure that the Topside and Housekeeping Surveys are accomplished, recorded, and analyzed per enclosure (2c) and (2d).

(2) Ensure that the Sound Absorption Material Survey is accomplished, recorded, and analyzed per enclosure (2h).

(3) With the assistance of the Supply Officer, ensure that equipment, stores, personal effects, and consumables are stowed in a manner that will not produce noise or transmit noise to the ship's hull or structure.

(4) Ensure that all survey deficiencies are entered in the noise reduction section of the ESL and reported to the Noise Reduction Officer. Ensure that prompt corrective action is taken and that work requests are submitted for deficiencies beyond the capability of Ship's Force.

(5) Ensure that personnel under his cognizance assigned to conduct noise reduction surveys are properly trained.

f. The NRPO must:

(1) Promote the Noise Reduction Program in their respective divisions.

(2) Perform or assist in the performance of noise reduction surveys under their respective division's cognizance per enclosure (2).

(3) Enter all survey deficiencies in the noise reduction section of the ESL and report deficiencies to the cognizant Division Officer.

g. The OOD must:

(1) Remain aware of the status of critical noise deficiencies and operate the ship in a manner that will minimize its radiated noise signature.

(2) Report all new noise deficiencies and the correction of existing deficiencies to the Noise Reduction Officer and the Commanding Officer. Ensure new deficiencies are recorded in the noise reduction section of the ESL.

(3) Ensure sonar watch standers conduct aural monitoring of own ship's noise signature upon initial dive and once per watch.

From: Noise Reduction Officer
To: Commanding Officer
Via: Executive Officer

Subj: QUARTERLY NOISE REDUCTION PROGRAM STATUS REPORT FOR PERIOD ENDING (DATE)

Encl: (1) Noise Reduction Section of ESL

1. The following MRCs associated with the Noise Reduction Program were not accomplished, partially accomplished, or deferred:

   MRC No., Deficiency reason or Corrective Action

2. The following noise deficiencies were identified during the current period:

   Deficiency, Source, ESL No. or Plan of Action for identification and repair

3. The following previously identified noise deficiencies were corrected during the current period:

   Deficiency or Corrective Action

4. The following noise deficiencies from the previous period are outstanding:

   Deficiency, Source, ESL No., Diagnostics and repairs performed or Plan of Action for identification and repair

5. Enclosure (1) summarizes all currently outstanding deficiencies associated with the Noise Reduction Program.

Submitted:_____

Noise Reduction Officer

Copy to:
Engineer Officer

Enclosure (1)

NOISE REDUCTION SURVEYS

1. This enclosure contains a description of the onboard surveys conducted in support of the Noise Reduction Program. For each survey, applicable references are cited and a summary of procedures and reporting requirements are presented. Surveys included are:

Enclosure 2a Platform Noise Survey

2b Propeller Cavitation Noise Survey

2c Topside Survey

2d Housekeeping Survey

2e Machinery and Hull Vibration Survey

2f Isolation System Survey

2g Damping Material Survey

2h Sound Absorption Material Survey

PLATFORM NOISE SURVEY

Reference: (a) Class Applicable Technical Manual for Platform Noise Monitoring Analysis for Noise Reduction
(b) Class Applicable SO-544 MIP/MRCs
(c) OPNAVINST 5513.5A Department of the Navy (DON) Security Classification Guidance for Undersea Warfare Programs

1. Responsibility. Sonar Officer.

2. Procedure.

   a. Platform Noise Surveys must be conducted as specified in references (a) and (b).

   b. Sonar supervisors must monitor each hydrophone for objectionable noises at least once each watch while underway and report results to the OOD. Problems detected must also be recorded in the Noise Reduction section of the ESL. Problem investigation and corrective action must be initiated as soon as possible within the current operations schedule.

   c. As soon as feasible, after diving, following an inport period, accomplish the following:

      (1) Monitor each platform hydrophone for objectionable noise while changing speed in five-knot increments up to Flank speed (monitor all frequency bands where applicable). At slow speed, monitor hydrophones nearest the rudder, stern planes and fairwater planes while each control surface is cycled. Monitor the hydrophone nearest the sail while each mast and antenna are cycled. If control surface deficiencies are found, complete the applicable portions of the Control Surface Noise Questionnaire, enclosure (3), to report control surface noise. This questionnaire assists in troubleshooting.

      (2) Check at least one point of the propeller cavitation curve. If results are significantly different from the previous data, establish a new cavitation curve at the earliest opportunity as discussed in enclosure (2b).

      (3) If operations preclude complete accomplishment of sub-paragraph (1) and (2), speeds and areas not monitored should be noted and carried forward in the sonar supervisor's log until they can be monitored.

      (4) Results of this monitoring will be reported to the OOD and deficiencies recorded in the ESL.

   d. For any abnormal noises, magnetic tape recordings should be made per reference (a). These tape recordings together with complete supporting data must be forwarded by priority registered mail second day delivery to:

For COMSUBLANT units: Carderock Division Naval Surface Warfare Center
9500 MacArthur Blvd.
West Bethesda, MD 20817-5700
Attn: Code 711 - Fleet Support Program Manager

Enclosure (2a)

For: New London Units, data packages should be forwarded to:
NSSC NEW LONDON CT, N42

For COMSUBPAC units:
Naval Surface Warfare Center Carderock Division
Detachment Puget Sound
7131 Sealion Road
Attn: Code 713
Naval Base Kitsap Bangor
Silverdale, Washington 98315-7102

NOTE: SIPRNET FILES FROM SHIP SHOULD BE LIMITED TO 400KB. HUITS AND SAILOR-MAIL CAN BE UTILIZED FOR LARGER FILES. MP3 OR OTHER COMPRESSED FORMATS SHOULD BE USED TO SAVE SPACE. 10-15 SECONDS OF AUDIO IS USUALLY ADEQUATE. IF URGENT REQUEST ON EVENINGS, HOLIDAYS, OR WEEKENDS, HAVE SWO CONTACT TYCOM STEALTH OFFICERS TO EXPEDITE. DURING TYCOM WORKING HOURS, NOISE REDUCTION SUPPORT CAN BE PROVIDED VIA CHAT. SUPPORT CAN BE ARRANGED ON EVENINGS OR WEEKENDS THROUGH SWO.

To receive immediate feedback, audio files can be sent via SIPRNET or other secure method to:

For COMSUBLANT units:
To: SUBLANT - Michael.N.Cowan@navy.smil.mil
CC: csl.swo@navy.smil.mil (if immediate response is required), ISIC, or operational commander as required.

For COMSUBPAC units:
To: SUBPAC – Rodney.A.Grogan1@navy.smil.mil
CC: swo.csp@navy.smil.mil (if immediate response is required), ISIC, or operational commander as required.

Units should request analysis and recommendations for corrective action from NAVSEAWARCEN CD. The response will be provided by message within 72 hours of receipt of the data package. If the package needs to be expedited, contact TYCOM Noise Reduction Officer prior to submission.

e. Platform noise hydrophone recordings are classified **CONFIDENTIAL** per reference (c), (Encl 55). If recordings include towed array signature data, then the classification is **SECRET**.

Enclosure (2a)

3. Frequency. Surveys will be conducted as specified within this instruction, reference (a) and applicable MRCs. Additional surveys will be conducted as required to support noise reduction efforts related to other shipboard surveys or whenever such monitoring is required for the identification of noise degradations or to verify the effectiveness of corrective actions. A comprehensive machinery survey should be conducted quarterly and a hull survey semi-annually by Ship's Force.
4. Record. Survey results will consist of platform noise spectra, cavitation data, and entries to the ESL and Sonar Line Log. Records will be kept as specified within this instruction, in reference (a) or as required to meet the needs of noise reduction efforts aboard ship.
5. Review. The Sonar Officer will review results of all surveys weekly and the Noise Reduction Officer will review all records in conjunction with Noise Reduction Board meetings monthly.

PROPELLER CAVITATION NOISE SURVEY

Reference: (a) Class Applicable Technical Manual for Platform Noise Monitoring Analysis for Noise Reduction
(b) NTTP 3-54.1 Submarine Tactical Security Manual

1. Responsibility. Sonar Officer.
2. Procedure. Propeller cavitation surveys and diagnostic procedures will be conducted as specified in reference (a). Propeller cavitation curves will be developed using the procedural guidance of reference (a), for the various tactical considerations specified in reference (b).
3. Frequency. Since the ship's operating schedule dictates the frequency at which propeller cavitation surveys can be made, no specific frequency can be assigned. However, a complete cavitation survey should be made after any CNO Maintenance Availability or upkeep period. One point of the current cavitation curve should be verified at the beginning of each underway period. If results are significantly different, a complete new curve should be developed.
4. Unacceptable Propeller Tip Cavitation Performance. Propeller replacement due to poor acoustic performance is often based on unacceptable tip cavitation. NAVSEAWARCEN CD personnel verify the ship recorded cavitation points and provide feedback to the TYCOM and the ship. Ships with emergent poor cavitation performance should immediately record and forward cavitation curve tapes per the Platform Noise Survey Section of this Appendix.
5. Reports. The original and the five most recent cavitation curves will be retained and compared for trend analysis until the propeller is changed.
6. Review. The Sonar Officer must compare new cavitation curves to previous ones and forward the results to the Commanding Officer via the Noise Reduction Officer.

Enclosure (2b)

TOPSIDE SURVEY

Reference: (a) MIP SO-591/901 MRC BNJ6 (R-1)

1. Responsibility. Noise Reduction Officer.
2. Procedure. The First Lieutenant must ensure that the following items are accomplished per reference (a):
   a. Open and inspect all line lockers and free flood areas for loose gear and other sources of noise, such as loose zincs, rattling pipes, loose grates, etc.
   b. Check all deck hatches to ensure they shut properly and will not rattle.
   c. Check that all towed-array fairing plates are properly secured (if applicable).
   d. Check all cleats for proper operation and ensure that they do not rattle when stowed.
   e. Check stowage of all portable equipment topside to ensure that proper gasket material is installed, all bolts and wing nuts are present, and equipment is securely held in place when mounted.
   f. When required, inspect sail area for loose gear and sources of rattles. Particular attention should be given to the mast bearings and operating equipment to ensure that masts will not be damaged or fouled. Before reinstalling sail plates, the sail should be inspected by the Noise Reduction Officer.
3. Frequency. A complete Topside Survey, including the sail, must be conducted after any major upkeep or inport period, or whenever major topside work is completed. A sail closeout inspection must be conducted by an officer prior to the reinstallation of any sail plate removed. Surveys should be completed as far in advance of underway as possible. Other inspections must be conducted as directed by the First Lieutenant.
4. Reports. A written report in memorandum form must be submitted to the Commanding Officer at the completion of each inspection. This report must include, as a minimum, the date the inspection was made, names of personnel conducting the inspection and uncorrected discrepancies noted in the ESL. Reports must be routed via the Noise Reduction Officer, with copies to cognizant Department Heads.
5. Review. A written report in memorandum form will be submitted for each inspection and will include, as a minimum, the date of the inspection, names of personnel conducting the inspection and the discrepancies noted in the Equipment Status Log. This report must be reviewed by the First Lieutenant and retained by the Noise Reduction Officer until all discrepancies are corrected.

HOUSEKEEPING SURVEY

Reference: (a) MIP SO-591/901 MRC BNJ7 (R-2)

1. Responsibility. Noise Reduction Officer.
2. Procedure. It is the responsibility of the NRPO to inspect their division's spaces per reference (a) for sound shorts or other silencing discrepancies which may result from improper stowage of loose gear.
3. Frequency. Improper stowage is a continuous problem and should be monitored as such. It is the responsibility of all hands to monitor the stowage of all gear and to ensure that sound shorts are not created by improper stowage. OODs, Engineering Officers Of the Watch and all watch standers are required by other instructions to inspect various spaces. These inspections should include monitoring for proper stowage and possible sound shorts. Prior to getting underway, all divisions must inspect their spaces for proper stowage at sea. Division Officers should acknowledge by signature on respective pre-underway check sheets that their spaces are stowed for sea.
4. Reports. Potential sound short discrepancies will be reported to the OOD who will inform the Commanding Officer and responsible Department Heads, to ensure that problems are corrected. Discrepancies not immediately corrected must be noted in the ESL.
5. Review. The Noise Reduction Officer must review all pre-underway check sheets and maintain a record of all noise discrepancy items until corrected.

MACHINERY AND HULL VIBRATION SURVEY

Reference: (a) Class Applicable Technical Manual for Machinery and Hull Vibration Testing and Monitoring of SSN/SSBN/SSGN Auxiliary Machinery
(b) MIP 4910/Series Vibration Noise Monitoring

1. Responsibility. Electrical Officer.
2. Procedure. Machinery and hull vibration surveys must be conducted as specified in reference (a) and following applicable PMS (reference (b)). Items found to be out-of-specification will be logged in the ESL as potential noise deficiencies. Machinery and hull vibration surveys are conducted on all submarines.
3. Frequency. A comprehensive machinery vibration survey should be conducted quarterly and hull vibration survey should be conducted semi-annually by Ship's Force. Results are submitted to PMT, who in turn forwards the packages to the applicable NSWC Detachment. Specific machinery and hull vibration monitoring surveys must be conducted by Ship's Force bi-weekly on selected equipment identified in the NSWC, machinery Vibration Deficiency Message and as required to support onboard noise reduction efforts.
4. Reports.
   a. NSWC evaluates and maintains machinery and hull vibration data collected by Ship's Force. They report out-of-specification equipment or hull vibration levels via message.
   b. During each machinery and hull vibration survey, a report is submitted to NSWC via the local PMT. This report must include the sound cut data and a feedback package.
   c. For the Hull Vibration Monitoring Program, a message should be sent from the submarine to NSWC within 45 days of receipt of the NSWC hull vibration deficiency message or when operationally feasible. This message should include the results of actions taken to identify and correct the sources of excessive hull vibration levels and to identify platform noise sources.
5. Noise Reduction Training. Crew training in noise awareness and noise reduction is absolutely essential to maintaining a quiet ship. The Submarine Force Training Manual discusses formal training courses and requirements pertaining to noise reduction as well as materials available for onboard training.
6. Review. The Electrical Officer must review and forward the results of all machinery and hull vibration measurements to the Commanding Officer via the Noise Reduction Officer and Executive Officer. This report must be submitted within five working days of the survey and must include a listing of which noise measurements have been taken and any out-of-specification equipment.

ISOLATION SYSTEM SURVEY

Reference: (a) NAVSEA S9073-AW-SNC-010/(U) Ship Acoustical Surveys
(b) NAVSEA S9073-AF-SNC-010/(C), Ship Noise Control
(c) Appropriate Noise Control Guidelines, Road Maps, and Equipment Guide Lists
(d) Appropriate System MIPs

1. Responsibility. Noise Reduction Officer.
2. Procedure. The Noise Reduction Officer must require Ship's Force to conduct a visual inspection of silencing equipment and components such as resilient mounts, flexible pipe, pipe hangers, ground straps, electrical connections, etc., to ensure they are properly installed, within periodicity, undamaged and not sound shorted. References (a), (b), (c) and (d) apply. When funded, these inspections will be conducted by a NAVSEA designated activity, however, the ship is still responsible for conducting the survey regardless of NAVSEA funding.
3. Frequency. An Isolation System Survey must be conducted as specified by reference (d) per reference (a). Additionally, a localized isolation system survey must be conducted in the area of sound isolated equipment change-outs and in the area of work accomplished on sound isolated systems. When requested and funded, a NAVSEA designated activity must provide training and assist in the performance of an isolation system survey.
4. Reports. The Noise Reduction Officer must ensure that all defects found are logged in the ESL and must report survey results to the Commanding Officer within five working days of completion of the inspection.
5. Review. The Noise Reduction Officer must maintain a record of all discrepancies noted until corrected.

DAMPING MATERIAL SURVEY

Reference: (a) NAVSEA S9073-AW-SNC-010/(U), Ship Acoustical Surveys
(b) NAVSEA S9073-AF-SNC-010/(C), Ship Noise Control

1. Responsibility. Sonar Officer.
2. Procedure. The Sonar Officer must ensure that a thorough inspection is conducted of all damping material installed in sonar array areas, fairwater, main ballast tanks, and free flood areas, to ensure that no deterioration has taken place per the guidance provided in reference (a). Reference (b) provides specific information relating to these materials.
3. Frequency. A Damping Material survey must be conducted as specified at each dry-docking, per reference (a).
4. Reports. A written report in memorandum form must be submitted for each inspection and must include, as a minimum, the date of inspection, names of personnel conducting the inspection, and the discrepancies noted in the ESL.
5. Review. The Sonar Officer must review the results of each inspection and forward them to the Commanding Officer via the Noise Reduction Officer within five working days of the completion of the inspection. This report must be retained by the Noise Reduction Officer until all discrepancies have been corrected.

SOUND ABSORPTION MATERIAL SURVEY

Reference: (a) NAVSEA S9073-AW-SNC-010/(U), Ship Acoustical Surveys
(b) NAVSEA S9073-AF-SNC-010/(C), Ship Noise Control

1. Responsibility. First Lieutenant.
2. Procedure. The First Lieutenant will ensure that a thorough inspection of the interior sound absorption and sound transmission loss material is conducted in all spaces. This inspection ensures that no deterioration of these materials has taken place. This inspection is accomplished with guidance from reference (a), while reference (b) provides specific information relating to these materials.
3. Frequency. A Sound Absorption Material Survey must be conducted prior to each major CNO Maintenance Availability. An inspection of any system affected by maintenance or other work must be conducted following completion of the work.
4. Reports. A written report in memorandum form will be submitted to the Noise Reduction Officer for each inspection and will include, as a minimum, the date of the inspection, names of personnel conducting the inspection, and discrepancies noted in the ESL.
5. Review. The First Lieutenant will review the results of each inspection and forward them to the Commanding Officer via the Noise Reduction Officer within five working days of the completion of the inspection. This report will be retained by the Noise Reduction Officer until all discrepancies have been corrected.

CONTROL SURFACE NOISE QUESTIONNAIRE

1. The purpose of this questionnaire is to provide more accurate and definitive information than reports of "noise in the fairwater" or “noise in the mud tank”. This information can reduce troubleshooting time, prevent unnecessary maintenance, and perhaps prevent an unnecessary and unscheduled dry-docking. It can also furnish vital data to assist in the resolution of a problem and prevent its recurrence. It is very important to monitor the audio during the greasing operations; the effects of greasing for worn bearings can be short.
2. Record audio of all platform noise evaluations per reference (a).
3. Perform all evaluations in all modes (Normal, Emergency and Automatic where applicable).
4. Note how long greasing effects the noise characteristics of the control surface (minutes, hours, days or months).

Hull Number: _____ Date:_____

Check the appropriate box or fill in the blanks in response to these questions:

1. Give the date when the noise was first noticed:		
2. Which control surface is suspected of causing the noise?		
a. Fairwater or Bow Planes	Yes ~	No ~
b. Stern Planes	Yes ~	No ~
c. Rudder	Yes ~	No ~
3. Was the noise observed upon leaving port?	Yes ~	No ~
a. If not observed upon leaving port, after how many days at sea?	_____	
4. Was the noise first observed during the first high speed run?	Yes ~	No ~
5. Was any work performed on this system, associated systems, or in its vicinity during the last refit or upkeep period (including welding or sandblasting)?	Yes ~	No ~
a. If yes, describe work ____ _____ _____		
6. How was the noise first detected?		
a. Audible to crew	Yes ~	No ~
b. Self noise monitoring system	Yes ~	No ~
(1) If yes, which system?	_____	
c. Other? (Describe) _____ _____		
7. Is the noise detected on any hydrophones?	Yes ~	No ~
a. If so, which hydrophone displayed the highest levels?	_____	
b. How does this hydrophone level compare to the most recent acoustic trial report or more recent baseline?	_____ _____	

(CONFIDENTIAL when filled in)

Enclosure (3)

8. Is the noise:			
a.	Barely audible?	Yes ~	No ~
b.	Moderate?	Yes ~	No ~
c.	Loud?	Yes ~	No ~
9. Since it was first detected, has the noise level:			
a.	Increased?	Yes ~	No ~
b.	Decreased?	Yes ~	No ~
c.	Remained constant?	Yes ~	No ~
d.	Fluctuated?	Yes ~	No ~
10. During cycling of the control surface, is the noise:			
a.	Constant?	Yes ~	No ~
b.	Intermittent?	Yes ~	No ~
11. If intermittent, has the frequency of the occurrence of the noise:			
a.	Increased?	Yes ~	No ~
b.	Decreased?	Yes ~	No ~
c.	Remained constant?	Yes ~	No ~
12. Describe the type of noise heard.			
a.	Clanking?	Yes ~	No ~
b.	Thudding?	Yes ~	No ~
c.	Groaning?	Yes ~	No ~
d.	Rubbing?	Yes ~	No ~
e.	Squealing?	Yes ~	No ~
f.	Chattering?	Yes ~	No ~
g.	Galloping?	Yes ~	No ~
h.	Hydraulic flow?	Yes ~	No ~
i.	Other? (Describe) _____ _____		
13. When, during the motion of the cycle of the planes is the noise heard (check all that apply):			
a.	At start of motion towards rise or right?	Yes ~	No ~
b.	At start of motion towards dive or left?	Yes ~	No ~
c.	At the end of motion towards rise or right?	Yes ~	No ~
d.	At the end of motion towards dive or left?	Yes ~	No ~
e.	Entering the rise or right hardstop?	Yes ~	No ~
f.	Entering the dive or left hardstop?	Yes ~	No ~
g.	Leaving the rise or right hardstop?	Yes ~	No ~
h.	Leaving the dive or left hardstop?	Yes ~	No ~
i.	The entire length of travel towards rise or right?	Yes ~	No ~

(CONFIDENTIAL when filled in)

j. The entire length of travel towards dive or left?	Yes ~	No ~
k. At some intermediate point(s) while moving towards rise or right?	Yes ~	No ~
(Indicate degrees of rise or right when heard):	_____	
l. At some intermediate point(s) while moving towards dive or left?	Yes ~	No ~
(Indicate degrees of dive or left when heard):	_____	
14. Is there any unusual hesitancy or motion during operation of the planes:		
a. Leaving the rise or right hardstop?	Yes ~	No ~
b. Leaving the dive or left hardstop?	Yes ~	No ~
c. At any other point(s) in the motion cycle?	Yes ~	No ~
(1) If yes, describe giving direction of movement and degrees of rise, dive, left, or right when noise occurs:	____ ____	
15. Does ship's speed or depth have any effect on whether or not the noise is generated?	Yes ~	No ~
a. If yes, describe:		
16. Does ship's speed or depth have any effect on when the noise is detected during the movement cycle as described in question 13?	Yes ~	No ~
a. If yes, describe:		
17. Is the noise audible:		
a. Surfaced, underway?	Yes ~	No ~
b. At periscope depth?	Yes ~	No ~
c. Below periscope depth?	Yes ~	No ~
18. Does sea state affect the degree of noise?	Yes ~	No ~
19. Does simultaneous operation of the stern planes and rudder cause or increase the degree of noise?	Yes ~	No ~
20. Are any of the following components very warm to the touch while operating the control surface suspected of causing the noise?		
a. Hydraulic tail rod (if installed)?	Yes ~	No ~
b. Hydraulic piston rod?	Yes ~	No ~
c. Through hull connecting rod?	Yes ~	No ~
21. On the control surface suspected of causing the noise, perform the appropriate quarterly greasing MRC for the components listed in question 22. Operate the control surface while greasing (except the guide cylinder). Listen to determine if greasing causes any change in the occurrence or loudness of the noise.	Greasing Performed? Yes ~	No ~
22. Did the noise diminish after greasing the following components?		
Fairwater or Bow Planes:		
a. Hull gland:	Yes ~	No ~

(CONFIDENTIAL when filled in)

Enclosure (3)

b.	Lower end of connecting rod: see Note 1	Yes ~	No ~
c.	Upper end of connecting rod: see Note 1	Yes ~	No ~
d.	Port stock bearing:	Yes ~	No ~
e.	Starboard stock bearing:	Yes ~	No ~
Stern Planes:			
f.	Hull gland:	Yes ~	No ~
g.	Forward end of connecting rod: see Note 1	Yes ~	No ~
h.	Aft end of connecting rod: see Note 1	Yes ~	No ~
i.	Port stock bearing: see Note 2	Yes ~	No ~
j.	Starboard stock bearing: see Note 2	Yes ~	No ~
k.	Port pintle bearing:	Yes ~	No ~
l.	Starboard pintle bearing:	Yes ~	No ~
Rudder:			
m.	Hull gland:	Yes ~	No ~
n.	Forward end of connecting rod: see Note 1	Yes ~	No ~
o.	Aft end of connecting rod: see Note 1	Yes ~	No ~
p.	Port stock bearing: see Note 2	Yes ~	No ~
q.	Starboard stock bearing: see Note 2	Yes ~	No ~
r.	Upper rudder stock bearing: see Note 2	Yes ~	No ~
s.	Lower rudder stock bearing: see Note 2	Yes ~	No ~
t.	Rudder carrier bearing (two fittings): see Note 2	Yes ~	No ~
23.	Pump one pound of grease into the guide cylinder grease fitting while the control surface is in the neutral position. Then operate the control surface about five cycles from full rise to full dive or left to right, as appropriate, while listening for the noise. Repeat this procedure for the guide cylinder until the specified amount of grease has been applied.	Greasing Performed? Yes ~	No ~

(CONFIDENTIAL when filled in)

NOTE 1: GREASE UNDERWAY IF THE APPROPRIATE ALTERATION IS INSTALLED TO PERMIT REMOTE GREASING OF THE STERN PLANES AND RUDDER CONNECTING RODS. THE FAIRWATER OR BOW PLANES CONNECTING ROD MAY BE GREASED LOCALLY WHILE UNDERWAY ON THE SURFACE EVEN IF REMOTE GREASING ALTERATION IS NOT INSTALLED.

NOTE 2: IF THE STERN PLANES ARE SUSPECTED OF CAUSING THE NOISE AND THE NOISE DID NOT DIMINISH AFTER GREASING THE STERN PLANE COMPONENTS, GREASE THE RUDDER COMPONENTS. IF THE GREASING DID NOT HELP A SUSPECTED NOISY RUDDER, GREASE THE STERN PLANES.

Deliver this questionnaire to:

For COMSUBLANT units:	Carderock Division Naval Surface Warfare Center 9500 MacArthur Blvd. West Bethesda, MD 20817-5700 Attn: Code 711 - Fleet Support Program Manager For: New London Units, data packages should be forwarded to: NSSC NEW LONDON CT, N42
For COMSUBPAC units:	Naval Surface Warfare Center Carderock Division Detachment Puget Sound 7131 Sealion Road Attn: Code 713 Naval Base Kitsap Bangor Silverdale, Washington 98315-7102

The NSWCCD will provide appropriate distribution to NAVSEA PMS 350, SEA 07T, PMS 392, TYCOM, and ISIC.

(CONFIDENTIAL when filled in)

APPENDIX D

PREDEPLOYMENT NOISE INSPECTION

1. Purpose. To provide requirements for Predeployment Noise Inspections.
2. Policy. This Appendix establishes the requirements for the Under Hull Sound Silencing Survey of all submarines.
3. Under Hull Sound Silencing Surveys. Under Hull Sound Silencing Surveys of submarines (using reference (g)) will be done at the following times:
   a. Prior to the ship leaving dry-dock.
   b. Waterborne Under Hull Inspection during the first week of a scheduled upkeep, normally accomplished by the inspecting facilities divers.
   c. Waterborne Under Hull Inspection prior to deployments of 30 days or greater, normally accomplished by the inspecting facilities divers.
4. Reports. The Senior Hull Inspector of the inspecting facility will conduct an inspection critique for the ship's Noise Reduction Officer and ISIC Material Officer. Copies of the final survey report (a format is provided on the following page) or reference (g) data sheets will be supplied by the inspecting facility to the submarine and cognizant ISIC Material Officer.

SOUND SILENCING SURVEY REPORT

1. Inspection performed by:

   Senior Inspector: _____

   Inspector #1 _____

   Inspector #2 _____

   Inspector #3 _____

   Inspector #4 _____

2. The following deficiencies were noted:

3. Submitted by:

_____

Senior Inspector

LISTING OF APPENDICES.

A Submarine Periodic Maintenance Requirement (PMR) Management Process
B Work Package Supplement - Shipyard Planning and Feedback Report
C Work Package - Ship's System Work Description (Part 4.13)

24.1 PURPOSE. This chapter defines the functions and responsibilities of the submarine Periodic Maintenance Requirements (PMR) Program, and applies to all submarines. Details of PMR documentation are described in Appendix E of reference (a). Unrestricted Operation (URO) PMR guidance is provided in chapter 25 of this volume. Hull Integrity Procedure (HIP) PMR guidance is provided in chapter 38 of this volume. Accomplishment of all PMRs is **mandatory**.

a. The submarine Class Maintenance Plans (CMP) form the basis of a PMR Program which takes the place of the Integrated Maintenance and Modernization Planning Program for these classes and defines the planned, corrective and inactive equipment Maintenance Requirements for all levels of accomplishment.

b. PMR work requires detailed planning and long lead-time material procurement; therefore, all PMR work has been assigned to the Fleet Maintenance Activity (FMA). Ship's Force is not expected to be called upon for PMR work other than the normal responsibilities for establishing plant conditions, authorizing shipboard work, monitoring work in process, interference removal, delivery of ship to shop items, retesting and accepting work. Ship's Force Work Center (WC) will not be assigned as Lead Work Center (LWC) for I-Level PMR work but may be assigned as an assist WC.

24.2 TYPE COMMANDER SCHEDULING SYSTEM. PMR program management has been assigned to Submarine Maintenance Engineering, Planning and Procurement Activity (SUBMEPP) who develops CMPs, Maintenance Requirement Cards (MRC), Maintenance Repair Standards (MRCs, Technical Repair Standards (TRS) and Submarine Maintenance Standards (SMS)), HIP and URO MRCs, and provides PMR configuration and scheduling information to the Submarine Force. These Inventories and Schedules aid in decisions concerning PMR scheduling and accomplishment during upkeep, provide visibility to problem areas and facilitate auditing and assessing the material condition of a ship.

a. For Non-SSBN and SSGN 726 Class submarines. The inventories and schedules include a section of I-Level PMRs coming due within the next xxx months (number of months as requested by Immediate Superiors In Command (ISIC)). Additionally, they provide a combined inventory of I and D-Level PMRs. This inventory identifies the availability for which the D-Level PMRs are planned for accomplishment.

b. For SSBN 726 and SSGN 726 Class submarines and Dry Deck Shelters. This inventory provides all I and D-Level requirements, with their due dates.

24.2.1 Periodic Maintenance Requirements Schedule. The PMR Inventories and Schedules are made available from Maintenance & Ship Work Planning (M&SWP) Reports at https://ebusiness.submepp.navy.mil/eBusiness/index.cfm by SUBMEPP. Appendix A of this chapter provides a flow chart of the Submarine PMR Management System. In addition, scheduling files, configuration files (M79E11) and Master Job Catalog (MJC) update files are distributed to those activities using Micro-PMR for PMR or URO call-down.

24.2.2 Scheduling Periodic Maintenance Requirements Work. The PMR scheduling system is based on calendar periods starting with the month following the completion month of a scheduled Chief of Naval Operations (CNO) Availability, or starting with the month following PMR completion for Fleet availabilities. It is designed to ensure reliable equipment operation during the unit's extended operating cycle. The ISIC, in conjunction with the FMA, will have to smooth the workload by spreading the work over several availabilities by re-planning the scheduled start and completion dates of individual Job Control Numbers (JCN) to ensure they are accomplished prior to the due dates. Once the actual completion dates are reported, subsequent scheduling for the future periods will retain the same relative time frames based on the periodicity of the requirement. The current PMR Inventories and Schedules provided by SUBMEPP must be maintained by the parent ISIC.

24.2.3 Periodic Maintenance Requirements Call Down and Brokering. I-Level PMRs which are due for accomplishment are called down from M&SWP or the local scheduling system, and brokered by the ISIC. PMRs should be screened to the FMA with a Priority Level of 2.

24.2.4 Calculating Adjusted Last Maintenance Action Date.

a. If the PMR is accomplished during a period other than the maintenance period listed in sub-paragraph b, the adjusted Last Maintenance Action (LMA) date will be the first of the month following the completion date listed on the PMR data form.

b. If the PMR is accomplished during a CNO availability, Major Maintenance Period, or refit, the adjusted LMA date will be the first of the month following the availability's actual completion date.

NOTE: ISIC OPERATING WITH THE ON-SITE PMR SCHEDULING SYSTEM MUST ENSURE THAT AVAILABILITY DATES ARE ACCURATELY MAINTAINED SO THAT COMPLETED AWR UPLINE REPORTED DATA REFLECTS THE ADJUSTED LMA DATE AND ON-SITE PMR SCHEDULING RECORDS CALCULATE THE PROPER NEXT DUE DATE.

24.2.5 Calculating Due Dates. Next Due Dates are calculated based on an Adjusted LMA date. Due dates are calculated, for scheduling purposes, by taking the adjusted LMA date month and year (number) and adding the periodicity months (number) to show the month and year due (i.e.,

an item with an adjusted LMA date of February 2003 (2/03) with a six-month periodicity would be due in August 2003 (8/03). The PMR will be accomplished prior to midnight of the last calendar day of the month due.

24.3 PERIODIC MAINTENANCE REQUIREMENTS ACCOMPLISHMENT. PMR requirements are to be accomplished on or before the scheduled due date listed in the SUBMEPP TYCOM PMR Scheduling System Inventories and Schedules. Accomplishment of all PMRs is **mandatory**. Only by accomplishing PMR maintenance on schedule and following specifications can safe and reliable operation be ensured and the period between CNO Availabilities be extended. When PMRs cannot be accomplished by their scheduled due date, they will appear overdue on the PMR Status web page. For overdue PMRs, the SUBMEPP representative assigned to each ISIC must identify on the web page the reasons the PMR could not be accomplished. The purpose of the web page is to provide increased visibility of overdue PMRs to aid the ISIC in their PMR Management responsibilities.

24.4 MATERIAL SUPPORT FOR FLEET MAINTENANCE ACTIVITY ACCOMPLISHED PERIODIC MAINTENANCE REQUIREMENTS.

24.4.1 Mandatory Parts. Parent FMAs requisition mandatory parts as specified on TRS, MRC or SMS documentation for PMRs that are scheduled to be accomplished by that FMA. Material requisitioning is accomplished by the FMA using standard supply procedures. Material is not normally stocked by the FMA and is requisitioned from the nearest stocking point.

24.4.2 Contingency Parts. Contingency parts will not be procured in advance for PMR requirements and will be ordered only upon determination that a contingency part is required based on observed equipment condition. Parent FMAs may have some high usage contingency material available in stock, as identified by the Tender Load List supplements, **(not applicable to SSBN or SSGN 726 Class submarines)** however, low usage contingency material is stocked only at designated stock points or not at all.

24.4.3 Requisitioning Procedures. Submarine Engineered Operating Cycle (SEOC) PMR material requisitions must be submitted through normal channels and must use a Project Code of "732". Appendix 6 of Reference (b) refers. Contingency material requisitions must be forwarded by message or telephone, and must include appropriate "work stoppage" indicator or codes. Forward Contingency Material requisitions directly to, Fleet Industrial Support Center San Diego, Pearl Harbor or Submarine Base New London by message or telephone as appropriate; use the phrase "SEOC Requisition" as the subject line on message requisitions.

24.4.4 Material Support Provided by the Advance Equipment Repair Program. Shore based spares are available for replacing some critical equipment, such as seawater system pumps and motors, during CNO Maintenance Availabilities. The Advanced Equipment Repair Program (AERP) is managed by SUBMEPP under the direction of Naval Sea Systems Command (NAVSEA) and both TYCOMs. AERP equipment scheduled for change-out will be specifically authorized in the ship's Availability Work Package (AWP). Although originally intended to support CNO Availabilities, AERP assets, when available, are used to support Casualty Reports (CASREP). In these instances, a CASREP requisition must be submitted to Naval Inventory Control Point and the shipment of equipment is monitored and tracked until the condition "F" off-load has been returned to the refurbishment activity or vendor identified by Naval Inventory

Control Point. The expedited return of an AERP off-load is essential to ensure adequate restoration turnaround time is afforded and to minimize AERP impact.

24.4.5 Material Support Provided by the TRIDENT Planned Equipment Replacement Program.

a. TRIDENT Planned Equipment Replacement (TRIPER) is a rotatable pool program for SSBN 726 and SSGN 726 Class submarines. TRIPER equipment is removed from the ship via pre-planned access routes and six-foot diameter Logistics and Escape Trunks, using specifically designed handling attachments and procedures. Removed equipment is replaced with fully interchangeable, tested, ready for issue units which can be rapidly installed and made fully operational within a refit period. Equipment replacement periodicity is determined by maintenance and reliability analysis and engineering judgments intended to preclude equipment failure or significant degradation during operational periods. Removed equipment is refurbished by approved Designated Overhaul Points, tested and returned to ready for issue condition for use on another SSBN 726 or SSGN 726 Class submarine.

b. Safety spares are made available for CASREPs which are considered as unplanned change outs. The TRIPER Program rotatable pool is managed by NAVSEA (PMS 392) and supported by various agencies and activities. Hull, Mechanical, Electrical, Ordnance and Electronics and Command and Control System equipment comprise the TRIPER inventory pool. Items under the cognizance of the Director, Strategic Systems Project Office and the Deputy Commander, NAVSEA Nuclear Power Directorate are excluded.

24.5 CORRECTIVE MAINTENANCE OF EQUIPMENT USING PERIODIC MAINTENANCE REQUIREMENTS. Scheduled restoration of equipment by the FMA or industrial activity is done following specified maintenance standards (MRC, SMS, TRS, Technical Manual, etc.). Whenever corrective maintenance is required on Hull, Mechanical and Electrical equipment, the SUBMEPP combined I and D-Level PMR inventory must be reviewed by the ISIC and FMA. The ISIC and FMA will determine whether to limit repairs to those described by the ship or to have the maintenance standard accomplished. If the corrective maintenance is to include the criteria of the MRC, SMS or TRS, the work request must be processed per paragraph 24.8.3 and 24.8.4 of this chapter.

NOTE: IN ORDER TO RECEIVE ACCOMPLISHMENT CREDIT, THE ISIC MUST ENSURE PROMPT COMPLETION REPORTING OF THE PMR. THIS WILL ENSURE THE CORRECT SCHEDULING OF PMRs FOR FUTURE ACCOMPLISHMENT.

NOTE: EQUIPMENT IS CONSIDERED TO HAVE BEEN RESTORED FOLLOWING PMR CRITERIA WHEN THE FOLLOWING SOFTWARE (MRC, SMS, TRS) REQUIREMENTS HAVE BEEN SATISFIED.

(1) THE EQUIPMENT IS RESTORED TO PLAN SPECIFICATIONS.

(2) THE COMPONENTS SATISFACTORILY PASS THE TEST REQUIREMENTS WITHIN THE MRC, SMS OR TRS.

(3) ALL MATERIAL LISTED ON THE MRC, SMS OR TRS AS MANDATORY HAS BEEN REPLACED.

(4) COMPONENTS AND EQUIPMENT ARE REPLACED WITH SUPPLY SYSTEM, AERP, OR TRIPER ASSETS.

24.6 PERIODIC MAINTENANCE REQUIREMENTS ACCOMPLISHMENT DURING CHIEF OF NAVAL OPERATIONS MAINTENANCE AVAILABILITIES. PMRs to be accomplished by the industrial activity will be included in the SUBMEPP PMR Inventories and Schedules.

a. For SSN 688, SSN 774 and SSN 21 Class submarines:

(1) The AWP prepared by SUBMEPP will reflect all PMRs authorized for shipyard accomplishment during the CNO Availability period at the AWP Ship Work List Item Number (SWLIN) level. The Work Package Supplement (WPS) accompanying the AWP will identify a specific PMR to the applicable AWP SWLIN paragraph. Appendix B provides an example of the WPS format. In addition, the DMP and overhaul AWPs will contain an I-Level PMR work package cross-index. This cross-index will enable maintenance planners to readily determine the I-Level PMRs accomplished incidental to accomplishing higher D-Level PMRs or other industrial activity authorized work. The cross-index will also identify I-Level PMRs which will become overdue by availability completion plus six months. These I-Level PMRs should only be listed in the cross index as a reference and not listed in the body of the AWP. Appendix C of this chapter provides an example of the cross-index format. This ISIC will report any I-Level PMRs from the cross-index that will not be completed prior to the arrival conference for adjudication.

(2) Upon receipt of Issue Two of a six month or greater scheduled CNO availability AWP the ISIC will review the AWP against the schedules and inventories and add those PMRs not covered by the Work Package (WP) coming due within six months after availability completion that aren't assigned to shipyard to a fleet maintenance availability prior to the CNO period, to a concurrent availability, or to a future availability with TYCOM concurrence.

(3) For I-Level PMRs assigned to the depot, or I-Level PMRs covered by higher-level maintenance assigned to the depot, the ISIC will enter "Assigned to <depot name> by AWP <AWP number>" in the Remarks or Completion block of the PMR Schedule and Inventory, Part 2 Section III and in the local scheduling system.

(4) Material Condition Assessment data for PMRs accomplished by the industrial activity during CNO Availabilities will be retrieved from the appropriate maintenance database. Upon completion of the availability, the Availability Work Package will be retained by SUBMEPP to identify PMRs accomplished during the availability. The PMR Schedule and Inventory and local scheduling system will be updated by SUBMEPP.

b. For SSBN 726 and SSGN 726 Class submarines:

(1) The Engineered Overhaul Work Package prepared by SUBMEPP will reflect all PMRs authorized for accomplishment during the CNO Maintenance Availability period at the SWLIN level. For each SWLIN, the specific PMRs

will be identified to the applicable component level. The Engineered Overhaul Work Package preparation process ensures all PMRs due prior to the first availability following the subject availability period are included in the Engineered Overhaul Work Package. The preparation process also includes review and inclusion of appropriate items from the ship's Current Ship's Maintenance Project (CSMP), Ship's Force originated deficiencies, and alterations screened for industrial activity accomplishment.

(2) Material Condition Assessment data for PMRs accomplished by the industrial activity during CNO Availabilities will be retrieved from the appropriate maintenance database. Upon completion of the availability, the Availability Work Package will be retained by SUBMEPP to identify PMRs accomplished during the availability. The PMR inventories and schedules and local scheduling system will be updated by SUBMEPP.

(3) Completions and MCA data for PMRs accomplished by TRIDENT Refit Facility Kings Bay or NAVIMFAC PACNORWEST during CNO availabilities will be called down and reported using their local scheduling system as identified in paragraph 24.2.3 of this chapter.

c. Operating Cycle and Interval Extension. An audit plan to assess the material condition of a ship prior to extending their operating cycles or intervals beyond PMR periodicity due to changing CNO Maintenance Availability dates is addressed in reference (c). Procedures and responsibilities are contained in volume II, part III, chapter 2 of this manual.

24.7 PERIODIC MAINTENANCE REQUIREMENT ACCOMPLISHMENT DURING DRY DECK SHELTER MAINTENANCE AVAILABILITIES.

24.7.1 Regular Overhaul.

a. The AWP prepared by SUBMEPP will reflect all PMRs authorized for accomplishment by the Industrial Activity (IA) during the regular overhaul (ROH) period. The Work Package Supplement (WPS) accompanying the AWP will identify a specific PMR to the applicable AWP SWLIN paragraph. Appendix E of this chapter provides an example of the WPS format.

b. During the ROH, the IA must use the WPS to document completion of PMRs by annotating in the remarks block of each line item, the Task Group Instruction (work package) used to accomplish the PMR. The IA will provide a copy of the completed WPS along with all OQE to the sustaining activity at the completion of the ROH. At the end of the availability, the IA also provides a Certificate of Completion (COC) letter detailing the status of all work and testing accomplished. Within the COC, the IA must make a positive statement that each PMR identified under tasking has been completed by separate line items. If a PMR is not accomplished in its entirety or is changed, the IA must include this information by annotating the applicable line item within the COC and in the remarks block of the WPS. PMRs not accomplished in their entirety also require an evaluation be performed to determine if a departure from specification (DFS) will be required.

c. After completion of overhaul and upon receipt of the WPS and COC from the IA, the sustaining activity must make red-line changes to the local copy of the PMR I-level or D-level inventory and submit these updates to SUBMEPP via the ISIC.

24.7.2 Restricted Availabilities (RAV). For restricted availabilities, the sustaining activity and ISIC must identify PMRs to be assigned to the IA and forward a list to the TYCOM via formal correspondence. TYCOM will evaluate the request and may approve or modify it as necessary by issuing an endorsement letter to PMS390N who initiates the work by tasking the IA following the current contract requirements. PMR completion reporting is then accomplished following the guidelines of paragraph 24.7.1.b. and 24.7.1.c. of this chapter except the WPS is not used. In this case, the COC and supporting OQE will be the only required documents to verify completion status of each PMR.

24.8 RESPONSIBILITIES.

24.8.1 Type Commander.

a. The TYCOM is responsible for providing an overall scheduling system for the accomplishment of PMRs for assigned ships.

b. Perform periodic audits of ISICs and FMAs to verify full compliance with the provisions of this chapter.

c. Provide guidance to the ISICs, obtaining NAVSEA concurrence per volume V, chapter 8, paragraph 8.2.4 of this manual.

24.8.2 Submarine Maintenance Engineering, Planning and Procurement Activity.

a. Receive reports of the completion of PMRs from industrial activities and extract Maintenance and Material Management (3-M) data from NAVSEA Logistics Center, Mechanicsburg PA of all Forces Afloat accomplished PMRs containing “JC” WC.

b. Review completion reports for any change in material condition status and analyze 3-M data for Material Condition Assessment to determine validity of requirements.

c. Update schedules to reflect new LMA and next due dates.

d. Ensure the PMR Inventories and Schedules are available on https://ebusiness.submepp.navy.mil/eBusiness/index.cfm.

e. Provide quarterly or more frequent (if requested) scheduling and configuration files (M79E11) and MJC update files to each parent ISIC using a local scheduling system.

f. Provide quarterly MJC update files to the ISIC brokering systems.

g. Adjust the due dates for any PMRs that are accomplished within ten months of the major CNO availability start date that will come due again during the availability by the number of months of the availability duration.

h. (SSBN 726 and SSGN 726 Class submarines) Provide Refit Work Package electronic files which reflect PMR scheduling to the TRIDENT Refit Facility Kings Bay at the arrival minus 60-day milestone.

i. Prepare and issue AWPs in support of CNO availabilities. Ensure the I-Level PMR section of AWP (Part 4.13) is updated on each issue of the AWP.

j. Manage AERP, Corporate Component Repair Program and TRIPER programs.

k. Extract PMR completion verification and documentation for SEOC availabilities from the appropriate maintenance database.

l. Update Overdue PMR Status web page (https://ebiz.submepp.navy.mil/fs/pmr_status/) with the reason for D-Level PMRs not meeting the due date.

24.8.3 Immediate Superior In Command.

NOTE: FOR DRY DECK SHELTERS, THE ISIC IS RESPONSIBLE FOR SCHEDULING AND ENSURING COMPLETION OF ALL PMR WORK.

a. Although the responsibility for the accomplishment of PMRs must rest with the ship's Commanding Officer, the ISIC is responsible for scheduling and ensuring completion of all I-Level PMR work within the planned periodicity in the CMP. Normally, PMR work is accomplished by the FMA which maintains the unit's CSMP. However, when submarines are assigned availabilities to other than the parent FMA, and that FMA is authorized by the TYCOM to perform PMRs, an agreement between the parent ISIC and the accomplishing FMA will identify the PMRs to be accomplished and any associated logistics.

b. For submarines, call-down all I-Level PMRs planned for accomplishment into the CSMP by availability dates. For SSBN 726 and SSGN 726 Class submarines, this must be 45 days prior to refit start. For non-726 Class submarines, 60 days prior to fleet maintenance availability. This ISIC must be proficient in these procedures to preclude erroneous or duplicate data from entering the CSMP. If the inventories and schedules contain errors or omissions, report the discrepancies to SUBMEPP.

c. Maintain auditable records of PMR accomplishment for each submarine or DDS. These records will include the current SUBMEPP Quarterly PMR Inventories and Schedules. For submarines, this will also include the last completed AWR for PMRs completed by the parent FMA, whether or not reflected in the SUBMEPP Quarterly PMR Inventories and Schedules. At sites which have access to electronic certified Task Group Instructions, these Task Group Instructions can be used in place of completed AWRs as an auditable record of PMR accomplishment.

d. At Naval Intermediate Maintenance Facility Pacific Northwest, PMR and non-controlled URO inspection scheduling, completion, LMA date establishment and next due date scheduling must be maintained in the appropriate automated database for SSBN 726 and SSGN 726 Class submarines. This database will contain the complete history for all occurrences (past), dates of completion, frequency of occurrence, next due dates and future scheduling data for each PMR or non-controlled URO inspection. Data will be entered from Objective Quality Evidence from refit closeout processes and the Departure and Assessment report.

e. Notify SUBMEPP Code 1814 if unable to create PMR Inventories and Schedules from M&SWP at https://ebusiness.submepp.navy.mil/eBusiness/index.cfm.

f. Keep the local scheduling system correct and accurate. This should be done by periodically doing a check of the data against the inventories and schedules, M&SWP and, for submarines, the ship's CSMP. Ensure the SUBMEPP representative assigned

to each ISIC updates the Overdue PMR Status web page (https://ebiz.submepp.navy.mil/fs/pmr_status/) with the reason for I-Level PMRs not meeting the due date.

g. The ISIC should make every attempt to accomplish PMRs on or before the next scheduled due date that appears in SUBMEPP Inventories and Schedules. Ensure PMRs which are not accomplished by the SUBMEPP scheduled due date are rescheduled.

h. Ensure that all I-Level PMRs, which will become due during a scheduled CNO Availability (but not authorized for industrial activity accomplishment), are scheduled for accomplishment by the FMA prior to the end of the availability. The PMRs may be assigned to an FMA concurrent availability with an end date the same as the CNO availability. This will allow for a more appropriate Adjusted LMA Date.

(1) Any I-Level PMR that is overdue by the availability start date minus 6 months and is identified in the AWP or WPS by SUBMEPP to be accomplished by the industrial activity does not have to be done prior to the availability start. This includes I-Level PMRs for which the higher tier D-Level PMR is authorized in the AWP or WPs.

(2) Notify the TYCOM representative at the Pre-Arrival Conference of any I-Level PMRs that will either not be accomplished prior to the availability start date or will become due during the availability.

(3) Any PMR accomplished within ten months prior to start of a major CNO Availability that becomes due again during the availability, will have their scheduled due date adjusted by SUBMEPP by the number of months of the availability duration.

i. Review completed AWRs or electronic certified Task Group Instructions, as applicable, prior to closeout of PMRs to resolve any discrepancies.

j. Transferring Periodic Maintenance Requirements to other Fleet Maintenance Activities for Accomplishment. When submarine availabilities are accomplished by other than the parent FMA (whether another FMA in the same geographic area or due to deployment), the parent ISIC will take the following action:

(1) Coordinate with the parent FMA to select only those PMRs for accomplishment for which all plans and materials will be available and ready for shipment prior to the availability or deployment of the submarine.

(2) Dispatch a message to the submarine, the recipient squadron and FMA identifying by JCN the PMRs to be accomplished, confirming that plans and materials are being shipped or will be carried by the deploying submarine and that the submarine's total CSMP tape will be either retained by the parent ISIC or transferred to the recipient squadron, Regional Support Group or Regional Maintenance Center as mutually agreed prior to the availability or deployment.

(a) If the CSMP is retained by the parent ISIC, an AWP tape (MM6031) will be provided to the recipient FMA which will maintain it as I-Level (only AWR completions for the tended submarine accomplished by the

FMA will be passed upline). The submarine will forward all 3-M transactions to the parent ISIC.

(b) If the total CSMP is transferred, the recipient FMA will maintain it as level II (the submarine will pass all 3-M transactions to the availability FMA). In addition, the PMR configuration and scheduling file will be transferred to the recipient FMA for URO, PMR and Calibration scheduling purposes.

(c) When the submarine departs from the tending FMA, the CSMP and PMR data files will be updated and returned to the parent ISIC with the letter of transfer. FMAs receiving only the work package tape will create a CSMP transfer out tape and transmittal letter for return to the parent ISIC. The parent ISIC Maintenance Document Control Officer (MDCO) will reconcile the master CSMP with the returning submarine's 3-M coordinator.

(3) Ensure that the FMA properly packages by JCN all materials, plans, drawings, etc., for dispatch to the receiving FMA or for custodial turnover to the submarine's Engineer Officer for delivery to the deployed FMA.

(4) Ensure MDCO and Analysis, Records and Reports Section (ARRS) takes coordinated action to provide a correct CSMP tape and letter of transmittal. The parent ISIC MDCO must retain copies of transfer-out and in letters for MJC Job Sequence Number control.

NOTE: ONCE A DEFERRAL HAS INITIALLY BEEN ENTERED IN THE COMPUTER AT THE ORIGINATING FMA, IT IS AUTOMATICALLY PASSED TO THE TYCOM MASTER CSMP. SUBSEQUENT TAPE TRANSFERS BETWEEN FMAs WILL NOT CAUSE THE DEFERRAL TO PASS AGAIN TO THE TYCOM PROVIDING THAT MDCO INPUTS THE TRANSFER TAPE (MM6031) TO MAINTENANCE RESOURCE MANAGEMENT SYSTEM (MRMS) PROGRAM 173 NOT 174.

k. Non-Scheduled Repairs of PMR components. The ISIC must add to the ship's CSMP those PMRs to be accomplished in conjunction with a repair action, in lieu of a repair action, or to be credited subsequent to a repair or replacement action. One of the following actions must be taken by the ISIC and MDCO:

(1) When a ship's submitted deferral references a PMR for concurrent accomplishment with the repair action, or if ISIC or FMA planners recommend a PMR, the ISIC must make the decision whether or not to invoke the PMR in conjunction with or in lieu of the requested repair. This will result in two AWRs being created. The planner will have work accomplished under one JCN (EA01) and use the second JCN (EAJC) for administrative completion crediting of the PMR.

(2) If the repair job has resulted in replacement of the PMR component or if the maintenance standard requirements were completely accomplished prior to retrieving the PMR from the MJC, call down the item from the local scheduling system. The ISIC should instruct FMA to report its completion

including the added narrative to identify the originally assigned ship's JCN. Though the materials used cannot be re-identified to the PMR JCN, it is recommended that the total man hours expended also be reported on the PMR AWR or subsequent analysis of required PMR support.

l. Training. The parent ISIC is responsible to provide assigned ship's training in the TYCOM PMR Scheduling System. Such training should include an overview of the SEOC Program, PMR scheduling products, SMS Library and PMR program accomplishment and reporting systems. Emphasis should be placed on the ship's responsibilities to the PMR program as identified in paragraph 24.8.5 of this chapter.

24.8.4 Fleet Maintenance Activity.

a. The FMA is responsible for accomplishing all PMR work as scheduled to the required repair standards.

b. Commence the planning and material procurement function when the PMR is called down by the ISIC from the local scheduling system and brokered to the FMA.

c. Progress the job, ensuring that the LWC coordinates with ship superintendent and all Assist WCs and that production time and current status is reflected in the local scheduling system.

d. Complete the job, report its accomplishment and as found material condition feedback code on the AWR. Any significant findings should also be documented on the AWR. The LWC then completes the AWR by filling in action taken codes, signing for completion and then obtains acceptance signature from Ship's Force. The AWR is then returned to ARRS. The ARRS will verify that all participating WCs have documented completion of their assigned tasks and then pass the AWR to the ISIC for review and updating of SUBMEPP inventories and schedules prior to close-out of the AWR by ARRS. The material condition feedback codes are described in Appendix C of reference (a) as part of the action taken code, and are:

NOTE: THE MATERIAL CONDITION FEEDBACK CODES MUST DESCRIBE THE "AS FOUND" CONDITION OF THE COMPONENTS AND NOT THE AFTER REFURBISHED CONDITION OF THE COMPONENTS.

(1) Code "A" means the material condition of the component being refurbished could have allowed the PMR to be deferred (extend the periodicity).

(2) Code "B" means the material condition of the component being refurbished justified the scheduled PMR.

(3) Code "C" means the material condition of the component being refurbished should have mandated an earlier completion of the PMR (shorten the periodicity).

NOTE: VARIATIONS TO THESE CODES MAY BE DESCRIBED IN INDIVIDUAL PMR MJC NARRATIVES.

e. ARRS will verify that all participating WCs have documented completion of assigned tasks, Ship's Force acceptance signature is on AWR and the final action taken code (2 characters) is entered. Prior to close-out of the AWR, ARRS will pass the AWR to the

ISIC for review. For MRMS FMA sites, it is essential that ARRS verify that the MRMS Availability file has the proper scheduled completion date and code to identify that it is a scheduled availability. This is done by showing a "Y" in answer to "Is this a CNO Availability" on the appropriate screen.

f. Adjustments of scheduled start and completion dates of the PMR and factual reporting of status codes.

g. Review corrective action request submitted by Ship's Force via a Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), to determine if the corrective action is to include the criteria of MRC, SMS or TRS requirements.

h. If the PMR maintenance procedure has a material condition feedback form, fill out the form and submit following the reporting requirements defined in the procedure.

i. Report to the ISIC when PMRs are met per paragraph 24.5 of this chapter, due to the expansion of work boundaries.

j. At the conclusion of an availability (not later than the Departure and Assessment Conference), in which I-Level PMRs were screened for FMA accomplishment, provide to the ISIC, verbally or by memo, the reason that any PMRs could not be accomplished (e.g., parts, manpower not available) as scheduled.

24.8.5 Submarine Commanding Officer.

a. The ship's Commanding Officer is responsible for the execution of PMR work on the ship.

b. All discovered maintenance deficiencies which affect the equipment and systems covered by the PMR program should be documented to reflect the possible PMR with which the deficiency is associated. This will provide the ISIC with the alternative of simultaneously imposing repairs to the criteria of the specified Maintenance Standard and credit PMR accomplishment.

c. All maintenance deficiencies will reflect in Block 46 (TYCOM SPECIAL PURPOSE), of the 2-Kilo whether or not quality control and Quality Assurance standards are required.

d. Review Depot Availability Work Packages and provide comments to the TYCOM and SUBMEPP representatives during the work package review.

e. Review CSMP reports with parent ISICs prior to upkeep periods in order to assist in planning for accomplishment of required PMR maintenance.

f. Ensure that the current MRCs, Maintenance Requirements and TRSs applicable to the ship class are carried on board.

g. Ensure that MRCs, SMSs and TRSs, which provide detailed information and repair guidance, are referenced and used during equipment maintenance.

h. If Ship's Force accomplishes a repair of a PMR component to an MRC, SMS or TRS, report same to the ISIC Material Officer so that the SUBMEPP can receive credit for accomplishment of PMR per paragraph 24.5.

i. Ensure all completed AWRs for PMRs are signed as accepted by Ship's Force.

j. At the conclusion of an availability (not later than the Departure and Assessment Conference), in which I-Level PMRs were screened for FMA accomplishment, provide to the ISIC, verbally or by memo, the reason that any PMRs could not be accomplished (e.g., parts, manpower not available) as scheduled.

24.8.6 Deep Submergence System Commanding Officer.

a. Ensure all PMRs are accomplished within the required periodicity as specified by SUBMEPP.

b. Review Depot Availability Work Packages and provide comments to the TYCOM and SUBMEPP representatives during the work package review.

c. Review the status of PMR maintenance in the SUBMEPP Quarterly PMR inventories and schedules with the ISIC prior to upkeep periods in order to assist in planning for accomplishment of required PMR maintenance.

d. Ensure that the current SUBMEPP Quarterly PMR Inventories and Schedules, MRCs, Maintenance Requirements and TRSs applicable to the ship class are carried on board.

e. All maintenance deficiencies which affect the equipment and systems covered by the PMR program should be documented to reflect the possible PMR with which the deficiency is associated. Whenever possible, corrective repairs should be performed to the criteria of the specified TRS in order to credit PMR accomplishment. If Ship's Force accomplishes a repair of a PMR component to an MRC or TRS, report the repair by making redline changes to the local copy of the PMR I-level and D-level inventory and submit to SUBMEPP via the ISIC.

f. At the conclusion of an availability, review the COC provided by the industrial activity to verify all scheduled PMR work was accomplished. Ensure that redline changes are accordingly made to the PMR I-level and D-level inventory and sent to SUBMEPP via the ISIC.

24.8.7 3M Coordinator. The 3-M Coordinator must maintain one copy of the current Quarterly PMR MRC inventories and schedules provided by SUBMEPP via the ISIC and provide this list to the Availability Coordinator. All required PMRs must be coordinated for accomplishment within the ship's CMAV work package by the Availability Coordinator (CMAV, MMP, Ship's Force Upkeep, and CNO Availabilities), with each work center planning and setting the required conditions for PMR execution.

25.1 PURPOSE. This chapter provides guidance and definition for the requirements, responsibilities and actions for continued submarine Unrestricted Operation (URO) to design test depth. The URO Maintenance Requirement Card (MRC) program is invoked on all Submarine Safety (SUBSAFE) certified submarines.

25.2 UNRESTRICTED OPERATION MAINTENANCE SCHEDULING, PLANNING AND REPORTING.

25.2.1 Maintenance Requirements for Continued Unrestricted Operation to Design Test Depth. Reference (a) establishes the Maintenance Requirements and identifies the responsibilities and actions required to support continued unrestricted submarine operations to design test depth. In conjunction with reference (a), Naval Sea Systems Command (NAVSEA) has issued individual manuals containing required, periodic SUBSAFE maintenance actions for each ship or class. The URO MRCs in these publications will identify degradation of the material condition of the hull integrity boundary and of those systems affecting ship's recoverability. The requirements set forth in these publications are, in addition, defect monitoring requirements, established on an individual ship basis, for submarines in which known uncorrected deficiencies exist. SUBSAFE certification indicates that a valid recommendation for URO to design test depth can be made. Maintenance of certification is dependent on both the positive control of all re-entries into the SUBSAFE boundaries per volume V, part I, chapter 5 of this manual, the satisfactory and timely completion of applicable URO MRCs as required by reference (a) and any necessary repairs. Accomplishment of the URO MRCs specified with this program identify changes within the SUBSAFE boundary which result from inadvertent error or from degradation caused by the service environment.

25.2.2 Scheduling and Reporting. In order for the Type Commanders (TYCOM) to carry out their responsibilities in the material certification of submarines and to aid in decisions concerning operational restrictions, an auditable system of scheduling the performance and

reporting of URO MRCs has been developed. This system provides visibility to problem areas, facilitates verification and provides a permanent record of URO MRC accomplishment in the ship's Maintenance and Material Management (3-M) machinery history maintained at the Naval Sea Logistical Center (NAVSEALOGCEN).

25.2.2.1 Non-SSBN 726 or SSGN 726 Class Ships. Submarine Maintenance Engineering, Planning and Procurement Activity (SUBMEPP) provided Periodic Maintenance Requirement (PMR) Inventories and Schedules and the 3-M Master Job Catalog (MJC) Programs are used for scheduling and reporting. The scheduled URO MRC requirements added to the Current Ship's Maintenance Project (CSMP) from the local scheduling system and the Automated Work Requests (AWR) produced will contain unique Job Control Numbers (JCN) consisting of ship's Unit Identification Code (five characters) plus WC (Department or Division + JC) (four characters) plus Job Sequence Number (four characters). Appendices A and B of this chapter show a URO AWR for Ship's Force and Fleet Maintenance Activity (FMA) accomplishment respectively. Appendices C and D of this chapter show examples of the SUBMEPP URO MRC inventories and schedules respectively.

25.2.2.2 SSBN 726 and SSGN 726 Class Ships. SUBMEPP provided URO MRC inventories, schedules, Master Job File, as well as the Refit Work Planning System, are used for scheduling and reporting. The scheduled URO MRC requirements added to the CSMP from the local scheduling system and the AWRs produced will contain unique JCNs consisting of ship's Unit Identification Code (five characters) plus WC (Department or Division + JC) (four characters) plus Job Sequence Number (four characters). Appendices A and B of this chapter show a URO MRC AWR for Ship's Force and FMA accomplishment respectively. Appendices C and D of this chapter show examples of the SUBMEPP URO inventories and schedules respectively.

25.2.2.3 SUBMEPP Activity Inventories and Schedules. The SUBMEPP inventories and schedules can be created from Maintenance & Ship Work Planning Reports (M&SWP) at https://ebusiness.submepp.navy.mil/eBusiness/index.cfm.

25.2.3 Baseline and Due Dates. The baseline date for determining URO MRC due dates is the Last Maintenance Action (LMA) date. LMA dates for new requirements will be based on the Change Issue Date of the URO MRC invoking the new requirement unless otherwise directed from NAVSEA. Due dates are calculated based on LMA dates per paragraph 25.2.3.2 of this chapter. It is recognized that upkeep and docking schedules for ships which are well into the operating cycle may not permit full compliance with the scheduled due dates. In such cases, a Departure From Specification (DFS) for the URO MRC will be addressed on a case-by-case basis as specified in volume V, part I, chapter 8 of this manual. LMA dates and URO MRC due dates are determined in the following manner:

25.2.3.1 Last Maintenance Action Date. For new construction ships, all URO MRCs have an initial LMA date established at delivery from new construction or from Post Shakedown Availability to start the operating cycle following the applicable URO MRC manual. During the operating period between commissioning and start of Post Shakedown Availability and during the operating cycle following Post Shakedown Availability, an adjusted LMA, as discussed in sub-paragraphs a and b, is used for URO MRCs. Calculate the adjusted LMA date in the following manner:

a. If the URO MRC is accomplished during a period other than the maintenance periods identified in subparagraph b below, the adjusted LMA date will be the first of the month following the completion date listed on the PMR data form.

b. If the URO MRC is accomplished during a CNO availability, Major Maintenance Period, or refit, the adjusted LMA date will be the first of the month following the availability's actual completion date.

NOTE: IMMEDIATE SUPERIORS IN COMMAND (ISIC) OPERATING WITH THE ON-SITE PMR SCHEDULING SYSTEM MUST ENSURE THAT AVAILABILITY DATES ARE ACCURATELY MAINTAINED SO THAT COMPLETED AWR UPLINE REPORTED DATA REFLECTS THE ADJUSTED LMA DATE AND ON-SITE PMR SCHEDULING RECORDS CALCULATE THE PROPER NEXT DUE DATE.

25.2.3.2 Calculating Due Dates. Next due dates are calculated based on an adjusted LMA date. Due dates are calculated, for scheduling purposes, by taking the adjusted LMA date month (number) and adding the periodicity months (number) to show the month due (i.e., an item with an adjusted LMA date of February 2003 (2/03) with a six-month periodicity would be due in August 2003 (8/03)). The PMR will be accomplished prior to midnight of the last calendar day of the month due.

25.2.4 Periodicity Extensions. When determining the due date for URO MRC inspections 001, 004, and 005 for an individual submarine, inactive time (defined as the number of days pier side plus the number of days in dry-dock) may be excluded from the time elapsed since the last inspection. When determining the due date for URO MRC 002, 003 (certain portions) and 035, only the time in dry-dock may be excluded from the elapsed time. The ships' deck log, engineering log, coolant discharge log, or Drydocking records will be used to determine the number of day's pier side or the number of days in drydock. Ship's Force will perform this review and provide the applicable dry-dock or inactive time via official correspondence to the ISIC. Extensions of periodicity from the next due date identified in the SUBMEPP PMR inventory for these URO MRCs can be authorized by the TYCOM without further NAVSEA approval. However, they are not automatic and such requests must be submitted by letter, in the format of Appendix E of this chapter, to SUBMEPP via the TYCOM. Upon receipt of TYCOM authorization, SUBMEPP will reflect the periodicity extension and the revised due date in the next issue of the ship's PMR inventories and schedules.

25.2.5 Scheduling, Planning and Reporting Unrestricted Operation Accomplishment at Ship or Fleet Maintenance Activity Level.

25.2.5.1 Scheduling. The TYCOM PMR Scheduling System Inventories and Schedules can be created from Maintenance & Ship Work Planning Reports (M&SWP) at https://ebusiness.submepp.navy.mil/eBusiness/index.cfm. Except at NAVIMFAC PACNORWEST, along with the Inventories and Schedules, electronic update files are provided to keep the local scheduling systems up to date with the Class Maintenance Plan (CMP). As a minimum, ISICs will schedule applicable URO MRCs 40 days (SSBN 726 and SSGN 726 Class submarines) or 40 days (non-SSBN726 or SSGN 726 Class submarines), as applicable prior to refit fleet maintenance availability. Those URO MRC AWRs requiring work packages or other planning are forwarded to the FMA Planning Section.

25.2.5.2 Planning. FMA Planners will requisition materials, obtain plans and drawings, prepare Formal Work Packages or Controlled Work Packages and coordinate the scheduling with the Ship Superintendent, Production Officer and ISIC Material Office. Then the job will be turned over to the production WC for accomplishment. The Maintenance Document Control Office (MDCO) will adjust the scheduled start and completion date within the local scheduling system.

25.2.5.3 Reporting. Each URO MRC AWR contains specific instructions on reporting the completed action and on use of a special feedback code to identify the material condition, or that a change in inspection frequency is required. In order to ensure URO MRCs are correctly accomplished and reported to SUBMEPP, action is to be taken prior to close-out of the AWR by Analysis, Records and Reports Section (ARRS). FMA Lead Work Centers (LWC) completing URO MRC AWRs must ensure that all assist WCs have completed their work. The LWC then completes the AWR by filling in action taken codes, signing for completion and obtains acceptance signature from Ship's Force. The AWR is then returned to ARRS. The ARRS will verify that all participating WCs have documented completion of their assigned tasks and then pass the AWR to the ISIC for review and updating of SUBMEPP inventories and schedules prior to close-out of the AWR by ARRS.

25.2.6 Unrestricted Operation Maintenance Requirement Card Accomplishment During Chief of Naval Operations Maintenance Availabilities.

a. The Availability Work Package (AWP) prepared by SUBMEPP will reflect all URO MRCs authorized for accomplishment during the availability at the AWP Ship Work List Item Number (SWLIN) level. The Work Package Supplement (WPS), accompanying the AWP, will identify a specific URO MRC requirement to the applicable AWP SWLIN paragraph. Appendix F of this chapter provides an example of the WPS format.

b. For URO MRCs assigned to the depot, the ISIC will enter "Assigned to <depot name> by AWP <AWP number>" in the Remarks or Completion block of the URO MRC Schedule and Inventory and in the local scheduling system.

c. URO MRC completions by an industrial activity during CNO Availabilities will be, for non-SSBN 726 or SSGN 726 Class submarines, retrieved from the shipyard information system by SUBMEPP. For SSBN 726 and SSGN 726 Class submarines, completions will be retrieved from the appropriate maintenance database. The WPS, or comparable report, annotated by SUBMEPP to show URO PMR completions and material condition feedback categories, will be retained by SUBMEPP upon completion of the availability. The ISIC will verify that all URO MRCs assigned to the shipyard were reported and subsequently updated by SUBMEPP.

25.2.7 Unrestricted Operation Maintenance Requirement Card Completion Reporting.

a. Within 30 days after the completion of an availability the activity accomplishing the URO MRC is required to provide a report of accomplishment to SUBMEPP and the ship's ISIC as well as other technical codes as designated in the URO MRC. Specific information to be included in the report is identified in the applicable URO MRC. The accomplishing activity must retain a legible copy of the most current inspection report until the ship is disposed of or stricken from the Naval Register.

b. Prior to Fast Cruise for CNO Availabilities, the industrial activity is required to provide the ship and ISIC with a letter of certification (including final inspection categories A, B, or C when applicable) that certifies all required inspections have been satisfactorily completed. For items which must be accomplished in dry-dock, the industrial activity is required to provide such certification prior to undocking.

c. Upon identifying a material condition that would result in a reduced inspection periodicity if not restored to Category A condition during the availability in which the condition was found, a special report is required to be submitted by the accomplishing activity per the applicable URO MRC and, if applicable, the AWP. This special report must be provided immediately to NAVSEA (SEA 07), TYCOM, ISIC, and SUBMEPP indicating:

(1) Applicable MRC.

(2) Equipment component identification.

(3) Inspection category.

(4) The reduced or deferred periodicity of each equipment component that should be inspected at less than its normal periodicity. This reduced periodicity report requirement is in addition to the completion reporting requirements of paragraphs 25.2.7 and 25.2.7.b.

25.2.8 Operating Cycle and Interval Extensions. An Audit Plan to assess the material condition of ships prior to extending their operating cycle or intervals beyond URO MRC periodicities due to changing CNO Availability dates or operational schedules is addressed in reference (b). Additional guidance and responsibilities are contained in volume II, part IIII, chapter 2 of this manual.

25.3 RESPONSIBILITIES.

25.3.1 Type Commander.

a. Perform periodic audits of the ISICs and FMAs to verify full compliance with the provisions of reference (a) and volume V, part I, chapter 9 of this manual.

b. Provide guidance to the ISICs, obtaining NAVSEA concurrence as necessary, when deviations in the scheduling or accomplishment of maintenance or repairs are required by a DFS request and resolution per volume V, part I, chapter 8 of this manual.

25.3.2 Submarine Maintenance Engineering, Planning and Procurement Activity.

a. Receive reports of completion of URO MRCs from all completing activities.

b. Review completion reports for compliance with the scheduled periodicity requirements and any change in the status category.

c. Establish an LMA date per paragraph 25.2.3.1 of this chapter.

d. Revise the periodicity and next due dates in ship URO MRC inventories and schedules to reflect any NAVSEA approved periodicity change, TYCOM approved periodicity extensions for URO MRCs 001 through 005, and 035 as allowed for in paragraph 25.2.4 and NAVSEA approval of Major DFSs for extending URO MRC requirements.

e. Notify the TYCOM via the on-site SUBMEPP Representative of any URO MRC beyond periodicity for TYCOM resolution.

f. Provide updated:

(1) For SSBN 726 and SSGN 726 Class ships, provide Refit Work Package electronic files which reflect URO MRC scheduling to the Trident Refit Facility at the arrival minus 60-day milestone.

(2) For those ISICs using Micro-PMR, provide scheduling and configuration files to process in the local scheduling system and FMA database quarterly.

(3) Provide MJC update files which reflect URO MRC changes to the ISIC or TYCOM at least quarterly or upon request.

g. Quarterly provide a list of URO MRCs that appear overdue in the schedules and a list of URO MRCs that have been reported complete by the fleet but Objective Quality Evidence has not been received by SUBMEPP.

h. Receive and review URO MRC Objective Quality Evidence for technical accuracy and maintain URO MRC completion history.

25.3.3 Immediate Superior In Command.

a. Maintain auditable records of URO MRC accomplishment for each submarine. These records must consist of:

(1) SUBMEPP Quarterly Schedules and Inventories.

(2) The last copy of letter of completion and inspection report for each O Level URO MRC.

(3) The last copy of letter of completion and inspection report for each I and D Level URO MRC. These may be disposed of once accomplishment is captured electronically on ISIC provided SUBMEPP Schedules and Inventories.

b. Conduct periodic audits of assigned FMAs and units to verify full compliance with the provisions of reference (a), volume V, part I, chapter 9 of this manual and this chapter.

c. In addition to the records of audits, maintain a file, by ship, of the current URO MRC inventories and schedules as provided by SUBMEPP. The schedules (Appendix D of this chapter) for each ship must be annotated with the Job Sequence Number (JSN), the new adjusted LMA date and the next due dates for the completions and any periodicity extensions authorized.

(1) Although the responsibility for the accomplishment of URO MRCs must rest with the ship's Commanding Officer, the nature and scope of the URO MRCs dictate that the ISIC coordinate the accomplishment of URO MRCs following the SUBMEPP provided PMR inventories and schedules. Accordingly, the ISIC must assist in the preparation of, and approve each submarine's URO MRC performance schedule. Monitor the URO MRC, Deep Submergence System and Hull Integrity Procedure Status Web Site periodically to identify potentially overdue URO MRC, Deep Submergence System or Hull Integrity Procedures. The SUBMEPP representative assigned to each ISIC must add

information, in the form of a comment to the web Site, addressing any overdue or potentially overdue items. Upon completion of a Ship's Force accomplished URO (e.g., 016, 019, 022, 025, 026, 029, 036), the ISIC URO Coordinator must update the SUBMEPP URO status web site by creating a comment, located at https://ebusiness.submepp.navy.mil/eBusiness/index.cfm, with the following information until the correct information is reflected on the web page:

(a) Name of person entering data

(b) URO completion date

(c) New LMA Date

(d) New Due Date

(2) In addition, the ISIC must:

(a) Unless previously notified by SUBMEPP of delays, notify the SUBMEPP Representative at TYCOM of the non-receipt of schedules and reports.

(b) Upon printing a new URO MRC Inventories and Schedules, perform a line-by-line verification of each ship's new URO MRC Inventory and Schedule against the URO MRC Inventory and Schedule report held by the ISIC. At a minimum, this verification will include a review of each URO MRC LMA, Due Date, and Periodicity to ensure any recent completion data or rescheduling data that has been submitted to SUBMEPP has been accurately incorporated into the new Inventory and Schedule. PMRs accomplished during the month preceding the quarterly report may or may not be reflected in the issue received. Similarly, upon receipt of URO MRC changes, audit the individual URO MRC procedural and schedule information against each ship's PMR Inventory and Schedule held by the ISIC to verify that the component or equipment and periodicity has not changed and that provided changes do not impact current schedules. Resolve identified deficiencies through the SUBMEPP Representative at TYCOM.

(c) Review the enclosures to the PMR procedural inventories and the schedule forwarding letter and advise SUBMEPP of the completion dates and JSNs for URO MRCs listed. Forward copies of completed Data Report Forms for these and any other URO MRC completions identified by SUBMEPP as having missing Data Report Forms.

(d) Quarterly, the ISIC must provide a copy of the individual ship's URO MRC Inventory and Schedule that has been customized by the ISIC, as necessary, to reflect the most current URO MRC status.

d. Control input of the SUBMEPP scheduling file (M79EII) to the local scheduling system and resultant call downs to the CSMP, which will produce the JCN and products for job completion.

e. Ensure that all URO MRC requirements with the appropriate screening (Ship's Force, FMA) are in the CSMP for subsequent development by SUBMEPP of forthcoming CNO Availability AWPs.

f. In the event that deviations from required periodicities or full requirements of the URO MRCs are required, request approval from the TYCOM by submitting a DFS request per Volume V, Part I, Chapter 8 of this manual. Such DFS requests will be a Major DFS for URO MRC program deviations. DFS requests are also to be submitted when repairs arising from the URO MRC inspections cannot be completely accomplished. Periodicity extension requests for URO MRC 001, 002, 003, 004, 005 and 035 must be submitted per paragraph 25.2.4 of this chapter.

g. Establish procedures to affect routing of completed AWRs from the FMA ARRS through the ISIC for all URO MRC transactions. The ISIC should ensure proper documentation has been completed as described in the special reporting procedures of the AWR. This must include the material condition feedback code as part of the final action, if required. A rejection series code (6A-6I) should not be accepted unless the FMA Repair Officer cannot accomplish the URO MRC at that site. Delays in accomplishment are to be reported as status changes so that the job remains in the production system and is visible as a "to-be-done" requirement. If the URO MRC requirement cannot be accomplished at the site, the ISIC must ensure update (re-screening) of the CSMP concurrently with DFS notification, if necessary. Each processed AWR is to be validated with the PMR Special Report described in the Maintenance Resource Management System section of volume II, part IIII, chapter 1 of this manual and, if satisfactory, passed to the Automated Data Processing Center for computer input. Upon receipt of the report of maintenance action accomplishment from an assigned unit or the FMA, review the report for completeness, consistency, acceptability of conditions and material trends. Where unsatisfactory conditions are found, direct repairs. Where repairs cannot be made, submit a DFS per Volume V, Part I, Chapter 8 of this manual. Ensure SUBMEPP inventories and schedules are updated per paragraph 25.3.3(c) of this chapter. Clear URO MRC major DFS upon TYCOM or NAVSEA approval and upon printing of the SUBMEPP Quarterly PMR inventories and schedules, and ensure they accurately reflect the new due date of the URO MRC as stated in the approved DFS.

h. Upon identifying a material condition that would result in a reduced inspection periodicity, ensure the accomplishing activity immediately reports the condition found via faxed letter to NAVSEA (SEA 07), the TYCOM and SUBMEPP per paragraph 25.2.7.c of this chapter.

i. Monitor the timely submission of URO MRC data report forms and the report of accomplishment for URO MRCs completed by the FMA and Ship's Force to ensure required documentation is submitted per paragraph 25.2.7 of this chapter. Ensure data report forms are submitted to report component replacement, repair or operation out of specification. Review all Ship's Force accomplished URO MRC data for compliance with the requirements of the URO MRC Program prior to submittal to SUBMEPP.

j. Prior to a ship's underway period, review the ship's certification continuity report, if submitted, to ensure the ISIC and ship's records (including the CSMP) accurately reflect URO MRC status.

k. The Parent ISIC of deploying ships will:

(1) Ensure that any URO MRC due for accomplishment by the ship during its deployment period is identified in the CSMP transfer file and that the ship possesses the URO MRC data report forms (if applicable) for reporting job completion.

(2) Provide a message to the applicable deployed FMA or Squadron identifying any URO MRC expected to be accomplished by the deployed FMA and the status of required materials for each submarine deploying to cover the period of the deployment.

(3) Provide a copy of the marked up URO Inventories and Schedules to the applicable deployed squadron prior to out-chop. Inform the deployed squadron if any changes have occurred from the time the URO Inventories and Schedules was sent to the actual out-chop date.

l. Deployed Squadrons will:

(1) Review the URO MRC status of deployed submarines upon in-chop. Perform the function of the Parent ISIC in ensuring all URO MRCs are accomplished and reported within the required periodicity while the submarine is deployed.

(2) Provide a copy of the marked up URO Inventories and Schedules to the parent squadron. Inform the parent squadron if any changes have occurred from the time the URO Inventories and Schedules was sent to the actual out-chop date.

NOTE: THIS IN NO WAY RELIEVES THE PARENT ISIC OF THE RESPONSIBILITY TO ENSURE THAT THE REQUIRED URO MRCs ARE ACCOMPLISHED WITHIN THE SPECIFIED PERIODICITIES.

m. Prior to the start of a CNO availability, ISIC URO coordinators will:

(1) Assign JCNs to URO MRC items assigned to Forces Afloat in the AWP and screen them to an availability prior to the start of the CNO availability or to the concurrent availability following the directions in the AWP. Forces Afloat items are accomplished by Ship's Force or Performance Monitoring Team. Care must be taken to appropriately assign URO MRC items to the correct accomplishing activity.

(2) ISIC URO coordinators will not assign JCNs to URO MRC items assigned to the shipyard in the AWP. In the URO MRC inventories and schedules, in the remarks or completion information area, enter "assigned to (name of shipyard) by AWP (name and number of availability)". The shipyard is responsible for performing, auditing and reporting all URO MRC items assigned by the AWP.

(3) URO MRCs assigned to Forces Afloat by the AWP for accomplishment prior to the start of the depot period, but for some reason were not completed, will

be reassigned to a concurrent availability or formally reassigned to the shipyard via a supplemental work request.

n. During a CNO availability, URO MRCs assigned to the shipyard by the AWP which are not accomplished during the depot period will be placed on the guarantee list or reassigned to a fleet availability by the TYCOM following the depot period provided the URO MRC does not exceed its due date. The ISIC will be notified of this reassignment by formal correspondence which will include justification and reason why the scheduled and planned requirements were not met.

o. Prior to CNO availability completion, ISICs will audit URO MRCs assigned to Forces Afloat by the AWP and ensure all have been satisfactorily completed and documented within the required periodicity. The ISIC audit will also verify that all URO MRC items coming due within six months of availability completion are complete or assigned to a follow-on fleet availability. Under no circumstances are URO MRC due dates to be exceeded. ISIC Quality Assurance Officers will not be responsible for auditing URO MRCs assigned to the depot in the AWP.

p. Following CNO availability completion, the ISIC URO coordinator will ensure that all URO MRCs assigned to the shipyard were reported and subsequently updated by SUBMEPP. ISICs will only upline the closed JCNs for URO MRCs completed by Forces Afloat.

25.3.4 Submarine Commanding Officer.

a. Ensure all URO MRCs are accomplished within the required periodicity as specified by reference (a), volume V, part I, chapter 5 of this manual and this chapter.

b. For visual inspections in between URO MRC 003 inspections, see volume V, part I, chapter 5, paragraph 5.4.3.c. of this manual for a description of requirements to inspect submarine hull structure in between the periodic URO MRC 003 inspections.

c. Maintain auditable records of the accomplishment of URO MRCs to permit verification of compliance with reference (a), volume V, part I, chapter 10 of this manual, and this chapter. These records must consist of:

(1) A copy of the TYCOM and NAVSEA SUBSAFE Material Certification message from new construction, Depot Modernization Period or overhaul until the ship's current status is reflected in reference (c). When the ship's current status is reflected in reference (c) the messages may be destroyed and the current notice will be retained.

(2) Copies of letter of completion for all URO MRC work accomplishment by other activities, including most recent FMA URO Accomplishment Letter. These may be disposed of once accomplishment is captured electronically on ISIC provided SUBMEPP Schedules and Inventories.

(3) Copies of letters of completion and inspection reports for work accomplished by Ship's Force. The ship must retain a legible copy of the most current inspection report (or required Data Report Form), until the ship is disposed of or stricken from the Naval Register. The required report forms are located at

the end of the individual URO MRCs. A copy of each completed report must be submitted to the ISIC for review a minimum of 24 hours prior to underway.

(4) One copy each of the current Quarterly URO MRC inventories and schedules as provided by the SUBMEPP Representative via the ISIC. Annotate the URO MRC Inventory Report when accepting completed work requests from the FMA or Ship's Force (LWC 991). It is the ship's responsibility for ensuring that the reports reflect the actual configuration, especially with regards to the equipment identity and the Allowance Parts List.

(5) The Quality Assurance Officer (QAO) assisted by the 3-M Coordinator must maintain one copy of the current Quarterly URO MRC inventories and schedules provided by SUBMEPP Representative via the ISIC. All required UROs will normally be coordinated for accomplishment within the ship's CMAV work package by the QAO and the Availability Coordinator, or when directed by the ISIC, with each work center planning and setting the required conditions for URO execution.

REQUEST FOR URO MRC PERIODICITY EXTENSION FORMAT

4790
Ser

From: Commander, Submarine Squadron
To: Commanding Officer, Submarine Maintenance Engineering, Planning and Procurement (SUBMEPP) Activity
Via: Commander Submarine Force, (Atlantic or Pacific Fleet)

Subj: REQUEST FOR EXTENSION OF PERIODICITY FOR URO MRC(S) _____ ON USS (Ship's Name and Hull No.)

Ref: (a) Applicable URO MRC
(b) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume VI, Chapter 25
(c) COMSUB(LANT or PAC) ltr 4790 Ser ____of (previous letter granting extension of periodicity)

1. Per references (a) and (b), request extension of URO MRC periodicity for USS (Ship's Name and Hull No.) to coincide with Selected Restricted Availability, Overhaul, Depot Modernization Period or Interim Dry-Docking using the data in this table:

URO MRC	Equipment Guide List Item Number or Component Ident	LMA Date	Current Due Date	Inactive Time		Extension Required	Required Next Due Date
				Pier Side Days *	Drydock Days		
001	All	June **82**	Apr **91**	200 days	100 days	7 months	Nov 91
002	All	June **82**	Aug **91**	N/A	100 days	3 months	Nov 91
003	4.b	June **82**	Aug **91**	N/A	100 days	3 months	Nov 91
004	INT Welds	June **84**	Apr **91**	200 days	100 days	7 months	Nov 91
005	INT Welds	June **84**	Apr **91**	200 days	100 days	7 months	Nov 91
035	All	June **84**	Aug **91**	N/A	100 days	3 months	Nov 91

* Credit for pier side days is awarded for days the ship is tied to the pier. No credit is given if the ship is underway anytime during the day.

2. Inactive time identified for the URO MRCs listed in paragraph 1 is the actual allowable time accrued to date since URO MRC was last accomplished or previous extension of periodicity was granted by reference (c).

CHAPTER 26

OPERATING DEPTH POLICY

REFERENCES.

(a) NAVSEA S9086-DA-STM-000 - NSTM Chapter 100 (Hull Structures)
(b) COMNAVSUBFOR OPORD 2000
(c) NAVSEAINST C9094.2 - Submarine Valve Operation Requirements for Builders and Post Overhaul Sea Trial Test Dives

26.1 PURPOSE. To provide Type Commander (TYCOM) policy with respect to the maximum allowable operating depths during trials, evolutions to be performed at the various depths, and the prescribed maximum water depth applicable in each case. Some deep diving submarines are limited to depths less than designed test depth pending accomplishment of certain hull and system modifications prescribed by Naval Sea Systems Command (NAVSEA) as necessary to permit certification to design test depth. As these modifications are accomplished during the availability, the integrity of the ships will be certified and they will be permitted to operate down to their design test depth either periodically or without restriction.

a. The sequence of events leading to authorization for operations at the maximum operating depth during postindustrial availability or new construction trials for SUBSAFE ships is:

   (1) Upon completion of the authorized industrial facility work, NAVSEA reviews the scope, degree and manner of accomplishment and recommends to the TYCOM that the submarine be authorized to test hull strength and integrity at an appropriate maximum keel depth during trials. This depth may be the designed test depth or a lesser depth.

   (2) Based on this recommendation the TYCOM will normally authorize operation to the NAVSEA recommended keel depth by message to the ship, information to the applicable Immediate Superior In Command (ISIC), Supervising Authority or Industrial Activity (as applicable), NAVSEA, Fleet Commander and Chief of Naval Operations.

b. In every instance where the maximum authorized operating depth is exceeded, a report must be made per reference (a). In addition to those addressees listed in reference (a), an information copy must be provided to the applicable TYCOM and ISIC.

26.2 INITIAL TIGHTNESS DIVE. The initial tightness dive following an industrial availability or new construction will be conducted following carefully planned procedures.

a. The initial tightness dive will be an especially deliberate, planned, step-by-step evolution using conservative angles and moderate speed, or slower, following the approved Sea Trial Agenda. Caution is required not only because the material condition of the ship is untested at any depth following major industrial facility work, but also because of the crew's lack of recent submerged operational experience. Reference (b) applies.

b. The maximum water depth allowable during the initial tightness dive will be as specified by reference (b). The approved Sea Trial Agenda and reference (c) describe those events to be conducted during the initial tightness dive and provide the requirements of the initial tightness dive. The approved Sea Trial Agenda also describes those events immediately following the initial tightness dive. The maximum operating keel depth will be 200 feet.

26.3 DEEP DIVE OR CONTROLLED DIVE. After demonstrating satisfactory hull strength and integrity during the initial tightness dive, the requirement exists to test the hull at submerged depths down to the maximum operating depth. The first approach to these depths subsequent to the repair of major hull or sea connected systems work will be made per the following subparagraphs.

26.3.1 Depth Limitations. The Deep Dive or Controlled Dive must be made to the maximum operating depth in water specifically designated for such trials and under specific water depth restrictions per reference (b), and as promulgated in the appropriate TYCOM or ISIC Operation Order.

26.3.2 Conduct of Deep Dives or Controlled Dives. Deep Dive or Controlled Dive depth changes should be conducted in no greater than 200-foot increments when above one-half the maximum operating depth and in no greater than 100-foot increments when below one-half the maximum operating keel depth. Moderate speeds (within the limits of the submerged operating envelope) and angles must be used. Trim must be continually adjusted to provide neutral buoyancy.

26.3.3 Deep Submergence Bill. The Deep Submergence Bill must be in effect with systems in the maximum secure condition and all unnecessary sea connected systems isolated. The main ballast tank blow system must be lined up with all banks within 200 psi of full pressure. Cycling of the rudder and planes through full travel should be limited to the maximum authorized operating depth minus 100 feet at a moderate speed.

26.3.4 Valve Operation. Seawater system valve operations during postindustrial availability and new construction Sea Trials will be per reference (c).

(e) OPNAVINST 5100.19 - Navy Occupational Safety and Health (NAVOSH) Program Manual for Forces Afloat
(f) SOBT Video SVT-GT-9336 - Submarine Preservation

LISTING OF APPENDICES.

A SPRUCE Key Event Schedule
B SPRUCE Report Form
C SPRUCE Check List

27.1 PURPOSE. The Scheduled Preservation Upkeep Coordinated Effort (SPRUCE) program has been established to ensure internal preservation is maintained at the highest possible level throughout the life of the ship. As a result of increased intervals between submarine Chief of Naval Operations Maintenance Availabilities, effective SPRUCE upkeeps are of prime importance. SSBN 726 and SSGN 726 Class submarines are exempt from SPRUCE upkeeps. Under special circumstances, requests for SPRUCE upkeeps on SSBN 726 or SSGN 726 Class submarines will be considered and must be conducted per this chapter.

27.2 SCHEDULING.

a. Immediate Superiors In Command (ISIC) must schedule a three-week SPRUCE below decks every 48 months. The SPRUCE must contain a 14-day production period which will not be scheduled to commence sooner than two days following an underway period. Per references (a) and (b), underway periods must not be scheduled within five days of completion of the production period. In summary:

Ship returns to port	0 days
Preparation period	2 days
Production period	14 days
Gas off period	5 days
TOTAL	21 days

b. ISICs must utilize every effort to accomplish a full three-week SPRUCE consisting of 14 days of production. ISICs may approve a shorter SPRUCE below decks of 5 to 14 days of production time on a case-by-case basis due to operational requirements. Total allotted time for SPRUCE will at no time be less than 12 days to encompass preparation and gas off periods. A shorter production period will equate to a corresponding reduction in the overall amount of square footage accomplished during the scheduled period. When a shorter period is executed for below decks SPRUCEs, meticulous attention should be given toward the accomplishment of additional below deck SPRUCE periods to ensure sufficient preservation is achieved to facilitate 33+ years hull life. SPRUCEs not meeting three weeks in duration must be properly documented by ISICs to ensure a complete history of ship's preservation is available.

Ship returns to port 0 days

Preparation period 2 days

Production period XX days

Gas off period 5 days

TOTAL 7+XX days

c. ISICs must schedule a one-week SPRUCE for the sail interior every 24 months. Sail SPRUCEs can be coincidental with routine availabilities.

d. A SPRUCE must not be scheduled during other Ship's Force or Fleet Maintenance Activity (FMA) upkeeps with the exception of the five-day gas off period which may be scheduled during a follow-on upkeep. A SPRUCE should not be scheduled within the six-month period prior to a Chief of Naval Operations Maintenance Availability. A SPRUCE should not be scheduled within six months after a Docking Selected Restricted Availability (DSRA), Extended Docking Selected Restricted Availability (EDSRA), Depot Modernization Period (DMP), Engineered Refueling Overhaul, or Engineered Overhaul because of the industrial activity's preservation programs.

e. The initial base date for scheduling is the official completion date of the ship's last DSRA, EDSRA, DMP, Engineered Refueling Overhaul or Engineered Overhaul.

27.3 RESPONSIBILITIES.

27.3.1 Type Commander.

a. Administer the SPRUCE program.

b. Maintain a file of SPRUCE lessons learned and distribute to ensure that all commands concerned have the latest information available.

27.3.2 Immediate Superior In Command.

a. Schedule and coordinate SPRUCE upkeeps per the Key Event Schedule of Appendix A of this chapter.

b. Coordinate submarine crew training.

c. Monitor the effectiveness of the SPRUCE program.

d. Chair a SPRUCE debrief with Ship's Force and FMA to review the effectiveness of the SPRUCE and generate lessons learned. The results of this meeting will be included in the Ship's SPRUCE completion letter.

27.3.3 Fleet Maintenance Activity.

a. Provide training, tools, consumables, services, and required support personnel.

b. Provide technical guidance consisting of around the clock coverage by a coatings inspector trained to the requirements of reference (c) and reference (d), as applicable. The coatings inspector will perform all inspections necessary to ensure proper preservation is accomplished and will complete Appendix B of this chapter for each area preserved. All completed forms from Appendix B of this chapter will be submitted to the ship for inclusion into their SPRUCE completion letter.

27.3.4 Submarine Commanding Officer.

a. Ensure preservation is performed by Ship's Force using the procedures contained in references (c) and (d), as applicable, through (f).

b. Ensure Ship's Force personnel are relieved of all requirements other than those necessary to maintain the safety and security of the ship during the SPRUCE.

c. Designate an officer or Chief Petty Officer (CPO) to serve as the SPRUCE Manager.

d. Ensure the ship is divided into preservation zones. Each zone will have an officer or CPO in charge during the SPRUCE. Conduct a thorough preservation inspection of each zone, assisted by an FMA coatings inspector (if possible) at least 90 days prior to the start of the SPRUCE to determine and prioritize the preservation to be accomplished. Appendix C of this chapter must be reviewed as part of this inspection.

e. Submit completion letter to the Type Commander (TYCOM) via the chain of command. This letter must report results of the SPRUCE, problems encountered, lessons learned, and must contain completed forms from Appendix C of this chapter.

APPENDIX A

SPRUCE KEY EVENT SCHEDULE

1. The ISIC is responsible for ensuring adherence to the following schedule to assure the effective planning of a SPRUCE upkeep. The ISIC will act for the ship to complete items should an underway period preclude timely accomplishment. The ISIC will alert the ship's Commanding Officer and the TYCOM in the event that any of the following time frames will be exceeded.

DAY	ACTION
-90	ISIC ensure SPRUCE is on the ship's operating schedule. Schedule the SPRUCE with the FMA. Notify TYCOM (N3, N4, or both) of planned SPRUCE dates.
-90	Commanding Officer assign SPRUCE manager and zone supervisors. Ship and FMA conduct preservation inspection.
-90	Commanding Officer submit OPNAV 4790 2K or 2L requests for powder coating services. Ships must make effective use of these services to enhance the effectiveness of preservation for components located in hostile environments.
-90	ISIC and Commanding Officer arrange for respiratory protection physicals, initial respiratory training for the ship's Hospital Corpsman, and respirator fit-checks for crew by FMA Occupational Safety and Health personnel. The crew must be trained in respirator use by the ship's Hospital Corpsman.
-90	ISIC and Commanding Officer make plans for crew technical training.
-30	Commanding Officer establish painting "Tiger Team" and ensure adequate number of personnel are assigned to accomplish the upkeep commensurate with ship checks. The Tiger Team should include personnel not necessary to maintain the safety and security of the ship. Issue a SPRUCE watchbill.
-30	Commanding Officer review and conduct training with assigned personnel and Work Center Supervisors. Establish a General Military Training program incorporating requirements of references (c) and (d), as applicable, (e), and (f) and the ship's paint schedule. Provide the SPRUCE Plan of Action and Milestone to the ISIC for review.

2. Conduct a 21-Day SPRUCE in the following manner:

DAY	ACTION
-2	Tiger team make preparations for SPRUCE.
1-2	Ship's Force preparations for SPRUCE.
3-16	Ship's Force execute SPRUCE preservation work.

DAY	ACTION
16	ISIC, Commanding Officer, FMA conduct SPRUCE debrief. Commanding Officer submit SPRUCE completion letter.
21	Ship's first available underway date.

APPENDIX C

SPRUCE CHECK LIST

1. Has a Navy Occupational Safety and Health or Environmental Protection Agency representative been onboard to ensure compliance with occupational health and environmental regulations?
2. Is the ship aware of all required training (Hazardous Material, Respirator, Technical)?
3. Assess level of effort required to accomplish SPRUCE. Assess type and quantity of tools and paint required. FMA informed for planning purposes.
4. FMA coatings inspector review SPRUCE report form (Appendix A of this chapter) of this chapter requirements with the ship. Discuss why, how, and when these inspections are required.
5. Does the ship have a copy of Submarine On Board Training Video SVT-GT-9336 (Submarine Preservation)?
6. Does the ship hold the most recent revisions to NSTM Chapter 631 (Preservation of Ships In-Service - General) and reference (d)?
7. Is the ship aware of the appropriate uses of powder coatings?
8. Does the ship hold the most recent "lessons learned" distribution from the TYCOM?

VOLUME VI

CHAPTER 28

CABLEWAY ASSESSMENT

REFERENCES.

(a) NAVSEAINST 9304.1 - Shipboard Electrical Cable and Cableway Inspection and Reporting Procedures

(b) DOD-STD-2003 - Military, Standard, Electric Plant Installation Standard Methods for Surface Ships and Submarines

LISTING OF APPENDICES.

A Sample Cableway Assessment Message

28.1 PURPOSE. The Cableway Assessment Program is a comprehensive inspection of shipboard electrical and fiber optic cables, conducted by Fleet Maintenance Activity (FMA) cableway assessment teams. The requirements for cableway assessments are contained in reference (a), which defines the training requirements, assessment criteria, and reporting procedures relevant to the assessments.

28.2 HAZARD CATEGORIES. The surface force ships and aircraft carriers' electrical cable and cableway assessment program is designed to identify and correct cable and cableway safety hazards in a prioritized, orderly manner, consistent with ship and personnel safety. The three categories of deficiencies are defined as:

a. Category 1 - IMMEDIATE HAZARD: Deficiencies which are, or have the immediate potential to be, personnel safety hazards, electrical fire hazards, or which negate firebreak integrity.

b. Category 2 - POTENTIAL HAZARD: Deficiencies which require corrective action to ensure continued reliable safe performance or to maintain watertight integrity, but are not an immediate danger to personnel or equipment.

c. Category 3 - NON-HAZARDOUS: Deficiencies which are not hazardous to personnel or equipment but are not in compliance with approved standard installation practices.

28.3 DEFICIENCY CORRECTION. The intent of this program is to ensure that deficiencies classified as Category 1 are corrected immediately. Deficiencies classified as Category 2 should be scheduled for repair during the ship's next regularly scheduled industrial availability as work priority permits. Category 3 deficiencies should be corrected whenever such repairs can be accomplished in conjunction with other scheduled repairs or alterations involving the cables or cableway in which the deficiencies exist.

28.4 ASSESSMENT SCHEDULING.

28.4.1 Initial Assessment. Initial cable and cableway assessments are conducted on each ship to establish a baseline configuration to ensure compliance with reference (b).

28.4.2 Follow-up Assessments. Follow-up assessments must be conducted within 12 months prior to a major or minor Chief of Naval Operations availability. The purpose of this assessment

is to validate the integrity of ship's cableways, identify discrepancies that require depot or commercial level work effort, and to train responsible Ship's Force personnel to meet requirements of paragraph 28.6.5 of this chapter. Both the initial and follow-up assessments will be comprehensive, complete ship assessments.

28.4.3 Partial Assessments. Following availabilities which modify shipboard cableways, ships may request partial assessments to validate the quality of the modified or newly installed cableways.

28.5 CABLEWAY ASSESSMENT ASSIST TEAM COMPOSITION AND PROCEDURES.

a. FMA Electrical Cableway Assessment shops ideally consist of 12 FMA personnel. The recommended shop manning is six certified personnel and six personnel in training. Certified personnel must have satisfactorily completed a cableway assessment or repair training course and satisfactorily demonstrated their practical knowledge based on enclosure (1) of reference (a). Personnel in training may assist in cableway assessments after satisfactorily completing the classroom training modules per reference (a) and satisfactorily demonstrating their practical knowledge to an FMA appointed certifying assessor. Assessors should be E5 or above, with shipboard experience, and from the following source ratings: AE, EM, ET, EW, FC, FT, GM, GSE, IC, IT, STG, and STS.

b. For assessment or assist visit purposes, the FMAs should establish sub-teams of one certified assessor, one trainee, and one Ship's Force member. Assign as many sub-teams as necessary to assess the entire ship. The assessed ship will assign a minimum of one Ship's Force person per FMA sub-team from the source ratings in sub-paragraph a, for the purpose of training, and to assist in shipboard assessment and repairs. Each FMA will assign one HT (qualified welder) to assist during shipboard cableway repairs.

c. In addition to technical training, all team members must be trained to administer Cardio-Pulmonary Resuscitation.

d. Upon completing the assessment of the entire ship, assessment teams will assist in the correction of cableway deficiencies as time and schedules permit. Repair efforts will concentrate on removal of dead-ended cables, correction of watertight integrity items, and Category 1 discrepancies.

28.6 RESPONSIBILITIES.

28.6.1 Immediate Superior In Command. Ensure assigned ships are scheduled to receive required cableway assessments and training.

28.6.2 Regional Maintenance Center. Schedule assigned ships for cableway assessments or assist visits and coordinate the training effort of Ship's Force personnel by the FMA.

28.6.3 Fleet Maintenance Activity.

a. Establish the following to support the Electrical Cableway program:

(1) Electrical Cableway Assessment and Repair Teams for the accomplishment of scheduled cableway assessments.

(2) Training program to support FMA training needs as specified in Part II of enclosure (1) of reference (a).

(3) Training program for ship's personnel. Training of Ship's Force personnel will include classroom training before the assessment and shipboard practical training during the assessment.

b. Give daily progress reports (briefing, if possible) to ship's Commanding Officer, identifying Category 1 findings and any other areas of concern.

c. Upon completion of the assessment, submit a final report per Appendix A of this chapter to the applicable Type Commander (TYCOM) (N434), info the Immediate Superior In Command (ISIC) and the Regional Maintenance Center. The final report should contain a list of Ship's Force personnel trained as cableway assessors or repairmen, including names and rate and rank.

28.6.4 Cableway Assessment Team.

a. Locate, identify, and categorize electrical cableway discrepancies on ships.

b. Train Ship's Force to assess, repair, and maintain shipboard cableways.

c. Correct identified discrepancies which are beyond Ship's Force capability, or document discrepancies for future correction.

d. Provide guidance for the repair of deferred discrepancies.

28.6.5 Ship Commanding Officer.

a. Assign Ship's Force personnel (E4 or above) from source ratings listed in paragraph 28.5.a of this chapter for FMA cableway assessment repair training. After completing training, they will serve as quality assurance personnel to minimize future discrepancies by contractors and electrical installation teams. They should identify, track, and repair cableway discrepancies within their departments.

b. Correct outstanding discrepancies listed in the final cableway assessment report.

c. Within 30 days of completion of the assessment, enter all unrepaired Category 1 discrepancies in the Current Ship's Maintenance Project. Schedule these items for corrective action at the earliest opportunity.

28.7 REPORTS. Upon completion of the cableway assessment, the assessing agency must submit a final report using the format of Appendix A of this chapter.

HEAT STRESS CONTROL AND REPAIR OF THERMAL INSULATION

REFERENCES.

(a) NAVSEA S9086-VH-STM-010 - NSTM Chapter 635 (Thermal, Fire and Acoustic Insulation)
(b) OPNAVINST 5100.19 - Navy Occupational Safety and Health (NAVOSH) Program Manual for Forces Afloat
(c) NAVSEA S9086-RQ-STM-010 - NSTM Chapter 510 (Heating, Ventilation, and Air Conditioning Systems for Surface Ships)

LISTING OF APPENDICES.

A Inspection Guide for Excessive Heat

29.1 PURPOSE. To provide guidance for reducing excessive heat generation and the control of asbestos lagging and insulation material.

29.2 HEAT STRESS.

a. Excessive temperatures not only cause discomfort to personnel and the risk of burns from hot surfaces, but also lead to inattentive or inefficient watch standing, and the inability to perform maintenance. They also lead to jury-rigging of ventilation systems, often making the situation more severe. While the principal problems are centered in the engineering spaces, these conditions also exist in other heat producing spaces (i.e., laundries, sculleries, and auxiliary machinery spaces).

b. The causes of excessive temperatures in ship machinery spaces are:

(1) Radiant heat from steam piping valves and machinery which has missing, water-soaked, or deteriorated insulation.

(2) Steam and water leaks.

(3) Boiler air casing leaks.

(4) Ventilation system deficiencies, such as, inadequate cleaning, improper maintenance or grooming, and design inadequacies.

c. Several steps have been taken toward correcting the problem of heat stress.

(1) Fleet Maintenance Activities (FMA) have increased their capability to accomplish lagging of piping and machinery.

(2) Special teams have been set up in some FMAs to aid ships in inspecting for insulation deficiencies.

(3) FMAs are outfitted with handheld pyrometers.

(4) Fire room lagging repairs are priority items during Chief of Naval Operations Maintenance Availability.

29.2.1 Measurement of Insulation Surface Temperatures.

a. Check and calibrate the pyrometer per the instrument directions. Checking for the proper emissivity setting is particularly important. The following emissivities apply to this procedure:

(1) Navy white paint (clean) - 0.9

(2) Navy aluminum paint (clean) - 0.4

b. Sight the pyrometer on the object to be inspected. Record pyrometer readings for each location tested. Measure and record ambient dry bulb readings in proximity to the surface being inspected for each location being inspected. When inspecting piping systems, scan the pipe run with the pyrometer. When a location with deteriorated insulation, producing a hot spot, is passed, the readings will increase significantly. Record this location as requiring insulation replacement.

(1) Items or systems being inspected must be at normal operating conditions and temperatures.

(2) If the pyrometer acts erratically (i.e., zero not adjustable), place the instrument in a cool air stream until the instrument stabilizes and then proceed with the readings.

(3) When not in use, store the pyrometer in an area having an ambient temperature of less than 100 degrees F.

c. Determine the maximum allowable surface temperature, as shown in reference (a). If the recorded temperature exceeds the maximum allowed per reference (a), corrective action must be taken.

d. Appendix A of this chapter is a checklist guide to be used in locating areas of excessive heat generations.

29.2.2 Heat Stress Area Stay Times. Heat stress is measured with a Wet Bulb Globe Thermometer per the instructions contained in reference (b). Using the Wet Bulb Thermometer readings, calculate stay times from the Stay Time Tables of reference (b).

29.3 INDUSTRIAL AVAILABILITY LAGGING PLAN. For any industrial availability period where major lagging work is expected, prepare an overall lagging plan, and schedule repairs that permit coordination with other planned work. The plan must show which areas to be repaired contain asbestos. Visual inspection and use of a pyrometer, when underway, is normally sufficient to reveal areas needing repair or replacement. For each piping system inspected, mark up a copy of the system piping diagram to show specific repairs needed, and attach the marked up diagram to a Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), work request.

29.4 ASBESTOS LAGGING AND INSULATION.

29.4.1 Asbestos Control and Safety. All personnel must understand and adhere to the policies and procedures provided in references (a) and (b) regarding the handling of asbestos. Those persons that meet the criteria in reference (b) must be enrolled in the Asbestos Medical Surveillance Program.

29.4.2 Repairs to Asbestos Lagging or Insulation. Exposed asbestos thermal insulation poses a danger to personnel who may breathe in the airborne fibers. Damaged asbestos insulation must not be left unattended. Corrective measures include:

a. Application of ARABOL (MIL-A-3316) for minor insulation damage.

b. Use of aluminized fibrous glass to protect insulation in high traffic area.

c. Use of chafing gear and other protection to reduce damage.

d. Training work center or work party personnel who may be contributing to excessive insulation damage.

e. Alerting all shipboard personnel to report any insulation damage.

29.4.3 Removal of Asbestos Lagging or Insulation.

a. If removal of asbestos lagging is required to carry out equipment repairs, request that the Type Commander arrange for a special asbestos handling team. The team will be assigned from either an FMA or contractor, depending on the size of the job.

b. If the ship is away from its homeport and damage occurs, remove minor areas of defective asbestos insulation using the methods specified in reference (a). Ship's Force must be made aware of the health hazards involved in removing asbestos, and know the measures required for personnel safety.

c. To simplify cleanup and reduce health hazards from dust, collect any debris from removed asbestos lagging in containers, per the requirements of reference (a).

APPENDIX A

INSPECTION GUIDE FOR EXCESSIVE HEAT

1. Insulation.
   a. Visually check piping, lagging pads, and bulkhead insulation for:
      (1) Deteriorated (crushed or frayed) lagging or pads.
      (2) Wet or oil soaked lagging or pads.
      (3) Missing pads. This is also a burn hazard!
      (4) Surface temperature.
2. Valves.
   a. Visually check valves for:
      (1) Leaking bonnet or spiral wound metal gaskets.
      (2) Proper packing adjustment.
      (3) Damaged or worn valve stems.
      (4) Proper lagging.
3. Boiler Casing Joints.
   a. Visually check casing for leaks.
4. Drains.
   a. Visually check steam drains for leakage and system misalignment.
   b. Check funnel drains for overflow conditions or missing contamination covers.
   c. Periodically check orifice plates for oversize conditions.
   d. Inspect for leaking or bypassed steam traps.
5. Bilge Levels.
   a. Dry bilges. Visual, no water present.
   b. Wet bilge. Visual, minimize bilge levels to control humidity levels.
6. Deck Plates.
   a. Ensure proper deck plate types (solid or open grate) are in place. Ensure proper airflow pattern.
7. Ventilation.
   a. Visually inspect for system cleanliness per reference (c). Particular attention must be paid to clogged exhaust screens, dirty ventilation ducting, missing or mutilated ductwork and misdirected terminals.
   b. Check system for breaks or openings due to corrosion. The system must be intact to deliver the proper velocity (minimum 250 Cubic Feet per Minute at each station).

Check for closed or partially closed “Circle William” dampers and inoperative fan motors and controllers.

c. Main spaces should have a negative air pressure differential of 1/4” to 1/2” (water) with supply and exhaust systems running at normal settings.

VOLUME VI

CHAPTER 30

PORTABLE TOOL ASSISTANCE PROGRAM

30.1 PURPOSE. To provide guidance in the acquisition of portable tools, not normally carried onboard ship, and the priorities for loaning these tools to a ship in an availability.

30.2 PORTABLE TOOL INVENTORY POLICY. Shipboard preservation conducted during a Chief of Naval Operations Maintenance Availability requires an inventory of power tools beyond a ship's daily needs or normal allowance. Ships in Naval industrial activities can borrow the necessary tools directly from the activity's tool inventory under the Fleet Support Program. Such service is not routinely available to ships undergoing availabilities in a private industrial activity, because the private activity cannot legally be funded to perform this function. For ships undergoing availabilities in private facilities, tools are available in varying degrees from most Fleet Maintenance Activities (FMA).

30.2.1 Distribution Priorities. The FMAs should maintain an adequate inventory to meet anticipated needs of assigned ships. When the demand exceeds the availability, the distribution of portable tools will be based on the following priority:

a. Priority I - Ships in availabilities in private industrial activities.

b. Priority II - Ships in Fleet Maintenance Activity Availabilities.

c. Priority III - Ships in availabilities in Naval industrial activities.

d. Priority IV - All other ships.

30.2.2 Borrowing Procedures.

a. The borrowing unit advises the lending FMA of the type, quantity, and date tools are required and the scheduled availability completion date.

b. FMA personnel assemble a tool package in the variety and quantity requested.

c. When the tools are picked up, an inventory receipt must be signed by an authorized representative from the borrowing command. The borrowing unit is financially responsible for the tools.

30.2.3 Borrowing Ship's Responsibilities.

a. The borrowing unit is financially responsible for the tools.

b. Routine maintenance (electrical safety check, fitting replacement, etc.) must be accomplished by the borrowing command.

c. Tools and equipment must be returned promptly upon job completion or no later than the due date.

d. Upon return and inspection of the tools, charges will be levied to the borrowing ship in the following manner:

(1) Lost Tools (to include tools not returned when due). Ships that fail to return tools when due will be reminded by letter or message that they have overdue

tools. If no response is received within 30 days, the ship will be charged for the missing tools.

(2) Damaged tools (to include missing parts).

CHAPTER 31

SURFACE FORCE SHIP MAINTENANCE PLACEMENT AND OVERSIGHT BUSINESS RULES

REFERENCE.

(a) NTRP 1-03.1 - Navy Tactical Reference Publication, Operational Reports
(b) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval Ships

LISTING OF APPENDICES.

A RMC Spotlight Reports

31.1 PURPOSE. The purpose of this chapter is to provide procedures and guidance regarding ship maintenance placement and oversight business rules. These procedures and guidance affect Regional Maintenance Centers (RMC), Type Commanders (TYCOM) and Ship Maintenance Teams.

31.2 BACKGROUND. Current directives demand a culture of readiness. The process described here addresses the need for a flexible maintenance support system that increases efficiency without compromising effectiveness, and defines a common planning process for ship maintenance and modernization. These processes need to be disciplined with objective measurements and institutionalized with a continuous improvement methodology.

31.3 SHIP MAINTENANCE FUNDING MANAGEMENT BUSINESS RULES.

31.3.1 Scope. The goals of the entitled funding process are to reduce premiums paid for maintenance while simultaneously improving the ability to respond to maintenance and operational requirements. The funding business rules establish the central role of the Ashore Ship's Maintenance Manager working with the ship's Commanding Officer to manage the funds required to support all maintenance for a given ship. Starting with the submission of an overall Maintenance and Modernization Business Plan (MMBP), the Ashore Ship's Maintenance Manager will establish the quarterly distribution of controls from the established annual maintenance target needed to accomplish the ship's maintenance in the most efficient manner. The process provides the ship with a level of funding stability that will provide for the execution of an effective maintenance plan.

31.3.2 Ship and Maintenance Team Business Responsibilities.

a. Each ship's Maintenance Team is led by the Ashore Ship's Maintenance Manager. The Ashore Ship's Maintenance Manager coordinates with the RMC to execute maintenance following Fleet and TYCOM maintenance policies and directives. The TYCOM must ensure that each ship's Business Plan is tailored to fit unique geographic and business climate situations.

b. The Maintenance Team (primarily the ship's Commanding Officer working with the Ashore Ship's Maintenance Manager) supports the Fleet Maintenance Officer and TYCOM in identifying budget needs based on well documented requirements in the Current Ship's Maintenance Project (CSMP), the Class Maintenance Plan, the

Baseline Availability Work Package, the class Technical Foundation Paper and historical data. The Ship's MMBP identifies the total funding budgeted to support the ship during the execution year, along with advance planning funding for availabilities to be executed in future years. The TYCOM determines how much of the Ship's MMBP they can fund (controls) of the total requested, and how much money per quarter (phasing plan) they can provide for executing the Ship's MMBP. The following guidelines are not all-inclusive but should be considered when structuring the phasing plan:

(1) The Maintenance Team will receive their actual spending levels or controls from the TYCOM. The RMC, with the TYCOM's approval, may adjust controls between maintenance teams as required during the course of the execution year. The goal is to establish controls before the execution year starts and then maintain these controls fixed throughout the execution year.

(2) The Maintenance Team provides the RMC and TYCOM with a quarterly spending or phasing plan based on their Ship's controls. The plan should be consistent with the ship's operational cycle and predefined maintenance periods. For example, deployments and underway periods in a given quarter should cause the displacement of Continuous Maintenance (CM) controls to other quarters where the maintenance is likely to occur.

(3) Funds will be provided to Maintenance Teams early enough to avoid premiums associated with late contract award, definitization or assignment of work.

c. Significant deviations from the final negotiated MMBP or controls will be documented in a Summary of Events. It is recognized that the drivers for MMBP changes are often outside the direct control of the Maintenance Team and will be documented as such. The fundamental guidelines for executing at MMBP financial control levels are:

(1) Follow the guidance in volume II, part I, chapter 4 (aircraft carriers) or volume II, part II, chapter 4 (surface force ships) of this manual regarding screening and brokering of work candidates.

(2) During the execution of an availability, growth and new work should be authorized only if the Business Case Analysis indicates that this is the best course of action, taking into consideration all applicable business and operational risks and factors.

d. The Maintenance Team, with the TYCOM's approval, may shift controls between the Chief of Naval Operations (CNO) availability and CM budget lines in order to most efficiently accomplish required maintenance and modernization.

e. The Maintenance Team must schedule continuous maintenance availabilities per volume II, part I, chapter 5 (aircraft carriers) or volume II, part II, chapter 5 (surface force ships) of this manual. Adjustment of Continuous Maintenance Availability dates must be coordinated with the RMC and requested from the Immediate Superior In Command via naval message. Date changes must be minimized in order to realize the maximum benefit from advance planning work. The Maintenance Team may not change CNO availability dates. The Maintenance Team must resolve CNO

availability scheduling issues with the TYCOM via the RMC. The TYCOM must include Program Executive Office (PEO) Ships in any discussions resulting in availability date changes when Program Alterations are scheduled for the availability.

f. The Maintenance Team must review proposals for fair and reasonable costs, work scope and applicable technical aspects prior to the Technical Analysis Report (TAR) process.

g. The Maintenance Team has the authority to adjust the MMBP in response to changes in ship operations, planned maintenance periods, and other business case reasons provided the intended distributions do not exceed the total remaining annual budget requirement allocated for that ship. This redistribution will be documented via a revised quarterly phasing plan, a Summary of Events prompting the change, and a formal recovery plan, which will be submitted to the TYCOM via the RMC for approval and adjustment of the Maintenance Team controls. Over the course of the fiscal year, some minor adjustments to the phased funding requirement can be expected. The cognizant RMC, with approval from the TYCOM, will establish funding redistribution limits below which a formal recovery plan would not be required, however, the revised quarterly phasing plan and Summary of Events would still be needed for approval. Ship's Commanding Officers must ensure that their Immediate Superior In Command is advised of any proposed changes to their MMBP which may affect operational schedules or planned modernization.

h. The Maintenance Team may not unilaterally adjust the MMBP when the adjustments would exceed the total remaining funding controls allocated for the ship. Any requirement in excess of the total MMBP currently approved will require the submission of a revised quarterly phasing plan, a Summary of Events related to the change, and a formal recovery plan. The RMC will evaluate the increased requirement and will make their recommendation for approval to the TYCOM based on total controls available. The RMC may not exceed an individual ship's total funding controls.

i. Depot level maintenance will normally be screened to the Private Sector Industrial Activity (PSIA) contractor. The Maintenance Team may go to other contracting vehicles when:

(1) The PSIA contractor and government cannot agree on cost and scope.

(2) The PSIA contractor does not have the capability or capacity.

(3) Indefinite Delivery, Indefinite Quantity or Commercial Industrial Services (or Simplified Acquisition Purchases and a qualified vendors list) is available.

(4) Other organic RMC assets are available and have the capability for the work.

(5) Work is to be accomplished outside of homeport area.

(6) Work is to be accomplished by an Alteration Installation Team (AIT).

j. During the execution of a maintenance availability, it is anticipated that deficiencies will be identified that could be accomplished as either growth or new work on the existing contract. The Maintenance Team must perform a Business Case Analysis to

decide whether or not to add the work to the current availability or schedule it during another maintenance opportunity.

k. When work deferral reduces the total cost of the job or maintenance completes with a cost under-run and funds can be recaptured, the funding controls will normally remain under the control of the respective Maintenance Team. If the funds are needed for critical work on another ship or to cover a funding shortfall at the TYCOM or Fleet level, the TYCOM will redistribute as necessary. The change will be documented in a revised quarterly phasing plan and the Maintenance Team(s) should provide to the RMC an impact statement and recommended plan to mitigate the effects of the plan change.

l. The RMC coordinates with the Maintenance Teams to comply with their approved ship's MMBPs. The RMCs must make a monthly MMBP execution report to the TYCOM.

m. Maintenance Teams will issue funds to the appropriate executing activity by submitting a planning estimate to the TYCOM (via the RMC) and the TYCOM will issue the actual funding document.

n. PSIA contractors normally submit cost reports to Maintenance Teams on a bi-weekly basis. The Maintenance Team will utilize these reports to assess the cost performance of the PSIA contractor and address items of concern to the RMC or TYCOM.

31.3.3 Regional Maintenance Center Business Responsibilities.

a. The RMC Commander has the authority to execute Surface Force Ship maintenance and must do so following Fleet and TYCOM policies and directives.

b. The RMC Commander develops an execution year spending plan for the TYCOM's approval based on the TYCOM approved MMBPs.

c. The Fleet Commander spending controls are issued to the TYCOM who then assigns spending controls to each Maintenance Team, informing the RMC. The RMC issues quarterly spending controls to all of the Maintenance Teams following the TYCOM's final TYCOM approved MMBP for each ship.

d. The RMC Commander will evaluate MMBP adjustment requests based on the Summary of Events, recovery plan, and quarterly adjustment provided by the Maintenance Teams. If the RMC supports the request, the RMC will forward the issue to the TYCOM for approval.

e. The RMC Commander must request approval from the TYCOM whenever redistribution of annual ship funding is required. The RMC must provide the TYCOM a record of all control changes for tracking purposes. Redistribution of funds between Active Fleet and Reserve Fleet funding lines or between different TYCOMs requires approval by the Fleet Commander.

f. In the event of significant program wide control changes the RMCs must:

(1) Provide an impact statement to the TYCOM regarding the effect on the execution of maintenance.

(2) Provide a recommendation to minimize the impact on Force readiness.

g. The RMC must evaluate the financial status of each of the Maintenance Teams on a monthly basis.

h. The RMC must submit monthly financial summary reports to the respective surface TYCOM. This report provides a comparison of actual versus planned funding execution. The last report for the execution year will include an annual summary showing how the funds were utilized, sorted by Naval Operations resource sponsor.

i. C3 and C4 Casualty Reports (CASREP), or a C2 CASREP with reasonable potential to become a C3 or C4 CASREP, are identified as emergent maintenance and will be funded with emergent dollars. Emergent work will be scheduled to minimize premiums in as much as the operational schedule will permit. C2 CASREPs will normally be corrected using the CM Process. Consideration will be given to schedule all maintenance, including emergent, at an opportune time to reduce premiums. The RMC Commander may, with the respective TYCOM's prior approval, convert Emergency Maintenance funds to execute CNO availability or CM maintenance.

j. Except as stated in paragraph 31.3.3i. of this chapter, C2 CASREPs will be corrected during CM periods (both scheduled Continuous Maintenance Availabilities and maintenance Windows of Opportunity) using CM funds. C2 CASREPs discovered during a CNO availability or Continuous Maintenance Availability will be addressed as new work. C2 CASREPs may be allowed to "age" until the appropriate repair opportunity. The RMC Commander has the responsibility to request TYCOM authorization when Emergency Maintenance funds should be used for the correction of C2 CASREPs or other non-CASREP related, but nonetheless urgent maintenance. The RMC is required to approve any planned delay of action on a CASREP. In the event that the delay effectively constitutes a CASREP deferral per reference (a), the RMC will forward the deferral recommendation to the TYCOM for approval.

k. The RMC Commander will generate monthly maintenance availability metrics for all assigned ships planning for a CNO availability and ships in a CNO availability. These metrics will be briefed at least monthly to the TYCOM at Surface Team 1 Maintenance and Modernization Continuous Improvement Team meetings. The business rules for preparation of these forms are included in Appendix A.

31.3.4 Type Commander Responsibilities.

a. The TYCOM establishes Force maintenance policies and directives, consistent with Fleet Commander guidance, and authorizes the Maintenance Team and RMC to act as the principal agent to execute those policies and directives.

b. The TYCOM will provide a list of Fleet Alteration requirements for the execution year as input to the ship's business plan no later than 15 February in the year prior to execution. To assist with business plan development, the TYCOM will identify which alterations are scheduled for accomplishment and will provide the Maintenance Team and RMC with the cost estimates for accomplishment.

c. When the Fleet issues the spending controls to the TYCOM, the TYCOM will in turn issue spending controls to the RMC and update those spending controls on a quarterly basis.

d. The TYCOM has the authority to recapture spending controls previously issued to the Maintenance Teams and RMCs in response to unforeseen Force budget requirements. This will be used as a last resort, as the goal is to maintain stable funding plans in support of ships' MMBPs.

e. If it is determined that the best course of action is not to fund a CNO availability, the TYCOM must (with concurrence from United States Fleet Forces or Commander, Pacific Fleet, whichever is appropriate) approve the removal of funds before the RMC initiates this action. The TYCOM must ensure PEO Ships is included in the decision process to not fund any availability where Program Alterations are scheduled for accomplishment during that availability.

f. The TYCOM will evaluate MMBP adjustment requests forwarded by the RMC based on the Summary of Events, recovery plan, and quarterly adjustment provided by the Maintenance Team. If the TYCOM supports the request but lacks spending "controls" required, the TYCOM will forward the issue to the Fleet for approval and additional controls.

g. The TYCOM will evaluate the RMC's end-of-month financial status reports to assess the degree of conformance to the approved RMC consolidated spending plan.

31.4 MAINTENANCE PROPOSAL REVIEW. The maintenance process must be flexible enough to be able to respond to changing operational requirements. The key to this flexibility is to reduce the cycle time involved prior to the actual execution of the maintenance. The Continuous Estimating, Incremental Planning Review Process guidelines will be utilized by the Maintenance Team to approve all proposed maintenance actions within time and budget constraints. The guidelines apply equally to Advance Planning, Long-Lead-Time Material, CNO, CM and Emergent Maintenance work.

31.4.1 Concept. The entitled process concept enables the Maintenance Team to review planned work items and estimates on a continuous basis as they are received. The Ashore Ship's Maintenance Manager is empowered to shift work items from CNO to CM or vice versa to optimize work scheduling and reduce premium exposure and overall cost.

31.4.2 Business Rules.

a. The Ashore Ship's Maintenance Manager, with support from the Maintenance Team and Government Availability Planning Managers, must analyze the work package against the availability schedule. In general, Maintenance Teams should consider scheduled availability lengths fixed and attempt to adjust the work package to ensure it can be completed within the scheduled dates. When justification exists, the Maintenance Team should recommend availability length adjustments to the TYCOM to minimize premiums.

b. The Ashore Ship's Maintenance Manager, with support from the Maintenance Team and Government Availability Planning Managers, must analyze the work package against potential CM windows of opportunity to maintain the scheduled dates of the

availability, to best level load the lead maintenance activity, and to minimize contractor premiums. Per reference (b), the entire maintenance continuum (e.g., CNO availabilities, CMAVs, WOOs) shall be considered when screening work, with the objective of leveraging opportunities to reduce depot-level work package size in CNO availabilities.

c. The Maintenance Team may not change CNO availability dates and must resolve scheduling issues with the TYCOM via the RMC. The TYCOM must include PEO Ships in any discussions resulting in availability date changes when Program Alterations are scheduled for the availability.

d. Work packages must be developed on a continuous basis in order to realize cost savings and avoid premiums associated with late identification of work following the business rules contained in volume II, part I, chapter 5 (aircraft carriers) or volume II, part II, chapter 5 (surface force ships) of this manual.

e. When capability and capacity allow, work must be brokered to the Fleet Maintenance Activity, otherwise, Depot level maintenance will normally be screened to the PSIA contractor. The Maintenance Team may go to other contracting vehicles when:

(1) The PSIA contractor and government cannot agree on cost and scope.

(2) The PSIA contractor does not have the capability or capacity.

(3) Other organic RMC assets are available and have the capability for the work.

(4) Work is to be accomplished outside of homeport area.

(5) AIT or Indefinite Delivery, Indefinite Quantity has been identified by the Naval Supervisory Authority (NSA) as the preferred provider.

f. The Maintenance Team must review proposals for fair and reasonable costs, work scope and applicable technical aspects prior to the TAR process.

31.4.3 Continuous Estimating Incremental Planning Review Process. The Continuous Estimating Incremental Planning Review Process (CEIPRP) is the process by which the Maintenance Team continuously compares PSIA contractor work item estimates to independently developed government work item estimates throughout the development of the work package. Completion of package development and submission of the 100% Work Package Proposal is followed by the Technical Cost and Scope analysis, proposal revisions, TAR, establishment of the Prorate, Pre- and Post-Business Clearance, and signing of the bi-lateral contract modification (definitization).

31.4.3.1 Concept. Use of the CEIPRP is intended to achieve flow of work items into the work package up to 100% lock while continuously comparing government to contractor estimates to avoid last minute surprises due to estimate differences. This process also allows for flexibility up to the 100% lock in order to develop a package that best addresses the material condition of the ship as it begins the availability. Following the planning activity specification development, the PSIA contractor continuously submits a Class C Planning Estimate. Simultaneously, the government Maintenance Team continuously develops the Independent Government Estimate (IGE). These two estimates are then compared and any differences in scope and price (generally those in excess of 10% difference) are resolved. Resolving these differences during work

package development also reduces the amount of time required for the TAR process. Following the 100% package lock, the planning activity completes planning, the PSIA contractor assembles and submits the 100% package proposal. Based on the 100% package proposal, an estimate of prorates is communicated to resource sponsors along with a final funding notification (as early as possible but no later than 14 days prior to the need date) in order to ensure on-time funding. This is followed by accomplishment of the TAR and business clearance processes.

31.4.3.2 Business Rules.

a. The contractor must continuously submit Class C estimates for each work item as a bottom line work item cost. The Planning Estimate provides a budget level tracking and establishes a basis for determining cost reasonableness. Paragraph cost estimates will be provided by the PSIA contractor when requested by the government to resolve differences between the contractor's Planning Estimate and the IGE.

b. The IGE is the government's detailed estimate to the trade and paragraph level. The IGE provides budget level tracking and establishes a basis for determining cost reasonableness allowing the government to validate the Planning Activity Estimate and resolve any differences in scope or cost estimates.

c. The package will be assessed at the 50% and 80% budget to ensure that work has been brokered to planning activities continuously. These milestones also reinforce timely identification of work by Ship's Force. Following the 50% and 80% milestones, the planning activity will complete planning and estimating for all work brokered to date.

d. Upon completion of the Planning Activity Estimate, that estimate will be compared to the IGE to gage whether the government and the Planning Activity are estimating a similar scope of work. If the individual work item Class C estimates vary by more than 10% or $10,000 (whichever is higher), the government Program Manager will establish a scoping conference to discuss or resolve the scope of work.

e. The 100% package lock is the official milestone to mark identification of 100% of the work requirements for an availability based on the MMBP budget. All work added to or deleted from the package after the 100% lock will be via an errata, addendum or inducted as new work via the Request for Contractual Change Process.

f. The Final Funding Notification with Estimates of Prorates will be a formal communication with resource sponsor (E-mail or Naval Message) with funding requirements. Estimate prorates based on Basic Work Package Proposal man-hour estimates, historical prorate data and sponsor requirements. The Maintenance Team should ensure that estimates provided to various sponsors throughout the planning process include anticipated prorate amounts.

g. The TAR will include all necessary information to develop a negotiation strategy, pricing recommendation and rationale to support a scope conference, if necessary, and subsequent work package cost definition. It must include background information, essential contractor proposal information, method of evaluation, scope of work, analysis of work items with rationale to support questionable costs and summary of pricing recommendations.

h. A scoping conference, if necessary, must include the appropriate members of the Project Team, Technical Analyst, Administering Contracting Officer (ACO) or Contract Negotiator and contractor. All work items with unsubstantiated differences identified in the TAR are discussed to reach agreement on the scope of work and contractor's proposal. When all differences have been resolved, the conference must end with an agreement on labor hours, subcontracts and materials between the contractor and ACO or Contract Negotiator.

i. The ACO or Contract Negotiator will take the work scope conference results and ensure correct application of indirect rates, fees and prepare appropriate documentation for signature and cost definition.

j. The ACO representative will negotiate target costs for new work.

k. The Project Team will minimize growth and overtime. Prior to definitization, growth items that cannot be settled by the Project Team must be forwarded to the Technical Analyst to be settled in the TAR process. For Surface Force ships only, the NSA Chief Engineer will review requested growth and new work items for technical compliance.

31.4.3.3 Schedule Modification. Operational commitments, port loading or other reasons may require modification to availability schedules and milestones may need to be adjusted accordingly as discussed in further detail in volume II, part I, chapter 5 (aircraft carriers) or volume II, part II, chapter 5 (surface force ships) of this manual.

31.5 GUIDANCE FOR FIRM FIXED PRICE CONTRACTS.

31.5.1 Overall Process. Unless specifically noted otherwise, the following are common practices in both the PSIA and Firm Fixed Price (FFP) contracting environments:

a. Validation, screening, and brokering process.

b. Maintenance Teams.

c. Planning Board for Maintenance.

d. MMBPs.

e. Movement of work between CNO and CM.

f. Maintenance Team metrics.

31.5.2 Firm Fixed Price Planning. Government activities must accomplish FFP planning with the goal of compiling a complete, clear, concise and well-defined work package. The Ashore Ship's Maintenance Manager must work with the Maintenance Team to define the work scope and solicitation in a FFP environment. The following points must be considered in the planning process for FFP contracts:

a. Assessments are an important part of the planning phase of any availability. The Ashore Ship's Maintenance Manager must ensure assessment results are considered for inclusion into the work package. The Ashore Ship's Maintenance Manager must also determine if additional assessments should be accomplished so that the material condition of critical systems and equipment can be determined prior to the work package lock date.

b. Proper work screening between CNO and CM availabilities is critical in order to reduce costs and premiums.

c. Work placed in a CNO FFP Availability should be limited to work requiring a facilitated shipyard, work that cannot be accomplished in short CM availabilities, or work that must be accomplished in the availability to support operational readiness.

d. When work, following the guidelines identified in paragraph 31.4.2b. of this chapter, cannot be accomplished in the designated time period without excessive premiums or with a low probability of success, the RMC Commander must be informed. Conversely, the RMC Commander must also be informed when there is insufficient work to justify a CNO availability.

e. The use of Master Specification Catalog (MSC) Templates by Planning Activities and Maintenance Teams is the normal expectation, not the exception. If a MSC Template does not exist for the Expanded Ship Work Breakdown Structure (ESWBS) being addressed by a tasked Work Notification, previously executed Work Items for the same or similar work may be reviewed as a starting point. Investigate changes to the Work Item, by reviewing associated Request for Contract Change (RCC) and Contractor Furnished Reports (CFRs). Previously executed Work Items, regardless of their source, shall never be used without reviewing for current applicability. Regulations, processes and procedures frequently change.

f. Ashore Ship's Maintenance Manager with assistance from the Maintenance Team must review all contract work specifications prior to issue, and specification review changes must be recorded and tracked by the planning activity.

31.5.3 Firm Fixed Price Placement. When building the availability package in preparation for contract placement, consideration must be given to risk mitigation to avoid premiums during execution due to late work identification. The use of Reservations and Option Items builds in flexibility to FFP contracts when it is impossible or impractical to adequately define all requirements.

a. Option Item guidelines:

(1) Option Items are to be utilized in a contract solicitation when there is a strong expectation the work will be accomplished if the prerequisite conditions requiring the work are met as a result of an event, inspection, or milestone.

(2) Prior to solicitation, the availability schedule must be evaluated to ensure each Option Item can be accomplished during the contract performance period.

(3) Material status must be confirmed to ensure Option Item material will be available to support the production schedule.

(4) Funding for Option Items will be managed by the Project Manager within the ship's designated annual funding allowance under their MMBP, by either designating Reservations in the availability budget or by using CM funds.

(5) Option Items must be invoked as early as possible, preferably during the period between contract award and the start of the availability. The later an option is

exercised, the greater the probability that premiums will be paid for its execution.

(6) A listing of all Option Items, including their respective "Not Later Than" invocation dates, must be provided to the RMC by the planning activity in the turnover letter. The Project Manager must be made aware of all Option Items and invocation dates well in advance of the availability start date. (The Maintenance Team provides the Option Items and invocation dates. This is discussed in the contract solicitation review board.)

(7) Option Items are not to be used as a "shopping list", and are reserved for work with a high expectation of being required. Lack of funds for a specific work item must not be used as justification for including that work as an Option Item.

b. During FFP solicitation, bidder's questions may be submitted to the Procurement Contracting Officer. The following processes related to bidder's questions should be followed:

(1) The Maintenance Team must not respond directly to bidder's questions. There must be a single point of contact for bidder's questions and answers. If queried directly, the Maintenance Team must refer the bidder to the Advance Planning Manager.

(2) The RMC Procurement Contracting Officer must ensure the Maintenance Team is provided with e-mail notification of all bidder's questions.

(3) The Maintenance Team and Government Availability Planning Managers must provide inputs to bidder's questions to the Procurement Contracting Officer within 24 hours (unless the response is required immediately, or another time period is agreed upon).

(4) The Maintenance Team and Government Availability Planning Managers input must be considered when formulating the Government's response.

(5) The final answer to bidder's questions must be made available to the Maintenance Team and Government Availability Planning Managers via e-mail or other electronic means.

c. FFP Oversight. During FFP availability execution, oversight of contract changes is critical to managing costs and reducing premiums. Processes that assist in the management of funds and reduction of premiums include:

(1) Conduct a business case for all growth and new work to determine the most efficient and cost effective time to execute the work.

(2) Recognize that late work premiums exist, and account for these premiums when it is necessary to add growth or new work to the availability.

(3) The RMC Project Manager must identify and record all validated Delay and Disruption charges paid by the Government using growth codes as a result of Navy actions. Discuss each Delay and Disruption event during Planning Board for Maintenance to prevent repeat occurrences.

(4) Project Manager, with the Maintenance Team, must document “lessons learned” during availabilities and provide these to the RMC for proper distribution and training of other Maintenance Teams.

(5) Departure Reports must be provided to the Maintenance Team, ensuring all applicable safeguards are in place to handle Business Sensitive Information.

APPENDIX A

RMC SPOTLIGHT REPORTS

1. PURPOSE. Establish guidelines for preparing an RMC Spotlight Presentation. This presentation is applicable to all ships undergoing planned (CNO or CMAV) availabilities.

2. SCOPE.

   a. This business rule describes the format and processes required to compile an RMC Spotlight Presentation.

   b. Applies to all Regional Maintenance Centers (RMC).

   c. Implements the standardized process to be used by all RMCs.

3. GENERAL REQUIREMENTS AND BACKGROUND.

   a. The RMC Spotlight Presentation consists of six sections: Project Spotlight Chart, Premium Performance Chart, Package Build Chart, Lessons Learned Status Report and Global Lessons Learned Data.

   b. The Project Spotlight Chart is a snapshot of the planning milestone status and execution performance for the RMC's CNO availabilities. Examples of FFP and PSIA Spotlight Charts are given in this appendix.

   c. The Premium Performance Chart is a snapshot of the performance with regard to premiums and churn for a specific ship in the execution phase of a CNO availability. An example Premium Performance Chart is given in this appendix.

   d. The Package Build Chart is a snapshot of the relationship between the value of the work package, as it is being developed, to the planned and budgeted limits for a specific ship in the planning phase of a CNO availability. It is extracted from the budget tab in Navy Maintenance Database (NMD). An example Package Build Chart is given in this appendix.

   e. The Lessons Learned Status Report is a snapshot of an RMC's local and global Lessons Learned issues from past CNO availabilities. An example Lessons Learned Status Report is given in this appendix.

   f. The Global Lessons Learned Data Report provides amplifying information regarding current global Lessons Learned issues. An example Global Lessons Learned Data Report is given in this appendix.

4. PROCESS.

   a. This appendix defines the RMC Spotlight Presentation, but additional slides may be included for amplification on a conservative basis. The RMCs must comply with standard formats.

   b. Project Spotlight Chart.

      (1) The left column of the chart must list all upcoming CNO availabilities for the port within the A-360 window and the next availability to reach A-360 at a minimum.

(2) The columns for the milestone will be populated and colored using the following guidelines:

(a) The top row contains the scheduled milestone date.

(b) The bottom row is populated with the actual date the milestone was accomplished.

(c) The top row is colored red, yellow and green after the milestone has been accomplished.

1 Green – milestone met on schedule.

2 Yellow – milestone 1-7 days late.

3 Red – milestone >7 days late.

(d) The bottom row is colored with a Red, Yellow and Green hash pattern depending upon impact to the next milestone. The bottom row is only colored for accomplished milestones and the follow-on milestone. It may be acceptable to color a future milestone if there exists substantial evidence that it will not be accomplished on time and will have a significant impact on the follow-on milestone.

1 Green hash – next milestone will be met.

2 Yellow hash – moderate risk for next milestone.

3 Red hash – high risk for next milestone.

(3) Comment blocks or balloons may be used to provide amplifying information as necessary.

c. Premium Performance Chart.

(1) The Premium Performance Chart is developed by exported data from NMD to an Access database. Commander, Navy Regional Maintenance Center metrics division is the point of contact for the procedure.

(2) Premium Performance Charts are ordered in the sequence listed on the Project Spotlight Chart.

(3) Comment blocks or balloons may be used to provide amplifying information as necessary.

d. Package Build Chart.

(1) The Package Build Chart is developed with the package build data from NMD. The information is available in the planning side of NMD under planning budget.

(2) Package Build Charts are ordered in the sequence listed on the Project Spotlight Chart.

(3) Comment blocks or balloons may be used to provide amplifying information as necessary.

e. The Lessons Learned Status Report is maintained by the RMC Lessons Learned Coordinator.

f. The Global Lessons Learned Data Report is to include the following, at a minimum, for the reporting period in which input is received:

(1) Discussion of best practices.

(2) Discussion of global issues including resolutions.

(3) Premium goal vs. actual (and if exceeded, an explanation as to why).

(4) Identification of premium drivers.

VOLUME VI

CHAPTER 32

TOP MANAGEMENT ATTENTION TOP MANAGEMENT ISSUES

REFERENCES.

(a) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval Ships
(b) OPNAVINST 3000.12 - Operational Availability of Equipments and Weapons Systems

LISTING OF APPENDICES.

A Top Management Attention and Top Management Issues Flowchart

32.1 PURPOSE. Reference (a) provides Chief of Naval Operations (CNO) Maintenance Policy for U.S. Navy Ships, which includes the Top Management Attention and Top Management Issues (TMA-TMI) program for addressing chronic maintenance problems. Commander, United States Fleet Forces Command (COMUSFLTFORCOM) is tasked with developing and forwarding Hull, Mechanical and Electrical (HM&E) and Combat System (CS) Technical Ticklers to identify common maintenance issues between Fleets. This chapter provides USFLTFORCOM policy, procedures and standardized metrics for selecting systems and equipment for inclusion in the TMA-TMI process.

32.2 BACKGROUND. The TMA-TMI process is the Navy's priority corrective action process for USFLTFORCOM, Fleet Commanders, Type Commanders (TYCOM), Systems Commands (SYSCOM) and Office of the CNO (OPNAV) Resource Sponsors. This process is the means to identify top material readiness and cost problems and develop solutions that effectively and efficiently achieve approved levels of performance while realizing near-term returns on investment.

32.3 APPLICABILITY AND SCOPE.

a. The TMA-TMI process encompasses all Surface Force, aircraft carrier and submarine installed equipment and systems, including aviation-oriented items that are integral parts of the ship. This process supports Navy goals and initiatives that improve fleet material readiness and increase the operational availability of those items that are identified by the fleet as needing primary attention and action. The TMA-TMI process excludes equipment under the responsibility of Director, Strategic Systems Programs and Director of Naval Nuclear Propulsion Program.

b. The TMA-TMI process uses data from diverse sources to:

(1) Objectively identify critical fleet problems that impact material readiness, maintenance cost and manpower or skill requirements, and warrant top-level attention.

(2) Focus management attention and resources needed to correct these problems.

(3) Enhance communication among CNO Resource Sponsors, Fleet Commanders, TYCOMs and Systems Command Program Offices.

(4) Execute the TMA-TMI process following the TMA-TMI Process Flowchart in Appendix A.

c. The TMA-TMI process is the Navy's priority corrective action process for Fleet Commanders, SYSCOMs and OPNAV Resource Sponsors. This process is the means for the Fleet, OPNAV, and SYSCOMs to identify top material readiness and cost problems and develop solutions that effectively and efficiently achieve approved levels of performance while realizing near-term Returns on Investment (ROI).

d. The TMA candidate selection process uses a variety of sources including Maintenance and Material Management (3-M) data prepared by the TMA-TMI Analysis Center to objectively identify critical fleet HM&E and CS problems that impact material readiness, maintenance cost and manpower or skill requirements and warrant top-level attention. Fleet and TYCOMs use this data to aid in the selection of their TMA-TMI candidate systems or equipment. Fleet and TYCOMs may also solicit topic input from subordinate Commanders for problems having significant negative impact on readiness.

e. Candidate systems or equipment metrics are forwarded from the TYCOMs to Naval Sea Systems Command (NAVSEA) for inclusion in the TMA process. The candidate selection process is a semi-annual process commencing immediately after TMA Fleet Week and culminating at Mid-Cycle with the nomination of new systems or equipment.

f. TMI topics are selected by the TMA panel from the topics presented at TMA which require flag level attention.

32.4 RESPONSIBILITIES.

32.4.1 Commander, United States Fleet Forces Command. COMUSFLTFORCOM Maintenance Officer (N43) is the Staff Officer responsible for implementation of this chapter and may direct HM&E and CS or equipment be included in the TMA-TMI process. TYCOM Maintenance Officers must:

a. Develop TYCOM HM&E and CS Technical Ticklers and identify common issues between ships every six months. Establish a priority ranking of systems based on selected attributes (e.g., man-hours, cost, readiness). Forward TYCOM HM&E and CS Technical Ticklers to Commander, Naval Sea Systems Command (COMNAVSEASYSCOM) 05 for Surface Force ships. For submarines, provide TMA issues to COMNAVSEASYSCOM 07, with copy to OPNAV Resource Sponsors and other cognizant SYSCOMs as appropriate, via a coordinated or joint cover letter.

b. Coordinate TMI Panel agendas and dates with TMA-TMI Working Group Chair(s).

c. Participate on TMA panels and chair TMI Panels.

d. Chairs the TMI panel at least annually either through established Enterprise Board of Directors meetings or as a separate TMI panel.

e. Coordinate Fleet participation in the TMA and TMI process (TYCOMs and Regional Maintenance Center Supports).

32.4.2 Naval Sea Systems Command. NAVSEASYSCOM coordinates overall SYSCOM participation in the TMA. Specifically, SEA 07 coordinates the efforts for submarine platforms. SEA 05 coordinates efforts for surface and carrier platforms.

32.4.2.1 Commander, Naval Sea Systems Command (05). COMNAVSEASYSCOM (05) for Surface Force ships and aircraft carriers must:

a. Form the TMA-TMI Working Groups and Panels and staff with appropriate representatives.

b. Receive and disseminate the TYCOM HM&E and CS or C4I Surface Force Ship Technical Ticklers to the appropriate TMA-TMI Working Groups.

c. Review and forward Plan of Action and Milestones and ROIs, or other technical presentations from TMA-TMI Working Groups to Fleet and TYCOMs.

d. Chair the Surface Force ships and aircraft carrier TMI Panel and establish the NAVSEA response to Fleet identified TMI issues.

32.4.2.2 Naval Sea Systems Command 07 and Program Executive Officer Submarines. SEA 07 and Program Executive Officers (PEO) Sub must:

a. Form the TMA-TMI Working Groups and Panels and staff with appropriate representatives.

b. Receive and disseminate the TYCOM HM&E and Nuclear Planning and Execution System TMA issue letter to the appropriate program offices for action.

c. Review and forward Plan of Action and Milestones, Business Case Analyses or other appropriate technical presentations to Fleet and TYCOMs.

32.4.2.3 Commander, Naval Sea Systems Command Program Offices. COMNAVSEASYSCOM Program Offices (and Commander Naval Information System Command for subparagraphs b. through f. of this paragraph) must:

a. Chair TMA Panels per paragraph 32.4.2.1 of this chapter.

b. Participate on TMA and TMI Panels as requested.

c. Develop Plan of Action and Milestones and Business Case Analyses to address TYCOM HM&E and CS Technical Tickler issues.

d. Coordinate other activities as required to determine root causes and develop corrective actions.

e. Review minutes from TMA and TMI Panels and take action as appropriate.

f. Work with TYCOMs for resolution of HM&E and Nuclear Planning and Execution System Technical Issues and Action Items.

32.4.2.4 Program Executive Officers and Direct Reporting Program Managers. PEO and Direct Reporting Program Managers must:

a. Assign representatives to the appropriate TMA-TMI Working Groups.

b. Chair the applicable submarine TMI Panels as described in paragraph 32.4.2.1 of this chapter.

c. Review minutes from TMA-TMI Panels and take action as appropriate.

32.4.3 Top Management Attention-Top Management Issues Panels. The TMA-TMI Panels must:

a. Review, discuss, and agree on the course of action to resolve each technical issue presented.

b. Publicize minutes of the Panel Meetings.

32.4.3.1 Top Management Attention Panels. TMA Panels meet every six months, to assess the applicability of Plan of Action and Milestones and ROIs, and monitor the progress of issues. TMA panels are meetings chaired at the O-6 level. In general, TMA Panels discuss those issues that can be handled within the SYSCOM organizations. The TMA Panel will identify top issues based on specific attributes (e.g., man-hours, cost, readiness) for presentation at TMI.

a. TMA Panels: TMA Panel composition and agendas are coordinated between applicable TYCOM staffs, Fleet staffs and SYSCOM Program Offices. Attendees to the appropriate TMA Panels include, but are not limited to, the following:

(1) COMNAVSEASYSCOM (05) representative as chairman for the Surface Force, Aircraft Carrier and CS panels and COMNAVSEASYSCOM (SEA 07) representative as chairman for the Submarine Force panel.

(2) CNO (N43) and applicable Resource Sponsor (N8, N6) representative(s).

(3) Maintenance and Supply representatives from Fleet, TYCOMs, and Regional Maintenance Centers (RMC).

(4) COMNAVSEASYSCOM Program Offices, engineering codes and logistics codes representative(s).

(5) Commander, Naval Information Warfare Systems Command (COMNAVWARSYSCOM) Program Office representative(s) as requested.

(6) Commander, Naval Air Systems Command (COMNAVAIRSYSCOM) Engineering representative(s) as requested.

(7) In-Service Engineering Agent representatives.

(8) Naval Supply Weapon Systems Support (NAVSUP WSS) representative.

(9) Training Command representative.

(10) Naval Research Laboratory representative.

(11) Board of Inspection and Survey representative.

b. Submarine Force TMI Panel: The Submarine Force TMI Panel is chaired by COMSUBFOR. The TMI is normally conducted as a part of the Undersea Enterprise Board of Directors meeting. COMSUBFOR and COMSUBPAC Directors for Maintenance and Material Readiness coordinate the agenda with the COMSUBFOR Enterprise office. Panel Members may include, but are not limited to, the following:

(1) COMSUBFOR, SEA 07, PEO SUBS.

(2) CNO (N43) and applicable Resource Sponsor (N8, N6) representative(s).

(3) COMSUBFOR and COMSUBPAC Maintenance and Supply Officers.

(4) COMNAVSEASYSCOM program offices, engineering code and logistics code representatives.

(5) COMNAVWARSYSCOM representative.

(6) COMNAVAIRSYSCOM representative.

(7) In-Service Engineering Agent representative(s).

(8) Commander, Navy Regional Maintenance Center and RMC representatives.

(9) NAVSUP WSS representative.

(10) Chief of Naval Education and Training representative.

c. Surface Force Ship and Aircraft Carrier TMI Panels: The Surface Force Ship or Aircraft Carrier TMI Panel is chaired by NAVSEA 05. NAVSEA 05, PEO Theater Surface Combatants, PEO Expeditionary Warfare, PEO Mine and Undersea Warfare, PEO CARRIERS and PEO Surface Strike jointly coordinate the agenda. Attendees of the appropriate TMI Panels include, but are not limited to, the following:

(1) PEO Expeditionary Warfare, PEO Theater Surface Combatants, PEO CARRIERS (Surface and Carrier), PEO Mine and Undersea Warfare, PEO Surface Strike, SEA 07 (Submarine).

(2) CNO (N43), and applicable Resource Sponsor (N8, N6) representative(s).

(3) COMLANTFLT, COMPACFLT, COMNAVSURFLANT, COMNAVSURFPAC, COMNAVAIRLANT, COMNAVAIRPAC, COMSUBLANT, and COMSUBPAC Maintenance and Supply Officers.

(4) COMNAVSEASYSCOM program offices, engineering code and logistics code representatives.

(5) NAVWARSYSCOM representative.

(6) COMNAVAIRSYSCOM representative.

(7) In-Service Engineering Agent representative(s).

(8) RMC and RMC representatives.

(9) NAVSUP WSS representative.

(10) Chief of Naval Education and Training representative.

(11) Naval Research Laboratory representative.

(12) Board of Inspection and Survey representative.

d. Combat Systems: The CS Troubled Systems Process supports the TMA-TMI process with selected inputs for the COMLANTFLT or COMPACFLT CS Technical Tickler.

32.4.3.2 Top Management Attention-Top Management Issues Working Groups. The TMA-TMI Working Groups must:

a. Receive TYCOM HM&E and CS Technical Ticklers or Issues White Papers as appropriate from NAVSEA 05 for Surface Force ships and aircraft carriers or from NAVSEA 07 for submarines and identify common and platform specific issues as appropriate.

b. Review TYCOM HM&E and Nuclear Planning and Execution System Technical Ticklers, White Papers or Action Items. Verify applicability of Fleet-recommended actions and achieve agreement with appropriate Fleet and TYCOM staff(s) as appropriate.

c. Notify appropriate COMNAVSEASYSCOM Program Offices and other SYSCOMs when equipment or systems under their care are identified as fleet material readiness issues.

32.4.3.3 Review. TMA-TMI Working Groups, comprised of SYSCOM representatives designated by NAVSEA 05 and 07, PEO SUBS, PEO Ships, PEO Integrated Warfare Systems, and PEO CARRIERS, review Fleet inputs to determine common and platform specific issues and assign issues to the appropriate SYSCOM Program Offices.

32.4.4 Top Management Attention-Top Management Issues Analysis Center.

32.4.4.1 Candidate Identification. The TMA-TMI Analysis Center will provide a combined Ranking Matrix to help determine the relative ranking of systems and equipment on a Navy wide basis. The TMA-TMI Analysis Center, using the TYCOM input plus RMC and TYCOM technical experts, will prepare a preliminary set of Fleet generated system problems and potential solutions, the Technical Tickler, for the systems and equipment chosen for inclusion in the TMA-TMI process. The TMA-TMI Analysis Center, using 3-M data, also provides the TYCOMs with a Ranking Matrix, Figures 32-1 and 32-2, and Impact Chart, Figure 32-3, by Allowance Parts List (APL) and Equipment Identification Code (EIC) for their review. The Ranking Matrix will be TYCOM specific, using the Ranking Matrix as a guide. The TYCOMs select systems or equipment for further evaluation and possible induction into the TMA-TMI process.

32.4.4.2 Candidate Expanded Metrics. The TMA-TMI Analysis Center provides the TYCOMs with a tailored TMA Report for their identified systems or equipment. This report contains a Balanced Score Card (BSC), Problem Free Time, Failure Rate, Parts Ranking and modified Ship's Logistics Indicator Computerized Report (SLICR) for the specific candidate system or equipment defined by APL or EIC nominated by the TYCOM. These are 3-M based reports that require no special data collection or analysis efforts.

32.4.5 Type Commanders. The TYCOMs, using the data provided in the TMA Report and other (RMC, SYSCOMs, etc.) Casualty Report (CASREP), maintenance, logistics or training inputs will determine which systems or equipment to nominate for inclusion into the TMA-TMI process. The nomination should include the TMA Metrics plus additional justification including the TYCOM's initial Root Symptom Analysis as to the causes of poor performance. Systems and equipment will be nominated at the lowest component level that can be identified as the reliability or cost driver. When multiple APLs or EICs from the same "System" appear at or near the top of the Ranking Matrix, the entire "System" can be nominated.

32.5 METRICS. Metrics used are generated directly from the 3-M database via Open Architecture Retrieval System (OARS) and require no subsequent data collection or analysis

efforts. All Navy systems and equipment that generate maintenance data are included and considered as part of this methodology. This is a three-month process, starting after Fleet Week and culminating at the Mid-Cycle review that gets new systems nominated by the Fleet to TMA. Systems not selected for TMA can be re-nominated by a TYCOM Representative at least 4.5 months prior to any future Fleet Week.

32.5.1 Top Management Attention-Top Management Issues Candidate Selection. There are two methods used to select topic candidates for TMA-TMI. TYCOMs may use any combination of the two methods to select topic candidates.

a. The first method entails soliciting fleet commanders, maintenance officers and TYCOM staff members for candidate topics. Candidate topics are then reviewed by both TYCOM maintenance officers and selected or rejected as TMA topics.

b. The second method is by a ranking matrix where costs, man-hours, CASREP volume and other attributes are measured and a "top ten" selection process is then employed.

32.5.1.1 Top Management Attention-Top Management Issues Ranking Matrix Method. Six attributes are used to rank systems and equipment as TMA-TMI Program candidates. Data for five of the attributes are downloaded directly from the 3-M database via OARS. The CASREP Volume data is extracted and sanitized from the NAVSUP WSS CASREP Database. The attributes are:

a. 2-Kilo Volume - Total number of Maintenance Actions (2-Kilos) generated by the system or equipment.

b. Man-hours - Total Ship's Force and Intermediate Maintenance Activity (IMA) man-hours expended on system or equipment maintenance.

c. Parts Cost - Total net cost of repair parts used to support the system or equipment.

d. Hi-Priority Failures - Total number of 2-Kilos that are Status 2 or 3 and Priority 1, 2 or 3 2-Kilos generated for a system or the equipment.

e. Hi-Priority Down Time - Total days of down time for the system or equipment based on hi-priority failures.

f. CASREP Volume - Number of CASREPs generated by the system or equipment.

32.5.1.2 Data on each attribute is collected over a two-year period. The Ranking Matrix is a multivariable Pareto ranking technique that avoids the distortion inherent in ordinary ranking schemes where variables representing different aspects of a system or equipment may have different units of measurement with widely differing scales. The technique gives full visibility to systems where even only one of the descriptive attributes has a high impact level. As a result, the "top ten Pareto" of each of the attributes winds up on or near page one of the overall ranking. The process is easily automated in MS Excel or MS Access. This method is applied to approximately 43,000 APL and 4,200 EIC systems and equipment. The resultant Ranking Matrix provides Fleet decision makers a list of potential TMA-TMI candidates.

32.5.1.3 Ranking Matrix Calculation. Data for each attribute are scaled, normalized or standardized (depending on the language in your field of study) in a way that creates unit vectors (0 to 1, with a few high outliers > 1) in statistical units (Standard Deviation multiples sometime referred to as "Z" scores). The scaling used results in the 3-sigma value of the data being scaled

to equal one. The 99.86th percentile of the data is used to locate that value in the ranked raw data, which is a percentile commonly used for "normal" distributions with a single tail as being equivalent to the 3-sigma value. Although the five attribute distributions are not "normal", they are close to being "log normal" so the percentile technique works. The percentile technique works well regardless since the data is a 100% sample and the statistical distribution (which should be known if samples are used for estimating) is not a critical issue. After scaling the attributes, the vector equivalents are then combined using vector addition to create a balanced rank value that can be used for final ordering of the ranking. The vector addition technique is straightforward (Pythagorean). For over three years this has produced a tight pattern of the top ten for each attribute falling within the top 50 fleet-wide. The method is objective, repeatable, and robust and uses the "actual data", not a representation of the data.

Figure 32-1 Sample TMA APL Ranking Matrix

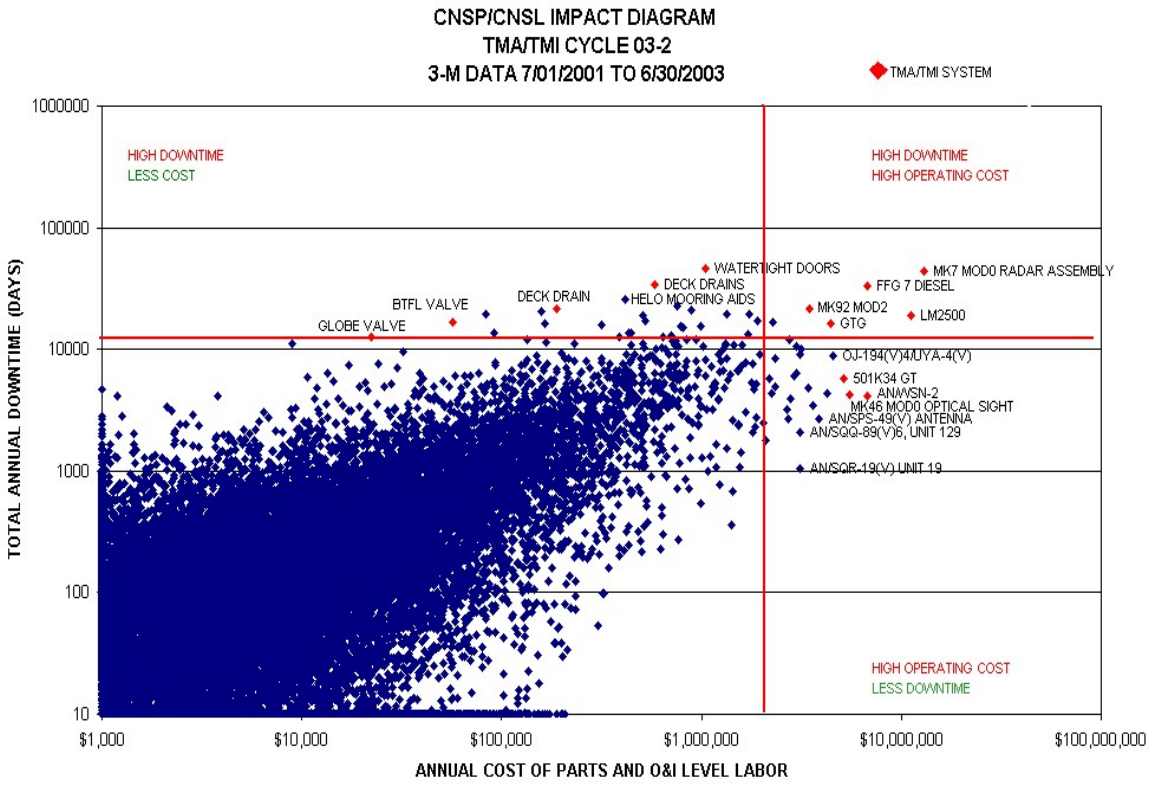
32.5.2 Charts and Graphs.

32.5.2.1 Impact Chart. The Impact Chart provides a means of plotting the Ranking Matrix and showing, using a two-axis display, the TMA-TMI systems or equipment and potential candidate systems or equipment. Annual Cost of Parts and Labor are combined to form the X-axis and Days Down Time the Y-axis, providing a visual "high cost", "high down time" display of TMA-TMI current and candidate systems or equipment.

Figure 32-3 Sample Impact Diagram



32.5.2.2 Balanced Score Card.

a. Ratio analysis is a valuable tool for interpreting financial and operating data (from balance sheets, profit-and-loss statements, production data, etc.) to detect favorable or unfavorable conditions in business performance.

b. Ratios are used to show the proportional relationship of data from a variety of sources. Business owners should compare their ratios for a specific period with previous periods to ascertain possible reasons for change. They may also choose to compare the ratios for their operation with the industry standard.

c. After an operation has been in existence for a reasonable time, the ratios tend to stabilize and in many industries, desirable ratios are well established. Therefore, there is a minimum percentage that an operation can cost (manpower or capital) and still provide proper service, and a maximum that it can cost before the operation is shut down or re-engineered.

d. This business approach can be applied to the management of systems in the fleet. The BSC developed by the TMA-TMI Analysis Center allows the user to:

(1) Observe the shape, or system behavior and maintenance strategy (relative proportions or ratios, variable to variable).

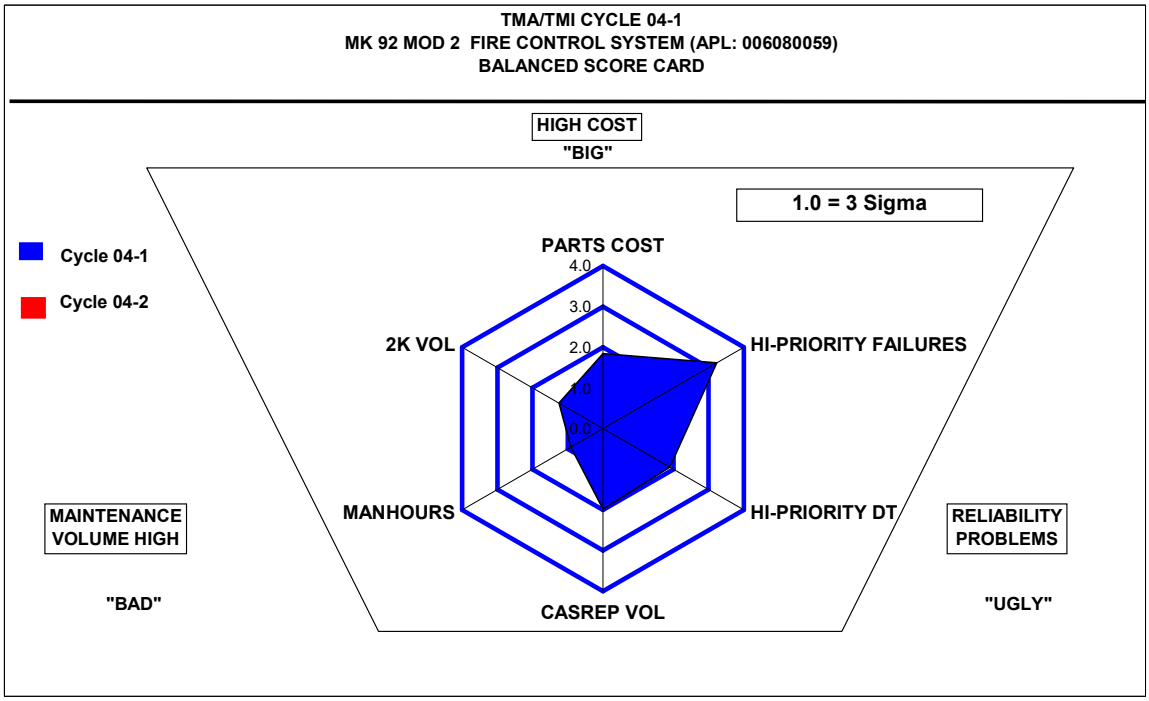
(2) Compare a single variable with the entire fleet (since the data is scaled using the upper control limit of all fleet data for each variable as the 100% mark).

(3) Observe the enclosed area which is proportional to the TMA-TMI balanced ranking value.

(4) Identify problem areas for follow-on analysis.

Notice that ratios of variables that have the same value on the grid (1:1) are at the fleet average or norm. For example, if Hi-Priority Failures and Hi-Priority Downtime are equal, the connecting line is parallel to the grid and that system has an Average Logistics Response Time equal to the fleet average. Other ratios behave in the same way. A typical BSC has six sides representing the six TMA-TMI attributes. Additional variables from other data sources may be added and, if scaled to the upper control limit of that data source, will achieve similar results.

Figure 32-4 Sample BSC



32.5.2.3 Time (problem free). Reference (b), establishes Operational Availability (Ao) as the primary measure of material readiness for navy mission-essential systems, subsystems and equipment installed in platforms. Ao represents the expected percentage of time that system or individual equipment will be ready to perform satisfactorily in an operating environment when called for at any random point in time. To provide the primary measure of material readiness for the TMA-TMI systems or equipment, the TMA-TMI Analysis Center has developed a measure

of Ao for selecting, tracking and trending TMA-TMI systems and equipment called Time Problem Free (T (pf)).

a. T (pf) uses the mathematical description of Ao provided by reference (b). Generally, Ao is interpreted as the percentage of time that the system will be ready to perform satisfactorily in an operating environment. T (pf) is interpreted as the percentage of time that the system or equipment is free of hi-priority failures during that same period. Quantitatively, this is expressed in the formula:

Ao = Uptime divided by Uptime + Downtime

For the purposes of describing TMA-TMI systems or equipment, Uptime is equal to Mean Time Between Failure (MTBF) and Downtime is equal to Mean Down Time (MDT). The TMA-TMI formula for T (pf) becomes:

T (pf) = MTBF divided by (MTBF + MDT)

Data to calculate T (pf) is extracted from the Navy's 3-M Database via the OARS. OARS provides a ten-year maintenance history of system and equipment performance.

MTBF (in days) is calculated using the formula:

MTBF = 1 divided by (No. Failures divided by (30.44*0.667*Population)) where

b. No. Failures = the number of Status 2 and 3 2-Kilos written per month. Status 2 is defined by 3-M as inoperative and Status 3 is degraded performance. Limiting 2-Kilo data to Status 2 and 3 eliminates approximately 75% of all 2-Kilos written and provides the basis for measuring mission-degrading performance. Together the TMA-TMI process identifies these as "Deck Plate" CASREPs or maintenance actions that reduce a system or equipment's ability to satisfactorily perform in an operating environment. 30.44*0.667 = 30.44 days in an average month times 0.667, which is defined by reference (b) as "the percentage of time that the system will be ready to perform satisfactorily in an operating environment". For sea-going systems, this operating tempo is approximated as 2/3-calendar time.

c. Population = the actual population of the system or equipment under evaluation or the number of platforms the system or equipment is installed in. Actual numbers of equipment are generally used for CS and larger HM&E items such as Main Engines or Ships Service Generators. Number of platforms is used for multiple installations of smaller HM&E items such as pumps or valves.

d. MDT is computed by month directly from OARS and is the mean number of days from the opening of Status 2 or 3 2-Kilos until the Deck Plate CASREPs are corrected and the 2-Kilos closed. MDT is all-inclusive. It contains such items as Mean Logistics Delay Time, Administrative Time, Mean Total Time to Repair, etc. Breaking MDT down into the contributing elements requires expensive data collection and analysis and is not necessary for TMA-TMI purposes.

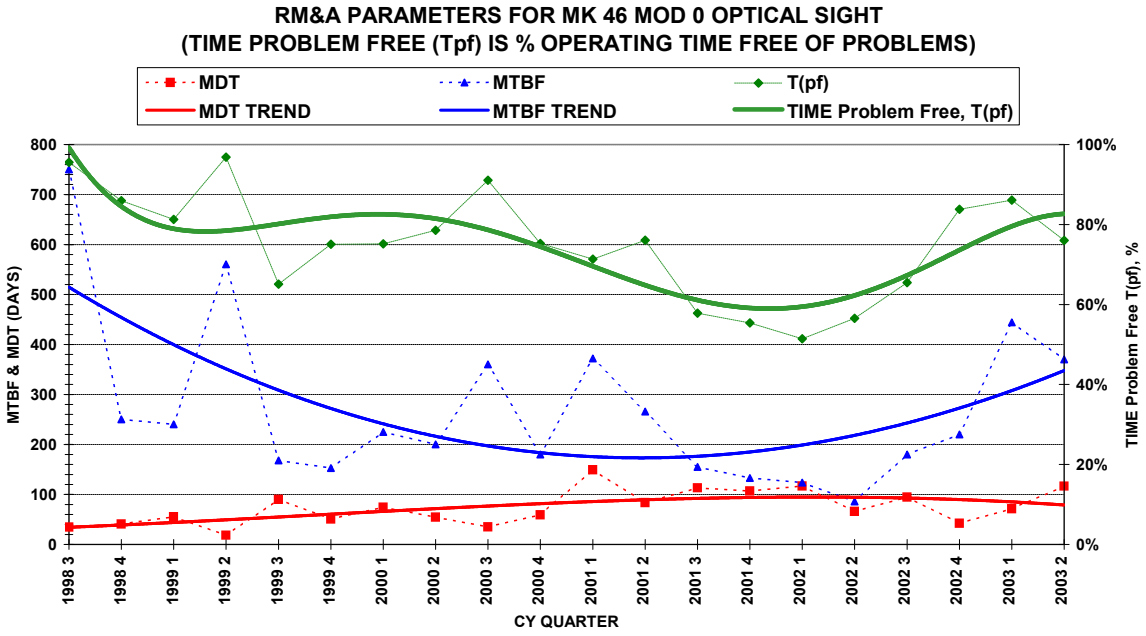
e. Time (problem free) Assessment. The resultant T (pf) meets the requirements of reference (b) and provides a means of assessing:

(1) Operational Availability of TMA-TMI systems or equipment.

(2) Effectiveness of the TMA-TMI program in resolving chronic problems in those systems and equipment.

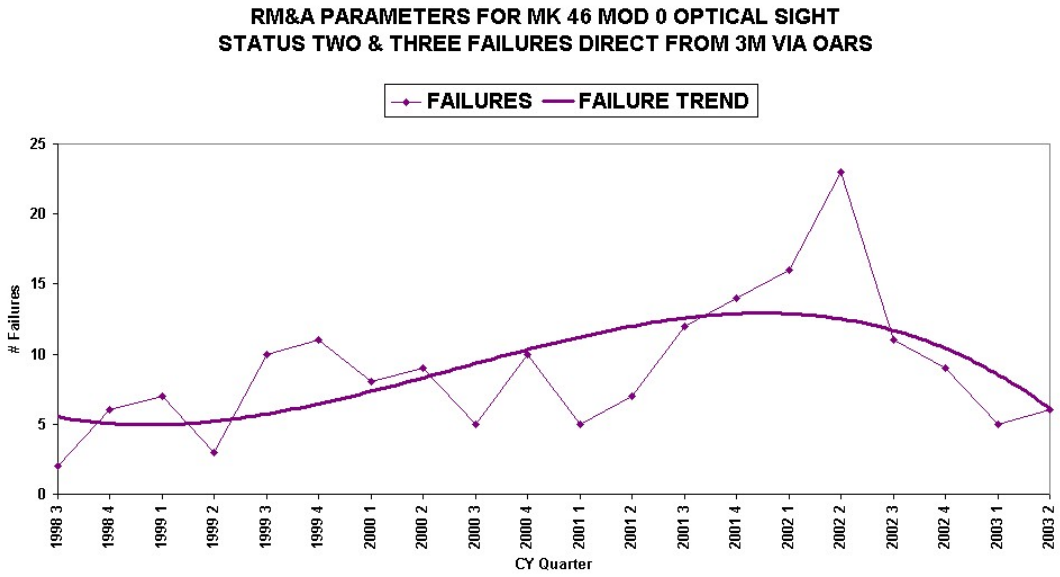
(3) Systems or equipment trends in T (pf), MTBF and MDT over time.

Figure 32-5 Sample T(pf)



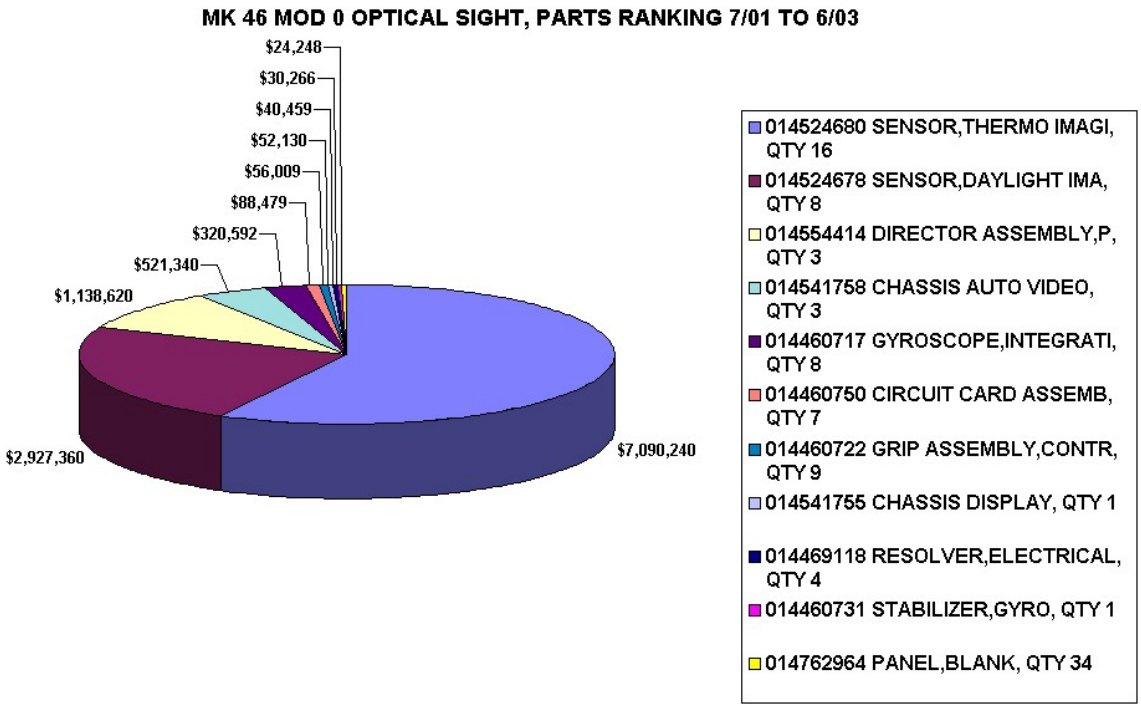
32.5.2.4 Failure Trend. The failure trend provides a failure history for the candidate TMA-TMI system and equipment. Hi-Priority Failures are plotted quarterly for the past five years and a polynomial trend line provides the direction of movement.

Figure 32-6 Sample Hi-Priority Failure Trend



32.5.2.5 Parts Ranking. The Supply Parts Ranking Report, L0201, is a Ships 3-M Standard Report extracted from OARS. This report provides a quick method for determining fleet material problems based on total parts issued and total cost. Parts Ranking is the ten highest "TOTAL_PRICE" parts extracted from OARS. This represents total cost to the Navy, not necessarily to the individual unit. Cost to the unit will be increased for failure to turn in a Depot Level Repairable carcass. The Parts Ranking provides the National Item Identification Number (NIIN), abbreviated NIIN nomenclature, quantity and total cost per NIIN for the ten most expensive repair parts for the candidate system or equipment.

Figure 32-7 Sample Parts Ranking



32.5.2.6 Ship's Logistics Indicator Computerized Report. The SLICR, L0106, is a Ships 3-M Standard Report extracted from OARS. The SLICR is intended to identify problem equipment within the fleet. The SLICR provides the following metrics:

a. APL/EIC.

b. APL_NOMENCLATURE/EIC_NOMENCLATURE.

c. FAILURES: Count of maintenance actions with Status_Code 2 or 3.

d. SF_MNHRS: Total number of Ship's Force man-hours expended by Ship's Force personnel or other installing personnel in completing and documenting the maintenance action.

e. PART_ISSUES: Total number of 1250 and 1348 Supply Order Forms processed in support of maintenance.

f. REPLCMNT_COST: The cost to replace parts used in maintenance with new (not refurbished) parts.

g. IMA_MNHRS: Total number of IMA man-hours expended in completing and documenting the maintenance action.

h. VISITS: The count of maintenance actions with TYCOM screening code = 1, 2 or 3.

i. ACTIONS: A count of deferral, non-deferral and IMA maintenance actions.

j. OWNSHP_COST: The sum of the cost of the labor of Ship's Force personnel, the cost of labor of the IMA personnel, the cost to replace non-repairable items and the cost to fix repairable items for a group of Job Control Numbers for a given APL or EIC.

k. COSAL: COSAL Effectiveness is the probability a requested item is stocked onboard whether or not it is available when requested.

l. NET_COSAL: NET Effectiveness is the probability that a stocked item is onboard when requested.

m. GROSS_COSAL: GROSS Effectiveness is the probability that any requested item is onboard when needed and is the product of COSAL*NET effectiveness.

n. LOG_TIME: The sum of (issue date – open date) divided by the total number of issues; average waiting time for a part issue in days.

o. MAINT_EFFECT: The probability of all required repair parts for a given maintenance action being onboard.

Figure 32-8 Sample SLICR Report

32.5.2.7 Ranking Matrix. The Ranking Matrix is similar to the TMA Ranking Matrix except that it provides data for all six TYCOMs and contains data on over 60,000 APLs. This fleet wide Ranking Matrix allows the Fleet to prioritize TMA-TMI selections on a Navy wide basis.

CHAPTER 33

MAINTENANCE AND MODERNIZATION BUSINESS PLAN

REFERENCES.

(a) OPNAVNOTE 4700 - Representative Intervals, Durations, Maintenance Cycles, and Repair Mandays for Depot Level Maintenance Availabilities of U.S. Navy Ships

LISTING OF APPENDICES.

A. Executive Summary Sheet

33.1 MAINTENANCE AND MODERNIZATION BUSINESS PLAN.

a. The Maintenance and Modernization Business Plan (MMBP) identifies the total private sector maintenance funding budget available to support the ship during the execution year and advance planning and funding needs for availabilities to be executed in future years. The MMBP also includes funding for modernization. This includes funding for all Fleet Alterations and those Program Alterations managed by the Type Commander (TYCOM) or Naval Supervisory Authority (NSA) (Regional Maintenance Center (RMC), Naval Shipyard or Supervisor of Shipbuilding). The MMBP does not include funding for modernization that is managed by the Ship's Program Manager (SPM) or Participating Acquisition Resource Manager and accomplished by Alteration Installation Teams through separately administered contracts.

b. MMBPs will be developed for all ships that will be in commission at the start of the upcoming Fiscal Year (FY). A second MMBP will be developed for any ship scheduled to start a Chief of Naval Operations (CNO) Availability in the first quarter of the following FY. This second business plan will address only the CNO Availability controls, a Risk Assessment and will not include Continuous Maintenance (CM) controls. The TYCOM will normally use the same TYCOM Target Controls for these out-year CNO Availabilities as used for the upcoming FY CNO Availability controls. These out-year MMBPs will require additional refinement in the next MMBP cycle.

33.2 MAINTENANCE AND MODERNIZATION BUSINESS PLAN RESPONSIBILITIES.

33.2.1 Maintenance Team Responsibilities. The Maintenance Team identifies budget needs to the NSA and the TYCOM based on well-documented work in the Current Ship's Maintenance Project (CSMP) and Class Maintenance Plan. The Maintenance Team MMBP identifies the total maintenance funding.

a. The Maintenance Team establishes the funding phasing plan that will roll up to the Fleet Commander's overall phasing plan. It should be noted that the accuracy of the phasing plan is critical to the Fleet and TYCOM's ability to provide timely and stable funding. A Maintenance Team over executing or under executing its budget will cause unnecessary funding churn. For this reason, Maintenance Teams and NSAs should develop phasing plans that are accurate and reasonably achievable. For

example, if a CNO Availability is scheduled to start in the first month of a quarter, the funding for that availability will be required in the previous quarter and should be phased in the earlier quarter. CM phasing will depend largely on ships' schedules and should not simply be divided into four equal quarters in the phasing plan.

b. Each Maintenance Team will include an assessment of known material readiness risks associated with the MMBP funding levels in their initial MMBP submittal. In a case where there is unacceptable risk associated with the assigned funding controls, the TYCOM may agree to adjust assigned controls.

c. Maintenance Teams must use the format provided in Appendix A for MMBP submission.

33.2.2 NSA Responsibilities. For submarines and aircraft carriers, actions assigned to the NSA may be performed directly by the TYCOM or a designated agent (i.e., Immediate Superiors In Command (ISIC), Trident Refit Facility, or Naval Submarine Support Center).

a. The NSA has the authority to execute ship maintenance and must do so following Fleet and TYCOM policies and directives.

b. When conditions warrant, the NSA will develop a Business Adjustment Factor (BAF) percentage for CNO Availabilities to account for local business conditions. BAFs are established as a percentage of the availability budget, similar to the growth or award fee percentages. The BAF is an adjustment or hedge against impacts to the man-day rate or premium levels for specific CNO Availabilities due to factors such as high or low port loading. Examples of other situations that may require an allowance in the BAF are seasonal adverse weather patterns, anticipated labor union issues, anticipated labor rate adjustments or the general business conditions in the port.

c. The NSA will make any additional adjustments to TYCOM target controls based on prioritization of the work package, risk analysis and Business Case Analysis (BCA) included in the Maintenance Team's MMBP submissions. The overall, total NSA CNO Availability funding controls and total CM funding controls provided to the NSA by the TYCOM may not be exceeded in these adjustments.

d. (Surface Ships only) During the year of MMBP execution, changes to individual ship controls exceeding 10% require TYCOM notification; changes in excess of 20% require TYCOM approval. In the event adjustments are required that exceed available funds, the NSA will provide a written justification supporting the change and a formal recovery plan to the TYCOM for approval.

e. Appendix A may be modified as required, with TYCOM concurrence, for unique NSA processes or circumstances.

33.2.3 TYCOM Responsibilities (Surface Force Ships only).

a. Establish Force maintenance policies, directives and authorize the NSA to execute those policies and directives.

b. Provide Target Controls to the NSA in March of each year and review those controls as required by the budget approval process. These controls are between the TYCOM and the Port Engineer.

c. Ensure the established modernization plan is accurate and issue Fleet Alteration Letters of Authorization.

d. Validate MMBPs and issue approved CNO availability and Continuous Maintenance funding controls in naval message format at the beginning of each fiscal year.

e. Align Surface Warfare Enterprise processes with established waterfront support organizations and establish the readiness and cost control processes required to provide greater overall enterprise effectiveness.

f. Support the ISIC with warships ready for tasking by aligning manning, training, equipping and maintaining processes of ships by class.

g. Assess current readiness, analyze metrics, examine trends, determine root causes, establish lessons learned and provide recommendations and solutions, while emphasizing readiness and cost control.

h. The TYCOM will provide the RMCs with TYCOM Target Controls in March of each year and will revise these controls as required by the budget approval process.

33.2.4 TYCOM Responsibilities (Aircraft Carriers and Submarines only). The TYCOM establishes Force maintenance policies and directives and authorizes the NSA to execute those policies and directives.

a. The TYCOM ensures that the established modernization plan is accurate and issues Fleet Alteration Letters of Authorization.

b. The TYCOM has final approval of all MMBPs and will issue approved CNO Availability and CM funding controls in naval message format.

33.2.5 Ship Program Manager Responsibilities. The SPM ensures that the Letter of Authorization for Program Alterations is accurate and includes Program Alterations funding estimates.

33.3 THE MAINTENANCE AND MODERNIZATION BUSINESS PLAN SUBMISSION.

33.3.1 MMBP Spreadsheet. The required format for submission of MMBPs is provided in Appendix A of this chapter. As noted in paragraph 33.2.2.e., changes may be made to Appendix A to reflect NSA unique circumstances.

33.3.1.1 General Description. The MMBP provides the maintenance team's description of the planned maintenance and funding phasing.

33.3.1.2 Executive Summary Sheet.

a. Section I: The Schedule Overview is intended to illustrate major milestones in the current and upcoming year: assessments, deployments, availabilities, decommissioning, etc.

b. Section II: This section begins with initial controls (CNO and CM) and applies adjustments to those controls by TYCOM and RMC. The final numbers in each of these categories are funds available for assignment to CM and CNO work as appropriate. Particular care must be taken to ensure that the sign (where subtraction has a "-" or a number is preceded and followed with parentheses, e.g., "(10)"

indicating a negative number) of these numbers are correct, as they are linked to the CONTROLS AND PHASING sheet.

c. Section III: Ensure that program alterations (K-Alterations) are included here and not included in other locations. D-Alterations, Machinery Alterations, and Ship Change Documents should be located in Section II.

d. Section IV: This section provides an area for the maintenance teams to indicate areas of risk associated with the particular FY's maintenance plan. This section does not include topics that are not applicable to the execution FY risk. Areas to be discussed here:

(1) Work items identified in the UNFUNDED REQUIREMENTS sheet, and their impact to current or future operations.

(2) Upcoming assessments that may identify serious discrepancies.

e. Section V: This section provides a general rollup of the work planned for the execution FY. Items in this section need not be identified by Job Control Number or Job Sequence Number, but rather a general layout of work to be brokered to individual availabilities and their notional values; this should include historical repairs from assessments. The bottom of this sheet sums items from other portions of the workbook for comparison purposes. Items of note in this section:

(1) The items identified in the "green" section of Section V are planned for completion in the execution FY and therefore are not elements of risk.

(2) The "shortfall" cell should be equal to or less than the UNFUNDED cell.

(3) The Risk section on the bottom of the spreadsheet feeds directly from the UNFUNDED REQUIREMENTS SHEET. This section sums the unfunded items by funding type and then by associated risk (see paragraph 33.3.1.4).

33.3.1.3 Controls and Phasing Sheet. This sheet applies changes (growth pools, overhead, award fees, and the business adjustment factors) to the adjusted controls. This sheet provides a further adjustment to the controls, as well as a phasing of the controls that should be completed by the Maintenance Teams so as to reflect the maintenance schedule. Particular care should be taken to ensure that sums are correct, since TYCOMs use this sheet to plan quarterly cash flows.

33.3.1.4 Unfunded Requirements Sheet.

a. This sheet identifies those items in the Class Maintenance Plan or validated maintenance items in the ship's CSMP that cannot be completed in the execution FY due to funding constraints. To be included in the UNFUNDED REQUIREMENTS list, the following conditions must be satisfied:

(1) The work can be accomplished in the time available if additional funding is applied, or

(2) The work can be accomplished in the execution year if additional Continuous Maintenance Availability (CMAV) or CNO time were allotted.

b. The column marked "Funding Type" has permissible entries: CM, CNO and AP. They are meant to indicate the most likely funding areas to which the work would be brokered if funding were available.

c. The "Risk" column has permissible entries of "High," "Medium" and "Low" as determined by a BCA guided by Volume II, Part I, Chapter 4, Appendix D of this manual. These columns must be populated in order to properly assess the risk associated with the MMBP, as well as to feed properly to the Executive Summary Sheet.

33.3.2 Prioritization. Maintenance Teams should use any and all resources at their disposal to prioritize the work for which funds are available. The prioritized work should support the ship's current readiness requirements as well as work designed to ensure the ship can operate effectively its full service life.

33.3.3 Maintenance Summary and Risk Assessment. The Maintenance Team and TYCOMs will address any known maintenance risks based on Funding Controls or ship's maintenance schedule for the upcoming FY. This risk assessment must provide sufficient detail to enable NSA or TYCOM to make critical decisions with respect to funding adjustments. Photographs, inspection reports, docking reports, operating logs, vibration analysis, Maintenance Figure of Merit (MFOM) data and other objective evidence of important maintenance which is not able to be accomplished within the Maintenance Teams funding controls should be included.

33.4 BUDGET PROCESS AND MAINTENANCE AND MODERNIZATION BUSINESS PLAN DEVELOPMENT TIMELINE.

33.4.1 Guidance. In order to develop MMBPs prior to the start of the FY in which they will be executed, it is necessary to begin the process well before the final budget is approved and financial controls are passed to the Fleet Commanders, TYCOMs, and eventually to the Maintenance Teams. Maintenance Teams must develop MMBPs using the following guidance and timeline. For submarines and aircraft carriers, actions assigned to the NSA may be performed directly by the TYCOM or a designated agent (i.e., ISICs, TRIDENT Refit Facility, or Naval Submarine Support Center).

33.4.2 Initial Budget Guidance (March).

a. The TYCOM, in coordination with the Fleet Maintenance Officer, will establish an initial estimate of the expected funding controls for the next FY. Based on this information, TYCOMs will develop a common maintenance funding strategy, establish initial TYCOM Target Controls for each ship's CNO Availability and each ship's CM budget. The CM budget provides funds for both the yearlong continuous availability and scheduled CMAVs. TYCOM Target Controls are passed from the TYCOM to the Maintenance Team as the initial input to the MMBP process.

b. The TYCOM and the SPM will ensure Letters of Authorization accurately reflect the modernization plan. SPMs and Participating Acquisition Resource Managers will provide installation estimates for Program Alteration installations or installation support services for which funding will be provided to the Maintenance Team. The TYCOM Target Controls will be separated into Fleet maintenance and Fleet funded alteration controls by the TYCOM before the controls are passed to the NSA.

33.4.3 Provide Controls to Maintenance Team (April).

a. The Maintenance Teams will use the Class Maintenance Plan to develop assessment schedules with NSA for inclusion in individual MMBPs.

b. ISIC must provide ship operational schedule information to the Maintenance Team. This information is used to schedule CMAVs and Assessments for the upcoming year.

c. The NSA will establish BAF if required for each CNO Availability, anticipated CNO Availability and CM growth percentages, support service percentages and Award Fee percentages as applicable for entry into the MMBP Budget Planning Sheet, Appendix A. For surface ships, Maintenance Teams may modify target controls for ships within a class based on their relative material condition.

d. Maintenance Teams will develop MMBPs based on these initial controls. This iterative process will involve risk assessment and a BCA of any differences between the Maintenance Teams identified funding needs and the funding controls established for them.

33.4.4 Execution Strategy Adjustments (May). The TYCOM in coordination with Fleet Commanders will determine if adjustments to the TYCOM Target controls are required. For surface force ships, the TYCOM will provide the NSA with direction for the adjustment of controls.

33.4.5 (Surface Ships only) Maintenance Team Submit MMBPs for Approval via NSA (June). The NSA approves, consolidates and submits copies of each assigned ship's MMBP to the TYCOM for review and approval.

33.4.6 TYCOM Approves MMBPs (July).

a. The TYCOM approves MMBPs and issues final approved CNO availability and CM controls.

b. The TYCOM or RMC provides final CNO budget controls and CM controls to the Maintenance Teams.

33.4.7 Submit Phasing Plans (August).

a. The NSA funds administrators will review and adjust each Maintenance Team's phasing plan to correspond with the total controls. Each NSA will provide the Maintenance Team phasing plans to TYCOM.

b. The TYCOM will submit phasing plans to the Fleet Commander.

c. The Project Manager is responsible for ensuring all MMPB related information is entered in the Navy Maintenance Database for all surface ship availabilities, including the TYCOM Annual Operating Controls. If the TYCOM controls are unknown at time avail is established within NMD, then a Notional Control must be entered in the interim until an actual control is established.

33.5 BUSINESS PLAN RESOURCES. The following resources and information must be reviewed and considered in the development of MMBPs. This list is not intended to be all-inclusive and is provided as a starting point.

a. The notional CNO man-day requirements used by the TYCOM to establish initial TYCOM Target Controls.

b. The ship's CSMP.

c. The ship's Baseline Availability Work Package.

d. The Class Maintenance Plan.

e. Areas of specific concern that will be assessed or inspected prior to the availability.

f. Modernization Plan - Program and Fleet Alterations.

(1) Program Ship Change (SC) Authorization letters provided by Program Executive Officer Ships include NAVSEA, Naval Information Warfare Systems Command (NAVWAR), Naval Supply Systems Command and Naval Air Systems Command (NAVAIR) planned installations.

(2) Fleet SC Authorization letters provided by the TYCOM include Fleet Alterations, Alterations Equivalent to Repair and Machinery Alterations.

(3) Information contained in Program Executive Officer or Systems Command and TYCOM SC authorization letters will be consolidated into Hull Modernization Plans. Hull Modernization Plans will list all SCs (Program and Fleet Alterations) programmed for installation on each ship for the entire FY.

g. Deployment and operational schedules.

h. Assessment and inspection schedules (Hull, Mechanical, Electrical Readiness Assessment (HMERA), Command, Control, Communications, Computers and Combat Systems Readiness Assessment (C5RA), Board of Inspection and Survey (INSURV), etc.).

i. Ship's event schedules (Change of Command, etc.).

j. Long-term ship's CNO Availability and decommissioning schedule.

k. CNO Availability and CMAV Planning Milestones.

l. Departures from Specifications.

m. Habitability Project Plan or Schedule (TYCOM provide).

n. Other Availability Programs (TYCOM provide).

(1) Underwater Hull Cleaning.

(2) Calibration.

(3) Other miscellaneous.

APPENDIX A

EXECUTIVE SUMMARY SHEET

USS XXX (XX-XX)

MAINTENANCE AND MODERNIZATION BUSINESS PLAN

FY 2010

PORT ENGINEER: **PE**
PROJECT MANAGER: **PM**

I. SCHEDULE OVERVIEW

	EVENT		DATES	
A.	**CNO Availability**	**(Start-End)**		
B.	**Continuous Maintenance Avails (CMA)**			
	CMA 0A1	(Start-End)		
	CMA 0A2	(Start-End)		
	CMA 0A3	(Start-End)		
	CMA XA4	(Start-End)		
C	**Surge Ready Asset**			
		(Start-End)		
		(Start-End)		
D.	**Assessments - Major**			
	PSART	(Start)		
	C5RA	(Start)		
	Main Propulsion Plant Assessment DEI 1, 3 SSDG	(Start)		
	Main Propulsion Plant Assessment Gas Turbine Inspections	(Start)		
	Total Ship Readiness Assessment (TSRA) (1, 2, 3, 4)	(Start)		
E.	**Training Cycle**			
	Ultra E + C (Engineering and Combat Readiness Training Assessment, 12M Cert)	(Start)		
	Ultra S+ (Sustainment, 12M Cert)	(Start)		
	Group Exercise	(Start)		
	Group Certification	(Start)		
F.	**Deployment**			
			Deploys	**Returns**

	EVENT		DATES	
G.	**INSURV**	**(Last-Next)**		
			Deploys	**Returns**
H.	**Out-Year CNO Availabilities**			
		(Start-End)		
		(Start-End)		
		(Start-End)		
I.	Docking CNO Avail - Next	(Start-End)		
J	Planned DECOMM Date	(End)		

II. TYCOM FUNDING CONTROLS

A.	MFOM Data		
	a.	Class Average Weighted MROM (MFOMw)	$0
	b.	MFOMw	$0
B.	Continuous Maintenance & I - Level Expenditures		
	a.	Initial TYCOM CM Target Control (total)	$0
	b.	CM Control Designated for Fleet Alterations	$0
	c.	RMC Net Target Control for Maint (c+d)	$0
	d.	Prior Year Funds Available	$0
	e.	RMC Adjustments (Indicate + or -)	$0
	f.	FY-10 TYCOM Funding CM CONTROL (Maint) e+f+g	$0
	g.	FY-10 TYCOM Funding DIL CONTROL (Maint)	$0
	h.	Total TYCOM CM & DIL Control (h+b+i)	$0
C.	FY-10 CNO Avail		
	a.	Initial TYCOM Target Control (total)	$0
	b.	CNO Avail Control Designated for Flt Alts	$0
	c.	CNO Maint Control before Adjustment(a-b)	$0
	d.	RMC Net Target Control for Maint	$0
	e.	Prior Year Funds Available	$0
	f.	RMC Adjustments (Indicate + or -)	$0
	g.	TYCOM Funding CNO CONTROL (Maint) (e+f+g)	$0
	h.	Total TYCOM CNO Control (h+b)	$0
D.	Advance Funding Previously Obligated on FY-10 CNO Avail		
	a.	FY-08 Advance Funding	$0
	b.	FY-09 Advance Funding	$0
	c.	TOTAL	**$0**

E.	Advance Funding for FY-11 CNO Avail		
	a.	FY-09 Advance Funding	**$0**
	b.	FY-10 Advance Funding	**$0**
F.	Habitability (TYCOM N43 Managed & Funded)		
G.	ORATA (TYCOM N43 Managed & Funded)		
	a.	Underwater Hull Cleaning	$0
	b.	Calibration, other Misc ORATA Programs	$0
	c.	Total	$0
H.	Assessments (Mission Funded - estimates for RMC budgeting only)		
	a.	HMERA	$0
	b.	C5RA	$0
	c.	TSRA	$0
	d.	Total	$0

III. PROGRAM ALTERATION FUNDING CONTROLS (Funding Managed by RMC)			
A.	NAVSEA (PEO-SPM)		
	a.	CNO Avail Program Alteration Controls	$0
	b.	CM Program Alteration Controls	$0
B.	NAVWAR		
	a.	CNO Avail Program Alteration Controls	$0
	b.	CM Program Alteration Controls	$0
C.	NAVAIR		
	a.	CNO Avail Program Alteration Controls	$0
	b.	CM Program Alteration Controls	$0

IV. NARRATIVE RISK ASSESSMENT

A. Schedule Summary		
	a. CNO avail:	
	b. Deployment cycle (Training sched):	
	c. INSURV	
	d. CMAV	

	e. Out-Years (Future major events, AP CNO, Home port shift, etc.)	
B. Assessment-Repair Summary		
	a. Main Propulsion	
	b. Auxiliary Equipment	
	c. Distributive Systems	
	d. Combat Systems	
C. Corrosion Control Summary		
	a. Tanks b. Decks/ Bilges c. Structural (fan rooms, stacks)	
D. CLASS Specific Major Anticipated Repairs.		
	a.	
	b.	
	c.	
E. TYCOM Unscheduled Modernization		
	a. Fleet Alts	
F. Summary Risk Assessment.

CHAPTER 34

FLIGHT DECK NON-SKID INSPECTION

REFERENCES.

(a) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval Ships
(b) COMNAVAIRFORINST 4790.2 - Naval Aviation Maintenance Program (NAMP)
(c) COMNAVSURFOR/COMNAVAIRFOR/COMMARFORCOM/COMMARFOR PACINST 4790.3 - Prevention of Foreign Object Damage (FOD) on CVN and LHD/LHA Class Ships
(d) NAVSEA S9086-VD-STM-010 - NSTM Chapter 631 - Preservation of Ships in Service General
(e) NAVSEA S9086-VG-STM-010 - NSTM Chapter 634 - Deck Coverings General
(f) COMNAVSURFOR/COMNAVAIRFOR 9634.2 Instruction – Deck Nonskid Application, Inspection, Training, Quality Assurance and Reporting Procedures

34.1 PURPOSE. The purpose of this section is to prevent Foreign Object Damage (FOD) to aircraft engines as it relates to flight deck non-skid, and to provide guidance on flight deck non-skid repair aboard Amphibious Class Ships and Aircraft Carriers conducting fixed wing aircraft operations. It is necessary to repair damaged non-skid in areas exposed to aircraft launch and recovery operations in a timely fashion in order to minimize risk of FOD to aircraft engines. Maintenance policy for ships is outlined in reference (a) and information regarding the Naval Aviation Maintenance Program is located within reference (b). The inspection of flight deck non-skid is to be accomplished prior to the first flight operation of the day per reference (c).

34.2 BACKGROUND.

a. Ingestion of foreign objects by gas turbine engines accounts for the largest percentage of premature engine removals from naval aircraft. FOD to an aircraft gas turbine engine caused by ingestion of flight deck non-skid can degrade engine performance and drive unscheduled removal and replacement of a damaged engine. Catastrophic engine failure from FOD may lead to loss of aircraft. Additionally, FOD presents personnel and material hazards, consumes valuable maintenance man-hours, imposes additional unscheduled workloads, creates additional logistics requirements, wastes dollars, and reduces operational readiness.

b. All non-skid materials will produce chips from daily wear associated with aircraft and ground support operations. Flight deck cleaning and FOD walk downs prior to flight operations are used as a precaution against ingestion of non-skid and other foreign objects by aircraft.

c. Routine operations may damage flight deck non-skid. Wear and tear associated with helicopter landing skids, and the impacts of dropped or dragged heavy or sharp items may each result in damaged non-skid that exposes the flight deck bare metal surface. Corrosion associated with this bare metal eventually undercuts the non-skid in adjacent areas, leading to failure of the non-skid coating and a subsequent FOD risk.

d. The consequences of damaged non-skid and the associate FOD risk make it imperative

that damaged non-skid is repaired in a timely manner.

34.3 SCOPE. This chapter applies to all Amphibious Warfare ships and Aircraft Carriers that conduct fixed-wing aircraft operations.

34.4 RESPONSIBILITIES.

34.4.1 Ship's Force.

a. The non-skid inspection and repair procedures described are accomplished by Ship's Force, in order to provide early detection and treatment of corrosion and non-skid failures. Maintenance Requirement Cards contained within the Planned Maintenance System provide specific guidance for performing inspection of critical coated non-skid decks for corrosion and non-skid coating failure(s). Refer to reference (d) for boundary requirements for preparation and painting and critical coated decks are described in reference (e).

b. The following actions apply to ship's force when non-skid discrepancies are found:

(1) Non-skid failure less than 36 square inches - Repair with primer no later than 28 days after discovery.

(2) Non-skid failure greater than 36 inches and less than 50 square feet - Repair with non-skid system no later than 28 days after discovery.

(3) Ship's force will contact the Type Commander when areas of non-skid failure are greater than 50 square feet, or total area of non-skid failure is greater than 500 square feet.

34.4.2 Quality Assurance Officer (where assigned). Refer to Non-skid Quality Assurance Officer (QAO) for disposition of failed non-skid requiring submission of Work Request to Industrial Activity to repair or replace failed non-skid. Nonskid QAO is defined in reference (f). All non-skid existing or corrected problems/discrepancies must be listed in the Work Center's CSMP for history purposes.

VOLUME VI

CHAPTER 35

REGIONAL MAINTENANCE CENTER I-LEVEL MAINTENANCE CAPABILITIES

LISTING OF APPENDICES.

A Regional Maintenance Center I-Level Maintenance Capability Matrix

35.1 PURPOSE. This chapter provides a listing of Regional Maintenance Centers (RMC) Intermediate Level (I-Level) maintenance capabilities for Surface Force ships and defines related reporting requirements. The Strike Force Intermediate Maintenance Activity (SFIMA), volume III, chapter 6 of this manual describes policies, provides governance and reporting requirements, and assigns roles, responsibilities, and actions necessary for Strike Group units.

35.2 BACKGROUND. The primary mission of an RMC is to promote surface ship readiness via assessment, troubleshooting, and repair of systems and equipment which are beyond the technical capability or capacity of Fleet units. A secondary mission of an RMC is to provide enough production work experience and on-the-job training to sailors for them to improve their technical knowledge and, where appropriate, earn a Navy Enlisted Classification (NEC) code used to fill Navy Afloat Maintenance Training Strategy (NAMTS) billets when returning to sea duty. An RMC accomplishes both of these missions, in part, with the sustainment and utilization of their I-Level maintenance capability.

35.2.1 Onboard Support. In addition to ship-to-shop and standard shipboard repair and maintenance work, the RMC I-Level capability is utilized to provide onboard Maintenance Assist Team (MAT) I-Level support to ships in port. The MAT concept was designed to bring RMC repair and maintenance training capability to bear on shipboard systems to improve Ship's Force repair, self-assessment, maintenance and equipment operations capability.

35.2.2 Applicable Regional Maintenance Centers. There are five RMCs with existing surface ship I-Level workforce: three of which are stand-alone Activities and two that are incorporated within Naval Shipyards. Southwest Regional Maintenance Center (SWRMC) is located in San Diego, CA. Hawaii Regional Maintenance Center (HRMC) is a function incorporated within Pearl Harbor Naval Shipyard and Intermediate Maintenance Facility (PHNSY&IMF). Northwest Regional Maintenance Center (NWRMC) is a function incorporated within Puget Sound Naval Shipyard and IMF (PSNS&IMF). NWRMC also includes Everett, WA maintenance operations. Mid Atlantic Regional Maintenance Center (MARMC) is located in Norfolk, VA. Southeast Regional Maintenance Center (SERMC) is located in Mayport, FL.

35.3 RESPONSIBILITIES.

35.3.1 Fleet Commanders. (individually or jointly, as appropriate).

a. Approve changes, additions and deletions to the I-Level Capabilities Matrix (Appendix A) as recommended by the Type Commanders (TYCOM).

b. Approve recommended changes to the NAMTS NEC At-Sea Requirements Matrix as provided by the TYCOMs.

c. Approve and forward, with endorsement, NAMTS NEC modifications as developed and recommended by Commander, Navy Regional Maintenance Center (CNRMC)

with TYCOM concurrence, to the Navy Enlisted Occupational Classification System Board.

d. Review, approve and submit Billet Change Requests (BCR) developed by CNRMC, to support the sea and shore rotation requirements.

e. Request additions and deletions to the I-Level capabilities listed in Appendix A and corresponding capacities at each RMC based on utilization metrics and written Business Case Analysis to the cognizant Fleet Commander.

f. Ensure full utilization of the full range of organic RMC I-Level capability identified in Appendix A.

g. Establish and communicate work priorities to CNRMC and cognizant RMCs. Resolve work priority conflicts as necessary.

h. Regularly assess NAMTS maintenance skills required on respective afloat units.

i. Approve CNRMC recommended, or recommend additional changes to specific NAMTS maintenance skills and required training for billets on respective afloat units.

j. In collaboration with CNRMC, review and recommend NAMTS NEC At-Sea Requirements Matrix revisions to the cognizant Fleet Commander(s).

k. Review and approve establishment and disestablishment of MATs, as recommended by CNRMC. Optimize utilization of MATs capacity within existing total I-Level workload in each cognizant RMC.

35.3.2 Commander, Navy Regional Maintenance Center. CNRMC will:

a. Provide the capabilities identified in Appendix A following all applicable policy, regulations and technical requirements. Ensure detailed capability manuals are issued by each RMC to expound on and clarify the exact capabilities identified in Appendix A.

b. Coordinate with the TYCOMs to ensure full utilization of the funded capacity, adjusting capacity as necessary. Include utilization analysis and NAMTS Program inspections in Fleet Maintenance Activity Assessments of RMCs.

c. Provide cost estimates and implementation plans to the Fleet Commanders for proposed additions and deletions to capabilities in Appendix A, as well as increases or decreases to capacity at any and all RMCs.

d. Establish policy, requirements and direction for NAMTS program management and execution at RMCs.

(1) Provide oversight of NAMTS program execution and qualifications to ensure:

(a) Compliance with NAMTS roles, responsibilities and program execution per the NAMTS Program Operations Guide, CNRMCINST 4700.10.

(b) NAMTS enrollment and qualification is maximized.

(c) “Hands-on” journeyman-level skills training is an integral part of Job Qualification Requirement (JQR) qualification.

(d) The number of experienced JQR journeyman qualified personnel produced, is adequate to fill NAMTS NEC-coded afloat billet requirements established by the cognizant Fleet Commander(s).

(2) Provide NAMTS JQR Life Cycle Management including the following:

(a) Coordinate with TYCOMs, Surface Warfare Officer's School - Fleet Enlisted Engineering Training and RMCs to ensure JQRs meet NAMTS NEC requirements. Changes to NAMTS NEC requirements may result from ship system modifications, upgrades or new acquisitions.

(b) Develop, review, coordinate feedback or revise JQRs as required. At a minimum, coordinate JQR reviews every three years.

(c) Approve new and changes to JQRs. Determine or approve which JQRs are executed at RMCs.

(d) For new JQRs, coordinate the development and submission of Course Identification Number packages to support NEC management and training accomplishment.

(e) Maintain Master JQR Library.

(3) Maintain and monitor a master test question data bank to support pre- and post-JQR examinations and JQR qualification oral boards.

(4) Promote NAMTS program awareness among Fleet activities and sailors, to include:

(a) Host and maintain an information web site that supports NAMTS program management and awareness, training materials and metrics.

(b) Publish newsletters and other media to enhance program awareness.

(c) Establish and maintain a system of metrics to reflect NAMTS program performance including eligibility, enrollment and qualification trends.

(5) Establish a manpower and NAMTS NEC At-Sea Requirements Matrix and coordinate periodic reviews with TYCOMs.

(a) Develop quarterly review schedules to ensure Ship Manning Documents for all afloat units are reviewed annually at a minimum.

(b) In conjunction with manpower reviews, the NAMTS NEC At-Sea Requirements Matrix must be reviewed annually.

(c) Review sea and shore rotation impacts resulting from recommended NEC changes.

(d) Submit review results and recommendations to United States Fleet Forces or Commander, Pacific Fleet via TYCOMs prior to BCR submissions.

1 NAMTS NEC At-Sea Requirements Matrix changes.

2 NAMTS NEC modifications through the Navy Enlisted Occupational Classification System Board process.

3 Navy Manpower Analysis Center NEC changes.

(6) Conduct Quarterly NAMTS Program Reviews with RMC representatives. Reviews must include at a minimum:

(a) Eligibility, enrollment, qualification and NECs award trends.

(b) Status of manpower, NAMTS NEC At-Sea Requirements Matrix reviews, BCRs, NEC modifications, feedback reports or other pending actions.

(7) Develop a series of metrics to measure and monitor the performance and overall health of the NAMTS program. In particular, eligibility, enrollment, qualification and NEC award trends, accounting for all Sailors in NAMTS NEC source ratings, must be measured and analyzed. Metrics must be developed to support both program monitoring within the NAMTS organization and up line reporting as required.

e. As MAT Program Manager, establish requirements and guidance for the execution of MATs at the RMCs, including reporting requirements.

f. Coordinate with the cognizant TYCOM on the establishment, disestablishment and utilization of MATs.

35.3.3 Regional Maintenance Center.

a. RMC areas of responsibility are the same as those identified in chapter 2Table 2.1 of this volume. The RMC must exercise all I-Level functions and responsibilities when services are required or requested by fleet activities within these areas unless assigned to another RMC by the Fleet Maintenance Officer. This includes utilization of the I-Level capability as appropriate.

b. Include details of I-Level capabilities in RMC capability manuals.

c. Identify and communicate shop loading to applicable Forces Afloat and TYCOMs to ensure full utilization of the funded capacity. This includes the use of this capacity to establish MATs.

d. These requirements apply to Naval Shipyards when they are assigned RMC functions.

35.4 REGIONAL MAINTENANCE CENTER PERFORMANCE MEASURES. (Submarine Only) RMC I-Level capability performance will be reported monthly to CNRMC per guidelines in volume II, part IIII, chapter 3, paragraph 3.6.5.1 of this manual for continuous evaluation.

a. MAT utilization and performance measures must be included in the RMC monthly I-Level Reports.

b. CNRMC will provide quarterly summary reports of I-Level performance, including MATs, to the cognizant TYCOM and Fleet Maintenance Officer.

APPENDIX A

REGIONAL MAINTENANCE CENTER I-LEVEL MAINTENANCE CAPABILITY MATRIX

CATEGORY	CAPABILITY	MARMC	SERMC	SWRMC	NWRMC	HRMC
I	EXECUTION OF ASSIGNED SHIP REPAIR AND MAINTENANCE	X	X	X	X	X
I-A	Perform structural repairs (Shipfitter)	X	X	X	X	X
I-B	Perform pipe repairs (Pipefitter)	X	X	X	X	X
I-C	Perform insulation and lagging services	X	X	X	X	X
I-D	Perform repair and maintenance of ship's RHIBs	X	X	X	X	X
I-E	Perform (Inside Machinist) machining services	X	X	X	X	X
I-F	Perform diesel engine governor and injector repairs and maintenance	X	X	X	X	X
I-G	Perform valve repair and maintenance	X	X	X	X	X
I-H	Perform diesel engine repair and maintenance	X	X	X	X	X
I-I	Perform hydraulics system repair and maintenance	X	X	X	X	X
I-J	Perform pump repairs and maintenance	X	X	X	X	X
I-K	Perform gas turbine repairs and maintenance	X	X	X	X	X
I-L	Perform (Outside Machinist) machinery repairs and maintenance	X	X	X	X	X
I-M	Perform air conditioning and refrigeration repair and maintenance	X	X	X	X	X
I-N	Perform flex hose fabrication and testing	X	X	X	X	X
I-O	Provide mechanical and photo engraving services	X	X	X	X	X
I-P	Provide key and lock repair services	X	X	X	X	X
I-Q	Perform repairs and maintenance to heat exchangers	X	X	X	X	X
I-R	Perform inside electrical repair and maintenance, including motor troubleshooting	X	X	X	X	X
I-S	Provide sound vibration analysis of rotating equipment (both in place and in shop)	X	X	X	X	X
I-T	Perform outside electrical repair and maintenance	X	X	X	X	X

CATEGORY	CAPABILITY	MARMC	SERMC	SWRMC	NWRMC	HRMC
I-U	Perform cableway inspections	X	X	X	X	X
I-V	Perform repair and maintenance of interior communication systems	X	X	X	X	X
I-W	Perform test, repair and maintenance of electronic modules (2M) and provide qualification services for shipboard site reviews and personnel certification of (2M) technicians	X	X	X	X	X
I-X	Perform repair and maintenance of electronics systems	X	X	X	X	X
I-Y	Perform repair and maintenance of sonar systems	X	X	X	X	X
I-Z	Perform repair and maintenance of fire control and weapons systems	X	X	X	X	X
I-AA	Perform repair and maintenance of antennas	X	X	X	X	X
I-AB	Provide corrosion control services (also as part of all NAMTS NECs)	X	X	X	X	X
I-AC	Perform repair and maintenance of HLS and RAST systems	X	X	X	X	X
I-AD	Perform repair and maintenance of life rafts	X	X	X	X	X
I-AE	Repair and overhaul CIWS and 25mm chain guns	X	X	X	X	X
I-AF	Perform repair and maintenance of mine warfare specific systems		X	X		
I-AG	Provide diving services, including hyperbaric chamber	X	X	X	X	X
I-AH	Perform rigging, weight testing and manufacture of weight handling devices	X	X	X	X	X
I-AI	Provide oil analysis, spectral analysis, fluid contamination and particle contamination services	X	X	X	X	X
I-AJ	Perform non-destructive testing	X	X	X	X	X
I-AK	Provide weld qualification services	X	X	X	X	X
I-AL	Provide the services of a certified Marine Gas Turbine Inspector	X	X	X	X	X
I-AM	Provide various calibration services not provided by regional calibration centers	X	X	X	X	X
I-AN	Provide SISCAL Level II services	X	X	X	X	X

CATEGORY	CAPABILITY	MARMC	SERMC	SWRMC	NWRMC	HRMC
I-AO	Provide shipboard welding and brazing services	X	X	X	X	X
I-AP	Provide SCBA Cylinder testing and mask flow testing	X	X	X	X	
I-AQ	Provide Maintenance Assist Teams (MAT)	X	X	X	X	X
I-AR	Provide test, repair and maintenance of fiber optics and provide qualification services for shipboard site reviews and personnel certification of fiber optics test and repair (FOTR) technicians	X	X	X	X	X

VOLUME VI

CHAPTER 36

SURFACE FORCE SHIP AND AIRCRAFT CARRIER MODERNIZATION PROCESS

36.1 SCOPE. This chapter is applicable to all Surface Force ships, Aircraft Carriers, and AEGIS ashore sites involved in the Navy Modernization Process (NMP), as delineated in reference (a). The provisions of this chapter have been developed in collaboration with Naval Operations (OPNAV). Where there are conflicts with reference (a), this chapter must take precedence until such time as OPNAV implementing directives can be modified and issued. Submarine Modernization is described in chapter 3. Exceptions and exemptions to the NMP are identified in reference (a). Reference (b) provides the policy for Command, Control, Communications, Computer, Combat Systems, Intelligence, Surveillance, and Reconnaissance modernization. Reference (c) governs the policy for Alteration Installation Teams (AIT) installing Ship Changes (SC) including the Regional Maintenance and Modernization Coordination Office (RMMCO) check-in and check-out process. Fleet Commanders (FLTCDR) and Type Commanders (TYCOM), per references (a) through (c), ensure implementation of this process.

NOTE: UNAUTHORIZED SHIP CHANGES TO NAVY SHIPS ARE PROHIBITED.

36.2 PURPOSE. The purpose of this chapter is to provide an overview of the entire NMP. The NMP provides a structure for identifying, planning, designing, approving, installing, sustaining, and maintaining configuration control of ship modernization. The NMP is designed to prevent unauthorized and non-supported SCs from being installed on Navy ships. Unauthorized SCs represent a substantial cost to the Navy in terms of the loss of configuration control, inefficiencies due to unexpected installation interferences, systems and equipment that are not logistically supported, and resources expended to support items which are no longer needed. Unauthorized SCs can also adversely impact the interoperability of highly technical and integrated combat systems which equates to a loss of combat effectiveness due to a reduction in Battle Group and Strike Force Interoperability (SFI) and individual ship capabilities.

36.3 BACKGROUND. The NMP has progressed from the pre-2004 Fleet Modernization Process to the Ship Maintenance process of 2005-2007 to the NMP of today. The Entitled Process (EP) for Navy Modernization was promulgated by the Commander, Naval Sea Systems Command (NAVSEA) in 2006 and, upon adoption, became known as the NMP to recognize its broad application and permanence.

36.4 NAVY MODERNIZATION PROCESS. The NMP employs five modernization phases: Phase I – concept design; Phase II - preliminary design; Phase III - detailed design; Phase IV - advance planning and procurement; and Phase V - installation, check-out and feedback. These phases and the associated policies and processes are documented in reference (a) and in NAVSEA Technical Specifications. Reference (a) also delineates the management roles within the NMP and their respective responsibilities. The NAVSEA Technical Specifications define policy, process, and responsibilities for specific modernization sub-processes, (e.g., Liaison Action Records (LAR), Ship Installation Drawings (SID), and Alterations Accomplished by AITs).

36.4.1 Exceptions and Exemptions. The following exceptions and exemptions apply to the NMP:

a. The Deputy Commander for Nuclear Propulsion, , is responsible for all technical matters pertaining to nuclear propulsion of U.S. Navy ships, including all aspects of integration of the nuclear plant into ship systems. The procedures and requirements of this chapter are not applicable to alterations under the cognizance of the Deputy Commander for Nuclear Propulsion.

b. Equipage as defined in reference (a). Equipage consists of portable items that are not permanently installed.

c. Habitability as delineated in volume VI chapter 16 of this volume.

d. Service Craft, Combatant Craft, and Boats as delineated in reference (d).

e. Information Assurance and Vulnerability Management (IAVM) products are exempt from this chapter. IAVM is a process that provides positive control of vulnerability notification, corresponding corrective action, and IAVM status visibility for the Department of Defense Network Assets. The IAVM program applies to any device on Department of Defense owned, controlled, or contracted networks.

f. Form, Fit, or Function replacement items as defined in reference (a).

g. Shipbuilding and Conversion, Navy funded installations occurring during new construction.

h. Database updates (e.g., threat library updates, technical manual database updates, etc.) are exempt from this chapter.

i. Littoral Combat Ship (LCS) Mission Modules (MM) are designed to provide the specific warfighting capabilities and operation for the LCSs. Their flexibility contributes to maritime dominance and provide improved access for the joint force. All MMs designated for embarkation have been authorized via the Mission Package Certification, Warfare Center Certification, Combat System Certification and

Integrated Logistics Support (ILS) Certification. The MM program will keep the Naval C5IMP Modernization Council (NCMC) apprised of currently certified and fielded Mission Package baselines. Additionally, it will identify plans for fielding newer baselines. Ao message and Electronic Configuration Control Board (eCCB) Risk Form per reference (b) will be submitted to the FLTCDR for approval prior to embarkation or debarkation on an LCS platform for non-mature MM baselines.

36.4.2 Software Policy. NMP requirements for software SCs are determined by their change categories defined in reference (a). The change categories are:

a. Major Release. Major releases are not exempt from any NMP requirements. Major releases consist of software that:

(1) Contains a noun name not currently fielded.

(2) Forces changes in the interface with an external system.

(3) Adds, removes, or implements major modification to a capability that was already implemented or intended to be implemented but was not released in a previous version.

(4) Requires an on-site installation visit duration including testing, but not training, of greater than 21 calendar days.

(5) Impacts functionality inside at least one certification boundary.

b. Standard Release. Standard releases are exempt from the Ship Change Document (SCD) review process. Alteration revision records must be created and scheduled in the Navy Data Environment (NDE) Navy Modernization.NET (NM.NET) application for standard releases. Standard releases are additional functionality that does not meet the requirements for a major release and:

(1) Corrects implementation of an existing interface with an external system.

(2) Offers a change in the interface with an external system.

(3) Shifts from one existing interface to another.

(4) Adds or removes implemented functionality.

(5) Has a training and, or operational impact that is noticeable to the user and can be informed by Fleet Advisory or electronic notification upon install.

(6) Has an operational impact that increases administrator or operator workload by no more than 20%.

(7) Requires an on-site installation.

(8) Are other impactful non-hardware changes to the hosting environment.

c. Minor Release. Minor releases are any other software change that does not meet the criteria for a major or standard release. Minor releases include Inconsequential

Overmatch Software Armory software deliveries. Minor releases are exempt from the NMP.

NOTE: SHIP'S FORCE MUST NOT BE RESPONSIBLE FOR ACCOMPLISHING RE-LOADS.

d. Restorative (Re-Load) Installation. Restorative installations are re-loads of previously installed software version on a newly installed hardware component, system, or operating system. New alteration accomplishment records must be created and scheduled in NDE NM.NET application for Restorative Installations. When an AIT needs to come onboard to accomplish the re-load and subsequent testing, the requirements of references (a) and (b) apply.

e. Qualified Development Security Operations (DevSecOps) Deployments. Qualified DevSecOps Deployments (QDD) are any functions, capabilities or fleet driven updates that are delivered over the network using a qualified DevSecOps Framework. QDDs are exempt from the SCD review process. Alteration records must be created NM.NET to capture QDD installations. QDDs are also exempt from the Target Configuration Date (TCD) Waiver process defined in reference (b).

36.5 SHIP CHANGE DOCUMENTS. The SCD is the mechanism used to communicate and obtain approval for planned modernization. SCDs are initiated in the NDE EP application, are submitted through a structured review process, and ensure that applicable Navy stakeholders review and approve the proposed SCs prior to installation or execution.

36.5.1 Scope. SCD scope consists of the following categories:

a. Ship Modifications. Ship Modifications consist of Ship Alteration and Alteration Equivalent to Repair Alteration Types.

b. Internal Equipment Modifications. Internal equipment modifications consist of Engineering Changes, Machinery Alterations, Ordnance Alterations, and Software Deliveries, as well as QDD Alteration Types.

c. Site Modifications. Site modifications are installations to shore sites.

36.5.2 Funding. SCD Funding comes from the following sources:

a. Program Funded. Funded for installation by a System Command (SYSCOM) or Program Executive Office.

b. Fleet Funded. Funded for installation by the Fleet.

c. Non-Navy Funded. Funding from non-Navy sources (e.g., Missile Defense Agency).

36.5.3 Duration. SCD Duration consists of the following types:

a. Permanent Changes. Permanent changes are modifications of ships and their systems that are not temporary in nature. A permanent SC may include a prototype installation to support development and operational testing.

b. Non-Permanent Changes. Non-Permanent Changes (NPC) are SCs that will be installed on a temporary basis for Test & Evaluation purposes or to demonstrate a

new or improved capability for the Fleet. NPCs are intended to be installed for one operational deployment and may not exceed one year in duration.

NOTE: NON-PERMANENT CHANGES WILL BE REMOVED WITHIN 1 YEAR FROM INSTALLTION UNLESS A WAIVER IS APPROVED BY THE FLTCDR OR TYCOM FOR AN EXTENDED EVALUATION PERIOD.

36.5.4 Non-Standard. Non-Standard SCDs address unique circumstances. Non-Standard SCDs are subject to additional or streamlined requirements.

36.5.5 Mandatory Safety. A SC to correct or mitigate a Serious or High System Safety Risk as defined in reference (e). It may also be a SC directed as the result of a Safety Investigation Board or Naval Safety Center as an action in response to a Class A mishap or as determined by formal Flag level direction. Fielding Plan (FP) changes to Mandatory Safety SCDs require a full SCD review cycle to ensure Technical Warrant Holder concurrence and approval from the Ship Program Manager (SPM), TYCOM, and resource sponsor. The deferral or cancellation, after any Decision Point of SCDs designated as Mandatory Safety, requires reevaluation for changes in mitigation strategy or residual risk acceptance of those changes. This review and approval will take place through the SCD review cycle.

36.5.6 Fleet Experimentation and Technology Demonstration. Fleet Experimentation (FLEX) SCs consist of experimentation requiring the services of fleet assets during exercises such as Trident Warrior. Experiments are supported by data collection and analysis, providing tangible products for Fleet use, and will provide resultant findings and recommendations leading to improvements in naval warfighting capabilities spanning Doctrine, Organization, Training, Materiel, Leadership Development, Personnel, Facilities, and Policy. A Technology Demonstration (TECH DEMO) is a system, equipment, capability demonstration to evaluate a system, principal unit or software and, or integrate with the required interfacing Naval systems. FLEX or TECH DEMO SCDs must adhere to the following conditions:

a. The duration of installations should not exceed 90 days including removal and restoration.

b. FLEX or TECH DEMO SCs can be accomplished in port or at-sea.

c. FLEX or TECH DEMO SCs cannot be used to provide an interim capability to support operational and training requirements for Platform TYCOMs, Operational Commanders, Immediate Superior In Command (ISIC), or Commander, US Fleet Forces Command (USFFC).

d. The FLEX or TECH DEMO SC installations must be removed at the end of the experiment, the ship(s) returned to the original configuration or state, and the original system recertified.

36.5.7 Emergent. Emergent SCDs are those items that require immediate installation (within 45 days or less of the first identification of the requirement) and, or reprioritization of tasking and reallocation of resources to support accelerated development and installation. Emergent SCs must meet the criteria defined in reference (a). The Participating Acquisition Resource Manager (PARM) or designated representative will issue an emergent change request message to the appropriate installation approval authority. The installation approval authority reviews and approves or disapproves the emergent change requirement via Naval Message. The approval

authorities for SFI Category (CAT) 1 or 2 SCs is the FLTCDR and the Platform TYCOM for SFI CAT 3 or 4 SCs.

36.5.8 Modernization Through Attrition And Modernization In Lieu of Repair. Modernization Through Attrition Modernization In Lieu of Repair (MTA/MILR) SCDs are SCs used to facilitate Condition Based Maintenance. Approval is based on the same criteria as any SC and installation will be determined by the TYCOM during the execution year. MTA/MILR actions are changes to components, or systems executed on an "as fails" basis or Condition Based Maintenance criteria. MTA/MILR actions targeted for a ship class, but without a known ship-specific FP, may be required to enhance maintainability, resolve hardware or software obsolescence, or to address declining Intermediate or Depot level repair resources. MTA actions may not impact shipboard or interfacing systems, certifications and do not result in additional operational capability.

36.5.9 Low Impact. Low Impact Internal Equipment Modifications are modernization or sustainment SCs which do not have a significant impact on Chief of Naval Operations (CNO) and Maintenance availabilities. Low impact ship changes can be authorized for CNO availabilities with condensed milestones.

36.6 SHIP CHANGE DOCUMENT PROCESS. The following paragraphs outline the SCD Process.

36.6.1 Ship Change Document Initiation. SCDs can be initiated at Phase I, II, or III. The initiator will coordinate with the SCD submitter to determine the entry phase based on the maturity level of the SC. SCDs should be initiated in the NDE EP application. The initiator will fill out the mandatory fields of the SCD at a minimum, including identification of the submitter responsible for the SCD and then submit to the SCD submitter for review.

NOTE: UPON IDENTIFICATION OF POTENTIAL SYSTEM OR EQUIPMENT IMPROVEMENT BY THE SHIP, SHIP'S FORCE PERSONNEL WILL FORWARD SC REQUESTS TO THE ISIC. THE ISIC WILL ENDORSE AND FORWARD THE REQUEST TO THE RESPECTIVE TYCOM FOR SCD INITIATION.

36.6.2 Ship Change Document Submission. The submitter should review and agree with the need for the change, the high-level proposed resolution and proposed FP prior to submitting the SCD for review by the Technical Assessment Team (TAT).

36.6.3 Technical Assessment Team Review. The TAT consists of SYSCOM and Program Executive Office technical personnel who review the SCD to ensure the SCD is technically feasible and to identify any ship integration issues that may impact its overall benefit to the Fleet. Upon completion of the TAT Review, the SCD will be forwarded to the SPM.

36.6.4 Ship Program Manager Review. The SPM will review the results of the TAT Review and provide an overall recommendation to the Decision Board. Upon completion of the SPM Review, the SCD will be forwarded into Cost Benefit Analysis (CBA) Review.

36.6.5 Cost Benefit Assessment Review. The CBA Change Manager coordinates the review of the CBA which includes the FP. The CBA Change Manager should review the results of the CBA review and determine if the CBA is complete and accurate prior to forwarding to the resource sponsor.

36.6.6 Resource Sponsor Review. The SCD should be forwarded to the applicable Office of the Chief of Naval Operations (OPNAV) resource sponsor for review. The resource sponsor will review the funding information in the CBA and determine if there is funding available and provide additional comments. Upon completion of resource sponsor review, the SCD is forwarded to the applicable NMP Decision Board for review and vote.

36.6.7 Ship Change Document Voting. SCD voters consist of the TYCOM, SPM, OPNAV Resource Sponsor of Record, FLTCDR, and, or OPNAV N83 (SCDs utilizing maintenance funds). The applicable Decision Boards are determined by the total cost of the SCD. The three hierarchical Decision Boards are O-6, 1 and 2 Star, and 3 Star.

36.6.8 Navy Modernization Process Phases. The following subparagraphs describe the phases of the NMP.

36.6.8.1 Phase I. The purpose of beginning in Phase I is to document a need for change, propose a resolution, or gain approval to proceed with development of that resolution into an engineered SC.

36.6.8.2 Phase II. The purpose of this phase is to perform preliminary design development of the SC, document results of the preliminary design, and gain approval to continue to Phase III (detailed design). Included in preliminary design development can be selection of technologies, establishment of design parameters, and prototype development. Phase II is also utilized to document the design of Prototypes, FLEX, TECH DEMOs, and NPCs which are authorized for installation upon Phase II approval.

36.6.8.3 Phase II(a). Phase II(a) combines Phases II and III and is appropriate for internal equipment modifications that meet the criteria in reference (a). Phase II(a) will allow early visibility of the change, via Phase I submission, while "bypassing" Phase II. A SCD can utilize the Phase II(a) process only upon request in Phase I with TAT concurrence. Phase II(a) results in a Decision Point (DP) 3 decision.

36.6.8.4 Phase III. The purpose of Phase III is to document detailed design development of the SC. The technical documentation provided with an SCD to support DP3 must include the level of detail sufficient to support a critical design review. DP3 provides authority to procure, test, and mature the SC.

36.6.8.5 Phase IV. The purpose of Phase IV is to accomplish ship and site-specific advanced planning and achieve maturity of the SC. The attention is redirected from overall SC design to specific requirements for installation on a specific ship or site. This phase includes availability work package integration, finalized ship or site design (including ship check, site survey and development of drawings, technical installation instructions, etc.), initiation of procurement, and installation readiness reviews.

36.6.8.5.1 Fielding Plans. When an SCD is initiated at any phase, the Submitter will provide a FP using the CBA Installation FP Tab that reflects the planned number of units, by ship or site, per Fiscal Year. Once the FP change has been approved in NDE-EP, ship-specific installation information will be scheduled by the PARM in Navy Data Environment-Navy Modernization (NDE-NM). The PARM and submitter must coordinate data entry to ensure that the applicable ships or sites and the total number of production units (e.g., quantity per Fiscal Year in the CBA) match the ships or sites numbers scheduled in NDE-NM at each DP and reflects any changes.

36.6.8.5.2 Ship Change Scheduling. SC Scheduling provides visibility to authorization activities for inclusion into the SPM or TYCOM authorization documents. SC Scheduling in NDE NM.NET must match the approved SCD FP.

a. Incremented Ship Change s. An increment of an SC is a finite, definable, bounded portion of the total scope of work required to fully accomplish a single SC. Increments are not to denote different versions of the same hardware or software system. If it is known during the development of an SCD that incremental installation is necessary and appropriate, the increments will be fully defined as part of the Description of Change and evaluated during the TAT review of the SCD.

b. If it is necessary to increment the installation post DP3 and before Start of Installation for the affected ship, a LAR approved by the SPM can be utilized to define the scope of each increment. The PARM should update the FP after approval of the LAR to show the newly defined increments and submit the revised SCD for approval via the DP Boards. The LAR should be attached to the SCD as a permanent record of the incremental decision. In cases when SID development has started, a LAR is required to the Planning Yard (PY) to identify changes required to the SIDs.

c. To increment an SC after the Start of Installation during a maintenance availability and the remaining production work needs to be scheduled in a subsequent CNO availability, an informational Electronic LAR (eLAR) should be developed by the PARM to define the scope of each increment for the affected ship. The eLAR should be attached to the SCD, SCD updated (including FP change), and forwarded to the NMP DB for approval. The PARM should update NDE-EP, NDE-NM, and NDE Afloat Master Planning System (AMPS) modules after approval of the eLAR to show the newly defined increments for the affected ship(s). The PARM has the responsibility to take all appropriate actions to address all increments including coordination with the PY to address SIDs for each increment, RMMCO to address status of the increments in RMMCO.NET, SPM to address status of ILS certification, and C5IMP stakeholders to address impacts to the baseline.

d. Some incremented installs may also require a Departure from Specification (DFS) to document the resulting ship's condition based on the incrementation. In those cases, the PARM should be responsible for generating the required DFS.

36.6.8.5.3 Ship Change Planning. The PARM should plan to accomplish all maturity requirements and modernization milestones paragraph below. The PARM should ensure all technical documentation is complete; all material has been procured and is available for installation; pre-installation testing has been accomplished per the appropriate installation and testing plans; all conjunctive SCs are either installed or mature; all certifications and qualifications have been completed.

a. Ship Installation Drawings. Drawings, change instructions, material procurement and logistics required for SC installation will be developed or accomplished as necessary utilizing internal processes. If the scope of the SC affects only internals to the equipment, SIDs are not required. Equipment level drawings will be developed to ensure that all technical requirements are identified. SIDs should be accomplished per reference (f). The PARM should task and fund ship checks and SID development per milestones paragraph below. SID approval is delegated by the SPM to the PY.

Installation Control Drawings and Installation Requirements Drawings are used to provide supplemental guidance in support of SID development per reference (f).

b. Liaison Action Records. LARs are the formal documentation tool for communication among Availability Planning Activities, PYs, SUPSHIPs, Executing Yards, SYSCOMs, PARMs, AITs, SPMs, In Service Engineering Agents (ISEAs), and other organizations involved in planning and executing ship modernization. LARs should be used to facilitate the resolution of design questions and change requests regarding drawings, technical documentation, and tasking assignments; requirements for departures; identification of increments not specified at the time of SC approval; and transmittal of drawings for approval or archiving. Policy for LARs is defined in reference (g).

c. Milestones. SC maturity and availability contractual requirements are subject to planning milestones to ensure timely planning and execution of availabilities. Enterprise specific milestones are identified in reference (a), formal SPM correspondence (e.g., Naval Messages, Memorandums, etc.) and volume II, part II, chapter 3, Appendix A and chapter 5, Appendix D, or volume II, part I, chapter 5, Appendix E of this manual. Failure to comply with JFMM volume II part II chapter 5 of this manual can result in deferral of a SC from SPM or TYCOM authorization documentation or additional requirements to be added or remain on a SPM Letter of Authorization (LOA) or TYCOM authorization documentation (e.g., Risk Assessment Approval, Late Add Approval, etc.).

d. Certifications and Qualifications. All required certifications and qualifications should be documented in the SCD and accomplished prior to installation. Certifications include, but are not limited to:

(1) Warfare System or Element (System) level Certifications

(2) Warfare System Installation Assessment

(3) ILS Certification

(4) Application Integration Certification

(5) Cybersecurity Accreditation and Certification

(6) Weapons Systems Explosive Safety Review Board non-firing concurrence for installation

(7) Electromagnetic Interference Impact Assessment and System Electromagnetic Capability Certification

(8) Shock Qualification or Submitted Shock Deficiency Plan

e. Fleet Commander C5I Baseline. The C5I Modernization Process is governed by reference (b). All SCs with a SFI CAT of 1 or 2 require authorization in the FLTCDR C5I Baseline. Authorization in the FLTCDR C5I baseline is critical maturity requirement for SPM or TYCOM authorization. SFI CAT determinations are made during SCD TAT Reviews.

(1) SCs can be added to the FLTCDR C5I Baseline through two different methods. SCs that are scheduled prior to the Baseline Lock Event (BLE) for a ship will be reviewed at the BLE and the FLTCDR will determine if the SC is authorized, planned not authorized, or will not be included in the baseline. Any SCs that were not added to the baseline during the BLE will require the PARM submission of an eCCB Risk Form and FLTCDR approval.

(2) Any SCs being removed from the baseline after BLE will require PARM submission of an electronic Removal eCCB Removal Risk Form and FLTCDR approval. Depending on the SC maturity and scheduling timeframe, Risk Assessment Requests and TCD Waivers may be required.

f. Risk Assessments. SCs that are immature require an approved Risk Assessment Request to remain on the SPM LOA after the LOA Late Add milestone in reference (a). Additionally, if a SC is scheduled after the Late Add milestone and immature, an approved Risk Assessment Request, in addition to a Late Add message, is required to be added to the SPM LOA. Immature SCs scheduled outside of CNO availabilities will require an approved Risk Assessment Request for FLTCDR or TYCOM authorization. Risk Assessment Requests are submitted to the FLTCDR or TYCOM per the Ao message templates in reference (b). FLTCDR approval is required for SFI Category I and II SCs, and TYCOM approval is required for SFI CAT III and IV SCs.

g. Target Configuration Date Waivers. The TCD is established by the FLTCDR for each ship to minimize configuration changes during the Basic, Integrated, Advanced, and Sustainment phases. Changes to the C5I baseline outside the Modernization Window adversely affect an operational unit's ability to train, and therefore, require TCD Waiver approval from the appropriate FLTCDR. TCD Waiver requests must be submitted for any SFI CAT I, II, or III SCs per reference (b).

h. Late Adds. SCs that are not authorized for a CNO Availability prior to the Enterprise specific LOA Late Add milestones paragraph above will require Late Add approval. Depending on the Enterprise, Late Add milestones may vary based on SC scope and impact to the availability. Late Add requests must be submitted by the cognizant PARM. The TYCOM is the activity responsible for reviewing and approval or disapproval of Late Add requests.

36.6.8.5.4 Ship Program Manager or TYCOM Authorization. SPMs and TYCOMs are the activities responsible for reviewing SC maturity and authorizing SCs for installation.

a. Ship Program Manager or TYCOM Authorization (CNO Availabilities). The SPM (Program Alterations) and TYCOM (Fleet Alterations) will evaluate the maturity of each SC scheduled to occur in a CNO Availability based on their Enterprise specific processes, using the Installation Readiness Assessment, per the applicable milestones. The SPM or TYCOM will document the decision to authorize or defer each individual SC via a LOA or a LOA Change message. Any SC that is not mature per the milestones will require Risk Assessment Request approval from the FLTCDR or TYCOM. Any SC that is not authorized in accordance with the LOA milestones will require an approved Late Add request.

b. Type Commander Authorization (Outside CNO Availabilities). The TYCOM will evaluate the maturity of each SC scheduled outside of a CNO Availability. Any SC that is immature requires Risk Assessment Request approval from the FLTCDR or TYCOM. For Carriers, SCs identified in the Modernization Readiness Assessment as mature are authorized for installation. For Surface Force Ships, the TYCOM will document authorized SCs via a Quarterly Installation Scheduling Message.

36.6.8.5.5 Pre-Installation Check-Out. Pre-Installation Check-Out (PICO) is a test designed to evaluate and baseline the operational status and performance of the equipment, systems, and interfaces. PICO completion is of vital importance to both the maintenance and modernization communities to ensure corrective actions and responsibility for discrepancy resolution is effectively and timely identified and completed. PICO must be conducted for all scheduled modernization installations during CNO availabilities when SCs or alterations modify or relocate existing equipment or systems, including modifications that affect existing interfaces between systems. The purpose is to identify pre-existing discrepancies, which if uncorrected, could delay or prevent the successful completion of the SC. The PARM or ISEA will ensure that PICO testing requirements are submitted to the coordinating activity per the Enterprise specific coordination method identified in references (a) and (c). Regardless of coordination method, all required PICO(s) will be targeted for completion 90 to 30 days prior to the Start of Availability based on the ship's operational schedule. For installations accomplished outside of CNO Availabilities, PARMs or ISEAs will coordinate with TYCOMs to accomplish the PICO.

a. For all installations (AIT and Non-AIT), Ship's Force will ensure discrepancies are documented in the ship's Current Ship Maintenance Project (CSMP) and coordinate new work with the Naval Supervisory Authority (NSA) and Lead Maintenance Activity (LMA).

b. The PARM or ISEA will provide a draft PICO Completion Naval Message using the suggested format in reference (c). All PICO discrepancies will have a Ship's Force CSMP entry, assigned Job Control Number, and be included in the PICO Completion Naval Message. Ship's Force will review and release the PICO Completion Naval Message. Ship's Force will continue to track CSMP items identified during the PICO and coordinate required maintenance actions (e.g., equipment repair and parts requisition) to support post installation testing. In the event a PICO can't be accomplished or completed, the PARM or ISEA will document via a Naval Message.

NOTE: THE AIT INSTALLATION COORDINATOR SHOULD BRIEF THE PICO STATUS AT THE SHIP'S IN-BRIEF PRIOR TO START OF INSTALLTION. SHIP'S FORCE WILL PROVIDE STATUS OF PICO DISCREPANCIES UNDER THEIR COGNIZANCE.

36.6.8.6 Phase V. The purpose of Phase V is to execute the SC and document completion and delivery of all installation requirements. SCs must be authorized in Phase IV to proceed to installation phase (Phase V). Once all planned installations for applicable ships have been completed and documented in NDE, the SCD is closed out.

36.6.9 Regional Maintenance and Modernization Coordination Office. RMMCO is a regionally aligned organization that serves as the initial control point for all waterfront-related SC installations performed by AITs per reference (c). The RMMCO Gatekeeper is designated by the NSA or Ship Acquisition Program Manager for New Construction ships. The RMMCO AIT

Check-In process provides the AIT Manager and AIT On-Site Installation Coordinator (OSIC) with a tool to initiate the check-in procedures required for the installation of an SC aboard ships.

NOTE: AITS SHOULD NOT BE ALLOWED ONBOARD ANY SHIP TO ACCOMPLISH INSTALLATION WITHOUT RMMCO AND NSA CHECK-IN AUTHORIZATIONS. IF AN UNAUTHORIZED AIT IS IDENTIFIED, SHIP'S FORCE SHOULD NOTIFY THE NSA.

36.6.9.1 Electronic Submission. The AIT Manager will submit an electronic RMMCO Form for each SC to the RMMCO Gatekeeper. RMMCO Gatekeepers will pre-screen the RMMCO Form and provide feedback on any discrepancies.

36.6.9.2 Regional Maintenance and Modernization Coordination Office Check-In. The AIT Manager, OSIC and AIT Lead must check-in with RMMCO prior to reporting to the ship. During check-in, RMMCO will review SC authorization and maturity documentation provided by the AIT Manager, OSIC and AIT Lead. All discrepancies identified during Electronic Submission must be addressed prior to RMMCO Check-In. RMMCO will require the following documentation for RMMCO Check-In:

a. AIT Quality Assurance (QA) Workbook.

b. Copy of ILS Certification or FLTCDR or TYCOM approved Risk Assessment

c. Copy of approved Platform System Operational Verification Test (SOVT) or Test Procedure (TP)

36.6.9.3 Naval Supervisory Authority Check-In. The AIT OSIC and AIT Lead will check-in with the NSA for review of logistics, Environmental, Safety & Occupational Health, and QA requirements. NSA Check-In will consist of the following:

a. NSA logistics representatives will review the most recent approved ILS certification.

b. The Environmental, Safety & Occupational Health representatives will review the following documents: fire safety plan, list of AIT personnel that have taken the NSA safety course (in-person) within the last year, permission to paint (if required), permission to use solvents and adhesives (if required), and list of Safety Data Sheets (SDSs) (if applicable).

c. The QA representatives will review the AIT QA Workbook. The AIT QA Workbook is not required for stand-alone software only changes unless directed by the AIT Manager.

d. Once the AIT installation package is verified, the RMMCO Check-In or Check-Out Form will be printed by RMMCO or the NSA and provided to the AIT. This form identifies all items that will require signature verification of accomplishment and, or receipt of the list of ILS deliverables.

36.6.9.4 Alteration Installation Teams Ship's In-Brief. The purpose of the AIT Ship's In-Brief is to provide an overview of the SC per reference (c). Additionally, the in-brief should consist of the following:

a. PICO Status Review

b. Work to be Accomplished

c. Schedule of Key Events and Milestones

d. Planned Ship's Evolutions

e. Impact of Support Services

f. AIT OSIC and Ship's Force Responsibilities

g. Conjunctive SCs

h. SOVT or TP

i. ILS and Training to be Provided

j. Points of Contact

36.6.9.5 In-Brief Scheduling. The in-brief should be scheduled and coordinated by the AIT OSIC. It should be conducted after RMMCO Check-In and prior to the initiation of SC accomplishment. The following personnel should be invited to attend the in-brief (as applicable):

a. Commanding Officer, Executive Officer, Ship's Availability Manager, applicable Department Heads, Division Officers, Supply Officer, and Technical Personnel, Operator Personnel (i.e., Fire Controlman [FC], Electronic Technician [ET], Operations Specialist [OS], etc.).

b. TYCOM, Squadron, NSA, LMA, Shipyard Trades Personnel (i.e., FC, ET, OS, etc.).

c. The AIT OSIC may invite ISEA representatives or other Subject Matter Experts to support the in-brief.

36.7 WORK EXECUTION.

36.7.1 Production Work. The designated Executing Activity will execute the work based on the technical documentation developed during Phase IV. The NSA is responsible for government oversight of all work performed during an availability. For SCs accomplished by AITs, the AIT OSIC, assigned by the AIT Manager, is responsible for overseeing contractor work and should work closely with the NSA to ensure the proper integration and installation of the SC. In the event any modernization related production or program deficiencies are identified, they are to be communicated between the NSA, AIT Manager or OSIC, AIT, and LMA using either the Production Deficiency Report or Program Action Request process of reference (a).

36.7.2 Plan of Action and Milestones Requirements. The following is guidance for AIT Plan of Action and Milestones (POA&M) and weekly progress updates during CNO and non-CNO availabilities per reference (c).

36.7.3 Notional Plan of Action and Milestones during CNO Availabilities. Notional POA&Ms (sometimes referred to as Preliminary POA&Ms) are provided during Phase IV. Notional POA&Ms are used to support advance planning scheduling and duration analysis for Surface Force Ships and initial integration to support the development of the Integrated Master Schedule or Integrated Production Schedule for Aircraft Carriers.

36.7.4 Production Plan of Action and Milestones during CNO Availabilities. Production POA&Ms must be provided by the AIT Manager to develop or update the Integrated Master Schedule or Integrated Production Schedule. All activities must comply with Key Event schedules promulgated by the NSA and LMA. To streamline and standardize AIT deliverable

documents, AIT Production POA&M submissions must contain data elements specified in NAVSEA SI 009-60, using the format in reference (c).

36.7.5 Plan of Action and Milestones during Non-CNO Availabilities. POA&Ms will be provided per reference (c).

36.7.6 Weekly Progress Updates. The NSA or LMA will require the AIT OSIC or AIT Lead to participate in routine and special progress meetings for the purpose of work coordination and progress reviews. Unless changes occurred to the SC or testing schedule, updates are not required until the production work has reached its planned start date. AITs are responsible for complying with the reporting requirements of NAVSEA Standard Items 009-60 or 009-111 for updated production schedules and progress reporting through weekly progress updates. Any changes to the work schedule provided via Weekly POA&M progress updates should be reported to the NSA, LMA, and Ship's designated point of contact as soon as changes are identified.

NOTE: SOVTS AND TPS SHOULD NOT BE SIGNED IF THE CAPABILITY TO BE DELIVERED HAS NOT BEEN SATISFACTORILY DEMONSTRATED OR THE SYSTEM IS NOT CYBER COMPLIANT.

NOTE: SOVT OR TP SIGNATORY APPROVALS SHOULD NOT BE WITHELD FOR CAPABILITIES OUTSIDE THE SCOPE OF THE SC OR ISSUES WITH PRIOR VERSIONS OF THE SYSTEM AND SOFTWARE.

36.8 SYSTEM OPERATIONAL VERIFICATION TEST AND TEST PROCEDURE. SOVTs and TPs are formal processes used to verify the installed system, and equipment that has been completed per applicable requirements including any interface with external systems or equipment and any systems or equipment that was temporarily moved or disconnected to accomplish the install. SOVTs and TPs can vary in scope, other than a full system test, if boundaries for the test are clearly defined and invoked to validate the modification or install. It can be a single test or a battery of tests that verifies the installed or modified component(s), equipment, systems, interfaces with existing systems, and systems impacted by the installation are properly installed and operates as intended at the platform specific requirement and environment. SOVT and TP format and requirements are contained in reference (a). The SOVT or TP will be conducted for all equipment directly impacted by accomplishment of the SC. A completed SOVT or TP is defined as an executed SOVT or TP document that has been witnessed and signed by Ship's Force, with all test results, system configuration details, and any discrepancies recorded or uploaded into the appropriate data repository. The SOVT or TP discrepancy list should be provided to the NSA. The OSIC, AIT Manager or ISEA will provide a complete set of test reports to Ship's Force and the NSA at the completion of the SC testing.

36.9 INTEGRATED LOGISTICS SUPPORT.

36.9.1 Integrated Logistics Support Product Delivery. The AIT OSIC is responsible for delivery of all ILS products, as outlined in the ILS Certification. The AIT OSIC should obtain required signatures verifying delivery and noting any ILS deficiencies. The AIT OSIC is responsible for providing an itemized inventory utilizing the form DD 1149 (if applicable) for all deliverables to the ship with a signature from the appropriate department head or authorized personnel. ILS Products Delivery will be tracked by the NSA's designated representative. For Surface Force Ships, the Regional Maintenance Center (RMC) or Fleet Logistics Center (FLC) has assumed the NSA's ILS functions, and ILS products may be delivered to the Ship by the AIT or NSA or FLC

as appropriate. For Aircraft Carrier availabilities conducted in Naval Shipyards, the shipyard has assumed the NSA's ILS function, and in private a shipyard, the resident Supervisor of Shipbuilding, Conversion and Repair performs the NSA's functions; all ILS products must be delivered to the Maintenance Support Center (MSC). Accordingly, the NSA, Regional Maintenance Center or FLC are responsible for verifying that all ILS products have been delivered to support the installation of a SC and ensuring all ILS products are available as needed for SC installation and check-out of systems and equipment.

36.9.2 Ship Installation Drawings Red-Lines. The AIT Manager will ensure that SID Red-Line mark-ups of all PY approved drawings for the SC, including all LARs, deviations, and variances approved by the PY, are provided to indicate the actual "as installed" configuration on the ship. Delivery of the final SID Red-Lines are required to the ship and PY no later than 30 days after the Ship's Force or NSA Out-Brief.

NOTE: FOR THOSE SHIP CHANGES NOT FULLY COMPLETE, ENSURE THE OUTSTANDING ITEMS ARE DOCUMENTED IN THE NSA COMPLETION MESSAGE AND, OR THE COMPLETION REPORT NAVAL MESSAGE. ADDITIONALLY, IF PRODUCTION IS INCOMPLETE, SOVT OR TP IS NOT STARTED OR COMPLETED, OR ALL ILS DELIVERABLES ARE NOT PROVIDED, THE OSIC SHOULD PROVIDE THE CURRENT SYSTEM AND EQUIPMENT STATUS AT THE OUT-BRIEF. IN THESE CASES, COMMUNICATION WITH THE RMMCO IS STILL REQUIRED.

36.10 COMPLETION.

36.10.1 Ship's Force or NSA Out-Brief. The Ship's Force or NSA outbrief should be scheduled and coordinated by the AIT OSIC for all SCs per reference (c). The TYCOM, NSA, LMA, NAVSEA 21 Phased Maintenance Representative, Ship's Force, and PY On-Site Logistics Representatives should be invited to attend all outbriefs. The outbrief should be conducted after completion of the SC and prior to RMMCO Check-Out. Normally, the AIT OSIC will obtain the required Ship's Force and NSA verification signatures per reference (c) on the Alteration Completion Report at the outbrief.

36.10.2 Completion Report Naval Message. The AIT OSIC should provide a draft copy of the Completion Report Naval Message. The message should be reviewed and released by Ship's Force within seven days of the outbrief. In addition to the ACR and Completion Report Naval Message, the status and timeline for completion of the following items will be addressed during the outbrief, if applicable:

a. SOVT or TP

b. Ship's Force training completion

c. ILS delivery

d. Configuration Data Manager's Database – Open Architecture (CDMD-OA) or Model Based Product Support (MBPS) final configuration data

e. SID Red-Lines

36.10.3 Regional Maintenance and Modernization Coordination Office Check-Out. After the SC completion and outbrief, the AIT OSIC or AIT Lead must check-out with RMMCO with the following documents:

a. Completed and signed RMMCO Form

b. Signed Training Verification Report (if applicable)

c. SOVT or TP cover sheet(s), discrepancy sheet and signature sheet

d. Signed form DD 1149 (if applicable)

NOTE: THE RMMCO FORM SHOULD NOT BE CLOSED OUT IF SHIP'S FORCE DOES NOT SIGN THE SOVT OR TP DUE TO DISCREPANCIES.

36.10.4 Ship Changes Completion Status Update. The PARM should set the accomplishment status code to a completion status and record the completion date for all completed SC accomplishments in the NM.NET application per reference (a).

36.10.5 Ship Change Document Closeout. Upon final planned installation completion, the SCD should be reviewed by the Submitter to ensure all planned installations are complete and confirm that all ILS has been delivered for all installations. Once this is accomplished, the SCD may be considered complete.

VOLUME VI

CHAPTER 37

REGIONAL MAINTENANCE CENTER PASSIVE COUNTERMEASURE SYSTEM SUPPORT REQUIREMENTS

37.1 PURPOSE. Per references (a) through (k), to provide guidance in the execution of a shore based Passive Countermeasure System (PCMS) maintenance program in the U.S. Surface Fleets. Waterfront support for the PCMS is focused through the homeport Regional Maintenance Center (RMC). To support the Fleet PCMS program each RMC must be capable of conducting the following core PCMS activities:

a. PCMS Readiness Improvement Program (RIP).

b. PCMS Maintainer and Supervisor technical training.

c. Installation and removal of Motion Measurement System.

d. AP-1 and AP-2 system assessments. AP-2 is not applicable to CVN.

e. Technical assists.

f. Prioritization and quality assurance of all topside PCMS work related to or impacting PCMS resources and procedures. Requirements for these tasks are identified in reference (b). A general system description is provided in reference (c).

g. Support of a RMC Production Repair Replace Facility. This facility will be outfitted and stocked by the RMC for accomplishment of tiling on ship items which have been removed from or are destined for PCMS ships. The facility must include, at minimum, an on-site RMC technician, certified by the NAVSEA Technical Warrant

Holder at Waterfront Level 2 Maintainer Instructor, to act as supervisor and manager of the production shop. The designated Code 900 production shop manager must coordinate training and oversight with PCMS SME (Code 200) at the RMC as needed. This capability will be RMC funded stocking of necessary tools, consumables and tiles such that work performed at the shop will not require specific ship provided materials or funding.

37.2 PASSIVE COUNTERMEASURE SYSTEM EVENT DESCRIPTION.

a. PCMS RIP. RIPs are scheduled by the Type Commander (TYCOM) via the Immediate Superiors In Command (ISIC). ISICs obtain primary and secondary dates, submit via action to TYCOM with information to the local RMC. This weeklong event is designed to provide on board training to the entire ship PCMS team, focused on maintenance and inspection training. Curricula are available for both the PCMS maintenance person and PCMS supervisor personnel. The RIP focuses on one day of classroom training, followed by shipboard training that includes assessment and repairs training to the system (trim, caulk, application of material, etc.). This is the primary method of delivering training and PCMS certification for Ship's Force personnel for CG/DDG/LPD. It also serves the purpose of providing a focused period for accomplishment of a prioritized selection of Ship's Force capable maintenance. Stand-alone onboard technical training (PCMS Supervisor or Maintainer) may be provided to ships CVN/CG/DDG/LPD) if delivering that training via the RIP process is not possible. This form of training can be requested by the ship directly through the local RMC PCMS SME. This training is requested through the RMC by ship submission of a Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo).

b. Motion Measurement System. Per references (d), ships without installed telemetry equipment require installation and removal of Motion Measurement System for radar cross-section testing. This is accomplished by the RMC following ship submission of a 2-Kilo request.

c. AP-1 and AP-2 (CG/DDG/LPD) assessments. These comprise the annual Subject Matter Expert (SME) assessment of the ship system. It utilizes a visual assessment process in order to provide a prioritized maintenance plan for the ship. This complements the ship's measurement. A structured discipline is used for this assessment.

d. Technical assistance. RMC SMEs are responsible for responding to Forces Afloat requests for PCMS technical assistance. The RMC technician must be certified by the NAVSEA Technical Warrant Holder at a minimum for Level 2 Maintainer Instruction, to directly assist the ship in identifying and organizing a Ship's Force PCMS maintenance project. The technician would provide on-site advice and quality assurance assistance.

e. Prioritization and Quality Assurance of I and D Level Work. RMC SMEs must be utilized by the RMCs to provide technical advice, including work prioritization, and quality assurance of all I and D Level PCMS related or PCMS impacting work executed under the purview of the RMC.

37.3 PASSIVE COUNTERMEASURE SYSTEM PERSONNEL CERTIFICATION.

37.3.1 Passive Countermeasure System In-Service Engineering Activity. The Naval Sea Systems Command (NAVSEA) Topside Signatures Technical Warrant Holder has assigned Naval Surface Warfare Center Port Hueneme Detachment (NSWC PHD) as the PCMS In-Service Engineering Agent (ISEA). The Technical Warrant Holder (NAVSEA 05P1) retains final authority for all PCMS personnel certification.

37.3.2 Support Personnel. Per reference (b), PCMS personnel certification is required every three years. Qualifications for PCMS certification are successful completion of NAVSEA sponsored PCMS installation course conducted under the authority of NSWC PHD (S22) and on-the-job-training witnessed by a certified PCMS instructor within the past three years. RMC Subject Matter Expert personnel are also required to retain proficiency through annual accomplishment of at least one AP-1 and one RIP. This certification enables RMCs and shipyards to maintain a cadre of qualified PCMS personnel and with the assistance of the PCMS ISEA, to coordinate further certification or recertification training as required. Specific certification levels are addressed in the relevant PCMS Program NAVSEA manual.

37.3.3 Training Requirements. Per reference (c) and (e), NAVSEA 05P1 has established the requirement that all personnel involved in PCMS installation and maintenance, including inspection/assessment, surface preparation, material application, final painting or quality assurance, must be U.S. citizens trained in the specifics of PCMS installation procedures prior to any actual tile installation work. As waterfront experience has underscored the absolute importance of limiting PCMS work to properly trained personnel, the certification process is the single most important element of quality assurance for the fleet customer. All personnel assigned PCMS repair duties must be trained in the requirements of reference (f).

37.3.4 Regional Maintenance Center Japan, Regional Maintenance Center Rota and Pearl Harbor Naval Shipyard. With the exception of CVN training, Forward Deployed Naval Forces (Regional Maintenance Center Japan, Regional Maintenance Center Rota and Pearl Harbor Naval Shipyard) are authorized to execute training of personnel organic to their production codes for all PCMS maintenance and installation work using the PCMS ISEA provided training guide.

37.3.5 Ship's Force Personnel. Per the requirements of reference (c) MRC S-1, fleet personnel conducting PCMS S-1 assessments must be graduates of a PCMS ISEA approved ship supervisor course which includes an assessment/inspection training module. Ship's Force personnel assigned maintainer duties to include all reference (d) MRCs except the S-1 must be graduates of the PCMS ISEA approved PCMS maintainer course. Ship's Force personnel assigned maintenance duties to include all reference (g) MRCs must be graduates of the PCMS ISEA approved CVN specific course.

37.4 PASSIVE COUNTERMEASURE SYSTEM TECHNICAL ASSISTANCE. PCMS technical assistance is available through the local RMC. Distance support is also available, if required.

37.5 RESPONSIBILITIES.

a. Commander, Naval Sea Systems Command:

(1) Certify personnel, facilities, and activities in PCMS handling, Quality Assurance, application, and destruction. Maintain records for each RMC certification.

(2) Provide Equipment Guide List (EGL) packages for AP-1, AP-2 and S-1 assessments. AP-2/S-1 is not applicable to CVN.

(3) Incorporate and distribute ship configuration revisions submitted following AP-1 and AP-2 assessments. AP-2 is not applicable to CVN.

(4) Conduct analysis of all measurements and provide Forces Afloat reports of results and recommendations.

(5) Adjudicate all PCMS related requests for Departures from Specifications.

(6) Designate a PCMS ISEA to function as the first line technical resource for Forces Afloat.

(7) Coordinate PCMS in service activities with the broader Surface Maintenance Engineering Planning Program (SURFMEPP) organization and other activities, such as corrosion control programs.

b. Navy Regional Maintenance Center:

(1) Ensure that RMCs have adequate PCMS SMEs/technicians to support PCMS core activities defined in paragraph 37.1. Provide stewardship of RMC SMEs to ensure a seamless transition when personnel are scheduled for transfer or retirement. If qualified PCMS Technicians are not available at local RMC, the RMC should contact the following (in order of contact) for assistance:

(a) Other RMCs.

(b) PCMS ISEA (NSWC PHD). This request must include funding for the performance of the activity.

(2) Ensure integration of PCMS SME support to all former SUPSHIP planning and execution of shipboard repairs and other upkeep performed under the auspices of the RMC organization.

(3) Establish I-Level PCMS tiling support shops at RMCs with PCMS responsibilities.

(4) Ensure the integration of PCMS restoration on all RMC conducted repairs and corrosion control projects where PCMS coverage is required. This is to ensure that PCMS restoration requirements generated as interferences to work performed by I and D level activities are not assigned to Ship's Force, but rather are restored as part of the I or D task. Should the Type Commander determine that it is necessary to abbreviate the funded task, he or she must direct the ship to submit a Departure from Specifications (DFS) to NAVSEA delineating the specifics of the unfunded PCMS restoration work.

c. Type Commanders must:

(1) Coordinate with the System Commands in identifying, solving and correcting PCMS deficiencies.

(2) Refer all PCMS related Departures from Specifications to NAVSEA for adjudication.

(3) Prior to promulgation, review and authorize all documents prepared by technical agencies that contain procedures relative to PCMS and the fleet PCMS program.

(4) Evaluate comments and recommendations regarding the fleet PCMS program. If necessary, issue changes to existing policy and procedures.

(5) Fund PCMS RIPs to provide for the additional RMC labor and material required to conduct these events at least bi-annually.

(6) Ensure that proper corrosion control procedures are employed in the planning and execution of I and D Level maintenance affecting PCMS areas. References (f) and (h) provide detailed guidance.

(7) Coordinate all aspects of scheduling ship measurements.

(8) Provide for the restoration of all PCMS materials removed as interferences for other tasks.

d. Immediate Superiors in the Chain of Command (ISIC) must:

(1) Submit requests to schedule PCMS core activities for each unit to maintain unit currency in trained personnel and ship measurements.

(2) Review and take the appropriate action to correct PCMS discrepancies for subordinate units.

e. RMCs must:

(1) Maintain qualified PCMS personnel and ensure assets are available to perform PCMS activities of paragraph 37.1, per reference (b).

(2) Budget and provide travel funding to the ISEA for RMC personnel PCMS competency certifications, as required. As an alternative, the RMC person requiring certification can travel to Norfolk or San Diego for certification from the ISEA.

(3) Budget for RMC PCMS SME attendance of Annual Waterfront PCMS Standardization Program Reviews required reference (b).

(4) Provide Technical Assistance via distance support or on site visit as appropriate.

(5) Conduct PCMS core activities. Provide the following to NAVSEA PCMS ISEA within four weeks following AP-1 events:

(a) Redlined updates to key plans and detailed drawings.

(b) Completed EGL inspection checklist, including revised items.

(c) Completed digital photo surveys consisting of any new systems and topside changes not previously submitted or not listed in the ship key plans.

(6) Ensure that RMC PCMS SMEs are involved in planning of all PCMS equipped ship topside maintenance where PCMS is affected.

(7) Ensure that RMC Quality Assurance personnel, certified by the PCMS ISEA, are actively involved in the Quality Assurance of all I and D level PCMS related repairs and installations.

(8) Ensure that contracted or I-Level jobs activities, facilities and personnel selected to conduct PCMS work are certified for the work being conducted.

(9) Conduct annual inventory of all locally RMC held PCMS materials and provide results to NAVSEA 05P1.

(10) Include in contracted I and D-Level jobs the provision of PCMS tiles for planned PCMS repairs and interference areas. Ships must not be tasked to provide tiles or other PCMS Allowance Parts List or Allowance Equipage List items to support work undertaken by other than Ship's Force, except with the specific concurrence of the TYCOM.

(11) Maintain repair capability detailed in paragraph 37.1.1.g.

f. PCMS Ship Commanding Officers must ensure:

(1) Scheduling of PCMS activities within periodicity.

(2) Obtaining RMC SME assistance in reviewing work packages to ensure identification of all topside signature related issues.

(3) Establishment and maintaining of the following shipboard organization:

NOTE: AS OUTLINED IN CHAPTER 19, APPENDIX C4H OF THIS VOLUME, THE OT02 WORKCENTER IS DESIGNATED AS THE PCMS MAINTENANCE WORKCENTER. CVN DOES NOT LIST A SPECIFIC PCMS WORKCENTER. REFERENCE (B) CONTAINS ALL CVN PCMS MAINTENANCE REQUIREMENTS AND MUST BE CARRIED UNDER WORKCENTER OS02 (ELECTRONIC WARFARE (EW) OR CRYPTOLOGIC TECHNICIAN, TECHNICAL (CTT)). ADDITIONALLY, THE CVN PCMS SUPERVISOR MUST COME FROM THIS WORKCENTER OR CAN BE A MORE SENIOR PERSON WITHIN THE SAME DEPARTMENT.

(a) PCMS Department Head: Per reference (a), the Commanding Officer must appoint a Department Head responsible for coordinating operation and maintenance of PCMS. Their responsibilities include:

1 Providing the Commanding Officer monthly PCMS effectiveness summaries including major PCMS deficiencies, the compliance of the ship with personnel certification requirements, an abbreviated Plan of Action and Milestones for correction of Category 1, 2 and 3 deficiencies and corrosion items, and the due date for the next ship measurement.

2 Coordinating shipboard PCMS indoctrination for newly reported personnel.

3 Coordinating ship-wide PCMS preventive and corrective maintenance schedule.

4 Coordinating distribution and update of Planned Maintenance System (PMS) materials, including ship specific PCMS key plan drawings and EGLs required for PMS inspections.

5 Serving as single point of contact for Quality Assurance of PCMS related Current Ship's Maintenance Project entries, review of all topside configuration changes (including program alterations, fleet alterations, field changes, etc.) to ensure Radar Cross Section reduction has been considered.

6 Ensuring PCMS is included in the command PMS spot-check program.

7 Assigning a command PCMS coordinator responsible to the PCMS Department Head for the detailed implementation of PCMS maintenance and operation.

8 Designate in writing the maintenance assignments by all work centers assigned PCMS responsibility, as applicable.

(b) Command PCMS coordinator: The command PCMS coordinator is the primary assistant to the PCMS Department Head in carrying out his or her responsibilities. Additional responsibilities include:

1 Request PCMS RIPs at intervals not to exceed 24 months (non-CVN).

a Designate team of minimum 8 people (DDG and LPD), (15 people (CG) to attend the RIP. This team must include at least two supervisor level personnel (E5 and above). These team members must be committed throughout the entire RIP duration and cannot be substituted once the RIP commences.

b Commit this team to the full 5-day period, arranging other individual requirements or commitments around the PCMS RIP. The names, rates and PRD of these personnel must be provided to the local RMC SME by e-mail or record message not later than 3 working days prior to the PCMS RIP. The senior ship’s force member of this team is responsible as the team’s mustering petty officer and must exercise military control of the team. Personnel may not be substituted once the RIP has begun.

c All PCMS training requested through the RMC will be done by ship submission of a 2-Kilo.

2 Maintain personnel certifications, ensuring the required number of trained personnel are onboard. For DDG and LPD, a minimum of 8 maintainers and 2 supervisor-trained personnel are required. For CG, a minimum of 15 maintainers and 2

supervisor-trained personnel are required. For CVN, a minimum of 15 personnel are required to be trained in the CVN-specific training, one of which formerly designated as the ship's PCMS Supervisor.

3 During RMC technical assists, ships would be expected to provide a minimum, dedicated team of five Level 1 Maintainer personnel and one Level I Supervisor personnel for such a technical assist. The team would be required to muster at least 80% of its assigned personnel continuously for workdays during the technical assistance period.

(c) Supply Officer: Maintain Allowance Parts List stocks of PCMS materials and sufficient Allowance Equipage List items to support maintenance requirements. All shipboard stocks must be within shelf life.

VOLUME VI

CHAPTER 38

DEEP SUBMERGENCE SYSTEMS HULL INTEGRITY PROCEDURES

REFERENCES.

(a) NAVSEA SS800-AG-MAN-010/P-9290 - System Certification Procedures and Criteria Manual for Deep Submergence Systems

LISTING OF APPENDICES.

A SUBMEPP DSS HIP Inventory
B SUBMEPP DSS HIP Schedule
C Request for DSS HIP Periodicity Extension Format

38.1 PURPOSE. This chapter provides guidance and definition for the requirements, responsibilities and actions for Deep Submergence Systems (DSS) Hull Integrity Procedures (HIP) to continue certification for manned operations. The DSS HIP program is invoked on Dry Deck Shelter (DDS) certified under reference (a).

38.2 HULL INTEGRITY PROCEDURES MAINTENANCE SCHEDULING, PLANNING AND REPORTING.

38.2.1 Maintenance Requirements for Continued Certification. Reference (a) establishes the Maintenance Requirements and identifies the responsibilities and actions required to support continued unrestricted Submarine and DSS manned operations. In conjunction with reference (a), Naval Sea Systems Command (NAVSEA) has issued individual manuals containing required, periodic Scope of Certification (SOC) maintenance actions for each DSS. The DSS HIP procedures identify degradation of the material condition of the hull integrity boundary and of those systems affecting occupant safety. SOC certification indicates that a valid recommendation for continued manned operations can be made. Maintenance of certification is dependent on the positive control of all re-entries into the SOC boundaries per volume V, part III, chapter 5 of this manual, the satisfactory and timely completion of applicable DSS HIP procedures as required by reference (a) and any necessary repairs. Accomplishment of the DSS HIPs specified with this program identify changes within the SOC boundary which result from inadvertent error or from degradation caused by the service environment.

38.2.2 Scheduling and Reporting. To enable the Type Commanders (TYCOM) to carry out their responsibilities in the maintenance of certification of DSSs and to aid in decisions concerning operational restrictions, an auditable system of scheduling the performance and reporting of DSS HIPs has been developed. This system provides visibility to problem areas, facilitates verification and provides a permanent record of DSS HIP accomplishment in the DSS's Maintenance and Material Management (3-M) machinery history maintained at the NAVSEA Logistics Center.

38.2.2.1 Dry Deck Shelter. Submarine Maintenance Engineering, Planning and Procurement (SUBMEPP) Activity provides Periodic Maintenance Requirement (PMR) inventories and

schedules are used for scheduling and reporting. Appendices A and B show examples of the SUBMEPP DSS HIP inventories and schedules respectively.

38.2.2.2 Submarine Maintenance Engineering, Planning and Procurement Activity Inventories and Schedules. The SUBMEPP inventories and schedules are provided at https://ebusiness.submepp.navy.mil/eBusiness/index.cfm.

38.2.3 Baseline and Due Dates. The baseline date for determining DSS HIP due dates is the Last Maintenance Action (LMA) date. LMA dates for new requirements will be based on the Change Issue Date of the DSS HIP invoking the new requirement unless otherwise directed from NAVSEA. Due dates are calculated based on LMA dates per paragraph 38.2.3.2. It is recognized that upkeep schedules for vehicles that are well into the operating cycle may not permit full compliance with the scheduled due dates. In such cases, a Departure From Specification (DFS) for the DSS HIP will be addressed on a case-by-case basis as specified in volume V, part I, chapter 8 or volume V, part III, chapter 8 of this manual. LMA dates and DSS HIP due dates are determined in the following paragraphs.

38.2.3.1 Last Maintenance Action Date. All DSS HIPs have an initial LMA date established at installation to start the operating cycle following the applicable DSS HIP manual. During the operating cycle, an adjusted LMA is used for DSS HIP. Calculate the adjusted LMA date as:

a. If the HIP is accomplished during a period other than a scheduled Availability (e.g., voyage repair periods, at sea, port calls, Fleet Maintenance Activity (FMA) Availability, refit, upkeep, etc.) the adjusted LMA date will be the first of the month following the PMRs completion date.

b. If the HIP is accomplished during a scheduled availability (e.g., Overhaul or Restricted Availability), the adjusted LMA date will be the first of the month following the scheduled availability's actual completion date.

38.2.3.2 Calculating Due Dates. Next due dates are calculated based on an adjusted LMA date. Due dates are calculated, for scheduling purposes, by taking the adjusted LMA date month (number) and adding the periodicity months (number) to show the month due (i.e., an item with an adjusted LMA date of February 2005 (2/05) with a six-month periodicity would be due in August 2005 (8/05)). The HIP will be accomplished prior to midnight of the last calendar day of the month due.

38.2.4 Periodicity Extensions. When determining the due date for certain DSS HIPs inspections, inactive time may be excluded from the time elapsed since the last inspection.

a. Inactive Time for HIPs 001, 003, 004 and 005 is defined as days in which a DDS is in a Restricted Availability (RAV), Regular Overhaul (ROH), storage, or other non-operational period. The definition of Inactive Time for HIP 002 is limited to only the time during which a DDS is in an availability (e.g. RAV, ROH). The sustaining activity must submit a Minor, Temporary, Non-Precedent setting DFS to the TYCOM, via the ISIC, to request a periodicity extension for the subject DDS HIP based on inactive time alone. This DFS must be specific to the HIP items and portions that will exceed the required periodicity, and must include supporting OQE (Transfer of custody letters, Dive log records etc.) to account for the inactive time. TYCOM must approve this DFS as temporary, with a due date of the requested HIP periodicity extension, and the DFS must remain active until the SUBMEPP PMR Inventory for

the HIP is updated. Upon update of the SUBMEPP PMR Inventory for the HIP, the DFS can be cleared.

b. General Periodicity Extensions: These authorization requests are for HIP periodicity extensions other than an Inactive Time Periodicity Extension of 1-9.d.1., and are generally due to technical or scheduling obstacles that prevent timely completion of a HIP. The sustaining activity must submit a Major, Temporary, Non-Precedent setting DFS to NAVSEA, via the ISIC and TYCOM, to request a periodicity change for the subject DSS HIP. This DFS must be specific to the HIP items and portions that cannot be or are not completed and must include rationale to support the requested change. This may include emergent operational needs, unavailability of material, incomplete integrity inspections, etc. The originator should provide supporting OQE (inspection and test reports accumulated, etc.). The originator will indicate when the HIP will be accomplished, propose any restrictions or limitations, and identify whether or not manned operations will be conducted between now and when the HIP inspection is accomplished. NAVSEA must approve this DFS, if appropriate, as temporary, with a due date of the requested HIP periodicity change, and the DFS must be active until the SUBMEPP PMR Inventory for the HIP is updated. Upon update of the SUBMEPP PMR Inventory for the HIP, the DFS can be cleared.

38.2.5 Scheduling, Planning and Reporting Hull Integrity Procedure Accomplishment at Sustaining Activity or Fleet Maintenance Activity Level.

38.2.5.1 Scheduling. The TYCOM PMR Scheduling System Inventories and Schedules are located at https://ebusiness.submepp.navy.mil/eBusiness/index.cfm. An inventories and schedules is to be provided to each applicable Unit Identification Code (UIC) by the ISIC. As a minimum, ISICs will schedule applicable DSS HIPs 60 days prior to scheduled availabilities.

38.2.5.2 Planning. FMA Planners will requisition materials, obtain plans and drawings, prepare Formal Work Packages or Controlled Work Packages and coordinate the scheduling with the Ship Superintendent, Production Officer and ISIC Material Office. Then the job will be turned over to the applicable Work Center for accomplishment.

38.2.5.3 Reporting. Each DSS HIP contains specific instructions on reporting the completed action and on use of a special feedback code to identify the material condition, or a change in inspection frequency is required. In order to ensure DSS HIPs are correctly accomplished and reported to SUBMEPP, the following actions are to be taken:

a. Sustaining Activities completing DSS HIPs must provide a report of accomplishment to SUBMEPP via the ISIC.

b. The Sustaining Activity must update the local inventory report and verify the completed HIPs are subsequently updated by SUBMEPP.

38.2.6 Scheduling, Planning and Reporting Hull Integrity Procedures Accomplishment During Regular Overhaul (ROH). Each DSS HIP contains specific instructions on reporting the completed action and on use of a special feedback code to identify the material condition, or a change in inspection frequency is required. In order to ensure DSS HIPs are correctly accomplished and reported to SUBMEPP, the following actions are to be taken.

a. The Availability Work Package (AWP) prepared by SUBMEPP will reflect all DSS HIPs authorized for accomplishment during the ROH at the AWP Ship Work List Item Number level.

b. For DSS HIPs assigned to the depot, the ISIC will enter "Assigned to <depot name> by AWP <AWP number>" in the Remarks/Completion block of the DSS HIP Schedule/Inventory and in the local scheduling system.

c. The Sustaining Activity will verify that all DSS HIPs assigned to the depot were reported and subsequently updated by SUBMEPP.

38.2.7 Scheduling, Planning and Reporting Hull Integrity Procedures Accomplishment During Restricted Availabilities (RAV). Each DSS HIP contains specific instructions on reporting the completed action and on use of a special feedback code to identify the material condition, or a change in inspection frequency is required. In order to ensure DSS HIPs are correctly accomplished and reported to SUBMEPP, the following actions are to be taken.

a. Prior to each RAV, the Sustaining Activity must identify HIPs required to be accomplished during the availability and assign them to the responsible repair activity for accomplishment. Forward this list via formal correspondence to the ISIC.

b. ISIC must review and verify these requests and forward to NAVSEA via the TYCOM.

c. The Sustaining Activity will verify that all DSS HIPs assigned for completion during the RAV are reported to the ISIC and subsequently updated by SUBMEPP.

38.2.8 Deep Submergence System Hull Integrity Procedures Completion Reporting.

a. Within 30 days after the completion of an availability or completion of a HIP outside an availability, the Sustaining Activity is required to provide a report of accomplishment to SUBMEPP and the DSS ISIC as well as other technical codes as designated in the DSS HIP. Specific information to be included in the report is identified in the applicable DSS HIP. The accomplishing activity or Sustaining Activity and ISIC must retain a legible copy of the most current inspection report until disposal of the DSS.

b. Prior to Manned Operations, the DSS Sustaining Activity must submit a letter to SUBMEPP via the ISIC that certifies all required inspections have been satisfactorily completed.

c. Upon identifying a material condition that would result in a reduced inspection periodicity if not restored to Category A condition during the availability in which the condition was found, a special report is required to be submitted by the accomplishing activity following the applicable DSS HIP and, if applicable, the AWP. This special report must be provided immediately to NAVSEA (PMS 390N) (SEA 07Q), TYCOM, ISIC and SUBMEPP indicating:

(1) Applicable DSS HIP.

(2) Equipment component identification.

(3) Inspection category.

(4) The reduced or deferred periodicity of each equipment component that should be inspected at less than its normal periodicity. This reduced periodicity report requirement is in addition to the completion reporting requirements.

38.3 RESPONSIBILITIES.

38.3.1 Type Commander.

a. Perform periodic audits of the ISICs and FMAs to verify full compliance with the provisions of reference (a), volume V, part I, chapter 9 of this manual and this chapter.

b. Provide guidance to the ISICs, obtaining NAVSEA concurrence as necessary, when deviations in the scheduling or accomplishment of maintenance or repairs are required by a DFS request and resolution per volume V, part I, chapter 8 and part III, chapter 8 of this manual.

c. Review requests for HIP accomplishment as required per paragraph 38.2.6.

38.3.2 Submarine Maintenance Engineering, Planning and Procurement Activity.

a. Receive reports of completion of DSS HIPs from all completing activities.

b. Review completion reports for compliance with the scheduled periodicity requirements and any change in the status category.

c. Establish an LMA date per paragraph 38.2.3.1.

d. Revise the periodicity and next due dates in DSS HIP inventories and schedules to reflect any NAVSEA approved periodicity extension changes, or TYCOM approved periodicity extensions due to inactive time as allowed for in the individual DSS HIP and paragraph 38.2.4.

e. Notify the TYCOM via the on-site SUBMEPP Representative of any DSS HIP beyond periodicity for TYCOM resolution.

f. Provide updated DSS HIP inventories and schedules following the distribution.

g. Quarterly, provide a list of DSS HIPs that appear overdue in the schedules and a list of DSS HIPs that have been reported complete by the fleet but Objective Quality Evidence has not been received by SUBMEPP.

h. Receive and review DSS HIP Objective Quality Evidence for technical accuracy and maintain DSS HIP completion history.

38.3.3 Immediate Superior In Command.

a. Maintain auditable records of DSS HIP accomplishment for each DSS. These records will include the current SUBMEPP Quarterly inventories and schedules, DSS HIPs completed and data report forms or reports submitted as a result of last accomplishment and all approved DFSs.

b. Conduct periodic audits of assigned FMAs and Sustaining Activities to verify full compliance with the provisions of reference (a), volume V, part I, chapter 9 and part III, chapter 9 of this manual, and this chapter.

c. In addition to the records of audits, maintain a file, by DSS, of the current DSS HIP inventories and schedules as provided by SUBMEPP. The schedules (Appendix B) for each DSS must be annotated with the new adjusted LMA date and the next due dates for the completions and any periodicity extensions authorized.

d. Although the responsibility for the accomplishment of DSS HIPs must rest with the DSS Commanding Officer, the nature and scope of the DSS HIPs dictate that the ISIC coordinate the accomplishment of DSS HIPs following the SUBMEPP provided inventories and schedules. Accordingly, the ISIC must assist in the preparation of, and approve each DSS HIP performance schedule. In addition, the ISIC must:

(1) Unless previously notified by SUBMEPP of delays, notify the SUBMEPP Representative and TYCOM of the non-receipt of schedules and reports.

(2) Upon printing, review each vehicle's quarterly DSS HIP inventory and schedule against the schedule information on the individual DSS HIP to verify DSS HIP scheduling or periodicity is accurate and that any rescheduling data which has been submitted to SUBMEPP has been accurately incorporated. HIPs accomplished during the month preceding the quarterly report may or may not be reflected in the issue received. Similarly, upon receipt of DSS HIP changes, audit the individual DSS HIP procedural and schedule information against each DSS's HIP inventory and schedule to verify that the component or equipment and periodicity has not changed and that provided changes do not impact current schedules. Resolve identified deficiencies through the SUBMEPP Representative at TYCOM.

(3) Review the enclosures to the HIP procedural inventories and the schedule forwarding letter and advise SUBMEPP of the completion dates and JSNs for DSS HIPs listed. Forward copies of completed Data Report Forms for these and any other DSS HIP completions identified by SUBMEPP as having missing Data Report Forms.

e. Ensure that all DSS HIP requirements with the appropriate screening (Ship's Force, FMA) are in the CSMP for subsequent development by SUBMEPP of forthcoming availability AWPs.

f. In the event that deviations from required periodicities or full requirements of the DSS HIPs are required, request approval from the Program Manager with Sustaining Certification Authority (SCA) concurrence by submitting a DFS request per volume V, part III, chapter 8 of this manual. Such DFS requests will be a Major DFS for DSS HIP program deviations. DFS requests are also to be submitted when repairs arising from the DSS HIP inspections cannot be completely accomplished. Periodicity extension requests for all DSS HIPs must be submitted per paragraph 38.2.4.

g. Establish procedures to affect routing of completed DSS HIP transactions. The ISIC should ensure proper documentation has been completed as described in the special reporting procedures of the HIPs. This must include the material condition feedback code as part of the final action, if required. Upon receipt of the report of maintenance action accomplishment from an assigned unit or the FMA, review the report for completeness, consistency, acceptability of conditions and material trends. Where

unsatisfactory conditions are found, direct repairs. Where repairs cannot be made, submit a DFS per volume V, part I, chapter 8 and part III, chapter 8 of this manual. Ensure SUBMEPP inventories and schedules are updated per paragraph 38.3.3.c. Clear DSS HIP major DFS upon TYCOM or NAVSEA approval and upon receipt of the SUBMEPP Quarterly PMR inventories and schedules, and ensure they accurately reflect the new due date of the DSS HIP as stated in the approved DFS.

h. Upon identifying a material condition that would result in a reduced inspection periodicity, ensure the accomplishing activity immediately reports the condition found via official correspondence to NAVSEA (PMS 390N), the TYCOM and SUBMEPP per paragraph 38.2.7.c.

i. Monitor the timely submission of DSS HIP data report forms and the report of accomplishment for DSS HIPs completed by the FMA, Sustaining Activity or industrial activity, as applicable, to ensure required documentation is submitted per paragraph 38.2.7. Ensure data report forms are submitted to report component replacement, repair or operation out of specification. Review all Sustaining Activity accomplished DSS HIP data for compliance with the requirements of the DSS HIP Program prior to submittal to SUBMEPP.

j. Prior to a DSS's underway period, review the vehicle's certification continuity report, if submitted, to ensure the ISIC and DSS's records (including the CSMP) accurately reflect DSS HIP status.

k. The Parent ISIC of deploying ships will ensure that any DSS HIP due for accomplishment by the ship or DSS during its deployment period is identified in the transfer of custody message and that the ship possesses the DSS HIP data report forms (if applicable) for reporting job completion.

l. Deployed Squadrons will review the DSS HIP status of deployed DSSs upon in-chop. Perform the function of the Parent ISIC in ensuring all DSS HIPs are accomplished and reported within the required periodicity while the DSS is deployed.

m. Prior to the start of an availability, ISIC DSS HIP coordinators will:

(1) Assign Job Control Numbers to DSS HIP items assigned to Forces Afloat in the AWP and screen them prior to the start of the availability following the directions in the AWP. Care must be taken to appropriately assign DSS HIP items to the correct accomplishing activity.

(2) ISIC DSS HIP coordinators will not assign Job Control Numbers to DSS HIP items assigned to the industrial activity in the AWP. The industrial activity is responsible for performing, auditing and reporting all DSS HIP items assigned by the AWP.

(3) DSS HIPs assigned to Forces Afloat by the AWP for accomplishment prior to the start of the depot period, but for some reason were not completed, will be reassigned to a concurrent availability or formally reassigned to the industrial activity via a supplemental work request.

n. DSS HIPs assigned to the industrial activity by the AWP which are not accomplished during the depot period will be reassigned to another availability by NAVSEA (PMS

390N) following the depot period provided the DSS HIP does not exceed its due date. The ISIC will be notified of this reassignment by formal correspondence which will include justification and reason why the scheduled and planned requirements were not met.

o. Prior to availability completion, ISICs will audit DSS HIPs assigned to Forces Afloat by the AWP and ensure all have been satisfactorily completed and documented within the required periodicity. The ISIC audit will also verify that all DSS HIP items coming due within six months of availability completion are complete or assigned to a follow-on fleet availability. Under no circumstances are DSS HIP due dates to be exceeded. ISIC Quality Assurance Officers will not be responsible for auditing DSS HIPs assigned to the depot in the AWP.

p. Following availability completion, the ISIC DSS HIP coordinator will ensure that all DSS HIPs assigned to the industrial activity were reported and subsequently updated by SUBMEPP.

38.3.4 Deep Submergence System Commanding Officer.

a. Ensure all DSS HIPs are accomplished within the required periodicity as specified by SUBMEPP.

b. Maintain auditable records of the accomplishment of DSS HIPs to permit verification of compliance with reference (a), volume V, part I, chapter 10 and part III, chapter 10 of this manual and this chapter. These records must consist of:

(1) Copies of letters of completion and inspection reports for all DSS HIP work accomplished by all activities. The required data forms are located in the individual DSS HIPs. A copy of each completed report must be submitted to the ISIC for review a minimum of 24 hours prior to manned operations.

(2) One copy each of the current Quarterly DSS HIP inventories and schedules provided by SUBMEPP. Annotate the DSS HIP Inventory Report when accepting completed work requests from the FMA or Ship's Force (LWC 991). It is the DSS responsibility for ensuring that the reports reflect the actual configuration, especially with regards to the equipment identity and the Allowance Parts List.

(3) Copy of outstanding DSS HIPs to be accomplished by Ship's Force.

(4) One copy of each approved DFS from the requirements of reference (a), volume V, part I, chapter 8 and part III, chapter 8 of this manual and this chapter. This authority is based on the following factors and considerations:

(a) The completion of all DSS HIPs, or portions thereof, will be reported by the ISIC per paragraph 38.2.5.3. Particular care must be exercised to ensure that existing conditions found at the time of inspection or need for repair or replacement of components is recorded in detail as prescribed by the DSS HIP.

(b) Deviations from DSS HIP requirements or periodicities may result in operational restrictions being placed on a unit. In order to determine

whether such restrictions are necessary, the TYCOM must be fully apprised of the number and extent of deviations involved.

(c) Allow no deviations in the scheduling or accomplishment of required DSS HIP maintenance actions unless formal NAVSEA approval of such deviations has been granted by an approved DFS or as allowed in paragraph 38.2.4. All system disassembles, repairs and reassemblies must be conducted per volume V of this manual, including requests for a DFS, if necessary.

(d) Except in an emergency, refrain from manned operations if all required DSS HIP maintenance actions have not been completed within the specified periodicities unless formal authorization to deviate from these requirements has been granted by NAVSEA. NAVSEA recommendation and TYCOM authority to conduct manned operations are contingent upon the satisfactory completion of these maintenance actions.

APPENDIX C

REQUEST FOR DSS HIP PERIODICITY EXTENSION FORMAT

4790

Ser

From: Commander, DSS Squadron ___
To: Commanding Officer, Submarine Maintenance Engineering, Planning and Procurement (SUBMEPP) Activity
Via: COMNAVSPECWARCOM

Subj: REQUEST FOR EXTENSION OF PERIODICITY FOR DSS HIP (S)_____ON DSS Vehicle or Shelter and Hull No.)

Ref: (a) Applicable DSS HIP
(b) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume VI, Chapter 38
(c) COMNAVSPECWARCOM ltr 4790 Ser ___of (previous letter granting extension of periodicity)

1. Per references (a) and (b), request extension of DSS HIP periodicity for Deep Submergence System (Vehicle or Shelter and Hull No.) as:

DSS HIP	Equipment Guide List Item Number or Component Ident	LMA Date	Current Due Date	Inactive Time		Extension Required	Required Next Due Date
					Inactive Days		
001	All	June 82	Apr 91		100 days	7 months	Nov 91
002	All	June 82	Aug 91		100 days	3 months	Nov 91
003	All	June 82	Aug 91		100 days	3 months	Nov 91
004	All	June 84	Apr 91		100 days	7 months	Nov 91
005	VB-10	June 84	Apr 91		100 days	7 months	Nov 91

2. Inactive time identified for the DSS HIPs listed in paragraph 1 is the actual allowable time accrued to date since DSS HIP was last accomplished or previous extension of periodicity was granted by reference (c).

Copy to:

CHAPTER 39

MAINTENANCE AND MODERNIZATION PERFORMANCE REVIEW AND LESSONS LEARNED CONFERENCE FOR SURFACE FORCE SHIPS

LISTING OF APPENDICES.

A Access to Lessons Learned Conference and MMPR Sites on the ST1 Portal

39.1 PURPOSE.

a. The Maintenance and Modernization Performance Review (MMPR) is a semi-annual forum for maintenance and modernization professionals to share, identify issues and focus on continuous process improvement opportunities within the Surface Maintenance and Modernization Community. The MMPR provides a path for communication between the individual Project and Ship Lessons Learned Conferences (LLC) and the top-level maintenance and modernization leadership.

b. The primary purpose of the LLC is to facilitate communication between Project Teams of all Surface Force ship classes across all Regional Maintenance Centers (RMC) and supporting activities at various stages in their availability to assist in improving cost, schedule and performance. The LLCs provide a singled-up approach to evaluate and capture critical lessons learned and barriers brought forward by Project Teams to facilitate process improvements in the Surface Navy.

c. The LLC process encompasses the established milestones and meetings within the planning and execution of availabilities per volume II, part II, chapter 3 Appendix A of this manual for continental United States (CONUS) and Hawaii (HI) availabilities, or volume III, chapter 4, Appendix B or G of this manual for Forward Deployed Naval Forces (FDNF) availabilities. Meetings that already exist to reinforce process improvements may include the Advance Planning Meeting, Work Package Integration Conference, Work Package Execution Review, Arrival Conference, 50% Conference and Completion Conference. While these events occur at various times, the feedback process exists to continually collect information to improve processes.

39.2 MAINTENANCE AND MODERNIZATION PERFORMANCE REVIEW OVERVIEW.

39.2.1 MMPR Objective. The MMPR topics will be relevant to process improvements for future availabilities and may include ship class or port specific process issues, best practices, success stories, industry feedback, technical issues, Surface Team One (ST1) initiatives and new developments and Fiscal Year Availabilities.

39.2.2 MMPR Key Membership.

a. The ST1 Executive Steering Committee (ESC) will select the MMPR Process Master and is responsible for managing and executing the MMPR.

b. Nearly all commands linked to the Surface Ship Maintenance and Modernization Community participate in the MMPR. These commands include Commander, Navy Regional Maintenance Center, RMCs, Naval Sea Systems Command (NAVSEA) 21, Type Commanders (TYCOM), Surface Maintenance Engineering Planning Program

(SURFMEPP), Planning Yards, Private Sector Industrial Activity Contracting Partners, Ship's Force (Commanding Officers through Department Heads), Fleet, SEA 05, SEA 09, Naval Information Warfare Systems Command, Program Executive Officer Integrated Work Schedule and Office of the Chief of Naval Operations N43. At a minimum, the following organizations will be invited to attend all MMPRs:

(1) Commander, Navy Regional Maintenance Center.

(2) RMCs Southeast Regional Maintenance Center (SERMC), Southwest Regional Maintenance Center (SWRMC), Puget Sound Naval Shipyard and Intermediate Maintenance Facility (PSNS & IMF), Northwest Regional Maintenance Center (NWRMC), Pearl Harbor Naval Shipyard and Intermediate Maintenance Facility (PHNSY & IMF), Hawaii Regional Maintenance Center (HRMC), Mid-Atlantic Regional Maintenance Center (MARMC), Forward Deployed Regional Maintenance Center (FDRMC), Ship Repair Facility (SRF)-Japan).

(3) Commander, Naval Surface Forces Atlantic.

(4) Commander, Naval Surface Forces Pacific.

(5) NAVSEA 21.

(6) SURFMEPP.

(7) Ship's Force.

(8) Commander, U.S. Fleet Forces Command.

(9) Commander, U.S. Pacific Fleet.

(10) Industry Partners.

(11) Naval Information Warfare Systems Command.

(12) Naval Surface Warfare Center (Philadelphia, Port Hueneme, Corona).

(13) NAVSEA 05.

(14) NAVSEA 09.

(15) Program Executive Officer Integrated Work Schedule.

c. MMPR Planning Team. The MMPR Planning Team will be chaired by the ST1 ESC. MMPR planning meetings will be conducted on a monthly basis preceding a scheduled MMPR. The objective of these meetings is to develop the agenda and ensure any information from ST1 priority topics is included.

39.2.3 MMPR Action Items. All action items resulting from an MMPR meeting will be tracked by ST1 and documented and tracked on the ST1 Portal with Lessons Learned Conference Action Items and barriers. Documents from the MMPR will be posted to the MMPR site under the ST1 Portal. Instructions on gaining access to the ST1 Portal are located in Appendix A.

39.2.4 Further Guidance. Further guidance regarding the MMPR process is outlined in the MMPR Business Rules.

39.3 LESSONS LEARNED CONFERENCE OVERVIEW.

39.3.1 Lessons Learned Conference Concept. The LLC is not a program review, an evaluation of the Maintenance Team (government or contractor) or a forum to acknowledge heroism or place blame. It is a process review, an evaluation of the execution of the availability from the advance planning to the completion of the availability. It is also a place to identify process issues that can further improve overall end-to-end maintenance and modernization process.

39.3.2 Lessons Learned Conference Objective. The objective of the LLC is to increase in-depth cross-Project Team discussions of common issues and to include risk mitigation strategies and best practices. Feedback will be shared locally and globally in the surface force ship community and will ultimately be embedded into the maintenance and modernization processes.

39.3.3 Lessons Learned Conference Key Membership.

a. Process Owner. Commander, Naval Surface Forces Atlantic N43 and Commander, Naval Surface Forces Pacific N43 are the overall LLC process owners. As such, Commander, Naval Surface Forces Atlantic N43 and Commander, Naval Surface Forces Pacific N43 are responsible for the general management of implementing the LLC process to ensure process effectiveness. While the TYCOMs are the LLC Process Owners, the LLCs are part of the ST1 structure as a "Knowledge Sharing Network". Each Knowledge Sharing Network under ST1 is assigned a Process Master; the LLC Process Master will be identified by the Process Owners.

b. RMC LLC Analysis Team. Each RMC must have a designated LLC Analysis Team Coordinator and a designated LLC Analysis Team Waterfront Operations Representative on the Analysis Team. Some RMCs may choose to have the Coordinator and Waterfront Operations Representative to be one and the same due to the time requirements demanded of an Analysis Team Member.

(1) The LLC Analysis Team Coordinator is responsible for the coordination and facilitation of their local RMC's scheduled LLCs. This person serves as the liaison between the Project Teams and the global LLC Community. Further guidance regarding the RMC LLC Coordinator's responsibilities are outlined in the LLC Analysis Team Business Rules.

(2) The LLC Analysis Team RMC Waterfront Operations Representative is responsible for providing the Waterfront expertise and knowledge for their local RMC to the Analysis Team. This person serves as the liaison between their RMC's waterfront and the global LLC Community. Further guidance for the roles and responsibilities of the local RMC LLC Analysis Team Member in completing the LLC Waterfront Perspectives Questionnaire is contained in the LLC Analysis Team Business Rules.

NOTE: WHILE THE LLC ANALYSIS TEAM MEMBER POSSESSES MANY RESPONSIBILITIES AS THE LLC MEETING FACILITATOR, THEY SHOULD EXPECT TO RECEIVE ASSISTANCE FROM ALL STAKEHOLDERS.

c. RMC Availability Project Manager. The RMC Project Manager is responsible for preparing and briefing their ship's Chief of Naval Operations Availability based on the Waterfront Perspectives Questionnaire they provided answers and comments on. The RMC Project Manager will capture all lessons learned, action items and barriers

deemed necessary to be communicated to the Surface Maintenance and Modernization Community.

d. Maintenance Community. Other maintenance activities involved with ship availabilities (in addition to those highlighted in preceding paragraphs) will participate in the LLC. These representatives are active members of the LLC Community and are responsible for maintaining awareness of availability issues and participating in the topic specific LLCs. The following participants are mandatory:

(1) TYCOM N43 Type Desk Office.

(2) TYCOM Project Engineer.

(3) Immediate Superior In Command.

(4) Ship's Force Representative.

(5) Private Sector Industrial Activity or Firm Fixed Price Contractor.

(6) SURFMEPP Detachment Representative.

(7) Government Availability Planning Manager (GAPM).

e. Modernization Community. Representatives of any Alteration Installation Team or other non-repair activity involved with availabilities will participate in the availability LLC meetings as appropriate:

(1) NAVSEA 21.

(2) Field Activities.

(3) Naval Information Warfare Systems Command.

(4) Program Manager Representative.

(5) Planning Yard Representative.

39.4 PREPARING FOR THE LESSONS LEARNED CONFERENCE.

39.4.1 Preparation. To adequately prepare for an LLC, Project Teams should review any lessons learned and barriers that they feel will be beneficial to other Project Teams throughout their Planning and Execution phases regarding the LLC. All Project Teams will be first introduced to the LLC Process during their first scheduled Integrated Project Team Development Event following the milestones listed in volume II, part II, chapter 3, Appendix A of this manual (for CONUS-HI) and volume III, chapter 4, Appendices B and G of this manual (for FDNF) by their local RMC LLC Analysis Team Coordinator or Waterfront Operations Representative.

39.4.2 Lessons Learned Conference Presentation Overview. The LLC Availability Overview Presentation serves as the format for the Project Teams to articulate key lessons learned and barriers encountered during their Availability Cycle. The LLC Waterfront Perspective Questionnaire template is available through the RMC Analysis Team Member. However, it will be tailored to each LLC Topic. Throughout the planning stages and execution of the availability, Maintenance Team members, other RMC personnel including the GAPM, Ship's Force, contractor, Alteration Installation Teams and other key availability stakeholders must assist the RMC Project Manager in submission of the LLC presentation. Input should also be gathered from:

a. Ship's Commanding Officer's Weekly Situation Reports.

b. Standard metrics identifying top cost drivers.

c. Late add alteration risk assessment messages (including comparison of expected versus actual impact to the availability).

d. Late add alteration risk acceptance.

e. Waivers for work added after the late add impact assessment as dictated by the milestones listed in volume II, part II, chapter 3, Appendix A of this manual (CONUS-HI) and volume III, chapter 4, Appendices B and G of this manual (FDNF) of this manual (including impact to availability).

f. Cost variance forms provided by contractor.

g. A review of contract changes to the base work package.

39.5 CONDUCTING A LESSONS LEARNED CONFERENCE.

39.5.1 Lessons Learned Conference Schedule. LLCs are scheduled as topics are identified for inclusion in the LLC process. Required LLC Project Teams are determined based on their applicability to the selected topic.

39.5.2 Agenda. The primary focus of the meeting is to discuss lessons learned, best practices and barriers pertaining to the specific topic. An agenda for all scheduled LLCs will be forwarded to all participants by the ST1 LLC Process Master, RMC LLC Analysis Team Coordinator. The agenda will also be available on the LLC site on the ST1 Portal: https://usff.navy.deps.mil/sites/surflant/st1/default.aspx.

39.5.3 Lessons Learned Conference Focus Areas. Surface Force Ships are required to participate in LLCs to promote synergy toward the identification and resolution of common availability issues. Topics of a LLC can be identified by any member of the Surface Ship Maintenance and Modernization Team. The topic specific LLC will bring together people from around the enterprise to share lessons learned on issues that are affecting the ability of project teams to complete availabilities on time or are constant drivers of growth and new work.

39.5.4 Invitees. Key membership and project team personnel involved with the availability, including the TYCOM, will be notified of the LLC meeting by the ST1 LLC Process Master, the RMC LLC Analysis Team Coordinator or the Class Team Leader. Key stakeholders involved with future availabilities will also be invited to attend the meeting.

39.5.5 Invites and Announcement. The RMC LLC Analysis Team Coordinator will review the scheduled LLCs on no less than a monthly basis. The schedule will include an agenda of upcoming LLCs based on topic relevance. The RMC Analysis Team Coordinators will recommend and designate the specific ship Project Teams to present at upcoming LLCs.

39.5.6 Lessons Learned Conference Documents. All LLC documentation will follow the LLC Analysis Team Communications Plan. Requirements for documents will also be discussed during the weekly LLC Telecoms.

39.5.7 Lessons Learned Conference Minutes. All participants, action items and barriers will be documented in minutes (KMails), following each LLC. The KMails will be forwarded no later

than five business days to all invitees, ST1 ESC and RMC Commanders. The minutes will also be posted on the LLC site on the ST1 Portal.

39.5.8 Lessons Learned Conference Web Site. LLC process meeting documents and information must be posted on the LLC site on the ST1 Portal. This site tracks all scheduled LLCs throughout the calendar year, all meeting preparation materials to include necessary read-ahead material for participants, Project Team Point of Contact Lists and approved KMails. The site should be used to aid in planning work packages and preparing for availabilities to ensure that any barriers and lessons learned identified by previous LLC Project Teams are applied to future availabilities. The site is located at https://usff.navy.deps.mil/sites/surflant/st1/default.aspx. See Appendix A for instructions on obtaining access.

39.6 INTERACTION AMONG FEEDBACK PROCESSES.

39.6.1 Relationships. The LLC meeting is sensitive to the contractor-government relationship and the legal procedures that accompany it. The Department of the Navy Acquisition Reform strategy includes a goal to "build a continuous dialogue with industry to identify mutually beneficial opportunities and practices". While the Department of the Navy encourages open communication between the contractor and the government, many legal issues arise from such information sharing. It is critical that the LLC meetings and general processes maintain awareness of the following legal procedures: Federal Advisory Committee Act, Procurement Integrity Act, Trade Secrets Act and Organizational Conflicts of Interest. Additionally, the LLC process is mindful of other feedback and review processes, such as the Award Fee Board and Contractor Performance Assessment Report.

39.6.2 Consistency. These business rules recognize the need for consistency between other feedback processes and the need for all to exist. As the LLCs will most likely occur prior to the Award Fee Board and the Contractor Performance Assessment Reports issuance, sensitive issues may arise. The LLCs intend to remain focused on process improvement, lessons learned and barrier identification. The LLC will allow for sensitive issues to remain in closed sessions or within the scope of their existing feedback and review processes.

39.7 LESSONS LEARNED CONFERENCE APPLICATION AND KNOWLEDGE SHARING. Lessons Learned, Barriers and Action Items and their associated resolutions are only useful when they are communicated between maintenance and modernization professionals. The following are the required methods for sharing information in a timely manner, but are not the only means to share this information:

a. MMPR. Status of LLC Action Items and Barriers will be provided during each MMPR.

b. ST1 ESC Meetings. When requested, the LLC Process Master will brief the ST1 ESC. As a minimum, each ESC meeting will include a status brief of all open action items and barriers. When barriers are briefed to the ESC, the barrier will be assigned to the correct point of contact for action and closure.

c ST1 Monthly Process Master Meetings. Monthly meetings will be conducted with each Knowledge Sharing Network Process Master and designated support personnel. These meetings will serve as a venue to provide a critical review of assigned action items from each LLC.

APPENDIX A

ACCESS TO LESSONS LEARNED CONFERENCE AND MMPR SITES ON THE ST1 PORTAL

In order for users to be granted access, they must have a .mil or .gov address and have a CAC.

1. Go to: https://flankspeed.sharepoint-mil.us/sites/NAVSEA_TeamShips_SEA21_ST1
2. Fill in the information requested and submit.
3. Your command approvers will create the account, usually within 48 hours.
4. If an individual already has an account for a different site within iNavy, they will see the User Registration Dashboard that will indicate your status.

CHAPTER 40

SUBMARINE MESSAGE REPORTING

REFERENCES.

(a) SECNAVINST 5510.36 - Department of the Navy Information Security Program Regulation
(b) NAVSEAINST 4720.14 - Temporary Alterations to Active Fleet Submarines, Control of
(c) NAVSEA SL720-AA-MAN-030 - Navy Modernization Process Management and Operations Manual (NMP-MOM)

LISTING OF APPENDICES.

A Sample (SUBS) Initial Message
B Sample (SUBS) Update Message
C Sample (SUBS) Final and Closeout Message
D Sample (SUBS) SHIPALT and TEMPALT Installation Message
E Sample (SUBS) SHIPALT and TEMPALT Removal Message

40.1 PURPOSE. This chapter provides policy and guidance regarding the utilization of (SUBS) messages. Reactor Plant and Strategic Weapons Systems material issues are not governed by this document and must not to be reported via (SUBS) message format. (SUBS) message requirements for New Construction, Chief of Naval Operations, (CNO) and Type Commander (TYCOM) depot availabilities are addressed in volume II, part III, chapters 2 and 3 of this manual and will not be addressed in this chapter. This chapter supersedes all other policy, procedures or guidance previously issued regarding (SUBS) messages.

40.2 BACKGROUND. Submarine material and equipment problems or requests for technical assistance reported via message have experienced delays receiving the required resolutions for identified problems. Delays were associated with insufficient data and or improper message addressing.

40.3 SCOPE. To establish protocol for the reporting of submarine equipment, systems and material issues that affect ship's mission or ship or personnel safety. To establish a reporting procedure that will ensure all necessary commands and technical authorities are contacted without delay. To ensure the correct action is identified and provided to the ship using the most rapid means.

40.4 POLICY.

a. The parenthetical code word (SUBS) must appear as the first word in the subject line before the subject description.

b. (SUBS) messages must identify its status by using the words INITIAL, UPDATE or FINAL at the end of the subject line.

c. The (SUBS) message must not be used as a substitute for any Casualty Report, Situation Report or Incident Report that may be required by higher authority. A (SUBS) message must be sent to provide further supplemental information needed to

explain the problem, provide troubleshooting support and identify its effect on the ship.

d. (SUBS) messages are intended for material and technical assistance request issues pertaining to ship's mission or personnel safety and should not be used to report routine administrative items such as visit requests, post tech assist visit reports or any other event not requiring the urgency of a (SUBS) message.

e. (SUBS) messages originated by submarines will be updated by the submarine at a periodicity not greater than once every 30 days. UPDATES should include equipment status, repair efforts in progress and if known anticipated repair date.

f. To identify (SUBS) message priority use the following precedence:

(1) ROUTINE - REQUEST ANSWER WITHIN 5 WORKING DAYS.

(2) PRIORITY - REQUEST ANSWER WITHIN 3 WORKING DAYS.

(3) IMMEDIATE - REQUEST ANSWER WITHIN 24 HOURS.

g. (SUBS) messages must be used to identify the installation and removal of Temporary Alterations (TEMPALT) and Ship Alterations (SHIPALT). However, the 30-day UPDATE requirement and precedence identification is waived for these instances.

h. (SUBS) messages identifying the installation or removal of a TEMPALT or SHIPALT will identify such message by placing the words (TEMPALT) or (SHIPALT) at the end of the subject line.

i. (SUBS) messages are to be classified appropriately per reference (a) chapter 6.

j. (SUBS) messages must be addressed to the controlling Immediate Superior In Command (ISIC) for action and INFO Naval Sea Systems Command (NAVSEA), NAVSEA 08, TYCOMs and Technical Authority as appropriate ensuring parent commands are included as addressees. INFO NAVSURFWARCENDIV PHILADELPHIA PA for all submarine messages. SSBNs and SSGNs will INFO Director, Strategic Systems Programs (DIRSSP).

k. A FINAL close out (SUBS) message must be sent upon correction of the reported material problem or if in the Commanding Officer's judgement, a technical resolution has been reached or no additional response is required from Technical Authorities, NAVSEA, TYCOM or ISIC.

l. NAVSEA must review all (SUBS) messages and provide responses to the ISIC within the precedence timeline as identified in paragraph 40.4 f.

m. (SUBS) messages initiated by NAVSEA requesting information from one or more Commands must be tracked by NAVSEA.

n. (SUBS) messages being initiated for the purpose of gathering technical information from submarines must be provided to the TYCOM for action.

o. Technical Authorities must provide all (SUBS) message responses to NAVSEA, TYCOM and ISIC for review and action. For messages addressed to SSBNs or SSGNs, INFO DIRSSP.

p. (SUBS) messages must not be initiated by a Technical Authority unless authorized by NAVSEA, TYCOM or ISIC.

40.5 RESPONSIBILITIES.

40.5.1 Type Commanders.

a. Review (SUBS) message traffic and when necessary readdress or forward to ensure the proper Technical Authority was identified and aware of the message.

b. Assist and support the ISIC as required to generate (SUBS) messages.

c. (SUBS) messages initiated by the TYCOM, requesting information from one or more Commands are to be tracked by the TYCOM department generating the message.

d. Track all (SUBS) messages generated by submarines under its cognizance.

40.5.2 Immediate Superior In Command.

a. Review and take for action all (SUBS) messages coordinating with NAVSEA, TYCOM and the Technical Authority to generate and provide message responses as required and within the precedence time line as identified in paragraph 40.4 f.

b. (SUBS) messages sent to or initiated by a submarine under its cognizance must be tracked by the ISIC.

c. (SUBS) messages initiated by the ISIC requesting information from one or more commands must be tracked by the ISIC.

40.5.3 Ship's Commanding Officer.

a. (SUBS) messages initiated by the ship must be tracked by the ship until closeout.

b. All technical assistance (SUBS) requests must include the Ship's job sequence number (JSN).

c. Responses to technical assistance (SUBS) messages must be answered as soon as the troubleshooting efforts have results. If requested troubleshooting efforts are not accomplished due to ship's operations or lack of test equipment, generate a (SUBS) message containing efforts taken, results, effect on ship and any further assistance needed.

d. When requesting onboard technical assistance, Chapter 2 of this volume, Fleet Technical Assistance, must be used as guidance.

e. Issue a (SUBS) message to identify the installation and removal of TEMPALTs and SHIPALTs.

40.6 MESSAGE REQUIREMENTS.

a. All (SUBS) messages requesting technical assistance will contain, as a minimum, the following requirements:

(1) EXECUTIVE SUMMARY - faulted equipment, when the fault occurred, functions lost and equipment effected.

(2) BACKGROUND (if any) - previous related equipment problems, when experienced, corrective action taken, last completed system certification.

(3) DESCRIPTION OF THE PROBLEM - affected equipment, type of fault, fault indications, system indications.

(4) TROUBLESHOOTING EFFORTS - procedures used, documentation held onboard, Ship's Force training and experience with the equipment, troubleshooting limitations, special equipment held, any possible fault identified during Ship's Force troubleshooting.

(5) ASSISTANCE DESIRED - repair parts needed, distance support or onboard technical assistance needed, if known identify the technical authority and the next available ship operation where a technician could board the ship. Identify the problem as corrected, no further assistance required and justify it as a FINAL REPORT with no additional action required. When answering an information request (SUBS) message a closeout message is not required and should be identified as such in Paragraph 5 of the message. (i.e., no additional action required by this message)

(6) COMMANDING OFFICER'S ASSESSMENT - level of impact assessment of ship's capabilities to complete operational commitments, any additional backup or redundant systems and its operational status.

(7) REQUIRED RESPONSE DATE - Specify the calendar date response is due by to support ship operations.

b. All (SUBS) messages reporting TEMPALT and SHIPALT completion will contain, per references (b) and (c), the following requirements:

(1) ACTIVITIES: Unit and installing activity identified.

(2) BACKGROUND: TEMPALT number, TEMPALT name, installation period dates, installation completion date, Ship's Force operational testing completion acceptance date.

(3) PROVIDED INFORMATION:

(a) Type of installation: New equipment, Upgrade, Design change, etc.

(b) TEMPALT number: XXXX K/D.

(c) Certifying Statement: "all work was accomplished in full compliance with applicable contractual standards, specifications and installation drawings as outlined in reference ( )". System Operation Verification Testing (SOVT) was completed on XX NOV XXXX, results were provided to Ship's Force.

(d) TEMPALT installation issues resolved: Ship's Installation Drawings require revision. All Liaison Action Requests submitted to the planning yard were resolved. Ship's Force has been provided copies of all Liaison Action Requests and red line drawings. Red line drawing forwarded to planning yard.

(e) TEMPALT Completion Report completed and forwarded XX Dec XXXX, results provided to Ship's Force.

(f) Equipment installed: example AN-BLQ-10 ES SYSTEM.

(g) Integrated Logistics Support provided: Tech manuals, Maintenance Requirement Cards library data, On Board Repair Parts.

(h) Training Provided: identify by name all personnel trained.

(i) Summary: installation schedule issues, delays, support required, etc.

(j) Anticipated TEMPALT removal date.

(4) POC: Point of Contact (POC) at installing activity.

(5) COMMANDING OFFICER COMMENTS: Describe any issues of concern, provide positive and negative comments and identify any other pertinent information.

c. All (SUBS) messages reporting TEMPALT removal will contain, per reference (b), the following requirements:

(1) ACTIVITIES: Ship's name and Hull number.

(2) BACKGROUND: TEMPALT Number and Title.

(3) PROVIDED INFORMATION:

(a) Date of removal.

(b) Certifying statement the ship was restored to original configuration.

(c) Removal Issues; any outstanding item preventing restoration.

(4) POC: Removal Activity POC.

d. To ensure the appropriate Technical Agencies are informed of the material problems or request for technical assistance the addressee guidance provided for Casualty Reporting located at https://mfom.nola.navy.smil.mil/mfom (SIPR access required) should be used for (SUBS) messages.

e. Appendices A through E provide samples of the message format to be used for (SUBS) messages.

RMKS/**1. EXECUTIVE SUMMARY**: EMERGENCY PROPULSION MOTOR (EPM) CIRCUIT BREAKER AT EPM CONTROL PANEL (EPMCP) TRIPS ON OVERCURRENT WHEN TAKING THE EPM ABOVE 18 SHAFT RPM IN THE AHEAD DIRECTION. CONTROL OF EPM MOTOR ARMATURE CURRENT BETWEEN SPEEDS OF 13 AND 18 SRPM IS SENSITIVE, WITH MOTOR ARMATURE CURRENT SPIKING AS MOTOR SPEED IS INCREMENTALLY RAISED. THE EPM REMAINS OPERATIONAL AT SPEEDS LESS THAN 15 SRPM AHEAD. OPERATION ASTERN IS NORMAL.
2. BACKGROUND: SHIP IS CURRENTLY CONDUCTING POST-SRA SEA TRIALS. SHIPALT 3461K (EPM HIGH TORQUE CLUTCH) WAS INSTALLED DURING SRA. EPM OPERATION WAS TESTED SATISFACTORILY PIERSIDE ON XXAUGXX TO A MAXIMUM SPEED OF 15 SRPM AHEAD AND ASTERN WITH NO ABNORMALITIES NOTED.
3. DESCRIPTION OF PROBLEM:
A. WHILE SLOWLY BRINGING THE EPM FROM 13 TO 18 SRPM AHEAD BY INCREMENTALLY TURNING THE HANDWHEEL (LESS THAN 1/64TH TURN) CLOCKWISE THE MOTOR ARMATURE CURRENT SPIKES TO APPROXIMATELY 800 T0 1100 AMPS DC THEN RETURNS TO NORMAL STEADY RUNNING CURRENT (APPROX 250 AMPS DC). THE MAGNITUDE OF THE SPIKE IS DIRECTLY PROPORTIONAL TO THE MOTOR SPEED/HANDWHEEL POSITION. MOTOR FIELD CURRENT BEHAVES NORMALLY, RUNNING FROM 7-9 AMPS DC.

B. AS SPEED IS RAISED ABOVE 18 SRPM, AN ARMATURE CURRENT SPIKE OF 1800 AMPS DC IS INDICATED AS THE EPM BREAKER TRIPS. THE MOST LIKELY CAUSE OF THE BREAKER TRIP IS OVERCURRENT (RATED INSTANTANEOUS TRIP POINT IS 2800 AMPS DC), BUT THE AMMETER RESPONSE IS TOO SLOW TO REGISTER FULL DEFLECTION.

4. TROUBLESHOOTING EFFORTS:

A. PERFORMED CLEAN AND INSPECT OF EPM CONTROL PANEL AND CONTROLLER PER EL-26 A-5 AND A-2 SATISFACTORILY.

B. TESTED OPERATION OF EPMCP PER EL-26 R-2M SATISFACTORILY.

C. INSPECTED EPM CIRCUIT BREAKER SATISFACTORILY.

5. ASSISTANCE DESIRED: REQUEST FURTHER TROUBLESHOOTING GUIDANCE VIA MESSAGE BY XXAUGXX.

6. CO ASSESSMENT AND REPAIR DESIRES: ORIG IS CONTINUING WITH POST-SRA SEA TRIALS, LIMITING EPM TO 15 SRPM AHEAD. ADDITIONAL TROUBLESHOOTING WILL BE PERFORMED UPON SURFACING.//

CHAPTER 41

MAINTENANCE AND PROJECT TEAM

REFERENCES.

(a) NAVSEA SL720-AA-MAN-030 - Navy Modernization Process Management and Operations Manual (NMP-MOM)
(b) NAVSEA SI009-60 - Schedule and Associated Reports for Availabilities over 9 Weeks in Duration
(c) NAVSEA TS9090-310 - Alterations to Ships Accomplished by Alteration Installation Teams

LISTING OF APPENDICES.

A Sample Supervising Authority Report of Availability Lessons Learned

41.1 PURPOSE. The purpose of this chapter is to define and establish the membership and responsibilities of the Maintenance Team and Project Team (PT) and those supplemental members of both that support the maintenance and modernization process. The Maintenance Team, PT and those that supplement under the Planning Process are integral members of a complex evolution that requires communication, coordination and collaboration in order to accomplish availability planning, execution and close out efficiently and effectively. The contents of this chapter complement volume II, part I, chapter 4 (Aircraft Carrier), part II, chapter 4 (Surface Force Ships), or part III, chapter 4 (Submarines); volume VI, chapter 31; volume VI, chapter 33; and volume VII, chapter 7 of this manual.

41.2 MAINTENANCE TEAM. Each ship must have a formally structured Maintenance Team. The team is led by the Ashore Ship Maintenance Manager and consists of representatives from the ship and the supporting shore maintenance infrastructure. The responsibility of the Maintenance Team is to manage the advanced planning and planning of maintenance, the routine maintenance of the ship and modernization following the maintenance policies, directives and business rules of the Fleet Commander, Type Commander (TYCOM) and the Naval Supervisory Authority (NSA).

41.2.1 Crew Swap. When a crew swap occurs that rotates a different crew to a hull, the non-crew members of the Maintenance Team must remain with the hull and provide continuity in planning and execution.

41.2.2 Maintenance Team Members. While there are many who contribute to the planning of ship maintenance and modernization, some key personnel have a continuing involvement in and responsibility for management of the overall advanced planning and planning of the ship's maintenance and modernization. The Maintenance Team forms the core of the PT. The Maintenance Team must be permanently assigned to the ship and must consist of the following members:

a. Ashore Ship Maintenance Manager. Validates, screens and brokers all maintenance and modernization, including assessments, requiring off ship assistance. Ensures the Project Manager (PM) has visibility of all assigned work. For all combat systems

related maintenance and modernization the Ashore Ship's Maintenance Manager will coordinate with the Combat Systems Port Engineer. Assignments are:

(1)	Surface Force	Port Engineer
(2)	Naval Air Force	TYCOM Maintenance Program Manager
(3)	Submarine Force	Maintenance Coordinator
(4)	Naval Information Force	Maintenance Manager

b. Ship's Commanding Officer. Primary representative for the ship. (The Commanding Officer may delegate to a representative.)

c. I-Level Ship Superintendent. Manages Regional Maintenance Center (RMC) or Fleet Maintenance Activity (FMA) Government production work for Continuous Maintenance (CM), Continuous Maintenance Availability (CMAV) and Chief of Naval Operations (CNO) availabilities. Manages I-Level production work planning, integration, execution and close out, reporting progress and status to the PM and Ashore Ship's Maintenance Manager.

d. Project Manager. NSA support to the Ashore Ship's Maintenance Manager in the advanced planning and close out phases of the maintenance availability (not applicable for Submarine Fleet Availabilities).

e. Ship Material Maintenance Officer. Coordinates Maintenance Team activities with Ship's Force personnel. Assignments are:

(1)	Surface Force	Ship Material Maintenance Officer
(2)	Naval Air Force	Ship Maintenance Manager*
(3)	Submarine Force	3M Coordinator
(4)	Naval Information Force	3M Coordinator

* The Reactor Maintenance Officer fills this role for Nuclear Propulsion issues.

f. Contractor Program Manager (when required). Manages authorized contractor or company work. Assignments are:

(1)	Surface Force	Prime Contractor Program Manager
(2)	Naval Air Force	Prime Contractor for RMC contracted (non-Naval Shipyard (NSY)) work
(3)	Submarine Force	Prime Contractor for RMC contracted (non-NSY) work
(4)	Naval Information Force	Prime Contractor Program Manager

g. Maintenance Support Team (LCS class ships only).

h. Combat Systems Ashore Ship's Maintenance Manager. Coordinates with the Ashore Ship's Maintenance Manager to ensure that combat systems-related maintenance and modernization are scheduled and completed (Surface ships only).

41.2.3 The Principal Roles of the Maintenance Team.

a. Management of Ship Maintenance. The Maintenance Team ensures the ship's Current Ship's Maintenance Project (CSMP) and Availability Work Package (AWP) are validated and accurately reflect the ship's material condition and current maintenance status. The Maintenance Team ensures there is an initial cost estimate in man-days and material dollars for all work candidates, including assessments and technical assistance. The estimates must be developed by the Ashore Ship's Maintenance Manager during initial review of the work candidates to be as accurate as possible, based on available information such as return costs from similar jobs, Ashore Ship Maintenance Manager experience, NSA and other government prepared or approved estimates. These estimates must be updated within the CSMP, as they are refined in order to provide the Maintenance Team with adequate data to plan maintenance actions. For Aircraft Carriers, these estimates will be entered in the Proposed AWP and finalized in the Authorized AWP. The Maintenance Team coordinates inspections, certifications, assessments and assist visits in support of the class maintenance plan. Additionally, the Maintenance Team may provide on-scene assessment of equipment condition to develop valid and accurate work candidates.

b. Budgeting for Ship Maintenance. The Ashore Ship's Maintenance Manager is responsible for the ship's Maintenance and Modernization Business Plan (MMBP). The Maintenance Team develops the budget recommendation for funding maintenance requirements for the fiscal year. The Maintenance Team assesses the ship's anticipated material condition for budget consideration including the validated CSMP, Class Maintenance Plan, planned fleet alterations, outstanding Departures From Specification (DFS), Temporary Standing Orders and Casualty Reports. This MMBP must address the funding required for execution year maintenance. Ashore Ship's Maintenance Manager and the Maintenance Team members will maintain their ship within the fiscal guidance defined by the approved MMBP. Chapter 33 of this volume describes the development and maintenance of the MMBP.

c. Logistics and Technical Expertise. The Maintenance Team members maintain a current, valid CSMP and AWP that serve as the authoritative source for all information on maintenance requirements. All technical guidance and advice provided by the members of the Maintenance Team must be in compliance with Systems Command approved technical guidance and policy. In instances where action by a Technical Authority is needed, the Project Manager must ensure this authorization is obtained. The effective logistics support for maintenance depends on the accuracy of the ship's configuration records. The Maintenance Team oversees prompt submission of change documentation pursuant to maintenance or modernization, validates change entries and ensures configuration records (e.g., Configuration Data Managers Database - Open Architecture) are updated.

d. Availability Coordination. The Ashore Ship's Maintenance Manager works for the TYCOM to develop, plan and coordinate scheduled availabilities, CM opportunities and emergent repairs of assigned ships within the resources provided. The Ashore Ship's Maintenance Manager must enter CNO availabilities, assessments, associated routine tasks and authorized Fleet and Programmed Alterations into the appropriate Maintenance Automated Information System following standard availability planning milestones. The Maintenance Team serves as the point of contact for the NSA or

Lead Maintenance Activity (LMA) in coordinating maintenance and planning activities. The Maintenance Team facilitates the orderly conduct of work candidate identification, validation, screening and brokering.

NOTE: RESPONSIBILITIES FOR EACH MEMBER HAVE BEEN BROKEN DOWN INTO TWO CATEGORIES, ACCOUNTABLE AND RESPONSIBLE.

e. Accountable: Owns the work, the person who makes the final decision on a task and has the ultimate ownership over that task.

f. Responsible: A contributor, this will be the person or people assigned to do the work.

41.2.4 Specific Duties of Maintenance Team Members.

41.2.4.1 Ashore Ship's Maintenance Manager.

a. For Aircraft Carriers, receives the Baseline Availability Work Package (BAWP) from the Carrier Planning Activity. Builds and refines the Proposed and Authorized AWPs.

b. Accountable:

(1) Leads the Maintenance Team and maintains frequent contact with the Commanding Officer and conducts personal observations of shipboard conditions. Establishes and maintains an effective communications plan with the ship during deployment. More information can be located in volume II, TYCOM specific part I, II, or III, chapter 4 of this manual.

(2) Maintains the CSMP shore file accuracy and provides recommended changes for the shipboard CSMP to the Ship Material Maintenance Officer and 3M Coordinator. (See volume II, TYCOM specific part I, II, or III, chapter 4 of this manual.)

(3) Validates all off ship maintenance for assigned ship(s), including off-ship assessments. (See volume II, TYCOM specific part I, II, or III, chapter 4, of this manual.)

(4) Develops initial planning estimates based on information such as return costs from similar jobs and Government prepared or approved estimates. (See chapter 31 of this volume.)

(5) Screens or schedules work candidates to the right time period and maintenance availability based on the MMBP, operational schedule, material readiness requirements and cost benefit analysis. (See volume II, TYCOM specific part I, II, or III, chapter 4 of this manual.)

(6) Brokering as discussed in volume II, TYCOM specific part I, II, or III, chapter 4 of this manual.

(7) Schedules, and assists the ship's Commanding Officer in conducting the Planning Board for Maintenance (PB4M) meetings, including agenda development. (See volume II, TYCOM specific part I, II, or III, chapter 3.)

(8) Coordinates all off-ship maintenance and modernization requirements.

(9) Screens Automated Work Requests in support of 100%, 80% and 50% package lock, including CSMP, Class Maintenance Plan (CMP) and TYCOM routines.

(10) Initiates Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), for "service" work.

(11) Develops Business Case Analysis and generates applicable Engineering Services Request, provides advice and serves as the ship's point of contact for access to technical expertise for all ship maintenance and modernization requirements, including the development of Ship Changes.

c. Responsibilities:

(1) Communicates, coordinates and tracks ship and applicable class problems.

(2) Ensures configuration change requests are promptly submitted.

(3) Ensures completion work candidates 2-Kilos are entered into the CSMP and the appropriate IT system. (See chapter 2 of this volume.)

(4) Executes the approved MMBP to best utilize windows of opportunity. (See volume II, TYCOM specific part I or part II, chapter 5 of this manual.)

(5) Makes recommendations to the ship's Commanding Officer and management on any deferred work items. (See volume II, TYCOM specific part I ,II, or III, chapter 4 of this manual.)

(6) Coordinates maintenance availability scheduling and execution. (See volume II, TYCOM specific part I or part II, chapter 5 of this manual.)

(7) (Surface Force only) Supports the RMC in planning assigned ship maintenance and modernization availabilities. (See volume VII, chapter 1 of this manual.)

(a) Develops and schedules work packages. Recommends resolutions to CNO scheduling issues.

(b) Recommends CM opportunities to the ship's Commanding Officer and the NSA management. Creates CM availabilities.

(c) Screens work candidates 2-Kilos to appropriate level of maintenance (Organizational, Intermediate, Depot (O, I, D)). Reviews assessment results for inclusion in work packages.

(d) Assists Project Manager with work package analysis for Private Sector Industrial Activity (PSIA) contracts.

(e) Provides availability evaluation input documentation during availabilities supporting Contractors Performance Appraisal Reporting System (CPARS).

(8) Supports Fast Cruise, Dock Trials, Sea Trials, Propulsion Plant Light Off Assessment (LOA) and Production Completion Date (PCD), Combat Systems or Aegis Light Off and TYCOM validation of PCD.

(9) Attends Integrated Project Team Development (IPTD), Work Package Integration Conference (WPIC), Work Package Execution Review (WPER),

Lessons Learned Conference (LLC) Life Cycle Planning, Docking, Arrival, 25%, 50% and 75% reviews, Undocking, and Departure conferences,

(10) Plans, coordinates and executes mid-deployment ship check.

(11) Supports Ship's Force for AWP collection and management of Objective Quality Evidence (OQE).

(12) Performs AWP risk assessments and verifies deliverables to contractor (O, I, D work items and Alteration Installation Team (AIT) schedule requirements).

(13) Assists the NSA with technical close out and availability work certification. Assists ship in achieving maintenance phase exit criteria.

(14) Supports the 100% Package Lock Letter.

(15) Validates growth and new work, assists with the Regional Calibration Center process.

(16) Supports and participates in work specification review.

(17) Provides incremental funds for ordering Long Lead Time Material (LLTM) for both repair and alteration or modification work to meet required dates.

(18) Submits change deferral request to appropriate platform planning activity.

41.2.4.2 Ship's Commanding Officer. Primary representative for the ship. Works with the Ashore Ship's Maintenance Manager on the development and prioritization of the ship's maintenance and modernization including the MMBP.

a. Accountable:

(1) Reports progress weekly to the TYCOM. Recommends urgent and compelling decisions to the TYCOM.

(2) Works with the Ashore Ship's Maintenance Manager to develop the final work package submission for the ship.

(3) Directs efforts to identify all shipboard maintenance requirements and ensures accurate and timely entry into the CSMP. Reviews, plans and monitors accomplishment of organizational level work.

(4) Initiates requests for technical assistance, including distance support.

(5) Determines the effect of material deficiencies on mission capability and releases Casualty Reports.

(6) Integrates maintenance planning in the ship's operational schedule.

(7) Ensures the ship is prepared for and ready to conduct propulsion plant PCD and LOA events (and Command, Control Communications, Computer, Combat Systems, Intelligence Light Off (C5ILO) event for Surface Ships).

(8) Chairs the PB4M meeting.

b. Responsibilities:

(1) Verifies technical assistance final resolution satisfies ship's maintenance issue.

(2) Ensures Ship's Force assists with the management and oversight of work execution by maintenance activities and AITs.

(3) Executes shipboard DFS process.

(4) Ensures ship properly supports 25%, 50% and 75% reviews; Arrival, Docking, Undocking, Fast Cruise, Dock Trials, Sea Trials, Departure, and Completion key events and conferences; IPTD, WPIC, WPER events; and CSMP, DFS, BAWP Mid-Cycle reviews.

(5) Ensures Integrated Logistics Support (ILS) is provided.

(6) Assists in scheduling and execution of mid-deployment ship check.

(7) Collaborates in the authorization of growth or new work.

(8) Supports the Integrated Test Plan (ITP)execution and work certification.

(9) Assists in achieving maintenance phase exit criteria. Ensures proper space turnover, Ship's Force AWP collection and management of OQE, and availability technical closeout.

41.2.4.3 I-Level Ship Superintendent.

a. Accountable:

(1) Manages the collection of I-Level OQE.

(2) Manages RMC or FMA work planning, scheduling, integration, and work execution. Resolves conflicts with other Executing Activities. Ship checks work candidates (2-Kilo) as applicable and provides estimates on all I-Level work candidates. Recommends cancellation of invalid work candidates, if applicable.

(3) Represents the RMC or FMA to Ship's Force for RMC or FMA production maintenance work. Coordinates the performance of I-Level work including all scheduling and availability coordination, ensuring the I-Level work package is fully accepted following the milestones.

b. Responsibilities:

(1) Ensures completion of I-Level production work supporting LOA, propulsion plant PCD, Aegis and Combat Systems Light Off, Docking, Undocking, Fast Cruise, Dock Trials, Sea Trials, and Availability Completion.

(2) Assists ship in achieving maintenance phase exit criteria. Ensures I-Level work is complete in support of availability certification, completion, and technical close out.

(3) Attends availability production meetings; Arrival, Docking, Undocking, Departure, WPIC and WPER conferences.

(4) Coordinates work planned and performed by RMC production department. FMA repair division submits I-Level schedule to NSA or LMA for integration, coordination of I-Level open and inspects, coordination of oversight for I-

Level work (Product Verification Inspection (PVI), Procedure Evaluation (PE), Procedure Review (PR)).

(5) Provides recommendations regarding assignment of work candidates to RMC production department or FMA repair division based on the capabilities and capacities of the RMC or FMA. Works closely with the Ashore Ship's Maintenance Manager on the validation and screening of all work candidates to the I-Level.

(6) Ensures completed maintenance action (2-Kilo) for completed work.

41.2.4.4 Project Manager.

a. Accountable:

(1) Supports the Ashore Ship's Maintenance Manager in the performance of maintenance and modernization.

(2) Accepts or rejects work candidates to scheduled availability periods and performing activities per guidance in volume II, TYCOM specific part I, II, or III, chapter 4 of this manual. Integrates work candidates to form optimized work packages.

(3) Establishes the availability in the appropriate maintenance execution IT system.

(4) Ensures LLTM for Firm Fixed Price and PSIA contracts is ordered to support availabilities.

(5) Conducts Work Specifications Review with Ashore Ship's Maintenance Manager.

(6) Serves as the advanced planning manager for contracted maintenance during CNO availabilities and scheduled CMAVs conducted at contractor or Government depots. Coordinates the continuous cost estimate review process.

(7) Provides timely financial accounting information during the execution of maintenance to customers.

b. Responsibilities:

(1) Supports CSMP, DFS and BAWP mid-cycle review.

(2) Attends IPTD events, scoping conferences (see volume VII, chapter 2, paragraph 2.12.1 of this manual), WPIC and WPER.

(3) Assists in coordinating mid-deployment ship checks.

(4) Provides incremental funds for ordering LLTM for both repair and alteration or modification work to meet required dates.

41.2.4.5 Ship's Material Maintenance Officer. (The Reactor Maintenance Officer fills this role for Nuclear Propulsion issues.) Coordinates Maintenance Team activities with Ship's Force personnel.

a. Accountable:

(1) Provides the Ship's Force work package to the Project Manager and executing activity. Assists in coordinating the integration of Ship's Force work for CNO or CMAV availabilities. Provides shipboard schedule inputs (see Volume II, TYCOM specific part I, II, or III, Chapter 4, of this manual). Interfaces with the Project Manager and the executing activity to resolve maintenance issues.

(2) Commanding Officer's principal assistant for management of ship maintenance. Prepares the ship input to the PB4M agenda in support of the Ashore Ship's Maintenance Manager. Works with the Maintenance and Material Management Coordinator to maintain an accurate shipboard CSMP. Approves, validates and ensures submittal of accurate work candidates (2-Kilo).

(3) Works with the Quality Assurance Officer and department representatives to submit and track DFSs.

(4) Ensures initiation of work candidates (2-Kilo) to request distance support and technical assists. Works with Subject Matter Experts (SME) to coordinate tech assist visits.

(5) Monitors timely submission of configuration change requests.

(6) Ensures Ship's Force verification of completed work and returns Completed Maintenance Action (2-Kilo) to the Ashore Ship's Maintenance Manager.

(7) Ensures valid deferred work is incorporated into the CSMP.

b. Responsibilities:

(1) Ensures repair work candidates are submitted supporting 50%, 80% and 100% D-Level lock milestones.

(2) Ensures Ship's Force I-Level work package 100% brokered and locked.

(3) Ensures ship's initial conditions are set for work to begin by outside activities and Work Authorization Forms are properly executed. Ensures systems and equipment are properly tagged out, drained and depressurized.

(4) Generates any new work requests along with supporting urgency information.

(5) Ensures Ship's Force has planned and prepared for propulsion plant PCD, LOA, and Aegis or combat systems PCD and light off, Fast Cruise, Dock Trials and Sea Trials mid-deployment ship checks.

(6) Attends the Docking, Arrival, 25%, 50% and 75%, Undocking and Departure conferences, WPIC, WPER, IPTD, LLC events, and CSMP, DFS and BAWP Mid-Cycle review.

(7) Provides oversight and management to ensure AIT controls are in place, Regional Maintenance and Modernization Coordination Office requirements are met prior to starting work onboard ship, and assignment of SMEs to support AITs.

(8) Ensures Ship's Force work is complete to support end of availability, space turnover, and availability work certification.

(9) Supports Ship's Force ILS and consolidates software delivery.

(10) Coordinates with Ship's Force the execution of the ITP.

(11) Ensures Ship's Force, RMC, LMA, AWP collection and management of OQE.

(12) Ensures AWP risk assessments are performed and deliverables to contractor verified.

(13) Collaborates in the authorization of growth or new work.

(14) Assists ship in achieving maintenance phase exit criteria.

41.2.4.6 Contractor Program Manager. Manages and supervises authorized contractor work (see volume II, TYCOM specific part I, II, or III, chapter 4 of this manual).

a. Accountable:

(1) Schedules and oversees contractor required open and inspects.

(2) Provides information and advice to the Government on matters of mutual concern to include contractor cost and time estimates, future work planning, contractor capability and capacity for varied work accomplishment (i.e., port loading), production management, integration of work from multiple activities and production problems for assigned availabilities.

(3) Establishes and recommends availability milestones. Provides schedule for: ITP, Universal Process Control Procedure (UPCP), Process Control Procedures (PCP), availability planning and assessments.

(4) Reviews and submits condition reports, initiates completion reports for authorized work completed.

(5) Ensures progressing Cost and Schedule Status Reports.

b. Responsibilities:

(1) Recommends scheduling of work to best take advantage of port work loading conditions, provides recommendations for reduction of premiums in the accomplishment of work.

(2) Ensures completion of 50%, 80% and 100% D-Level maintenance work package 2-Kilos are planned and estimated. Publishes work package in the appropriate IT system. Conducts work specification reviews in support of each milestone, final package submission and cost proposal. Ensures work package is Technical Analysis Reported, negotiated and definitized.

(3) Attends 25%, 50% and 75% reviews; Arrival, Docking, Undocking and Departure conferences; WPIC, WPER and LLC events.

(4) Ensures completion of the ITP, propulsion plant PCD and LOA, Combat Systems or Aegis PCD, and Light Off, Fast Cruise, Dock Trials, Sea Trials, and Availability work certification.

(5) Ensures consolidated software delivery and ILS support is provided.

(6) Supports the PM to ensure the availability business and technical close requirements are met.

(7) Supports the DFS process.

(8) Ensures requirements are met to support the UPCP, PCP, cleanliness processes.

(9) Provides contractor oversight of LMA checkpoint execution (V, G, I points) as well as PVI, PE, PR.

(10) Provides personnel to coordinate with AIT, Fleet Maintenance Activity and Ship's Force to update production schedule (NSI 009-060).

(11) Provides Integrated Total Ship Test Plan (NSI 009-067).

(12) Ensures contractor work is complete to support space turnover.

(13) Supports the authorization of growth or new work.

(14) Ensures habitability items are complete.

(15) Provides incremental funds for ordering LLTM for both repair and alteration or modification work to meet required dates, ensures delivery of material (LLTM and kitted materials) to executing activity.

(16) Ensures work and support services are in place to support dock and undock.

41.2.4.7 Combat Systems Port Engineer (Surface ships Only)

a. Accountable

(1) TYCOM's C5I waterfront representative who identifies, validates and prioritizes the C5I requirements.

(2) Serve as the TYCOM's Technical Expert for ship C5I maintenance, modernization and repair requirements.

b. Responsibilities

(1) Possess the technical knowledge, skills and ability to interface with Subject Matter Experts (SMEs).

(2) Serve as the Maintenance Team's C5I SME.

(3) Attend and provide C5I maintenance status at PB4M.

(4) Validate C5I work requirements prior to screening and brokering of Work Notifications (WNs) by Ashore Ship's Maintenance Manager.

(5) Provide input and priorities for final screening of C5I work.

(6) Maintain cognizance of assigned ship's C5I CASREPS.

(7) Perform a C5I interface function with class Planning Yard and PEO representatives.

(8) Schedule and coordinate C5I planning and ship check inspections with ship's force personnel.

(9) Coordinate C5I Tech Assists, inspections and grooms with customer's support agencies (SYSCOM, NAVWAR, RMC, OEM, Contractor, etc.).

(10) Review specifications to ensure accuracy and conformance for authorized C5I work.

(11) Provide C5I input and priorities for MMBP development for assigned ship(s).

(12) Validate the C5I ICMP or BAWP Program push and pull WNs.

(13) Coordinate Risk versus Cost Management assessments for C5I systems.

(14) Concur with proposed C5I growth and new work.

(15) Get underway on assigned ship(s) for rides of opportunity including, but not limited to INSURVs, Sea Trials and mid-deployment ship checks.

41.3 PROJECT TEAM. (Augmentation to manage RMC-contracted maintenance in availabilities between A-120 and C+60). The PT must be assigned to the ship availability and must consist of those persons listed here and all members of the Maintenance Team. The Project Manager leads the PT and has the responsibility to ensure overall integration, execution and close out of a ship's availability. The PM is responsible for quality, schedule and cost. Some PT members may be assigned responsibilities for more than one ship.

41.3.1 Project Manager.

a. RMC Project Manager:

(1) When an RMC is the NSA, the PM is responsible for integration, execution, and close out of the Work Package. When the NSY is the NSA, the RMC PM is responsible for planning, integrating, coordinating, and executing the PSIA contracted maintenance work items, in support of the NSY Project Manager.

(2) When an RMC is the NSA and the LMA is a contractor, the RMC PM is the senior NSA representative, leads the NSA PT and has the overall responsibility to plan, integrate and execute availabilities.

(3) When the NSY is the NSA and the LMA, the NSY Project Manager (Superintendent) is the senior NSA representative, leads the NSA PT and has the overall responsibility to plan, integrate and execute availabilities. In this situation, the RMC PM leads the supporting RMC Contract Management PT and is responsible for planning, integrating, coordinating, and executing the contracted maintenance work items in support of the NSY Project Manager (Superintendent), integrates into the NSA PT at the APS Level and operationally reports to the NSA Project Manager (Superintendent) during the project.

b. Accountable:

(1) Accepts and tracks all assigned maintenance work items through execution. Coordinates planning, cost estimating and design specification preparation and scheduling. Coordinates and manages ship checks per volume II, part I, chapter 5 for aircraft carriers or part II, chapter 5 for surface ships of this manual. Reviews specifications to ensure completeness and conformance with

authorized work. Ensures all specifications for work are developed using approved technical guidelines ensuring maximum use of current Naval Sea Systems Command (NAVSEA) approved Standard Items and Standard Work Item templates (Master Specification Catalogue).

(2) Analyzes feedback submissions per chapter 39 of this volume.

(3) Briefs Ship's Force on the status of all work, by work item (see volume VII, chapter 2 of this manual).

(4) Acts as business agent with other activities on availabilities and contracts assigned that includes ensuring that TYCOM funds are utilized properly. Evaluates all Technical Analysis Reports (TAR) and supports the Contracting Officer in contract negotiations. Acts as assistant funds administrator (when designated in writing from the RMC Commanding Officer) for assigned availabilities and contracts.

(5) (Surface ships only) Documents delay and disruption charges and lessons learned per chapter 31 of this volume.

(6) Manages ship repair and modernization work items, job orders and contracts assigned by progressing and evaluating all work to anticipate, prevent and minimize delays, resolving all problems that affect the end cost, quality, schedule and performance of assigned availability or contract.

(7) Evaluates and acts on the reports received from other members of the availability management team. Prepares reports on current status of assigned project or contract.

(8) Maintains liaison with customers, the ships Maintenance Team, Ship's Force Representatives, and financial or accounting personnel.

(9) (RMC PM only) Maintains liaison with RMC functional departments and the contractor.

(10) Arranges and conducts the arrival conference (see volume VII, chapter 7 of this manual), weekly progress conferences, weekly commanding officer's brief (see volume VII, chapter 7 and volume II, part I, chapter 2 for aircraft carriers or volume II, part II, chapter 2 for Surface Force ships) of this manual, Docking conference, and the Availability Completion conference. Attends weekly management meeting and on-site meetings to provide comprehensive information to all concerned and to remain current in all aspects of the project.

(11) (RMC PM only) Arranges for RMC representation at all conferences pertaining to assigned availabilities and contracts. Coordinates the on-site work effort in observing the contractor's in process production performance and operational testing events for projects assigned to the team.

(12) Reviews all work accomplished by assigned Shipbuilding Specialists to ensure compliance with regulations, directives, instructions, and policies as well as to ensure that intended work is practical and necessary.

(13) (RMC PM only) Reviews contractors work schedules, manning curves, material ordering or receipt schedules and special tasking or equipment requirements. Evaluates contractors' proposals prior to and during contract execution. Takes corrective actions to eliminate conflicts and prevent work stoppages. Identifies and initiates action to correct, prevent, and minimize delays, resolving all problems that affect quality, schedule and contractor performance.

(14) Provides written reports (CPARS) to the Contracting Officer for award fee evaluations on CNO availabilities.

(15) Coordinates required action as a result of post overhaul or repair inspections with the NSA Technical Authority and Maintenance Team per volume IV, chapter 4 of this manual.

(16) Maintains records for the Contracting Officer to include but not limited to the following:

(a) Maintains a Significant Event Log (see volume VII, chapter 7 of this manual). Collects significant events log from project team personnel.

(b) Maintains correspondence files containing copies of all correspondence to the contracts office both internal and external.

(c) Obtains work authorizations for growth and new work. Work authorizations may be in the form of naval messages, speed letters, letters, other transmittals or documents. In the case of growth work, the authorization may be verbal, a memo at a meeting or a telephone call. Verbal authorizations should be documented with a memorandum for the record.

(d) Maintains a ledger notebook or spreadsheet to assist in funds administration. For each contract modification initiated in the work package, the Project Manager must show the title of the item, cite the proper funding authorization and account and show the Government estimate. The ledger must show funds committed and obligated for each contract modification and other financial transactions and provide an indication of funds available for future use. When changes occur during the negotiation process, the funds reserved or obligated must be changed to reflect the current funding status. Periodically, at least monthly, the Project Manager must reconcile ledger accounts with the Contracting Officer and Comptrollers' accounts to ensure that funds are not over obligated or expended.

(e) Maintains material requisitions for Government Furnished Material (GFM) with prices.

(f) Maintains project orders and economy act orders issued to other Government activities.

(g) Maintains completion reports.

(h) Maintains departure reports including summary costs of individual work items.

(17) (RMC PM only) Reviews contractor condition reports (see volume VII, chapter 7 of this manual), exceptions list, and contract modifications for approval.

(18) Maintains contact with the ship through the guarantee period (see volume VII, chapter 7 of this manual).

(19) Prepares a "Readiness to Start" report (see volume VII, chapter 7 of this manual).

(20) Assists Contracting Officers (see volume VII, chapter 2), participate in the contract awards phase (see volume VII, chapter 7 and chapter 3 of this manual), manages funding for option items per chapter 31 of this volume, participates in the pre-award survey, verifies adequate funding for acceptable berthing and messing and performs contract administration.

(21) (RMC PM only) Provides appropriate clearance letters to the ship for RMC and contractor personnel (see volume VII, chapter 7 of this manual).

(22) Conducts underwater hull inspection and drydock walkthrough (see volume VII, chapter 7 of this manual).

(23) Provides a list of expected prorated items with work numbers assigned (see volume II, TYCOM specific part I or II, chapter 5 of this manual).

(24) (RMC PM only) Establishes a Ship Specification Package within Navy Maintenance Database (NMD) Planning for CMAVs and set up availability in NMD to receive Automated Work Requests from the appropriate IT system. (See volume II, TYCOM specific part I or II, chapter 5 of this manual.)

(25) (RMC PM only) Reviews and validates Automated Work Requests received in NMD Strategic Systems Programs planning availability daily (see volume II, TYCOM specific part I or II, chapter 5 of this manual).

(26) Prepares and schedules the LOA or propulsion plant light off (see volume II, TYCOM specific part I, II, or III, chapter 2 of this manual).

(27) (RMC PM only) Reports costs, schedules and maintains the status of all CNO and CMAV work conducted at contractor and Government facilities.

(28) Coordinates, schedules and administers advance planning functions. Analyzes work package to maintain available dates and minimize premiums.

(29) Participates in availability final cost validation.

(30) Participates in establishing controls to fund all repairs for an availability.

(31) (RMC PM only) Analyzes work package to level load contractor.

(32) Assures planning estimates are established for timely receipt of funds, requests funds and distributes relevant availability information.

(33) (RMC PM only) Coordinates review of both Government and contractor estimates for "reasonableness and fairness". Recommends alternate contracting vehicles if applicable.

(34) (RMC PM only) Submits contract work packages to appropriate procurement activity for solicitation and monitors progress of contract award.

(35) (RMC PM only) Responds to contract bidders' questions during Fleet Fast Pay solicitation.

(36) Provides inputs for funding requirements and serves as the Maintenance Team funds manager for CNO availability preparation and execution.

(37) Chairs advance planning meetings, reviews and accepts or modifies recommended availability milestones.

(38) Updates appropriate product and pricing databases.

(39) Prepares advance planning status messages, fuel and ammunition offload, readiness to start, pre-availability agreement, monthly availability status messages and completion messages for scheduled CNO or CMAV availabilities.

(40) Coordinates interface of outside activities during availability execution (i.e., Systems Commander, TYCOM, In-Service Engineering Agent, AITs and other customers).

(41) Oversees contractor or NSY work during availability execution. Progresses and monitors other integrated availability work.

(42) Assists with business case analysis preparation.

(43) Verifies that controls are sufficient to fund all repairs required to support operational commitments.

(44) Reviews cost reports for cost performance.

(45) Executes availability planning milestones. Enforces depot availability "lock", planning and estimating dates.

(46) Prepares the business case analysis for growth and new work recommendations and recommends resolutions to the Ashore Ship's Maintenance Manager. Reviews the authorization and funding, and submits information to the contracting officer for negotiation on growth and new work.

(47) Coordinates urgent and compelling requests.

(48) Chairs weekly production progress meetings and provides regular status reports to Ashore Ship's Maintenance Manager.

(49) Reviews condition reports and evaluates submitted time and cost estimates for accomplishment or deferral in concert with the Ashore Ship's Maintenance Manager's concurrence.

(50) Oversees an independent Government review of brokered work candidates for obligation of Government funds and execution.

(51) Ensures work candidate 2-Kilo documentation is complete and completion reports are initiated by the executing activity.

(52) Verifies funds availability and maintains funds tracking reports.

(53) (RMC PM only) Submits I-Level schedule to contractor for integration.

(54) Ensures work is complete to support PCD, LOA, combat systems light off, propulsion plant light off, Dock Trials, Fast Cruise, Sea Trials (contractual milestone).

(55) Provides oversight of AIT management.

(56) Attends 25%, 50%, 75% reviews; Arrival, Docking, Undocking, Departure, and Completion conferences; IPTD, LLC, WPIC and WPER events.

(57) Ensures work is complete and closed out to support business close.

(58) Coordinates condition report responses.

(59) Coordinates consolidated software delivery and ILS support.

(60) Ensures work is complete supporting habitability completion.

(61) Provides oversight of (PVI, PE, PR) and LMA checkpoint execution (V, G, I).

(62) Ensures LMA coordinates with AIT, Fleet Maintenance Activity and Ship's Force to update production schedule (NSI 009-060).

(63) Ensures LMA provides Integrated Total Ship Test Plan (NSI 009-067).

(64) Requests funds for repair and modification work LLTM, orders LLTM Firm Fixed Price or PSIA.

(65) (RMC PM only) Ensures contracted maintenance is complete supporting space turnover.

(66) (RMC PM only) Performs risk assessments and verify deliverables to contractor (O, I, D work items and AIT schedule requirements).

(67) Provides funds administration for all depot level funding on assigned ship(s) as designated in writing by the RMC Commanding Officer.

c. Responsibilities:

(1) Provides supporting information for Business Case Analysis for new work.

(2) Participates in CSMP, DFS and BAWP mid-cycle reviews, coordinates mid-deployment ship checks, and participates in scoping conference (see volume VII, chapter 2 of this manual).

(3) Reviews and provides feedback on Engineering Service Request.

(4) Ensures LMA and I-Level collection and management of AWP OQE.

(5) Provides oversight of the ITP Execution.

(6) (RMC PM only) Ensures contractor coordination of open and inspects with participating activities.

(7) Progresses Cost and Schedule Status Reports.

(8) Participates in risk letter development and signed out.

(9) Assists with the authorization of growth and new work.

(10) Assists ship in achieving maintenance phase exit criteria.

(11) (RMC PM only) development and execution of the Quality Management Plan.

41.3.2 Contract Specialist. The Contract Specialist who acts as the Administering Contracting Officer (ACO) and whose duties parallel the responsibilities of the Contracting Officer. Their authority is limited as specified by the level of their Defense Acquisition Workplace Improvement Act qualifications level of authority, specific limitations of their warrant and specific assignments made by the Contracting Officer. The ACO is assisted by additional warranted, Defense Acquisition Workplace Improvement Act qualified personnel, who are assigned specific responsibilities for processing contractual issues and to assist with the management and administration of a contract. The contract specialist is a contributor and this will be the person or people assigned to do the work. The contract specialist's responsibilities are listed in sub-paragraphs a. through d.

a. Participates in negotiations. TAR, advance planning funding administration and definitization. Prepares for and participates in the award fee board and CPARS.

b. Ensures financial and contractual requirements are met for availability completion and business close.

c. Assists in developing pre business clearance, progressing Cost and Schedule Status Reports and participates in the Regional Calibration Center process.

d. Provides incremental funds for ordering LLTM for both repair and alteration or modification work to meet required dates.

41.3.3 Quality Assurance Specialist. Supports the administration of the Contract Administration Quality Assurance Program to evaluate the effectiveness of the Contractor's Quality Management System on work being performed both shipboard and in the contractor's or subcontractor's plant.

a. Accountable:

(1) Develops a Quality Management Plan for each CNO availability following Commander, Navy Regional Maintenance Center (CNRMC) Standard Operating Procedure (appropriate local instruction for SRF-JRMC).

(2) Reviews contract specification items to determine inspections or tests required, and PCPs for review (PR, PE, Program Quality Assurance).

(3) Verifies all critical tests and inspections associated with Level I work, Nondestructive Testing and critical welding such as P-1 piping.

(4) Reviews past contractor quality data (Quality Data Evaluation, PVI, Government and contractor generated corrective action reports) to support planned surveillance actions.

(5) Reviews submitted list of sub-contractors to be utilized to support identification of Defense Contract Management Agency notification requirements.

(6) Issues the Quality Assurance (QA) plan to the PT for use via the Project Manager.

(7) Participates in bid specification and work specification review with the PT supporting quality and technical requirements following the invoked milestones. Provides feedback for incorporation into work specification requirements.

(8) Attends scheduled meetings, assesses contractor capabilities, monitors contract performance, provides technical support to the ACO, and participates in claims avoidance.

(9) Maintains a Significant Events Log. Provide a copy of the log to the contracting officer and PM at the completion of the availability.

(10) Completes Past Performance Information Surveys within 14 days of completing each availability and provides written reports to Contracts Department in support of Award Fee Evaluations and CPARS. Conducts Procedure Reviews for PCPs submitted by contractors.

(11) Maintains a copy of all Corrective Action Requests (CAR) generated by the Government, as well as those written by the contractor (when requested by the Government per NSI 009-04). Maintains a status of all CARs generated by the Government and updates the Project Manager.

(12) Informs Project Managers of quality problems that are, or have the potential to, affect their ship.

(13) Accomplishes Ship's Force QA Interface training prior to each CNO availability.

(14) Assists Shipbuilding Specialist, as functional responsibilities permit, in the coverage of G-Points.

(15) If, in the course of evaluating the prime contractor, AIT non-conformities are discovered, they are to be addressed to the Project Manager. If it is determined that the non-conformity warrants the issuance of a Government CAR, and the AIT manager or On-Site Installation Coordinator does not issue the CAR to the AIT, the RMC QA department must notify NAVSEA 04Q Quality and Oversight detailing the Government sponsor information.

(16) Performs 100% final preservation record review to support work certification at the end of the availability.

(17) Accomplishes in-process reviews of contractor's test and inspection plan to ensure compliance with NAVSEA Standard Item requirements.

(18) Reviews and oversight of PCP, UPCP.

b. Responsibilities:

(1) Provides quality assurance, quality control support of Aegis Light Off, combat systems light off, propulsion plant light off, production completion date, Fast Cruise, Dock Trials and Sea Trials.

(2) Provides quality oversight of AIT and AIT management

(3) Provides quality oversight and input of business close, technical close.

(4) Provides quality oversight, review, and condition report submission.

(5) Provides quality review of services request.

(6) Provides quality oversight of AWP, LMA, I-Level collection and management of OQE.

(7) Provides quality oversight of the ITP Execution.

(8) Provides quality oversight of LMA Checkpoint Execution (V, G, I), and (PVI, PE, PR).

(9) Provides quality control oversight of work certification.

(10) Provides quality oversight of all work specifications Face-to-Face reviews.

41.3.4 NSA Logistical Representative. Responsible for supporting the configuration management of a ship and validating configuration of the ship following modernization efforts.

a. Monitors the configuration management process.

b. Ensures timely action on submittal of configuration change requests and follows up to update configuration records and associated logistics support.

41.3.5 SEA 21 Hull, Mechanical and Electrical and Aegis Combat Systems On-Site Logistician. (Surface Force only) Accountable to ensure that all equipment has proper logistics support completed and available for delivery at the time of installation.

a. Researches, documents and coordinates delivery of all ILS in support of combat system material readiness to the ship.

b. Arranges storage and transportation of parts and equipment. Performs inventory audits of installation kits. Assists in the expediting of parts throughout the availability.

c. Provides applicable logistics data to project engineer's end of availability report.

d. Provides assessment data, near real time, into ship's CSMP.

41.3.6 Project Support Engineer. The Project Support Engineer is a critical part of availability certification and will work closely with the Project Manager and Chief Engineer to help certify the availability.

a. Accountable: Provides engineering and technical services during availability planning. The services include:

(1) Reviews of contractor work specifications ensuring the requirements of tasking documents are met, naval standards are invoked, and final acceptance testing will validate work performed.

(2) Attends all pre-availability planning meetings, assuming a leading role in addressing technical issues and coordinating resolution of technical authority issues.

(3) Maintains a records system of tasking documents, 2-Kilos, temporary DFS, a listing of specifications reviewed and documented comments forwarded for correction.

(4) Coordinates resolution of technical issues during availability execution (i.e., DFS, Condition Reports, Liaison Action Requests).

b. Provides engineering and technical services in support of ongoing waterfront production work at private contractor facilities. Serves as the principal point of contact for all engineering related technical issues between the Fleet Technical Support Divisions, the PT and other outside commands. These services include:

(1) Provides oversight of the contractor's technical performance of shipboard work for compliance to contract specifications.

(2) Provides oversight of contractor's quality assurance management program for technical documents and data.

(3) Provides oversight of contracted Original Equipment Manufacturer technical representatives.

(4) Provides technical evaluation and recommendations for contractor change proposals, growth and new work.

(5) Serves as the PT's technical authority point of contact. Assigned to resolve all technical issues, adjudicate non-conformances, DFS, waivers and deviations and provides for technical responses to contractor condition reports.

(6) Provides oversight of assigned planning yard on-site field personnel responsiveness and technical adequacy.

(7) Reviews and approves or disapproves contractor prepared PCP used to provide contractor mechanics guidance for accomplishment of critical repair processes.

(8) Initiates Liaison Action Request to document changes or questions to NAVSEA installation drawings.

(9) Technical point of contact for analyses during final acceptance testing, certifications and technical inspections.

(10) Attends all production meetings to assist and advise the PT in all matters concerning the repair and modernization of shipboard systems and equipment.

(11) Provides coordination for the ship availability technical closeout documents to ensure all technical related documents have been properly answered or adjudicated.

c. Participates as a member of the Maintenance Control Team.

41.3.7 Integrated Test Engineer. The Integrated Test Engineer is a critical part of availability certification and will work closely with the Project Manager and Chief Engineer to help certify

the availability.

a. Approves and provides oversight of the contractor's development and management of the ITP. Ensures the ITP is functionally linked to the Integrated Production Schedule. Ensures the ITP is responsive to changes in production schedule such that when production items completion dates change, their associated test dates change as well. Ensures the ITP includes all testing for all maintenance activities.

b. Reviews work specification to ensure appropriate work to test relationships have been developed.

c. Reviews AWP to identify testing key events and milestones that may be required in addition to production key events and milestones (i.e., Aviation Certification and Combat Systems Command, Control, Communications and Computer Readiness Assessment).

d. Coordinates with Project Manager to ensure the ITP accurately reflects the AWP and the integrated production schedule.

e. Coordinates with the Program Executive Office, CSPE and Test Coordinator (if assigned) to provide information and status as required.

f. Acts as the Governments primary point of contact to collect scheduling and testing information from all non-LMA maintenance activities including AITs, Fleet Maintenance Activity, In Service Engineering Agent (ISEA) and NSY. Provides this information as Government Furnished Information (GFI) to LMA for inclusion into the Integrated Schedule and ITP.

g. Acts as Government point of contact to coordinate Ship's Force testing schedule and major training evolution schedule information. Provides this information as GFI to LMA for inclusion into the Integrated Schedule and ITP.

h. Evaluates Test Sequence Networks provided by each maintenance activity prior to submitting to the LMA. Evaluates Integrated Test Sequence Networks provided by LMA.

i. Ensures the Integrated Testing Schedule is updated at least weekly or as milestones and growth work changes dictate.

j. Receives OQE for completed test procedures from all maintenance activities and evaluates results for completeness and accuracy. Ensures non-conformances are documented and action is taken to resolve or technically adjudicate.

k. Serves as Government representative on Total Ship Testing Task Group as outlined in NAVSEA Standard Item 009-67.

l. Provides a final report at the completion of the availability showing completion of all testing, or tests that remain unexecuted with exception reasons and plan for completion.

m. Ensures the availability of special instrumentation, recording devices, support services, test ranges and data collection requirements to support Sea Trials events.

Approves the LMA input to the Sea Trials agenda for submission to Ship's Force, ensuring all test procedures with underway requirements are properly scheduled.

n. Participates as a member of the Maintenance Control Team.

41.3.8 Assessment Director. Leader of assessment execution. Provides management of military personnel, Government engineers and technicians, contractors, data entry personnel and logisticians in support of assessment program visits and events. Plans, schedules, organizes, directs and manages the execution of Total Ships Readiness Assessment visits and CMP assessment events.

a. Accountable:

(1) Attends the AWP turnover with Surface Maintenance Engineering Planning Program (SURFMEPP) and TYCOM managers to ensure visibility, resource allocation and scheduling of all CMP assessment tasks.

(2) Augments and assists the PT in CMP assessment accomplishment.

(3) Updates the PT on progress in meeting established milestones and deadlines for completion of assignments, projects and tasks, and ensures all team members are aware of and participate in planning for achievement of team goals and objectives.

(4) Manages dedicated Visit Support Team performing logistics validation, data entry and data collection support functions.

(5) Utilizes data provided by the Fleet Technical Assist (typically RMC Code 200) personnel to assist the Maintenance Team in documenting, completing and closing CMP assessment requirements.

(6) Assists Ship in achieving Maintenance Phase Exit Criteria through execution of Assessments.

b. Responsibilities: Participates in CSMP, DFS and BAWP mid-cycle review and life cycle planning conference. Provides open and inspect oversight for screening potential repair.

41.3.9 Technical Matter Expert. The Technical Matter Expert is the Maintenance Control Team leader and acts as the principle assistant to the NSA for non-nuclear propulsion plant work. Accountable as owner of the work and the person who makes the final decision on a task and has the ultimate ownership over that task.

a. Provides technical guidance in the execution of Controlled Work Packages.

b. Reviews any revisions for technical adequacy. Verifies and provides recommendations in support of administrative changes. Represents the Government during selective checkpoints, to include testing, and acts as the RMC Chief Engineer's representative.

c. Participates as a member of the Maintenance Control Team.

41.3.10 Shipbuilding Specialist. Shipbuilding Specialists are individuals that possess a primary trade background but effectively perform across trade lines in two or more trade skill disciplines. Team assignments are made to balance trade expertise appropriately with the type of work in the

project. A wide variety of comprehensive duties and responsibilities are assigned to these individuals who are expected to act as decision makers with comprehensive knowledge of each work item assigned. Typical assignments include the following duties and responsibilities (as with Project Managers, this may vary depending on the supporting organization):

a. Accountable:

(1) Provides current information relating to assigned work items to the Project Manager (see volume VII, chapter 7 of this manual).

(2) Attends meetings, resolves production problems, develops scope of work requirements, assists in the development of Government TARs and negotiation positions, assesses contractor capabilities, work progress and performance, provides technical support to the ACO, and participates in claims avoidance and provides other technical support as required (see volume VII, chapter 7 of this manual).

(3) Interfaces with members of the Ship's Force to provide current project information, notifies responsible personnel of scheduled evolutions and solicits required or desirable Ship's Force (see volume VII, chapter 7 of this manual).

(4) Receives and investigates contractor reports, assists with the development of the Government's technical response, requests engineering support, prepares necessary contract modifications, develops the Government cost estimates, estimates the delay and disruption that may occur because of a contract modification, assists with negotiation preparation relative to TARs and contract modifications (as authorized by the ACO), provides the ACO support in negotiations and maintains records of actions taken (see volume VII, chapter 7 of this manual).

(5) Performs and witnesses Government "G" notification points, identified in the work specifications, when the contractor calls them out. Accomplishes random PVIs utilizing checklists or an attribute system to determine contractor compliance with the quality and technical requirements of the work specifications or contract. Writes a Corrective Action Request when nonconformities are detected per Chapter 11 of this volume (see volume VII, chapter 7 of this manual).

(6) Determines the physical progress, as a percentage of work completed, of each work item and each contract modification assigned. Updates this information weekly in a comprehensive progress report that is used in calculating the contractor's entitlement to progress payments as well as in evaluating the contractor's schedule performance (see volume VII, chapter 7 of this manual).

(7) Monitors the GFM and Contractor Furnished Material report to anticipate actions that may be necessary to preclude schedule impact by unsatisfactory material delivery dates. Initiates material orders to replace unsatisfactory GFM or to provide items with unique Government control and confirms the necessity for the contractor to make cash purchases from the Naval Supply system when it is in the best interest of the Government (see volume VII, chapter 7 of this manual).

(8) Monitors the contract guarantee period to help determine whether failure of equipment or systems covered by the guarantee clause is the responsibility of the Government or the contractor, ensures that the work determined by the ACO to be the responsibility of the contractor, whether it is covered by guarantee or was an exception to the completion of the contract, is repaired following the specification requirements and provides cost estimates for incomplete work so that the ACO can ensure that appropriate contract funds are retained in the event that the work must be deleted from the contract requirements or be procured from another contractor (see volume VII, chapter 7 of this manual).

(9) Provides positive and negative lessons learned along with feedback related to deficient or inefficient work specifications or work authorizations to the appropriate planning group for use in improving future procurements (see Volume VII, Chapter 7 of this manual). Include a brief summary to document the reasons growth or new work was required.

(10) Conducts oversight coordination and inspection of work-related environmental issues associated with Ship's Force and contractor's operations. This effort includes but is not limited to Hazardous Material and Hazardous Waste handling, removal, storage, transportation and disposal (see volume VII, chapter 7 of this manual).

(11) Provides input to the Project Manager to support Award Fee Evaluations and CPARS (see volume VII, chapter 7 of this manual).

(12) Maintains the following records: (see volume VII, chapter 7 of this manual)

(a) Significant Events Log.

(b) Work item specifications, references and estimates for the work package, updated to reflect all modifications.

(c) Contractor condition reports including Government replies.

(d) New work identified and not authorized.

(e) GFM delivery status.

(f) Records relating to the contractor's capabilities and capacity.

(g) Contractor performance evaluations.

(h) Supports LMA collection and management of AWP OQE.

(13) In the course of evaluating the prime contractor, report any AIT non-conformities to the Project Manager.

b. Responsibilities:

(1) Provides quality oversight to support propulsion plant, Aegis and combat systems light off.

(2) Provides quality oversight of availability completion.

(3) Provides support of Business Case Analysis for new work.

(4) Reviews condition report submissions and responses.

(5) Coordinates consolidated software delivery.

(6) Provides quality oversight supporting Fast Cruise, Dock Trials, Sea Trials Docking and Undocking.

(7) Reviews Engineering Services Request.

(8) Provides quality oversight of ITP execution.

(9) Participates in quality checkpoints supporting oversight of contracted work, PVI, PE and PR.

(10) Provides quality oversight of open and inspects.

(11) Provides quality oversight of the Regional Calibration Center process.

(12) Participates in work certification.

(13) Conducts work specification review.

(14) Capture initial lessons learned by documenting within Work Specification paragraph 4 (Notes) a brief summary concerning why a growth (positive or negative) change was required.

41.3.11 Combat Systems Project Engineer. (Surface Force only) These specialists monitor the contractor's performance of work and testing in the combat systems work package. The CSPE provides expert advice in the anticipation, identification and resolution of problems that may occur during the maintenance, repair and alteration installation phases, as well as during the grooming and complex systems level testing phases. The CSPE takes a more active role by accomplishing duties similar to those of production controllers, ship surveyors and shipbuilding specialists in addition to those of electronics engineers or technicians for Combat Systems work items during an availability or project.

a. Provides current information relating to assigned work items to the Project Manager. This may also include reports to the ship's assigned Port Engineer for Combat Systems (see volume VII, chapter 7 of this manual).

b. Attends meetings to resolve production problems, develops scope of work requirements, assists in the development of TARs to support the Government negotiation positions, assesses contractor capabilities, work progress and performance, provides technical support to the ACO, participates in claims avoidance and provides other technical support as required.

c. Interfaces with members of the Ship's Force to provide current project information, notifies cognizant personnel of scheduled evolutions, solicits required or desirable Ship's Force participation and provides technical advice.

d. Receives and investigates contractor reports, writes and receives answers to Liaison Action Requests, provides interim answers to Test Problem Reports, assists in developing the Government's technical response to contractor requests, assists the TAR writer by providing engineering support and in developing the Government cost estimates, assists in preparing necessary contract modifications, estimates the delay

and disruption that may occur because of a contract modification, and provides the ACO support in negotiations and maintains records of actions taken.

e. Observes "G" POINTS for electronic systems and equipment identified in the work specifications when they are presented by the contractor, witnesses required equipment or system tests and accomplishes random in-process inspections (PVIs) at the work sites to determine contractor compliance with the requirements of the specification. Documents the contractor's failure to satisfy contractual responsibilities.

f. Determines the physical progress, as a percentage of work completed, of each work item and each contract modification assigned. Updates this information weekly in a comprehensive progress report that is used in calculating the contractor's entitlement to progress payments as well as in evaluating the contractor's schedule performance.

g. Monitors the GFM and Contractor Furnished Material report to anticipate actions that may be necessary to preclude schedule impact by unsatisfactory material delivery dates. Assist the Fleet and Industrial Supply Center or RMC Material Department in visually identifying and verifying receipt of GFM. Initiates material orders to replace unsatisfactory GFM or to provide items with unique Government control and authorizes the contractor to make cash purchases from the Naval Supply system when it is in the best interest of the Government.

h. Monitors the contract guarantee period to help determine whether failure of equipment or systems covered by the guarantee clause is the responsibility of the Government or the contractor. Ensures that the work determined by the ACO to be the responsibility of the contractor, whether it is covered by guarantee or was an exception to the completion of the contract, is repaired following the specification requirements. Provides cost estimates for incomplete work so that the ACO can ensure that appropriate contract funds are retained in the event that the work must be deleted from the contract requirements or be re-procured.

i. Provides lessons learned and feedback related to deficient or inefficient work specifications or work authorizations to the appropriate planning group for use in improving future procurements.

j. Maintains a Significant Events Log.

k. Coordinates the efforts of the Master Ship Repair Agreement, Agreement for Boat Repair and each combat systems related AIT.

l. Participates in the Lessons Learned Conference as appropriate.

m. Provides written reports to support Award Fee Evaluations and CPARS.

n. Manages Combat System alteration package and AIT work and facilitates integration with the NSA.

o. Submits work candidates (2-Kilo) for industrial assistance required for AIT efforts.

p. Submits work candidates (2-Kilo) for Attack Weapons Systems Element Assessment CMP task accomplishment and uncovered deficiencies.

q. Ensures that lessons learned identified during availability LLCs are applied across the ship class.

r. Provides Combat System and Command, Control, Communications, Computers and Intelligence (C4I) test requirements and schedules.

s. Coordinates C4I schedules and installations, and manages the AIT execution activities.

t. Provides Combat Systems and C4I reach back to Participating Acquisition Resource Managers and ISEAs.

41.3.12 SEA 21 Hull Manager. (Surface Force only) Primary SEA-21 waterfront Surface Combatant Modernization and Integration Representative for execution, engineering, logistic and programmatic support. Primary interface between PT and program office funded activities for all program alterations.

a. Accountable:

(1) Coordinates with ISEA and Participating Acquisition Resource Manager to identify, document and resolve issues of possible concern to the program office as they relate to Navy Modernization Process alteration development or installation.

(2) Delivers material (LLTM and Kitted Materials) to Executing Activity.

b. Responsibilities:

(1) Participates in CSMP, DFS and BAWP mid-cycle review.

(2) Ensures work supports availability completion.

(3) Ensures consolidated software delivery and ILS support.

(4) Attends IPTD, Docking, Arrival, Undocking, Departure and 25%, 50% and 75% review events or conferences.

(5) Participates in work certification.

(6) Participates in work specification review.

(7) Performs risk assessments and verifies deliverables to contractor (O, I, D work items and AIT Schedule Requirements).

41.3.13 SURFMEPP Waterfront Engineer. (Surface Force only)

a. Accountable

(1) Integral member of the Project Teams, assists in the CNO availability Planning, Execution and Closeout Phases.

(2) Located at the waterfront to ensure the accomplishment of mandatory technical requirements.

b. Responsibilities

(1) Communicates the technical requirements identified in the Class Maintenance Plan (CMP).

(2) Project Team's advocate for resolution of CMP issues or concerns.

(3) Maintain relationships and communications with the RMC, TYCOM, Fleet and numbered Fleet Commander's staff.

41.3.14 Government Availability Planning Manager. (Surface Force only)

a. Accountable:

(1) Coordinates with PM, Planning Floor, Contracts, Engineering, and Quality Assurance Departments to oversee, monitor and develop executable depot level Work Packages.

(2) Monitors performance of the Planning Floor.

b. Responsibilities:

(1) Provides coordination and oversight of planning, estimating, and work specification development.

(2) Ensures depot level Work Package development adheres to current business rules; maintenance, modernization and contracting strategies; incorporates lessons learned; and meets planning milestones to support on-time contract solicitation.

(3) Monitors and coordinates advance planning of maintenance and modernization activities to ensure availability planning milestones are met.

(4) Reviews authorized Work Notifications and advises the Maintenance Team of deficiencies.

(5) Coordinates the development of grouping strategy for authorized work.

(6) Coordinates ship checks per volume II, part II, chapter 1 of this manual.

(7) Reviews Work Specifications to ensure completeness and conformance with authorized work.

(8) Reviews Work Specifications and depot level Work Package development processes to ensure compliance with regulations, directives, instructions, and policies.

(9) Ensures Work Specifications are developed using NAVSEA Standard Items and Master Specification Catalog templates per volume II, TYCOM specific areas of part II, chapter 5 of this manual.

(10) Continuous liaison with customers, Project Team, and Ship's Force Representatives.

(11) Coordinates with PM to submit depot level Work Packages to the procurement activity for solicitation.

(12) Monitors and supports contract award.

(13) Participates in advance planning meetings to include but not limited to: C+21, Life Cycle Planning Conference, mid-cycle reviews, IPTD events and scoping conferences.

(14) Reviews and provides recommendations concerning availability planning milestones.

(15) Monitors availability planning milestones and verifies documentation within NMD.

(16) Monitors, assigns and reviews adjudication of Planning Contractor Furnished Report (CFR).

(17) Monitors technical adjudication and incorporation of Engineering Service Requests.

(18) Monitors the identification and ordering of GFM (LLTM, Push, Kitted) for maintenance and modernization.

(19) Assists in availability risk assessment.

(20) Assists with the planning of new work.

(21) Incorporates Lessons Learned with feedback to the Planning Floors and Maintenance Teams related to depot level Work Specifications and planning processes.

(22) Assists Contracting Officer's Representative by serving as a Technical Point of Contact (TPOC).

41.3.15. Schedule Analyst. (Surface Force only) The Schedule Analyst is a critical member of the Project Team, a project management scheduling professional, and SME who is well versed in this manual, reference (c) scheduling guidance, and the contractual requirements of Government Stakeholders providing GFI in support of the Integrated Production Schedule (IPS) development and management.

a. Accountable:

(1) Coordinate gathering, managing, providing technical and quality reviews, and delivery of Standard Item 009-60/111 related submissions, and for the oversite of the contractor provided IPS.

(2) Provide direct support to the PM in all aspects of scheduling and IPS development oversight and management.

(3) Provide the initial Key Events and Milestone network that supports Critical Postproduction events (i.e., TYCOM End Game and Modernizations, System Operation Verification Testing, a duration analysis with schedule risk analysis and mitigations, and an initial Critical Control Path IPS that coincides with the initial Key Events and Milestone network to the RMC Government Availability Planning Manager prior to the applicable CNO availability WPIC.

b. Responsible:

(1) Gathers, manages, provides technical and quality review and delivery of Standard Item 009-60/111 GFI to the (LMA), beginning at the 80% TYCOM "D" level lock date but no later than the 100% lock date (A-180) through availability complete on and subsequent close out (target C+90).

(2) Acts as RMC Schedule Model Review representative participates in scheduling conferences, AIT in briefs, daily production meetings, weekly production meetings and other events specific to schedule, progressing the schedule, and providing facilitation, oversight and feedback of the stakeholders that provide input to the LMA IPS.

(3) Provide Standard Item 009-60/111 Direction to the LMA in managing schedule logic testing, submission, and corrective actions (Progressing, schedule adjustments, Schedule Model Reviews etc.) facilitating Key Event and Milestone accomplishment.

41.3.16. Work Integration Manager. (Surface Force only) The Work Integration Manager (WIM) is a critical member of the Project Team to ensure that all work during the availability is integrated and coordinated effectively in support of the work certification process. The WIM is well versed in and a SME in project management principles, production scheduling practices, system testing technical concepts and that will manage, coordinate, review and advise the NSA for all Integrated Production and Test Schedule related issues.

a. Responsible:

(1) Coordinates with the Integrated Test Engineer (ITE), Project Support Engineer (PSE), Ships Force and the LMA regarding systems testing with respect to test readiness and support of shipboard systems and operators.

(2) Assists in mapping technical sequences and test procedures to appropriate milestones or key events to ensure technically correct, timely and efficient execution of the availability. Ensures testing prerequisites that effect the ships restoration efforts are identified and authorized or scheduled for completion.

(3) Monitors shipboard testing progress and takes action to ensure that testing is conducted in accordance with approved safety and technical requirements. This includes ensuring that all stakeholders, whose work has been integrated, are aware of the key event, milestone and testing requirements.

(4) Act as the NSA and PT SME representative to support all scheduling conferences, daily and weekly planning and execution meetings as required, and other IPS related briefings and discussions specific to Schedule maintenance and development.

(5) Works with the Schedule Analyst and LMA to support or facilitate the development of the Integrated Production Schedule. This includes collaboration with the ITE and other SMEs to ensure that all required weekly progress updates are provided to the LMA and updated in the IPS.

(6) Chairs the weekly IPS review meetings with the PT SME and LMA Schedulers and assigned SMEs and will provide reference (c) support to the LMA in managing scheduled testing and system restoration requirements.

(7) Acts as the Project Manager's representative and liaison to the PT ITE and supporting LMA test and scheduling organization to verify that all related production and testing work and activities are properly technically sequenced into the IPS.

(8) Works with the Project Team and LMA to ensure that required temporary services and prerequisites required to be completed in support of the test program are in place and ready to support critical key events and milestones.

(9) Supports the PM and coordinates with the assigned ITE to ensure that system readiness required to support key event and milestone completion are maintained. Review of milestone readiness may also include review of outstanding work and testing in conjunction with the assigned PT, ITE and PSE to ensure conformance to all work specifications.

(10) Works with the assigned ITE and PSE to interpret and assist in the execution of NAVSEA technical authority and local requirements pertaining to the safe operation and testing of ship's systems.

(11) Provides recommendations to the Project Team, Ships Force, applicable AIT Onsite Installation Coordinators and LMA needed for the preparation of the Integrated Test Schedule, Comprehensive Test Plan and Sea Trials Agenda.

(12) Works with PMs, Division and or Department Managers, Project Superintendents, Ships Force, various Project Team Personnel, AIT OSICs, Supervisors and LMA Integration and Schedule SMEs on a daily basis. Many of these discussions or meetings may be off site where the WIM acts as the NSA or PT point of contact for all matters pertaining to work integration and coordination.

b. Accountable:

(1) Acts as the NSA and Work Integration SME for all items impacting IPS development, Test Schedule development and system restoration.

(2) Provides expertise necessary to successfully coordinate the Hull, Mechanical and Electrical production work and testing sequences and interface with Combat Systems Test Programs on availabilities assigned. Collaborates with and supports the LMA to manage scheduled testing and ensure that all stakeholders, whose work has been integrated, are working to achieve Key Event and Milestone requirements. Works with the assigned Integrated Test Engineer (ITE) to ensure that the IPS and Test Schedules align to support system restoration and testing efforts and that all fit within the availability windows and LMA IPS timelines.

(3) Personally, consults and advises the PT, AIT OSICs, senior RMC Leaders, and Ship's Commanding Officer on matters needed to support the LMAs development of the IPS and test program.

(4) Works with the PT ITE, LMA AIT Coordinators and Planners, OSICs, Ship Superintendents (Code 900 SMEs), Port Engineers and other designated SMEs, to ensure that all required GFI is submitted to the LMA in support of IPS development.

(5) Supports the Project Manager to ensure delivery of all required reference (b) and reference (c) GFI deliverables to the LMA in support of IPS development.

(6) Supports the PM and works with the assigned ITE to ensure that system readiness required to support Key Event and Milestone completion is maintained. Review of milestone readiness may also include review of outstanding work and testing in conjunction with the assigned PT, ITE and PSE to ensure conformance to all work specifications (Event Readiness).

41.4 ALTERATION INSTALLATION TEAM MANAGEMENT, OVERSIGHT, AND EXECUTION. The roles and responsibilities for the following personnel are identified in references (a) and (c).

a. The AIT Manager is the government organization, represented by government employee or military personnel, tasked and funded by the AIT Sponsor to initiate, fund, plan, coordinate, schedule, manage, and oversee the successful accomplishment of the SC or Alteration.

b. The AIT OSIC is the Government or military employee designated by, and acting with, the authority of the AIT Manager on-site.

c. The AIT Lead is the senior member of the AIT that ensures the AIT adheres to all requirements of references (a) and (c), the AIT Contract, and change authorization processes. The AIT Lead will report directly to the AIT OSIC and execute contract requirements.

d. An AIT is a unit (military, government activity or contractor and subcontractors), consisting of one or more members under the direction of an AIT Manager that is trained and equipped to accomplish specific SCs or Alterations on specified ships as defined in chapter 36 of this volume. The AIT is responsible for the installation, performance, and completion of the SC or Alteration.

41.5 PLANNING PROCESS SUPPORT. (Augmentation outside of maintenance availabilities) Supplements both the Maintenance and PTs in the planning and execution of engineered maintenance (CMP, Planned Maintenance System), modernization (Letter of Authorization) and corrective maintenance (CSMP) from advanced planning through close out. Consists of the following members and others as needed:

a. TYCOM representatives.

b. Program Executive Officer representatives.

c. CNRMC representatives.

d. Systems Command representatives.

e. SUPSHIP representatives.

f. Planning Yard representatives.

g. Carrier Planning Activity representatives.

h. Submarine Maintenance Engineering, Planning and Procurement (SUBMEPP) representatives.

i. SURFMEPP representatives.

j. RMC Technical and Logistical SMEs.

k. RMC Class Team Leaders.

41.6 PLANNING BOARD FOR MAINTENANCE. A regularly scheduled meeting between the ship's Maintenance Team members and stakeholders (e.g., TYCOM, Immediate Superior In Command, planning activity, Ship's Program Manager, etc.) to discuss ship-wide maintenance issues. This forum provides a routine and regularly scheduled management review of current planned off-ship and organizational maintenance, CSMP and AWP quality and accuracy, future maintenance and modernization planning, work prioritization, work integration and fiscal concerns. The objective is to ensure clarity of intent for both the ship's efforts and the shore infrastructure with respect to total ship maintenance, operational schedules and other concerns affecting ship material readiness. While the frequency of PB4M meetings may vary due to a ship's schedule, a minimum of one meeting per quarter is expected. The PB4M is the forum for discussing all maintenance issues, including metrics that are currently used to measure the maintenance effectiveness of the ship and the performance of the ship's assigned Maintenance Team. Each maintenance team will incorporate the following business rules.

a. Ashore Ship's Maintenance Manager will be responsible for all PB4M decisions.

b. The frequency of the PB4M meetings may vary due to a ship's schedule; a minimum of one meeting per quarter is expected.

c. The meeting will be chaired by the Commanding Officer.

d. The core Maintenance Team must participate in the PB4M. Other attendees may participate as required.

e. The Ashore Ship Maintenance Manager will prepare the agenda and provide it to the Commanding Officer and core team members 48 hours in advance.

f. The agenda provides a list of topic areas to be reviewed during the PB4M. It does not require an exhaustive examination of each topic during the meeting. Rather the meeting can be used to report the results of detailed reviews, updates, problem investigations and analyses conducted by assigned teams outside of the PB4M meeting.

41.7 WORKFORCE DEVELOPMENT PROGRAM. (RMC ONLY)

a. The Work Force Development (WFD) Program is designed as a vehicle for professionalizing the Surface Force Ship workforce. That objective is accomplished through a formal training and certification process that is robust, standardized and repeatable at each RMC. The intent is to support the professional growth of RMC maintenance community personnel and promote career progression opportunities that enhance the long-term prospects for individual work force members, while maximizing overall effectiveness of the maintenance community as a whole. The net result of the WFD Program is a capability that maintenance and modernization work performed at one RMC is both repeatable and standardized with identical maintenance and modernization work performed at any other RMC.

b. CNRMC serves as the WFD Program sponsor. CNRMC also serves as the Curriculum Control Authority for all WFD training courses and curricula. Each WFD course is delivered via a training team and WFD training covers the vital skills necessary to execute quality Surface Force Ship maintenance and modernization work.

c. The WFD Program is a requirement for the Surface Force ship contracted maintenance management workforce.

d. All WFD Program courses include comprehensive classroom training, position-specific case studies and practical exercises, and a detailed Job Qualification Requirement (JQR). While JQRs for a given position may be accomplished outside of the associated formal WFD course (i.e., either before or after completing the course), final certification of each course graduate is not granted by CNRMC until each JQR task is completed.

41.8 INTEGRATED PROJECT TEAM DEVELOPMENT. (Surface Force only)

41.8.1 Project Team. IPTD provides Project Teams (PT) with a foundation for the successful execution of a CNO Availability. IPTD events improve the functional performance of the Availability PT by ensuring roles and responsibilities of each PT member are known and understood, enhancing communication skills, team building (promoting relationships) between involved organizations, and developing executable project plans. IPTD is a forum for building relationships among the Surface Team One community. Each event builds a positive team dynamic by creating an environment for approaching and resolving challenges as a team and ultimately improving the availability execution process. Additionally, the events provide a venue for identifying and mitigating availability risks, as well as establishing and tracking progress to availability execution planning milestones.

a. The IPTD curriculum focuses on development and integration of the PT; development of availability expectations and success criteria; advance planning; development, reviewing, refining, validating and communicating key strategies; aligning all members of the integrated PT; process improvement; availability execution processes; and knowledge sharing. IPTD events develop Availability expectations, success criteria, build and validate strategies, and align members of the integrated PT. Events raise awareness of the Maintenance and Modernization End-to-End policies and processes.

b. Each IPTD event is tailored to meet the specific needs of the PT and is instrumental in transitioning the independent focus of the maintenance team into the integrated focus of the PT. IPTD personnel facilitate discussions on milestones to increase the probability of successful availabilities while clearly identifying those persons and entities responsible for deliverables throughout each phase of the availability.

41.8.2 Program Events. The IPTD program is notionally conducted in six events prior to the availability start date and one post-availability. FDNF ships will utilize a modified schedule based on their unique milestones. IPTD events are:

a. Initial Event. Transition ownership and responsibility for the final development of the AWP from the Advanced Planning Phase (SEA 21 - SURFMEPP responsibility), to the Planning Phase (CNRMC - NSA or RMC responsibility). Review planning milestones and draft execution key events and milestones. Review, update and identify risks.

b. Pre-Lock Event. Focus on finalizing work package development prior to 100% D-Level lock. Review modernization plan, TYCOM work package, and planning status. Develop draft Planning Event Readiness List. Review, update, and identify risks.

c. WPIC Event. The primary purpose of this event is to conduct the WPIC. Review approved modernization plan, TYCOM work package, and planning status. Review, update and finalize Planning Event Readiness List. Review, update, and identify risks.

d. Supplemental Event. At the discretion of the RMC project manager, supplemental event(s) can be scheduled as the need arises.

e. Post Award Event. This event integrates the LMA. Review critical path work, controlling work, tank sequencing or stability, 20% open and inspect plan, and execution risks. Identify, discuss, and document lessons learned and best practices. Develop plan for conducting readiness to start WPER event and follow-on Schedule Model Review.

f. Readiness to start WPER Event. The primary purpose of this event is to conduct the WPER. Review LMA integrated production schedule, modernization, I-Level work, and Ships Force work list. Discuss first 100-hour plan and execution risks.

g. Completion Event. The primary purpose of this event, also known as C+21, is to conduct a detailed review to include the LMA of the work package executed during the CNO Availability, and identify Lessons Learned that can be utilized for revising work items and class standard work templates for future maintenance availabilities. A Lessons Learned message from the ship must be sent within 30 days after the Completion Event. A sample message is provided in Appendix A of this chapter. Additionally, this event will serve as the transition (CNRMC - NSA or RMC) back to Advanced Planning (SEA 21 - SURFMEPP) to commence the next cycle in the Fleet Response Plan.

RMKS/1. THE FOLLOWING IS A COLLECTION OF LESSONS LEARNED AND BEST PRACTICES DURING USS (*Name of ship*)'S CNO AVAILABILITY CONDUCTED AT (Name of Lead Maintenance Activity) IN (Location) from (Dates).
2. PLANNING LESSONS LEARNED
A. LESSON LEARNED: (Provide general description of the lesson learned)
A.1. OBSERVATION: (Provide description of the principal causal factors)
A.2. DISCUSSION: (Provide description of the impact, and any short term corrective actions taken by the ship to mitigate the impact)
A.3. RECOMMENDATION: (Provide description of the recommended long term corrective actions)
3. EXECUTION LESSONS LEARNED
A. LESSON LEARNED: (Provide general description of the lesson learned)
A.1. OBSERVATION: (Provide description of the principal causal factors)
A.2. DISCUSSION: (Provide description of the impact, and any short term corrective actions taken by the ship to mitigate the impact)
A.3. RECOMMENDATION: (Provide description of the recommended long term corrective actions)
4. AVAILABILTY CLOSEOUT LESSONS LEARNED
A. LESSON LEARNED: (Provide general description of the lesson learned)
A.1. OBSERVATION: (Provide description of the principal causal factors)
A.2. DISCUSSION: (Provide description of the impact, and any short term corrective actions taken by the ship to mitigate the impact)
A.3. RECOMMENDATION: (Provide description of the recommended long term corrective actions)
5. COMMANDING OFFICER'S COMMENTS: (Provide closing comments).//
BT

Note: The following are areas and topics to consider when addressing lessons learned:

GENERAL TOPICS:
1. WAFS AND TAGOUTS, REPAIR ACTIVITY SIGNATURES
2. GFM ISSUES
3. CONTRACTUAL LEVERS
4. QUALITY OF WORK
5. INTEGRATED PROJECT SCHEDULE
6. DAILY/WEEKLY PRODUCTION SCHEDULES AND PRIORIZATION OF WORK WITHIN THE PROJECT
7. SCHEDULE DELAYS
8. RCC CYCLE TIMES
9. PRIORITY OF WORK ACROSS LOCATION PORT
10. SCAFFOLDING
11. MAST PRESERVATION
12. FIRE PREVENTION AND RESPONSE
13. MAINTENANCE REDLINE MANAGEMENT AND MITIGATION
14. IP SERVICES AND WEB-BASED APPLICATIONS
15. MOORING
16. CRANES AND BARGES
17. CALIBRATION LAB
18. I-LEVEL JOB COORDINATION AND COMPLETION
19. RCC PROCESS

ENGINEERING:
1. MAIN ENGINE ROOMS
2. SEA VALVES
3. BIRMIS
4. GAS TURBINES AND DIESEL ENGINES/GENERATORS
5. INTAKE/UPTAKE
6. TANK CLOSE OUTS

AVIATION:
1. NON-SKID TENT
2. NON-SKID SUB-CONTRACTOR
3. JP-5

SUPPLY
1. HAZMAT
2. REEFER TRUCKS
3. MESSING / BARGE MESSING
4. HABITABILITY
5. BERTHING SUPPLIES

MEDICAL/DENTAL (if applicable)

AIMD (if applicable)

SECURITY
1. PARKING PASSES
2. AT DRILLS
3. AT POSTURE
4. PORTABLE SECURITY BARRIER OPENINGS
5. ACCESS CONTROL LIST MANAGEMENT

WEAPONS
1. MAGAZINES
2. ORDINANCE HANDLING EQUIPMENT

3M
1. IEM AND RESTORATION

SAFETY
1. DAILY SAFETY WALKS AND DISCREPANCY TRACKER

TIGER TEAMS
1. BROKERED JOBS
2. OVERALL LEAD
3. MATERIALS AND TOOLS
4. DECKING MATERIALS

E Job Originator Identification Table

42.1 PURPOSE. To maintain units in a material condition that supports the required degree of operational readiness and the ability to accomplish assigned missions using a process designed to assess the right things at the right time with the right people using the right standards at the right cost. This process applies to all activities (e.g., Type Commanders (TYCOM), Regional Maintenance Centers (RMC), shipyards, System Commands, etc.) executing periodic material assessments (scheduled event) and focused system assessments (not a scheduled event) of key systems, equipment and programs that follow an established framework and methodology. When evaluating material condition, either partially or in its entirety, the material assessment Common Assessment Procedures or approved technical documentation, must be used and the results properly documented per this chapter via Automated Work Notifications (2-Kilo) to include material assessment tasks, (e.g., Condition-Directed Maintenance Tasks from the Class Maintenance Plan) and any discrepancies. The desired outcome of the assessment process is identification and documentation of required work to maintain adequate material condition. Appendix A provides an outline of the Assessment Process. In addition, this process applies and must be followed for the material evaluation piece of inspections, certifications, and visits (e.g., Board of Inspection and Survey (INSURV), Afloat Training Group, Safety Center, etc.) as defined here:

a. Assessment. A material assessment is part of the ship's Reliability Centered Maintenance (RCM) plan conducted by Unit personnel or by an external agent (e.g., Command, Control, Communications, Computers and Combat Systems Readiness Assessment (C5RA) and Total Ship Readiness Assessment (TSRA)). Depending on the context, material assessments may be individual "tasks" or "events" that group together numerous individual material assessment tasks for accomplishment during a period of time in the ship's operational schedule. Discrepancy documentation will be per this chapter.

b. Certification. A certification is regulatory and is required at some periodicity to authorize operation of equipment or systems (e.g., Flight Deck Certification, Aircraft

Launch and Recovery, Magazine Certification). Often, continued certification requires that some material assessments be accomplished or have been accomplished prior to certification. Results of a certification and their distribution will be following the associated certification's instruction.

c. Inspection. An inspection is an evaluation conducted by an internal or external activity with regards to the performance of equipment, systems, programs or functions to a recognized standard (e.g., Diesel, Boiler, INSURV, 3-M). Depending on the evaluation plan, this may involve judging the material condition of equipment or systems. Results of an inspection and their distribution will be following the associated inspection's instruction. Generally, results of the inspection will be provided to the unit's superior or higher authority.

d. Visit. A visit is the response to a request to provide technical assistance (e.g., NAVSAFECEN Visit). The technical assistance visit may or may not involve performing a material assessment. Required reports and their distribution from visits will be following the technical representative's organization's standard operating procedures.

e. Reliability Centered Maintenance. A methodology to develop or revise a maintenance approach with the objective of maintaining the inherent reliability of the system or equipment, recognizing that changes in inherent reliability may be achieved only through design changes.

f. Common Assessment Procedures. Common assessment procedures are assessments that, to the maximum extent possible, are common across platforms and serve all users for assessments, inspections and certifications. Common assessment procedures are RCM applicable and effective maintenance procedures that can be properly and consistently executed. They deliver accurate assessment and measurement of, determine and document discrepancies to, and specify repairs required to restore satisfactory material condition. Common assessment procedures satisfy the needs of work definition, inspections and certifications in a common document used both across ship classes and by all activities. The two types of commonality invoked are common across functional use and common across platforms with similar systems and equipment.

42.2 APPLICABILITY. This policy applies to all material condition assessments conducted on Surface Force ships, submarines, aircraft carriers, service craft and afloat or ashore activities under the cognizance of United States Fleet Forces Command and Commander, Pacific Fleet (e.g., Pre-Availability Testing, Point of Entry Testing, Common Assessment Procedures, TSRA, C5RA, Boiler Inspection, Diesel Inspection, etc.). This policy does not apply to the following special categories:

a. Reactor and Primary support systems under Naval Sea Systems Command 08 cognizance.

b. Fleet Ballistic Missile systems under the cognizance of Director, Strategic Systems Program.

c. Naval aircraft and avionics equipment.

d. Post repair testing (e.g., hydrostatic test, Non-Destructive Testing).

e. Operational examinations (e.g., Tactical Readiness Examination, Pre-Overseas Movement certification).

42.3 OBJECTIVES. The principal objectives are:

a. Identify and document system or equipment deficiencies.

b. Improve unit's material readiness at the equipment or systems level.

c. Identify and define work for upcoming maintenance availabilities.

d. Standardize how the fleet conducts material assessments.

(1) Certifications, inspections and visits tasks must use common assessment procedure standards and criteria in judging material condition.

(2) Assessments use standardized detailed procedures to determine material condition.

e. Identify material assessment training deficiencies and document any deficiencies using a Work Notification (2-Kilo). Conduct over-the-shoulder training for unit personnel.

f. Identify deficiencies with the Class Maintenance Plan (CMP) and document deficiencies using a Work Notification (2-Kilo).

g. Identify deficiencies with configuration or configuration data using Maintenance Figure Of Merit (MFOM) or Mission Readiness Assessment System.

42.4 PRINCIPLES. The critical success factors for a single integrated, effective material assessment process are:

a. Assessment procedures produced using a common assessment procedure development process based on RCM principles as discussed in reference (a).

b. Assessment procedures standardized to the maximum extent possible and identified in the CMP.

c. A standardized assessment tool set used to plan, execute and report assessments.

d. Assessment results recorded in a common shared data warehouse.

e. Accomplished using a common material assessment process, as defined in paragraph 42.5.2.

f. Assessment process has an effective method of feedback for periodic reviews and analysis for improvements.

42.5 MATERIAL ASSESSMENT PROCESS.

42.5.1 Discussion. The primary focus of the material assessment process is to coordinate and integrate the various Navy material assessment processes into a single, integrated, effective process designed to evaluate, measure and report individual unit's material condition. This information will be used to improve fleet readiness, ship design, maintenance and modernization identification, as well as the self-assessment capabilities of fleet units. Activities performing assessments are encouraged to communicate with each other to avoid duplicate work.

Additionally, the assessment process will provide data to help determine a unit's ability to reach its expected hull life, measure the effectiveness of the CMP and identify potential crew training deficiencies. (Submarines only) Reference (b) is applicable to all performing submarine material and maintainability readiness assessments.

42.5.2 Material Assessments. Units will undergo assessments per the CMP and as scheduled by the TYCOM. Systems and equipment are selected for assessment based upon:

a. The CMPs.

b. Ship Class trends.

c. Unit requests.

d. Review of the Current Ship's Maintenance Project (CSMP).

e. Maintenance Team inputs.

f. Integrated Condition Assessment Systems (ICAS)

g. Integrated Performance Assessment Reports

h. Corrosion Control Information Management Systems

i. Master Assessment Index

42.5.2.1 Submarine TSRA Material Assessments. Reference (b) is applicable to TYCOM managed activities with responsibility to perform submarine material and maintainability readiness assessments.

42.5.2.2 Surface Force TSRA Material Assessments. TSRA visits are nominally two weeks in duration. However, at the discretion of the TYCOM, TSRA events may be scheduled for more or less than two weeks in order to avoid conflicting with operational schedules. When the TSRA event is scheduled for less than two weeks, the focus of the TSRA will be identification and documentation of systems deficiencies.

42.5.3 Assessment Authorizing. The Platform Program Manager develops the CMP requirements as outlined in reference (c), and provides the requirements to the Platform TYCOM, who develop the assessment work packages and initiate assessments via "go assess work notifications" (GA2-K). Many factors determine what items will be selected for assessment, including the level of risk, funding constraints, ship's availability and ongoing maintenance and modernization. RMCs are tasked by Commander, Naval Sea Systems Command to support surface ships under the cognizance of Commander, Naval Surface Force Atlantic and Commander, Naval Surface Force Pacific to plan and execute TSRAs.

a. The CMP contains two types of assessment notifications that may influence the agenda:

   (1) Scheduled assessments.

   (2) Unscheduled "As needed" or "pulled assessments" ("Go Assess" maintenance notification). The Go Assess maintenance notification (GA2-K) identifies the equipment and the associated assessment procedure which must be used.

b. Individual material assessments (not more than five assessment procedures) may be scheduled outside of a scheduled assessment event or availability if they can be

planned and coordinated on a not to interfere basis with the unit's combined schedule (operational and maintenance). A larger number of assessments or assessment events require additional planning, integrated scheduling and project management (e.g., C5RA, TSRA, Carrier Material Assessment Team, etc.). In this case, a maintenance availability should be used or added to the ship's schedule. These assessment notifications are screened and brokered to the appropriate executing activity.

c. All material assessments are scheduled per the CMP and should not be repeated or duplicated by multiple activities. Assessment results must be shared and used by multiple activities.

d. Surface Force TSRAs will include comprehensive assessments of ship's Hull, Mechanical and Electrical, combat systems, Command, Control, Communications, Computers and Intelligence systems, support equipment and logistics condition per reference (d). TSRAs are tailored material assessment packages scheduled to occur at specific times during a ship's schedule to improve maintenance availability planning, CSMP management, equipment repair, Ship's Force technician proficiency and operational availability. The Master Assessment Index process is used by Surface TYCOM as a risk prioritization model to assist in the development of the TSRA agenda.

42.5.4 Assessment Planning. For scheduled material assessments or events, the Executing Activity identifies a Team Leader and develops the execution plan. The plan contains all of the necessary information required to complete the assigned tasks and should be integrated with the unit's schedule. Conduct assessments using the applicable pieces of the standard assessment tool set. To facilitate planning and scheduling and avoid redundancy, assessments may be consolidated into a material inspection. Deficiencies identified during other major ship inspections and assessments such as C5RAs must be incorporated into the final INSURV inspection report if the assessment was conducted within 60 days of the scheduled material inspection or as negotiated between INSURV and the TYCOM. Although deficiencies generated during the assessment will become part of the final INSURV report, these deficiencies will be annotated as "corrected", where applicable. The TYCOM will document this linked event by message request to INSURV, cognizant RMCs and the affected unit nominally four months prior to the scheduled material inspection. INSURV will evaluate the request and determine the scope and applicability of the linkage.

42.5.5 Assessment Execution.

a. Work with the unit's personnel to assess, analyze and document the material condition following standard procedures. Maintain good communications with all levels of unit personnel. Train unit personnel in assessment procedures and techniques.

b. The assessment includes validation of equipment configuration, evaluation of the maintenance periodicity and effectiveness, evaluation of the assessment periodicity.

c. Documentation of assessment results by the equipment Subject Matter Expert (SME) will include all required data. A maintenance ready work notification (2-Kilo) that is sufficiently defined, contains correct and complete information, provides an accurate diagnosis, and provides an applicable, effective and feasible recommended resolution. A properly validated maintenance ready work notification (2-Kilo) should allow the

planning and executing activities the ability to understand the requirement and not to expend additional manpower or time obtaining needed information for any deferred maintenance, and completion of the assessment maintenance notification. All Unclassified Non-Nuclear Naval Propulsion Information or Naval Nuclear Propulsion Information assessment results and data will be handled following current regulations and standing guidance from NAVSEA 08.

d. During Surface Force TYCOM TSRA assessments, repairs will be accomplished based on priority, availability of parts, Ship's Force support, SME availability or time remaining in the TSRA.

e. Conduct assessments using the Automated Work Notification software contained in Afloat Toolbox for Maintenance. This software is located in the MFOM Suite. All collected data is stored in the MFOM data warehouse.

f. Certifications, inspections and visits must document material deficiencies on an Automated Work Notification (2-Kilo) that at a minimum identifies the configuration item and adequately describes the symptoms or conditions that are below standards. For example, the 2-Kilo may identify that a specific component does not function properly and requests assistance to troubleshoot or diagnose system discrepancy. If the deficiency is clearly understood, the assessor is required to record what they know or understand the deficiency to be.

42.5.6 Assessment Reporting.

a. The Executing Activity conducting the assessment should analyze assessment results and notify the Commanding Officer or their designated representative of any findings that could result in a Casualty Report, underway limiting or Repair Before Operate condition. The System Command (NAVSEA 05, NAVWAR 05 or NAVAIR) must identify material improvement recommendations for new construction, future alterations or further analysis by the technical community.

b. For Surface Force Ships, RMC must send a Prerequisite and Test Requirements message per reference (d) at least five weeks prior to the start of the event.

c. For Surface Force Ships, the ship must send a Readiness to Commence message per reference (d) no later than five days prior to the scheduled event.

d. Report assessment results using the standard assessment tool set:

(1) To include whether an assigned assessment procedure was completed, partially completed or not accomplished.

(2) To produce a maintenance ready work notifications (2-Kilo) for each discrepancy identified during the assessment. Determine with unit personnel their repair capability or capacity when recommending level of effort, (i.e., Organizational, Intermediate or Depot repair).

e. To identify Integrated Logistic Support deficiencies and pass to TYCOM or Global Navy Distant Support to research and resolve, reporting any configuration discrepancies.

f. To provide any procedure discrepancies, validation and periodicity feedback.

g. To document man-hours and costs.

h. For Surface Force Ships, RMC must send a TSRA Completion message per reference (d) no later than five business days after TSRA completion.

42.5.7 Standard Assessment Tool Kit. The standard assessment tool kit consists of:

a. The catalog of approved assessments outlined in the ship's CMP. The procedure should be written in a format appropriate to the activity and experience of the personnel assessing (i.e., Maintenance Requirement Card for Unit personnel, Task Group Instruction for Naval shipyards, standard item for private shipyards, etc.).

b. If an equipment or system assessment does not exist, one must be developed following the assessment technical guide and identified in the CMP.

c. All assessments must be planned, executed and reported using the Fleet approved assessment computer application(s) and the results recorded in the Fleet designated data warehouse.

42.5.8 Assessment Personnel.

a. When assessments are conducted by the unit's personnel, they should be from a rating associated with the equipment being assessed (operationally knowledgeable) and should be experienced in conducting assessments.

b. Outside activity personnel should be technically knowledgeable in the area they will be assessing and considered SMEs. Additionally, they should be trained on the assessment process, how to document the material condition of the equipment or system and basic RCM principles as discussed in reference (a).

42.6 RESPONSIBILITIES.

42.6.1 Fleet Commander. Fleet Commander must:

a. Maintain a common material assessment process and policy. Conduct periodic reviews of processes and procedures as recommended by TYCOMs and technical warrant holders.

b. Be the Fleet's advocate and single point of contact for all material assessment issues to include:

(1) Policy.

(2) Training, assessment criteria.

(3) Procedures.

c. Provide and support a standard material assessment tool set.

d. Review the personnel and monetary resources required for the operation, improvement and support of the material assessment process and provide for these requirements in the budget effort.

e. Establish minimum standards of continuous program improvements for the TYCOMs.

42.6.2 Type Commander. TYCOMs or Immediate Superior In Command must:

a. Schedule and authorize material assessments.

b. Define the scope of material assessment.

c. Provide funding for execution and support when not part of the mission funded executing activities Capabilities Plan.

d. Conduct periodic reviews of the material assessment process.

e. Establish standards of effectiveness to ensure continuous program improvement.

f. Evaluate units' ability to self-assess and report training deficiencies to the appropriate activity.

42.6.3 Material Assessment Executing Activity. The Material Assessment Executing Activity must:

a. For RMC managed assessments, the RMC will send a Prerequisites and Test Requirements Message as directed by the TYCOM. Appendix B provides a sample message template. When requesting SMEs from another RMC for Assessment Events (TSRA, C5RA), the requesting RMC will fund travel and per diem expenses for government and military SMEs. For Surface Force Ships, use reference (d) sample message template and supplemental guidance for all TSRA events.

b. Conduct unit pre-visit brief in order to affect maximum support for the visit.

c. Assist the Assessment Team with access to the base and unit.

d. Review documented system deficiencies. Determine system material condition using established test procedures and unit's input. Unit personnel must be included in this process as a training effort.

e. Task the Team Leader to provide daily progress reviews to unit assessment event coordinator.

f. Determine, in concert with Unit personnel, the correct maintenance level (Operational, Intermediate, Depot) to correct deficiencies.

g. Document man-hours expended and assessment results using the standard assessment tool set and record the results of the "Go Assess" maintenance notification (GA2-K).

h. Document assessment deficiencies via maintenance notification. Document follow-on repair or technical assist 2-Kilos by always starting the Block 35 narrative with the words "Per Job Control Number (JCN)", where '(JCN)' is the Assessment JCN that generated the repair or technical assist 2-Kilo followed by the characters "XXX" (e.g., "Per YYYYYEM01ZA56XXX", where "YYYYY" is the ship's Unit Identification Code and "XXX" signifies a break between the JCN and the beginning of the 2-Kilo's text description). This methodology allows maintenance personnel to connect each follow-on repair or technical assist 2-Kilo to its initiating assessment.

i. Establish configuration baseline (sight validation) of selected systems to upgrade logistics support documentation. Initiate configuration changes for direct input into the ship's maintenance management system.

j. Assist unit personnel in repair and groom, as required, and as dictated by time or resource constraints and operational necessity.

k. Assist unit personnel in identifying material requirements to effect repairs.

l. Provide an out brief to the unit's Commanding Officer (or their representative), describing significant findings. Additionally, ensure all maintenance work notifications are loaded into the unit's CSMP and shore files complete and intact.

m. For Surface Force Ships, RMC must send a TSRA Completion message per reference (d) no later than five business days after TSRA completion.

n. Support assessments as requested by the TYCOM.

o. Initiate change recommendations for program improvement.

p. Ensure all assigned personnel are experienced, knowledgeable and qualified as required.

q. Schedule and conduct a TSRA program self-assessment at least once every 12 to 18 months.

42.6.4 Commanding Officer. Commanding Officers, as directed by the TYCOM, for scheduled assessments should:

a. Prepare for assessments events following this instruction.

b. Designate a senior management representative as the unit's assessment event coordinator.

c. Send, as directed by the TYCOM, a Readiness to Commence assessment message no later than five working days prior to the scheduled start of the assessment event. Appendix C provides a sample message template. Reference (e) provides a sample message template for all TSRA events. Include contact information for the ship's coordinator and key unit personnel.

d. Provide support for assessment team (e.g., ICAS data, access to specific spaces, electrical power and cooling water requirements, man aloft equipment tag-out and Radio Frequency radiation requirements, a secure space, Shipboard Nontactical Automated Data Processing Program or Legacy Organizational Maintenance Management System – Next Generation reports.)

e. Prepare systems or equipment, tag outs, Work Authorization Form, request support services and generate Quality Assurance packages as required.

f. Ensure there are no conflicting evolutions, training, drills, field days, major system overhauls or other events that would detract from the timely and efficient completion of the assessment event that have been planned or scheduled.

g. Reschedule the preventive maintenance requirements that will be accomplished during the assessment event to eliminate redundant accomplishment if the assessment is scheduled to occur so that no greater than one-half (1/2) of the scheduled periodicity is exceeded.

h. Host assessment event briefings.

i. Ensure the 3-M Coordinator, Functional Area Supervisors and the Supply Officer (or representative) are available as needed during the Assessment.

j. Ensure divisional personnel are assigned to work closely with the Assessment Team SMEs during testing and repair to maximize On the Job Training and awareness of identified equipment problems.

k. Remove key maintenance personnel from the watch bill during normal working hours in order to improve efficiency of the assessment event.

l. Correct material discrepancies as time permits.

m. Send, as directed by the TYCOM, a Quicklook completion message within five working days following the completion of the assessment event. Appendix D provides a sample message template. Additionally, include in the Quicklook report feedback and recommendations to the TYCOM to support continuous improvement of the assessment event process.

NOTE: INDIVIDUAL MAINTENANCE ASSESSMENTS (NOT MORE THAN FIVE ASSESSMENT PROCEDURES) MAY BE SCHEDULED OUTSIDE OF A SCHEDULED ASSESSMENT EVENT OR AVAILABILITY. HOWEVER, THEY STILL NEED TO BE COORDINATED WITH THE SHIP'S SCHEDULE AND SHOULD NOT INTERFERE WITH OPERATIONAL REQUIREMENTS.

APPENDIX A

ASSESSMENT PROCESS

1. Assessment Background, Scope, and Organizational Responsibilities.

   a. The Fleet Material Assessment Process provides comprehensive testing of equipment or system(s) to determine their current state of material readiness. The resultant data assists maintenance efforts to attain a high state of overall material readiness.

   b. This document provides supplemental information to assist in the execution of a material condition assessment. This material assessment process does supersede or supplant other instructions or notices covering material assessment.

   c. An SME may elect to conduct a material assessment procedure for the purposes of troubleshooting equipment or system(s) as part of a Fleet Technical Assistance.

   d. Job Sequence Numbers will be assigned per Appendix E.

   e. Only material assessment procedures currently identified in the CMP must be used. If a material assessment is not in the CMP, the executing activity must process a Departure From Specification through the appropriate TYCOM and technical authority before it can be scheduled and performed.

   f. A material assessment is part of the ship's RCM plan conducted by Unit personnel or by an external agent (e.g., C5RA or TSRA). Depending on the context, material assessments may be individual "tasks" or "events" that group together numerous individual material assessment tasks for accomplishment during a period of time in the ship's operational schedule.

2. Individual Material Assessment.

   a. Scheduling and Preparing for an Individual Material Assessment.

      (1) The term "Unit" applies to Ship's Force and shore personnel being assessed.

      (2) Due to the simple nature of this type of assessment, requests will normally be accomplished through a Go Assess Maintenance Notification (GA2-K). The assessment may be requested by a unit's TYCOM, unit's Immediate Superior in Command (ISIC), Maintenance Team or by the unit itself.

      (3) Once the assessment is scheduled, the SME assigned should ensure there will be proper support for performing the material assessment (e.g., tag-out, equipment operation, initial system conditions, material history, properly calibrated test equipment).

      (4) If an assessment was scheduled more than two weeks in advance, the SME should make a courtesy phone call or send an e-mail message as appropriate to ensure schedule changes have not occurred.

   b. Conducting the Individual Material Assessment.

      (1) Each Individual Material Assessment will have an in brief with the Commanding Officer or their designee. The in brief will include an agenda of the assessment, what procedures will be used to assess the equipment or

system(s) and unit specific safety policies. Daily briefs will occur, as appropriate.

(2) Upon the completion of the in brief, the SME(s) will team with the unit's point of contact to begin the assessment. Benefits of this teaming arrangement include training of personnel and meeting all safety requirements. Training is part of the material assessment and unit personnel should be present during the assessment.

(3) In the event the assessment discloses significant equipment or system failure(s) that prevents completion of the assessment, the SME must notify the Commanding Officer or their designee and coordinate repairs if appropriate.

c. Completing the Individual Material Assessment.

(1) All material discrepancies will be documented on a maintenance notification (2-Kilo) and uploaded to the CSMP. The goal is to provide an uploadable file (bulkload) of all final discrepancies upon completion of the assessment but no later than five working days.

(2) The SME must provide the Commanding Officer or their designee with an out brief. If requested by the unit, a formal final report of the assessment will be provided no more than 30 days after the conclusion of the individual assessment.

3. Assessment Availabilities.

a. Five or more concurrently scheduled assessments require additional planning, integrated scheduling and project management.

b. Preparing the assessment.

(1) The size and complexity of an assessment availability generally requires that it be scheduled as part of a maintenance availability or an individual event. All material discrepancies will be documented on a maintenance notification (2-Kilo) and uploaded to the CSMP. The goal is to provide an uploadable file (bulkload) of all final discrepancies upon completion of the assessment but no later than five working days.

(2) The unit should prepare and release the Readiness to Commence message no later than five working days prior to commencement of the assessment, if required by the TYCOM. Appendix C provides a sample format.

(3) The person designated to manage the Assessment Availability is referred to as the Team Leader or Assessment Director and their duties are:

(a) Prepare and release the Prerequisites and Test Requirements message four weeks prior to the start of the assessment. Appendix B provides a sample format.

(b) Arrange for adequate workspace and computer or network support.

(c) Ensure all members of the team are on the unit's access list.

(d) Work with the unit's maintenance team to ensure that the maximum benefit may be realized for the scheduled material assessments.

(4) Extend an invitation to the material assessment out brief to the appropriate TYCOM or ISIC and maintenance team.

c. Conducting the Assessment.

(1) The Team Leader or Assessment Director will:

(a) Coordinate with assigned Port Engineer to ensure accurate TSRA availability code has been created in VSB per volume II, part II, chapter 4, Appendix A of this manual. Perform the task listed in paragraph 2.a.(2) of this appendix.

(b) Conduct an in brief to ensure all assessment team members and unit personnel are given the latest guidance for the event.

(c) Verify the Standard Assessment tool kit is operational, that the proper configuration data is loaded and that the unit has provided the necessary computer network access (i.e., logins, passwords, accounts, etc.).

(d) Distribute appropriate technical documentation to conduct the assessment.

(e) Liaison daily or as required with the assessment team members to check on progress with their portion of the assessment.

(f) Conduct a daily brief of progress and report significant problem status with the Commanding Officer or designated staff.

d. Completing the Assessment.

(1) The Team Leader or Assessment Director will:

(a) Specify the time for final submission of assessment results.

(b) Provide major findings that pose a threat to personnel safety or equipment (e.g., inoperative alarms or safety devices; readings exceeding the limits of the assessment that are deemed unsafe or excessive fuel or oil leaks).

(c) Provide minor findings which are defined as any finding not considered to be a major finding and poses no threat to personnel.

(d) Findings for material history which do not impact on equipment system operation.

(e) Any repairs performed.

(f) Any over-the-shoulder training in support of conducting the assessment.

(2) The out brief will include:

(a) Report major discrepancies.

(b) Report the system(s) or equipment for which testing was not attempted, testing not completed and configuration changes were needed.

(c) Results of logistics discrepancies.

(d) Discrepancies assigned for follow-on technical assistance.

(3) Provide the ship with the draft Quicklook message within five working days of the completion of the assessment. A Quicklook message sample outline is provided as Appendix D.

(4) All material discrepancies will be documented on a maintenance notification (2-Kilo) and uploaded to the CSMP. The goal is to provide an uploadable file (bulkload) of all final discrepancies upon completion of the assessment but no later than five working days.

(5) The Team Leader must provide the Commanding Officer or their designee with an out brief. If requested by the unit, a formal final report of the assessment will be provided no more than 30 days after the conclusion of the individual assessment.

(6) When requested, provide special report(s) or brief(s) to the TYCOM, ISIC, maintenance team or designated representative(s) to facilitate repair of specific deficiencies.

POC/(LIST INFO AS APPROPRIATE)//
RMKS/1. IAW REFS A THRU D, ASSESSMENT WILL BE CONDUCTED ONBOARD USS (SHIP/SUB/CARRIER) STARTDATE-ENDDATE YYYY.
2. ASSESSMENT WILL PROVIDE THE FOLLOWING:
A. READINESS ASSESSMENT OF SYSTEMS MATERIAL CONDITION.
B. OVER-THE-SHOULDER MAINTENANCE TRAINING FOR SHIPBOARD PERSONNEL AS THEY PERFORM REQUIRED MAINTENANCE/CORRECTIVE ACTION.
C. ENTRY OF MAINTENANCE READY 2-KILOS INTO THE CSMP AND A CSMP VALIDATION FOR SYSTEMS ASSESSED.
D. (IF APPLICABLE) ASSESSMENT OF SHIP'S ELECTROMAGNETIC COMPATIBILITY POSTURE.
E. (IF APPLICABLE) CONFIGURATION REVIEW OF COSAL/SNAP DATABASE AND INVENTORY OF TECHNICAL MANUALS FOR SYSTEMS/EQUIPMENT (ELECTRONICS ORDNANCE) BEING ASSESSED.
F. (IF APPLICABLE) A SMALL ARMS READINESS REVIEW (SARR) IS OPTIONAL AND WILL BE CONDUCTED ONLY IF REQUESTED BY THE SHIP. THE SARR WILL HELP SHIP'S FORCE TO IDENTIFY POTENTIAL PROBLEM AREAS AND ENSURE QUALITY SMALL ARMS ARE ONBOARD FOR DEPLOYMENT.
3. BRIEFS AND CLEARANCE DATA:
A. PRE-BRIEF WILL BE CONDUCTED TO DISCUSS GUIDELINES, ESTABLISH REQUIRED SUPPORT, DISCUSS ANY TEST PLAN ISSUES AND REVIEW POSSIBLE CONFLICTING EVOLUTIONS. RECOMMEND ATTENDANCE BY CO, XO, DEPT HEADS, PRINCIPAL ASSISTANTS AND 3-M COORDINATOR.
B. RECOMMEND KICK-OFF BRIEF BE HELD ON THE FIRST MORNING OF THE EVENT.

C. ASSESSMENT DIRECTOR WILL PROVIDE DAILY PROGRESS UPDATES TO CO OR DESIGNATED REP.

D. AN OUTBRIEF WILL BE CONDUCTED AT THE CONCLUSION OF THE EVENT.

E. CLEARANCE DATA WILL BE PROVIDED BY SEPCOR.

4. USS (SHIP/SUB/CARRIER):

A. (IF APPLICABLE) RMC LOG REP WILL CONTACT SHIP FOR LOG DATA REQUIREMENTS PRIOR TO START OF ASSESSMENT.

B. TRAINING IN MAINTENANCE PROCEDURES AND PRACTICAL APPLICATION OF ONBOARD TEST EQUIPMENT AND TOOLS FOR INSTALLED SYSTEMS IS CONDUCTED. (IF APPROPRIATE) FOR MAXIMUM BENEFIT, REQ ALL TECHS, SUPPLY SUPPORT PERSONNEL AND 3-M COORDINATOR BE AVAILABLE FOR DURATION OF EVENT.

C. (IF APPLICABLE) TO FACILITATE CRYPTO VOICE/DATA CKT TESTING, REQ LOAD ALL APPLICABLE CRYPTO PRIOR TO EVENT START.

D. (IF APPLICABLE) DUE TO LARGE NUMBER OF PERSONNEL BOARDING EACH DAY, REQ PROCESS BE ESTABLISHED TO EXPEDITE BOARDING ACCESS.

E. THIS ASSESSMENT IS NOT AN INSPECTION AND NO PRE-EVENT TESTING IS REQUIRED. CONTINUE NORMAL PMS SCHEDULE.

F. IAW REF B, REQ TRANSMIT “READINESS TO COMMENCE” MESSAGE NLT ONE WEEK PRIOR TO START OF THE EVENT.

G. (IF APPLICABLE) RMC 2-M FLEET COORDINATOR WILL REVIEW SHIP'S 2-M PROGRAM. REQ SHIP'S 2-M COORDINATOR PROVIDE MODULE TEST AND REPAIR TRACKING SYSTEM (MTRTS) DATA FOR THE LAST TWO QTRS.

H. REQ ADVISE EARLIEST OF ANY SCHEDULE EVOLUTIONS WHICH COULD IMPACT THE CONDUCT OF THIS EVENT.

5. (ISIC): REQ ADVISE ALCON NAME AND TELEPHONE NUMBER OF STAFF MEMBER DESIGNATED AS ISIC REP.

6. REQ ALL SUPPORT ACTIVITIES ADVISE ALCON NAME/CLNC LEVEL OF REP(S) PROVIDING SUPPORT.
(LIST AS APPLICABLE TO THE ASSESSMENT)

7. REQ ALL TEAM MEMBERS REPORT ONBOARD NLT (TIME), DD MMM YY TO MEET WITH THE ASSESSMENT DIRECTOR (AND AS APPROPRIATE) TO OBTAIN TEST PLANS AND CONTROL SHEETS.

8. FOR FURTHER INFO CONTACT (LIST POC E-MAIL ADDRESS). (RMC) STANDS READY TO SUPPORT ALL FLEET UNITS 24/7 THROUGH THE COMMAND DUTY OFFICER: COMM (###) ###-####, DSN ###-####, UNCLASSIFIED E-MAIL (INSERT ADDRESS), CLASSIFIED E-MAIL (INSERT ADDRESS), AND BATTLE-CHAT SERVER (INSERT ADDRESS).//

COMPLETION QUICKLOOK MESSAGE (EXAMPLE)

FM (ASSESSMENT ACTIVITY OR USS)
TO (ISIC)
INFO (AS APPROPRIATE TO THE ACTIVITY)
BT
MSGID/GENADMIN/ASSESSMENT ACTIVITY OR USS/-/MAR//
SUBJ/QUICKLOOK REPORT FOR USS XXX MATERIAL INSPECTION (MI)//
REF/A/MSG/ASSESSMENT ACTIVITY/161402ZXXX04//
AMPN/REF A DOCUMENTS//
RMKS/1. AN ASSESSMENT WAS CONDUCTED ON USS XXX AT NAS NORTH ISLAND, CA DURING THE PERIOD XX-XX MAR 200X. CERTAIN DEFICIENCIES EXIST WHICH DEAL WITH THE XXX DEPARTMENT. THESE DEFICIENCIES ARE NOTED IN REF A.
2. SENIOR MEMBER COMMENTS:
A. THE SHIP WAS CLEAN AND WELL PREPARED FOR THE INSPECTION.
B. THE SHIP REPORTED A HISTORY OF XXX(SYSTEM AND DISCREPANCY).
C. THE RELIABILITY OF THE XXX SYSTEM IS SUSPECT. DURING THE COURSE OF THE INSPECTION, XXX WERE INOP DUE TO A NUMBER OF MATERIAL DEFICIENCIES AND XXX WERE INOP DURING THE DTE. THE SHIP HAS A MATERIAL HISTORY FILE THAT INDICATES A RECORD OF POOR RELIABILITY WITH XX CASUALTIES, INCLUDING XX CASREPS, DOCUMENTED OVER A PERIOD OF XXX DAYS. MANY OF THE CASREPS ARE RELATED TO PARTS NOT IN STOCK OR NOT CARRIED.
D. THE CONDITION OF THE DISTRIBUTED ELECTRICAL SYSTEM OUTSIDE OF THE XXX SPACES IS OF CONCERN. NUMEROUS UNLABELED/MISLABELED CIRCUITS, OVERSIZED/UNDERSIZED PROTECTIVE DEVICES, AND OTHER SAFETY DEFICIENCIES WERE NOTED.
E. TOPSIDE CORROSION, ESPECIALLY ALONG THE CATWALKS AND UNDER SPONSONS, WAS NOTED. THE SERIOUSLY DETERIORATED MAIN SPACE INTAKE PLENUMS SHOULD BE ADDRESSED IMMEDIATELY.
F. THE SHIP HAS NEVER HAD A COMPLETE OIL POLLUTION ABATEMENT SYSTEM (SPECIFICALLY AN OILY WATER SEPARATOR AND OIL CONTENT MONITOR) INSTALLED AND CONSEQUENTLY CANNOT COMPLY WITH EXISTING ENVIRONMENTAL PROTECTION LAWS. THE SHIP HAS ROUTINELY USED SPACE EDUCTORS TO REMOVE BILGE WATER WHILE AT SEA.
G. MINIMUM ACCEPTABLE EQUIPMENT FOR UNDERWAY OPERATIONS WAS ACHIEVED AT 1100 ON DAY TWO OF INSPECTION.
H. THE SHIP'S SELF-ASSESSMENT CAPABILITY WAS EVALUATED AS SATISFACTORY.
I. THE SHIP'S ABILITY TO RESOLVE SIGNIFICANT MATERIAL ISSUES DURING THE INSPECTION WAS EVALUATED AS SATISFACTORY.
3. THE FOLLOWING CASREPS WERE ACTIVE PRIOR TO THE MI:

NUMBER	NOMENCLATURE	CATEGORY
04XXX	XXXX	2

04XXX XXXX 2
04XXX XXXX 2

4. DEMONSTRATION RESULTS: SAT (0.80 - 1.00)/DEGRADED (0.60 - 0.79)/UNSAT (0.00 - 0.59):

- THE SELF-DEFENSE DTE WAS UNSAT (SCORE: 0.58) BECAUSE OF REDUCED DETECTION RANGES ON THE XXX SYSTEM, 3 OF 6 XXX WERE INOP OR DEGRADED, AND XXX FAILED TO CYCLE ROUNDS.
- THE XXX DEMONSTRATION WAS SAT (SCORE: 0.80).
- THE FULL POWER DEMONSTRATION WAS SAT (SCORE: 0.91). SEE REF A.
- THE QUICK REVERSAL AHEAD WAS SAT (SCORE: 0.98).
- THE QUICK REVERSAL ASTERN WAS UNSAT (SCORE: 0.50). SEE REF A.
- THE STEERING DEMONSTRATION WAS DEGRADED (SCORE: 0.63) BECAUSE THE RUDDER SWING RATES WERE OUT-OF-SPEC SLOW AND IMBALANCED.
- THE ANCHOR DROP DEMONSTRATION WAS SAT (SCORE: 0.89).

5. SIGNIFICANT MATERIAL DEFICIENCIES AND EQUIPMENT OPERATIONAL CAPABILITY (EOC) INCLUDE:

A. PROPULSION: 0.88. REF A DOCUMENTS DEFICIENCIES AND OBSERVATIONS NOTED IN THE XXX DEPARTMENT.

B. AUXILIARIES: 0.74.

- THE XXX WAS EXCESSIVELY WORN.
- 5 OF 8 XXX INDICATORS WERE INOP (CORRECTED).
- 10 OF 10 XXX HAD INOP OR OUT-OF-SPEC SAFETY SWITCHES (5 CORRECTED).
- 5 OF 5 XXX WERE INOP (3 CORRECTED).
- 17 OF 23 XXX HAD SIGNIFICANT DEFICIENCIES OR WERE INOP (13 CORRECTED).
- THE ACCOM LADDER UPPER PLATFORM WAS MISSING A THIRD LIFELINE.

C. COMBAT SYSTEMS: 0.83.

- 5 OF 6 XXX WERE INOP (2 CORRECTED).
- 2 OF 10 XXX WERE UNSAFE TO OPERATE (CORRECTED).
- 8 OF 10 XXX WERE UNSAFE TO OPERATE (CORRECTED).
- 25 OF 25 XXXX DID NOT HAVE REQUIRED FLOATATION AND HOLSTER SAFETY MODIFICATIONS INSTALLED.
- THE XXX WARNING BELL WAS INOP (CORRECTED).
- THE XXX WAS INOP (CORRECTED).
- THE CONDITION OF ELECTRONIC MATTING IN MANY XXX SPACES WAS NOT INSTALLED IAW NSTM CH 634 AND COVERED SIGNIFICANTLY CORRODED DECKS.
- THERE WERE SEVERAL SIGNIFICANT TOPSIDE AND MAST INSPECTION DISCREPANCIES INCLUDING VARIOUS CORRODED FERROUS FASTENERS AND ASSOCIATED HARDWARE, MISSING OR IMPROPERLY INSTALLED CLIMBER SAFETY RAIL PINS, AND MISSING ANTENNA SAFETY CUTOUT SWITCH RF HAZARD LABELS.
- THE CLIMBER SAFETY RAILS LOCATED ON THE XXX, NAVIGATION POLE, AND FANTAIL WERE NOT INSTALLED IAW THE NAVSEA STANDARD DRAWING.
- THE XXX WATER CIRCULATING PUMP WAS INOP (CORRECTED).

D. QUALITY OF SHIPBOARD LIFE: 0.83.

- THE FLAG PANTRY GARBAGE DISPOSAL HAD EXPOSED ELECTRICAL WIRES IN THE CABINET BENEATH THE SINK (CORRECTED).

PAGE 08 RUCOMFB8675 UNCLAS.
- THERE WERE NO DEEP FAT FRYER EMERGENCY DISCONNECT SWITCHES INSTALLED IN 5 OF 7 GALLEYS/PANTRIES.
- 17 OF 44 NEWLY INSTALLED GAYLORD HOOD FAIL-SAFE SWITCHES WERE INOP (CORRECTED).

E. NAVOSH: 0.84.

- 38 OF 41 XXX SAFETY NETS HAD DISCREPANCIES.
- IMMUNIZATION SUPPLIES WERE NOT STORED IN A BIOLOGICAL REFRIGERATOR THAT HAD HIGH/LOW TEMPERATURE AND LOSS OF POWER ALARMS INSTALLED (CORRECTED).
- 1 OF 5 BIOLOGICAL REFRIGERATORS WAS INOP.
- THE XXX CALL BUTTON SYSTEM AND XXX HEADS WAS INOP.
- 1 OF 3 MEDICAL/DENTAL STERILIZERS WAS INOP (CORRECTED).

6. VADM XXX, (CMD), RADM XXX, (CMD), AND RADM XXX, (CMD), WERE PRESENT FOR THE INSPECTION. CAPT XXX WAS THE SENIOR INSPECTOR.
7. PRESIDENT, BOARD OF INSPECTION AND SURVEY, CONCURS WITH THE FINDINGS.//
BT

NOTE: ENSURE MESSAGES ARE FOLLOWING CURRENT MESSAGE FORMAT AND CURRENT PLAD IS UTILIZED.

APPENDIX E

JOB ORIGINATOR IDENTIFICATION TABLE

Code	Short Description
A	HM&E RA (SUB/AIR)
B	C5RA (AIR) - Local TYCOM
C	C5RA (National)
D	C5RA (AIR) - Local TYCOM
G	RMC Inputs (AIR) - Local TYCOM
H	RMC Inputs (AIR) - Local TYCOM
J	ICAS (National)
K	C5RA (SURF) - Local TYCOM
P	PMT OSAR (SUB) - Local TYCOM
Q	Created by RMAIS (National)
R	INSURV (National)
S	Sail Deficiencies (SUB) - Local TYCOM
W	Class Maintenance Plans (AIR, SUB, SURFACE)
X	Class Maintenance Plans (AIR, SUB)
Y	MST (SURF) Class Maintenance Plans (AIR) - Local TYCOM
Z	MST (SURF), CMP (National) - Z-alpha (National), Z-numeric (MST)

References to “National” values indicate that, per SHIPMAIN direction, an Information Technology product has been identified as the only authorized tool that will create 4790/2Kilos containing the respective Job Originator code.

VOLUME VI

CHAPTER 43

GUIDANCE FOR ENHANCED MODERNIZATION AND ALTERATION INSTALLATION TEAM INTEGRATION DURING AVAILABILITIES

REFERENCES.

(a) NAVSEA TS9090-310 - Alterations to Ships Accomplished by Alteration Installation Teams (AITs)

43.1 CONCEPT.

a. Scope. This policy applies to all modernization work (Ship's Force, shipyard, Intermediate Maintenance Activity and Alteration Installation Team) conducted during all types of Availabilities (Chief of Naval Operations, Continuous Maintenance Availability, Fleet Maintenance Availability, etc.) on all platforms. This chapter compliments the support policy of the Navy Modernization Process (NMP) as described in chapter 3 and chapter 36 of this volume.

b. Overview. Ship availability duration must be limited to only that required to accomplish planned repairs and alterations. Unnecessary time in depot maintenance periods reduces the time when ships are operationally available to support the Fleet Response Plan. Accordingly, scheduling of production and test activity for all work must be optimized to keep availability schedule duration to a minimum. The key to duration optimization is rigorous, inclusive and detailed integrated planning, which encompasses all anticipated work into a balanced schedule. Once an integrated and executable schedule is established and agreed to by all participating activities, the Naval Supervisory Authority (NSA) must be responsible and have the authority to manage the execution of the modernization through its completion.

c. This chapter provides planning and execution requirements for all modernization activities participating in an availability. Disconnected or diffused planning and execution creates local delays and disruption to the overall availability effort, creates additional coordination challenges for NSAs and Ship's Force, and results in excessive availability durations and higher secondary costs.

d. Essential to establishing an integrated and executable schedule is a stable and properly funded repair and modernization work package. Type Commanders and Program Managers must structure, plan and program repairs and installations with an understanding that they will be executed not in isolation, but as part of a larger, integrated effort with competing constraints and requirements. Accordingly, repair candidates and alterations not authorized at the Work Package Integration Conference (WPIC) will not be included in the integrated schedule, and will only be authorized after the WPIC when the NSA has advised the customer of the cost and schedule impact associated with a proposed late work addition.

e. (For surface ships only) Effective consolidation and tracking (to repair or completion) of deficiencies that have a potential impact to Combat Systems testing requires effective Maintenance Team coordination throughout the planning and execution

phases of an availability. By leveraging existing processes such as Planning Board for Maintenance, Total Ship Test Task Group, and Weekly Execution Brief meetings, these deficiencies can be prioritized and tracked to completion prior to Command, Control, Communications, Computer, Combat Systems, Intelligence Light Off (C5ILO).

f. (For surface ships only) Also essential to establishing an integrated and executable schedule is the coordination of pre-installation assessments (e.g., Pre-Installation Checkouts, Ship Checks) of all equipment and systems that modernization interfaces. Historical data shows that non-modernized Remain-In-Place Legacy systems coming out of layup are the primary driver of failed System Operability Verification Tests (SOVT) at the end of availabilities. Effective coordination of the various activities involved with pre-installation assessments (Program Office, Participating Acquisition Resource Manager (PARM), Regional Maintenance Center, Type Commander, Immediate Superior in Command, and Ships Force personnel) can significantly improve efforts to identify deficiencies before equipment is placed into layup. Although a separate process, coordination with events such as Total Ship Readiness Assessments, where possible, may be beneficial in leveraging windows of opportunity that minimize the burden on Ships Force while maximizing assessment potential. Identifying (and subsequently correcting) these deficiencies prior to C5ILO can significantly reduce SOVT delays or failures.

NOTE: FOR SURFACE FORCE SHIPS SUSTAINMENT, REPAIR CANDIDATES AND SHIP CHANGES NOT AUTHORIZED AT THE WPIC WILL NOT BE INCLUDED IN THE INTEGRATED SCHEDULE, AND WILL ONLY BE AUTHORIZED AFTER THE WPIC WHEN THE NSA HAS ADVISED THE CUSTOMER OF THE COST AND SCHEDULE IMPACT ASSOCIATED WITH A PROPOSED LATE WORK ADDITION.

43.2 AVAILABILITY PLANNING BUSINESS RULES.

a. The NSA or Lead Maintenance Activity (LMA) has overall responsibility for the availability and possesses the authority to organize, structure and coordinate availability execution matters. All other participants must support the NSA or LMA in this regard. Accordingly, it is paramount that the NSA or LMA balance the needs of all participants and customers in the availability.

b. All participating activities must provide all availability requirements (specifications, Automated Work Requests, major Planned Maintenance System and Ship's Force projects, approved installation drawings, schedule needs, system and compartment release dates, industrial support requirements, etc.) to the NSA or LMA as specified by other applicable milestones in this manual. Technical Points of Contact (TPOC) for each repair or installation activity must also be provided to the NSA or LMA to assist with integrated planning questions. These TPOCs must also be present during the execution of the availability and have authority to represent their organization's interest in matters relating to their repair or installation. For Aegis ships, all Combat System upgrade packages must be assembled, scheduled and integrated by the Aegis Combat System Project Engineer and submitted to the NSA or LMA as a package via the SEA21 Hull Manager.

(1) Alteration Installation Teams must provide requirements per reference (a).

(2) The LMA must develop an inclusive, detailed, integrated and resource-loaded schedule of all participating activities. All participants must meet and review the proposed plan and make necessary adjustments to render a balanced and optimized integrated schedule. This formal schedule review must occur after the WPIC, but no later than the Work Package Execution Review. The NSA or LMA must serve as the final arbiter of conflicts. By the Work Package Execution Review, all integrated schedule conflicts must be resolved by the NSA or LMA.

NOTE: FOR SURFACE SHIPS, THIS FORMAL SCHEDULE REVIEW MUST OCCUR AFTER THE WPIC, BUT NO LATER THAN THE WORK PACKAGE EXECUTION REVIEW. THE NSA OR LMA MUST SERVE AS THE FINAL ARBITER OF CONFLICTS. BY THE WORK PACKAGE EXECUTION REVIEW, ALL INTEGRATED SCHEDULE CONFLICTS MUST BE RESOLVED BY THE NSA OR LMA.

(3) The LMA must be specifically tasked to accomplish integrated availability planning and execution. For Regional Maintenance Centers, the following related set of specifications achieving end-to-end integration must be invoked in the availability Contract Line Item Number at a lead-time commensurate with the complexity of the work package:

(a) "Availability Program Management Alteration Installation Team Integration" Standard Work Template 897-04 (Appendix ___).

(b) Combat Systems Light-off or Aegis Light-off Compartment Release Schedule, SWT 813-01 (Appendix ___), as applicable.

(c) Propulsion Plant Light-off Assessment Standard Item(s), as applicable.

(d) Aegis Light-off NAVSEA Standard Item(s), as applicable.

NOTE: TASKING MUST ENSURE THE NSA OR LMA CAN PROVIDE INITIAL "SCHEDULE CONFLICT AWARENESS" AT THE WPIC.

c. Costs for this integration effort must be prorated amongst the participating customers using existing, standardized proration conventions.

d. The participation of Installing Activities (Program Sponsors or PARM representatives) in Integrated Project Team Development events, including the WPIC and Work Package Execution Review, is critical to the successful integration of modernization work, as well as risk mitigation. Specifically, Program Sponsors or PARM representative should provide the following information at the WPIC for each installation planned for the availability:

(1) TPOCs.

(2) Status of Ship Class Ship Installation Drawings and Plan of Action and Milestones development.

(3) Duration of install.

(4) Funding and Material status.

(a) Government Furnished Material, Contractor Furnished Material projected roadblocks and lessons learned.

(b) Split installation requirements.

(5) Pre-Installation Chek Outs required. Include Pre-Installation Check Outs and assessment requirements for equipment and systems that will be affected by the install (Remain In-Place Legacy systems needed for SOVT).

(6) Combat Systems Support Equipment needed (e.g., air, power, water).

(7) A DC plate-type display showing affected spaces.

(8) If removal of equipment or obstructions are required.

(9) If any foundation welding is required.

(10) Risks and Lessons Learned from previous installations.

(11) SOVT Plan.

43.3 AVAILABILITY EXECUTION BUSINESS RULES.

a. During availability execution, the LMA must manage and coordinate the project and recommend resolutions to conflicting issues. The NSA will be the final arbiter for conflict resolution.

b. The LMA must host weekly production progress and work review meetings. All activity participants must ensure their TPOC is present to assist in coordination and conflict resolution.

c. LMAs also conduct daily production coordination meetings. It is recommended that all activity participants and TPOCs attend these on an as-needed basis to assist (in real-time) with coordination and conflict resolution.

d. In all availability meetings, communications and forums, a forward-looking, anticipatory focus should be applied by all parties to intercept potential problems and resolve them as soon as possible and with least cost and schedule impact.

3.3 Agreements VII-3-2
3.3.1 Master Agreement for Repair and Alteration of Vessels VII-3-2
3.3.2 Job Order VII-3-2
3.3.3 Clauses VII-3-2

3.4 Eligibility Requirements for Master Ship Repair Agreement and Agreement for Boat Repair Program VII-3-3
3.4.1 Major Requirements for a Master Ship Repair Agreement Certification VII-3-3
3.4.2 Master Ship Repair Agreement Requirements VII-3-3
3.4.3 Additional Requirements VII-3-4
3.4.4 Remote Site Work Performance Plan VII-3-5
3.4.5 Agreement for Boat Repair Requirements VII-3-5
3.4.6 336611 Ship Building and Repairing VII-3-6
3.4.7 336612 Boat Building and Repairing VII-3-6

3.5 Responsibilities Applicable to the Master Ship Repair Agreement or Agreement for Boat Repair Program VII-3-6
3.5.1 Contractors VII-3-6
3.5.2 Contracting Officers at Regional Maintenance Centers VII-3-6

3.6 Procedures for Master Ship Repair Agreement and Agreement for Boat Repair VII-3-8
3.6.1 Period of Agreement VII-3-8
3.6.2 Solicitations for Job Orders Outside of Existing Contracts VII-3-8
3.6.3 Pre-Award Survey for Job Orders and Determination of Eligibility VII-3-9
3.6.4 Award of a Job Order VII-3-9
3.6.5 Emergency Work VII-3-10

3.6.6 Modification of Master Agreements VII-3-10
3.6.7 Resolving Inconsistencies Between Master Agreements and Job Orders VII-3-10
3.6.8 Transfer of Master Agreements VII-3-11

3.7 Private Sector Industrial Activity Contracts VII-3-11
3.7.1 Private Sector Industrial Activity Contract VII-3-11
3.7.2 Requirement VII-3-11
3.7.3 General Contract Structure VII-3-11
3.7.4 Pre-Availability Planning VII-3-12
3.7.5 Availability Oversight VII-3-12
3.7.6 Growth and New Work VII-3-12

Appendices
A Master Ship Repair Agreement VII-3A-1
B Agreement for Boat Repair VII-3B-1

CHAPTER 4 - CONTRACT SPECIFICATION DEVELOPMENT

4.1 Preparation of Specifications and Estimates of Cost VII-4-1
4.1.1 Purpose VII-4-1
4.1.2 Scope VII-4-1
4.1.3 Design Versus Performance Specifications VII-4-2
4.1.4 Regulatory Requirements for Specifications VII-4-3
4.1.5 Restrictive and “Brand Name or Equal” Specifications VII-4-4

4.2 Work Package Development VII-4-4
4.2.1 Work Packages for Non-Private Sector Industrial Activity Contracts VII-4-4
4.2.2 Work Packages for Private Sector Industrial Activity Contract VII-4-4
4.2.3 Naval Sea Systems Command Standard Specification Program VII-4-4
4.2.4 Standardization Usage VII-4-5

4.3 Specifications VII-4-5
4.3.1 Preparation of Specification Work Items VII-4-5
4.3.2 The Specification Package VII-4-5
4.3.3 Master Specification Catalog VII-4-6

4.4 Preparation VII-4-6
4.4.1 Steps in Preparing a Work Item Specification VII-4-6
4.4.2 Determining Requirements and Understanding What the Contractor Must Do VII-4-6
4.4.3 Research, Data Gathering and Analysis VII-4-6
4.4.4 Availability of References VII-4-7
4.4.5 Preparation of a Detailed Outline VII-4-8
4.4.6 Preparation of the Initial Draft VII-4-8
4.4.7 Material Requirements VII-4-8
4.4.8 Tests, Inspections and Performance Criteria VII-4-9
4.4.9 Split Repair Responsibility VII-4-10

4.5 Specification Review VII-4-10
4.5.1 Review and Editing by the Writer VII-4-10

4.5.2 Review and Editing by Someone Other Than the Writer VII-4-12
4.5.3 Team Review and Modification VII-4-12
4.5.4 Government Check Points VII-4-12

4.6 Other Functions of the Work Item Planner VII-4-12

4.7 Planning Review VII-4-13

4.8 Non-Scheduled Availabilities VII-4-13
4.8.1 Special Planning Procedures VII-4-13
4.8.2 Other Non-Scheduled Work VII-4-14

4.9 Regional Maintenance Center Actions Upon Receipt of Work Requests VII-4-15

Appendices
A Not Used VII-4A-1
B Not Used VII-4B-1
C Not Used VII-4C-1
D Not Used VII-4D-1
E Procedures for the Preparation and Use of Work Item Specifications for Ship Repair VII-4A-1
F Work Package Integration Conference Agenda and Check List VII-4B-1

CHAPTER 5 - COST ESTIMATING

5.1 Introduction VII-5-1

5.2 Types of Estimates VII-5-1
5.2.1 Pre- and Post-Contract Award Estimating VII-5-1
5.2.2 Preliminary Cost Estimate VII-5-1
5.2.3 Contract Cost Estimate VII-5-2
5.2.4 Final Cost Estimate VII-5-2
5.2.5 Predicted-End-Cost VII-5-2

5.3 Classification of Cost Estimates VII-5-2
5.3.1 Class A - Detailed Cost Estimate VII-5-3
5.3.2 Class C - Budget Quality Estimate VII-5-3
5.3.3 Class D - Feasibility Estimate VII-5-3
5.3.4 Class F - “Ballpark” Estimate VII-5-3
5.3.5 Class X - Directed or Modified Estimate VII-5-3

5.4 Standard Estimating VII-5-3
5.4.1 Average Contractor VII-5-3
5.4.2 Elements of Standard Estimating VII-5-4
5.4.3 Standard Estimating Example VII-5-4

5.5 Estimating Environment VII-5-5
5.5.1 Environment Defined VII-5-6
5.5.2 Cost Accounting Standard VII-5-6
5.5.3 Other Factors Affecting the Contractors’ Estimating Environment VII-5-6
5.5.4 Regional Maintenance Center Estimating Instructions VII-5-7

5.6 Cost Estimating Methods, Standardization and Standards VII-5-9
5.6.1 Variables VII-5-9
5.6.2 Standardization of Cost Estimates VII-5-10
5.6.3 Detailed Estimating Techniques VII-5-11
5.6.4 Use of Historical Data VII-5-11
5.6.5 Parametric Cost Estimating and Cost Estimating Relationships VII-5-11

5.7 Preparing the Cost Estimate VII-5-13
5.7.1 Preparation VII-5-13
5.7.2 Developing the Estimate VII-5-13
5.7.3 Quantification of the Labor Estimate VII-5-15
5.7.4 Material Estimating VII-5-18

5.8 Estimating for Contract Modifications VII-5-20
5.8.1 Contractor Modifications VII-5-20
5.8.2 Acceleration VII-5-21
5.8.3 Disruption VII-5-21
5.8.4 Delay VII-5-21

5.9 Ship Change Estimates VII-5-21
5.9.1 Navy Modernization Process VII-5-21
5.9.2 Classification of Ship Change Estimates VII-5-22
5.9.3 Sources of Ship Change Estimating Data VII-5-22
5.9.4 Ship Change Estimating Techniques VII-5-22
5.9.5 Prorated Cost Estimates VII-5-22

5.10 Labor Rate Estimating VII-5-23
5.10.1 Projections VII-5-23
5.10.2 Labor Rates VII-5-23

5.11 Forward Pricing Rates VII-5-28

5.12 Master Specification Catalog Template Preliminary Estimates VII-5-29
5.12.1 MSC Template Preliminary Estimates Process VII-5-29
5.12.2 What MSC Template Preliminary Estimates “Do Represent” and “Do Not Represent” VII-5-30

Appendices
A Standard Cost Estimate VII-5A-1
B Estimating Check-Off List VII-5B-1
C Category I Standard Item Hard-Core Labor Considerations VII-5C-1
D Excaliber Contractor Other Direct Labor Factor Calculation (6 Month Period) VII-5D-1

CHAPTER 6 - FUNDING AND ACCOUNTING

6.1 Purpose VII-6-1

6.2 Scope VII-6-1

6.3 Policy VII-6-2

6.4 General Information Concerning Funding and Funds Administration VII-6-3
6.4.1 Appropriations VII-6-3
6.4.2 General Classifications of Funds Transactions VII-6-4
6.4.3 Repair Funds VII-6-4
6.4.4 Navy Modernization Process Funds VII-6-5
6.4.5 Berthing and Messing Funds VII-6-5
6.4.6 Commercial Industrial Services Contracts VII-6-5
6.4.7 Environmental Compliance Oversight VII-6-6

6.5 Legislated Responsibilities for Control of Public Funds VII-6-6
6.5.1 Commanding Officer Responsibility VII-6-6
6.5.2 Comptroller VII-6-6
6.5.3 Fund Administrators and Funds Managers VII-6-7

6.6 Responsibilities for Ship Maintenance Funding Management Business Rules VII-6-7
6.6.1 Maintenance Team Funding Business Rules Responsibilities VII-6-7
6.6.2 Regional Maintenance Center Funding Business Rules Responsibilities .. VII-6-9
6.6.3 Type Commander Responsibilities VII-6-9

6.7 Funding Violation Reporting VII-6-10

6.8 Funding Violation Penalties VII-6-10

6.9 Funding Methods and Accounting VII-6-10
6.9.1 Accounting and Reporting VII-6-10
6.9.2 Operating Budgets VII-6-11
6.9.3 Reimbursable Orders VII-6-11
6.9.4 Project Orders VII-6-11
6.9.5 Economy Act Order VII-6-12
6.9.6 Direct Citations VII-6-12
6.9.7 Requests for Contractual Procurement VII-6-12
6.9.8 Letters of Authority VII-6-12
6.9.9 Orders Placed With Government Agencies VII-6-12

6.10 General Information Concerning Availability and Obligation of Funds VII-6-13
6.10.1 General VII-6-13
6.10.2 Effects of the Grassley Amendment VII-6-13

CHAPTER 7 - AVAILABILITY AND PROJECT MANAGEMENT

7.1 Purpose VII-7-1

7.2 General VII-7-2
7.2.1 Areas of Responsibility VII-7-2
7.2.2 Standards of Conduct in Availability Management VII-7-2
7.2.3 Improper Actions VII-7-2
7.2.4 Documenting Significant Events VII-7-3

7.3 Project Management VII-7-3
7.3.1 Project Management Team VII-7-3
7.3.2 Project Manager VII-7-4

7.3.3 Material Expediter VII-7-6
7.3.4 Ashore Ships Maintenance Manager VII-7-6
7.3.5 Shipbuilding Specialists VII-7-6
7.3.6 Quality Assurance Manager VII-7-8

7.4 Contract Administration Team VII-7-8
7.4.1 Administrative Contracting Officer VII-7-9
7.4.2 Commercial Industrial Services Contract Program Managers VII-7-10
7.4.3 Contract Specialist VII-7-11
7.4.4 Cost Monitors VII-7-11
7.4.5 Navy Property Administrator for Contracts VII-7-11
7.4.6 Allowance Specialist VII-7-11
7.4.7 Accounting Technician VII-7-11

7.5 Support Staff VII-7-11
7.5.1 Functional Support Staff VII-7-11
7.5.2 Design Coordinator VII-7-11
7.5.3 Planners and Estimators VII-7-12
7.5.4 Combat Systems Managers or Representatives VII-7-12
7.5.5 Manager - Environment Compliance and Occupational Safety and Health Act VII-7-13
7.5.6 Technical Representatives from Other Activities VII-7-14
7.5.7 Planning Yard Technical Representative VII-7-14

7.6 Availability Performance VII-7-14
7.6.1 Preparation for a Contracted Availability VII-7-14
7.6.2 Pre-Award Survey VII-7-14
7.6.3 Readiness to Start VII-7-15
7.6.4 Work Specification Review VII-7-15
7.6.5 Ammunition Off-Load Prior to an Industrial Availability VII-7-15
7.6.6 Fuel Off-Load Prior to an Industrial Availability VII-7-16
7.6.7 Berthing of Ship and Crew VII-7-16
7.6.8 Contractor’s Assumption of Responsibility VII-7-16
7.6.9 Security VII-7-17
7.6.10 Special Events During Availabilities VII-7-18

7.7 Scheduled Conferences and Meetings VII-7-18
7.7.1 Arrival Conference VII-7-18
7.7.2 Weekly Commanding Officer’s Conference VII-7-19

7.8 Availability Management VII-7-20
7.8.1 Quality Assurance VII-7-20
7.8.2 Constructive Changes VII-7-20
7.8.3 Work Stoppage VII-7-20
7.8.4 Award Fee Board Conferences VII-7-20
7.8.5 Fire Fighting and Fire Prevention Conference VII-7-21
7.8.6 Fire Prevention, Safety and Housekeeping VII-7-21
7.8.7 Fire Watches VII-7-22
7.8.8 Docking Conference VII-7-22

7.8.9 Drydocking VII-7-22
7.8.10 Hazardous Material VII-7-23
7.8.11 Government Furnished Material VII-7-24
7.8.12 Testing of Ship's Systems and Equipment VII-7-25
7.8.13 Ship's Selected Records VII-7-25
7.8.14 Documentation VII-7-26
7.8.15 Fast Cruise, Dock Trials and Sea Trials VII-7-26

7.9 Availability Processes VII-7-26
7.9.1 Schedules VII-7-26
7.9.2 Progressing VII-7-30
7.9.3 Progress Payments VII-7-34
7.9.4 Progress Conferences VII-7-34

7.10 Funds Administration VII-7-37
7.10.1 Over Obligation VII-7-37
7.10.2 Growth and New Work VII-7-37
7.10.3 Contract Modifications VII-7-38

7.11 Delays In Performance VII-7-39
7.11.1 Risk VII-7-39
7.11.2 Performance VII-7-39
7.11.3 Material VII-7-39
7.11.4 Excusable Delays VII-7-40
7.11.5 Non-Excusable Delays VII-7-42
7.11.6 Compensable Delays VII-7-42
7.11.7 Concurrent Delay VII-7-43

7.12 Availability Finalization VII-7-43
7.12.1 Availability Completion Conference VII-7-43
7.12.2 Exceptions to Completion of the Contract VII-7-44
7.12.3 Availability Completion VII-7-44
7.12.4 Contract Guarantee Period VII-7-44
7.12.5 Completion Reports VII-7-45
7.12.6 Availability Completion Reports VII-7-45

7.13 Insurance VII-7-45
7.13.1 Introduction VII-7-45
7.13.2 Master Ship Repair Agreements or Private Sector Industrial Activity Contracts – Loss or Damage to Government Property VII-7-46
7.13.3 Administration of Insurance Requirements VII-7-47

Appendices
A Arrival Conference Agenda VII-7A-1
B Fire Fighting and Fire Prevention Conference Agenda VII-7B-1
C Drydocking Conference Agenda VII-7C-1
D "Activity" Progressing Method Example VII-7D-1
E Progress Guidelines VII-7E-1

CHAPTER 8 - TESTING, TRIALS, REDELIVERY AND GUARANTEES

8.1 Purpose VII-8-1

8.2 Scope VII-8-1

8.3 Application of Total Ship Test Program to Modernization and Repair Work VII-8-1
8.3.1 Introduction VII-8-1
8.3.2 Ship System Testing (Hull, Mechanical and Electrical VII-8-2
8.3.3 Combat System Testing VII-8-2

8.4 Trials for Overhaul and Repair Availabilities VII-8-3
8.4.1 General VII-8-3
8.4.2 Post Repair Trials VII-8-3

8.5 Finalization Procedures for Repair and Modernization Availabilities VII-8-3
8.5.1 General VII-8-3
8.5.2 Availability Completion and Readiness for Sea VII-8-4
8.5.3 Completion Report VII-8-4
8.5.4 Terminal Inventory Report VII-8-5
8.5.5 Release of Retained Funds and Final Payment to the Contractor VII-8-5
8.5.6 Release of Retained Funds VII-8-5
8.5.7 Final Payment to Contractor VII-8-5
8.5.8 Departure Reports VII-8-6
8.5.9 End of Availability Certification VII-8-7
8.5.10 Guarantee Engineer and Industrial Availability Quality Assessment Reports VII-8-7
8.5.11 Integrated Logistic Support Requirements VII-8-7

8.6 Final Acceptance VII-8-7
8.6.1 Guarantee Period VII-8-7
8.6.2 Correction of Defects VII-8-8
8.6.3 Availability Extensions VII-8-8
8.6.4 Notices to Contractor VII-8-8
8.6.5 Work Correction Under Another Naval Supervisory Authority VII-8-9

Appendices
A Work Item Completion Report VII-8A-1

CHAPTER 9 - PROPERTY ADMINISTRATION

9.1 Scope VII-9-1

9.2 Real and Personal Property VII-9-1
9.2.1 Government Property Types VII-9-1
9.2.2 Duties and Responsibilities for Contract Administration of Government Property VII-9-2

9.3 Providing Government Property to Contractors VII-9-4
9.3.1 Property VII-9-4
9.3.2 Material VII-9-4
9.3.3 Special Tooling VII-9-6
9.3.4 Special Test Equipment VII-9-6

9.3.5 Agency-Peculiar Property VII-9-6
9.3.6 Facilities VII-9-6
9.3.7 Industrial Plant Equipment VII-9-6
9.3.8 Automated Data Processing Equipment VII-9-6

9.4 Contractor Use and Rental of Government Property VII-9-6

9.5 Administration of Government Property VII-9-6
9.5.1 Regulation and Contractual Requirements VII-9-6
9.5.2 Responsibilities and Duties VII-9-7
9.5.3 Plant Clearance VII-9-8

9.6 Responsibilities of the Contractor VII-9-10

9.7 Repair or Modification of Government Furnished Property VII-9-10

9.8 Facilities and Leases VII-9-10
9.8.1 General VII-9-10
9.8.2 Property Accountability VII-9-10
9.8.3 Use of Facilities VII-9-10
9.8.4 Rental Payment VII-9-10
9.8.5 Insurance VII-9-11
9.8.6 Need for Funds VII-9-11
9.8.7 Maintenance Responsibility Under Facilities Use Agreements VII-9-11
9.8.8 Inspection and Report of Machinery and Equipment Maintenance VII-9-11
9.8.9 Inspection and Report of Maintenance of Civil Works VII-9-12
9.8.10 Inspection of Dry Docks VII-9-13
9.8.11 Fire Protection Measures VII-9-13
9.8.12 Inspection and Report of Mobilization Readiness VII-9-13
9.8.13 Shore Facilities Planning System VII-9-13
9.8.14 Redistribution and Disposal VII-9-13

CHAPTER 10 - ENVIRONMENTAL, SAFETY AND HEALTH

10.1 Purpose VII-10-1

10.2 Environmental Protection VII-10-1
10.2.1 Background VII-10-1
10.2.2 General Policy VII-10-1
10.2.3 Regional Maintenance Center Responsibilities VII-10-2
10.2.4 Regional Maintenance Center Oversight Functions VII-10-3
10.2.5 Hazardous Waste VII-10-3

10.3 Occupational Safety and Health VII-10-4
10.3.1 Background VII-10-4
10.3.2 Policy Guidance VII-10-4
10.3.3 Regional Maintenance Center Responsibilities VII-10-4
10.3.4 Occupational Safety and Health Oversight Functions VII-10-5
10.3.5 Inspections VII-10-6

CHAPTER 11 - CONTRACT ADMINISTRATION QUALITY ASSURANCE PROGRAM

11.1 Purpose VII-11-1
11.1.1 Scope VII-11-2
11.1.2 Applicability VII-11-2
11.1.3 Quality Assurance Directives VII-11-2
11.1.4 NAVSEA Evaluations VII-11-2
11.2 Program Direction and Control VII-11-2
11.2.1 Contractor Responsibilities VII-11-2
11.2.2 Government Responsibilities VII-11-2
11.2.3 Specification Review VII-11-3
11.2.4 Retention and Disposal of Inspection Records VII-11-4
11.3 Personnel Capability Requirements VII-11-4
11.3.1 Quality Assurance Manager or Department Head VII-11-4
11.3.2 Training VII-11-4
11.3.3 Welding and Brazing Workmanship Training Requirements VII-11-5
11.3.4 Nondestructive Test Personnel Requirements VII-11-5
11.3.5 Ship's Force Quality Assurance Interface VII-11-7
11.4 Surveys and Conferences VII-11-7
11.4.1 Bidders' Conference VII-11-7
11.4.2 Pre-Award Surveys VII-11-7
11.4.3 Post-Award Conference VII-11-8
11.4.4 Arrival Conference VII-11-8
11.5 Elements of the Contract Administration Quality Assurance Program VII-11-8
11.5.1 Planning VII-11-8
11.5.2 Document Review VII-11-9
11.5.3 Procedure Evaluation VII-11-9
11.5.4 Product Verification Inspection VII-11-10
11.5.5 Quality Audits VII-11-10
11.5.6 Corrective Action VII-11-13
11.5.7 Quality Data Evaluation VII-11-15
11.6 Government Contract Quality Assurance Actions at Source VII-11-15
11.6.1 General VII-11-15
11.6.2 Exception VII-11-16
11.6.3 Requesting Government Contract Quality Assurance at Source VII-11-16

Appendices
A Corrective Action Request VII-11A-1
B Letter of Delegation (Example Only) VII-11B-1

CHAPTER 12 - CONTRACTED SUBMARINE PRESERVATION SYSTEM REPAIRS

12.1 Purpose VII-12-1
12.2 Scope VII-12-1
12.3 Applicability VII-12-1
12.4 Submarine Preservation Requirements for Contracting VII-12-1

12.4.1 Structural Integrity VII-12-2
12.4.2 Tanks VII-12-2
12.4.3 Blasting VII-12-2

12.5 Reporting VII-12-2
12.5.1 Existing Conditions VII-12-2
12.5.2 As Arrived Conditions VII-12-2
12.5.3 SSN 21 and SSN 774 Class Submarines VII-12-2

12.6 Submarine Preservation Waivers and Deviations VII-12-2
12.6.1 Requirements VII-12-3
12.6.2 Notification VII-12-3

CHAPTER 13 - SHIPBOARD CONTRACTING STRATEGY AND UTILIZATION

13.1 Purpose VII-13-1

13.2 Scope VII-13-1

13.3 Applicability VII-13-1

13.4 Objective VII-13-1

13.5 Background VII-13-1
13.5.1 Optimal Use of Surface Force Ship or Aircraft Carrier Private Sector Industrial Activity Contracts VII-13-2
13.5.2 Indefinite Delivery, Indefinite Quantity Contracts VII-13-2
13.5.3 Industrial Capabilities VII-13-2
13.5.4 Contracts Portfolio VII-13-2

13.6 Overview VII-13-2

13.7 Responsibilities VII-13-3
13.7.1 Fleet Maintenance Board of Directors VII-13-3
13.7.2 Contracts Governance Council VII-13-3
13.7.3 Systems Commands and Program Executive Offices VII-13-3
13.7.4 Fleet Maintenance Activities VII-13-3

13.8 Contracts Governance Council VII-13-3
13.8.1 Structure VII-13-3
13.8.2 Contracts Governance Council Process VII-13-3
13.8.3 Contracts Governance Council Membership VII-13-3
13.8.4 Contracts Governance Council Policy VII-13-4
13.8.5 Contracts Governance Council Products VII-13-4
13.8.6 Contracts Governance Council Expectations VII-13-4

VOLUME VII

FOREWORD

CONTRACTED SHIP MAINTENANCE

LISTING OF APPENDICES.

A Glossary of Terms

1.1 PURPOSE. This volume provides information relative to the procurement, oversight and execution of ship maintenance and modernization work performed in the private sector. Supervisor of Shipbuilding (SUPSHIP) Operations Manual (0910-LP-012-7750 Rev 1) has served as the primary source for information contained in this manual.

1.2 SCOPE. This volume applies to all ships and shore activities under the cognizance of Commander United States Fleet Forces Command (COMUSFLTFORCOM), Commander, Pacific Fleet (COMPACFLT), and Commander, Naval Reserve Forces (COMNAVRESFOR). Additionally, although new ship construction is the primary mission area for the remaining SUPSHIPs, this volume is also applicable to those SUPSHIPs that continue to have repair and modernization responsibilities for submarines and aircraft carriers. These SUPSHIPs should familiarize themselves with appropriate sections of this manual as it applies to the repair and modernization contracts that they procure and administer. This volume is not intended to be all encompassing, since the guidance for many elements of the maintenance programs and their execution are issued by higher operational, contracting and technical authority (e.g., Office of the Chief of Naval Operations Instructions, Naval Ships Technical Manuals, and Federal Acquisition Regulations (FAR)).

a. This volume contains general topics, applicable to all ships and units under the cognizance of COMUSFLTFORCOM or COMPACFLT. In those cases where chapters are not applicable to certain Forces, an applicability statement has been used for clarification.

b. Equipment under the cognizance of the Strategic Systems Project Office or Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) is maintained following Strategic Systems Project Office and NAVSEA 08 directives, respectively.

c. In relation to contractual matters, where a policy or requirement is not established by FAR, Defense Federal Acquisition Regulation Supplement (DFARS), Navy and Marine Corps Acquisition Regulation Supplement (NMCARS), Naval Sea Systems Command Contracts Handbook (NCH), or other Navy or DoW directive, this manual contains the procedural requirements for compliance. Otherwise, the FAR, DFARS, NMCARS, NCH, and other Navy and DoW Directives take precedence over this manual. When a new or revised policy or requirement is issued by FAR, DFARS, NMCARS, NCH, or other Navy and DoW Directives that is not consistent with this manual, the new or revised policy and requirements will be followed. Material required to be submitted to higher authority by the NMCARS or NCH will be forwarded via the Regional Maintenance Center Contracts Department Head or Chief of the Contracting Office at SUPSHIP to NAVSEA 02.

d. Appendix A of this chapter contains a glossary of terms used throughout all chapters of this volume.

1.3 CHANGES AND CORRECTIONS. Changes and corrections will be issued as required. Comments and suggestions for improving or changing this volume are invited. Address comments, recommendations and requested changes to Submarine Maintenance Engineering, Planning and Procurement Activity utilizing the change request form located in the front of this manual. If changes are submitted in electronic format, facsimile or e-mail, each change request must contain the information required on the change request form.

APPENDIX A

GLOSSARY OF TERMS

TERM	DEFINITION
Administrative Change	A unilateral contract change, in writing, that does not affect the substantive rights of the parties (e.g., a change in the paying office or the appropriation data).
Administrative Contracting Officer	A contracting officer who is administering contracts.
Approved Purchasing System	A contractor's purchasing system that has been reviewed and approved per FAR Part 44.
Aircraft Carriers	All ships under the responsibility of Naval Air Forces, Atlantic and Pacific Fleets. Includes all CVNs and supporting activities.
Attribute	A characteristic or property that is used to determine acceptability or unacceptability with respect to a given requirement.
Bilateral Modification	A contract modification that is signed by the contractor and the contracting officer.
Business Unit	Any segment of an organization or an entire business organization not divided into segments.
Certification	The procedure and action by a duly authorized body of determining, verifying and attesting in writing to the qualifications of personnel, processes, procedures or items following applicable requirements.
Change Order	A written order signed by a contracting officer. It directs the contractor to make a change that the Changes clause authorizes the contracting officer to order without the contractor's consent.
Characteristic	A physical, chemical, visual, functional or any other identifiable property that helps differentiate between items of a given sample or population. The difference may be either quantitative (by variables) or qualitative (by attributes).
Check Point (G)	A symbol inserted in a Work Item to establish a point in the sequence of accomplishment of work at which time the Government must be notified to permit observation of a specific inspection or test by the Government.
Check Point (I)	A symbol inserted in a Work Item to establish a point in the sequence of accomplishment of work at which time the contractor must inspect or verify and document the inspection or test. (I) Inspections require verification by a separate individual, other than the person who has accomplished the work, qualified as an inspector.
Claim	A written demand or written assertion by one of the contracting parties seeking, as a matter of right, the payment of money in a sum certain, the adjustment, or interpretation of contract terms or other

TERM	DEFINITION
	relief arising under or related to a contract.
Consent to Subcontract	The contracting officer's written consent for the prime contractor to enter into a particular subcontract.
Contract Modification	Any written change in the terms of a contract.
Contracting Officer	A person with the authority to enter into, administer, or terminate contracts and make related determinations and findings. The term includes certain authorized representatives of the contracting officer acting within the limits of their authority as delegated by the contracting officer.
Contractor	A business unit.
Contractor Acquired Property	Property acquired or otherwise provided by the contractor for performing a contract and to which the Government has or takes title.
Contractor Furnished Material	Material provided by the contractor to which the Government has acquired a lien or title solely because of partial, advance or progress payments.
Contractor Purchasing System Review	The complete evaluation of a contractor's purchasing of material and services, subcontracting and subcontract management from development of the requirement through completion of subcontract performance.
Corrective Action	An action taken to correct a specific nonconformance by repair, rework, replacement or a change in requirements and the elimination of the causes to prevent recurrence.
Corrective Action Request	Any request to the contractor for the correction of a non-conformance.
Cost Analysis	The review and evaluation of the separate cost elements and proposed profit of an offeror's or contractor's proposal, including cost and pricing data or information other than cost or pricing data. This requires the application of judgment to determine how well the proposed costs represent what the cost of the contract should be, assuming reasonable economy and efficiency.
Cost or Pricing Data	All facts that prudent buyers and sellers would reasonably expect to significantly affect price negotiations. This concerns data as of the date of price agreement or, if applicable, another date agreed upon between the parties that is as close as possible to the date of agreement on price. Cost or pricing data is information requiring certification per FAR 15.408.
Deviation	Written authorization granted prior to the manufacture of an item, to depart from a particular performance or design requirement of a specification, or referenced document, for a specific number of units or specific period of time.

TERM	DEFINITION
Document	A medium and the information recorded on it that generally has permanence and can be read by a person or machine.
Effective Date	Effective date has one of the following meanings, based on the circumstances in which it is used: (1) For a solicitation amendment, change order or administrative change, the effective date will be the issue date of the amendment, change order or administrative change. (2) For a supplemental agreement, the effective date will be the date agreed upon by the contracting parties. (3) For a modification issued as a confirming notice of termination for the convenience of the Government, the effective date of the confirming notice will be the same as the effective date of the initial notice. (4) For a modification converting a termination for default to a termination for the convenience of the Government, the effective date will be the same as the effective date of the termination for default. (5) For a modification confirming the termination contracting officer's previous letter determination of the amount due in settlement of a contract termination for convenience, the effective date will be the same as the effective date of the previous letter determination.
Estimating System	A contractor's policies, procedures and practices for generating cost estimates which forecast costs based on currently available information. An estimating system includes the organizational structure; established lines of authority, duties and responsibilities; internal controls and managerial reviews; flow of work, coordination and communication; and estimating methods, techniques, accumulation of historical costs and analyses used to generate costs estimates and other data included in proposals.
Government Furnished Property	Property which the Government has possession of and provides to a contractor or directly acquires to provide to the contractor, including related data and information requested or furnished to the contractor that is reasonably required for the intended use of the property.
Growth Work	Any work that is identified after 100% Package Lock milestone and prior to avail completion that is related to a work item included in the original work package. Growth does not include pre-priced options or reservations that were specifically identified in the solicitation or defined package.
Indirect Appeal	Assertion by the subcontractor of the prime contractor's right to appeal or the prosecution of an appeal by the prime contractor on the

TERM	DEFINITION
	subcontractor's behalf.
Inspection	The act of measuring, examining, testing, gauging or otherwise comparing of supplies or services with requirements to determine conformity.
Inspection Record	Recorded data concerning inspection results.
International Organization for Standardization (ISO)	A worldwide federation of national standards bodies.
Lead Auditor or Team Leader	A person who is qualified to perform and designated to lead or manage a quality audit team.
Major Nonconformity (Method B)	A nonconformance that judgment and experience indicate could impair the performance or life of the product or result in hazardous or unsafe conditions for the user.
Minor Nonconformity (Method A)	A nonconformance or flaw that will probably not impair the performance or life of a product, nor result in unsafe conditions for the user (previously referred to as Method A corrective action).
NAVSEA Standard Item (NSI)	Those items written to describe procedures and general requirements for the Item performance of work to be accomplished under the job order. The Standard Specification for Ship Repair and Alteration Committee approves NSIs. NSI numbers are assigned in a 009-XX series.
New Work	Any additional work identified after 100% Package Lock milestone and prior to avail completion that is not related to a work item in the original work package.
Nonconformance	A departure of a quality characteristic from its intended level or state that occurs with a severity sufficient to cause an associated product or service not to meet a specification requirement.
Objective Quality Evidence (OQE)	Any statement of fact, either quantitative or qualitative, pertaining to quality of a product or service based on observations, measurements or tests that can be verified.
Observation	An action that occurs when one attribute is verified to one unit of product.
Preventive Action	An action taken to eliminate the causes of a potential nonconformity, or other undesirable situation, to prevent occurrence.
Process	A set of interrelated resources and activities that transform inputs into outputs with the aim of adding value.
Process Quality Audit	An analysis of elements of a process and appraisal of completeness, correctness of conditions and probable effectiveness.
Product Quality Audit	A quantitative assessment of conformance to required product

TERM	DEFINITION
	characteristics.
Products	The results of activities or services; a generic term that denotes goods or services.
Quality	The composite of all features and characteristics of a product or service that bear on its ability to satisfy given needs.
Quality Assurance	A planned and systematic pattern of all actions necessary to provide adequate (QA) confidence that the product or service conforms to established technical requirements.
Quality Audit	A systematic and independent examination to determine whether quality activities and related results comply with planned arrangements and whether these arrangements are implemented effectively and are suitable to achieve objectives.
Quality Management System	The organizational structure, responsibilities, procedures, processes and resources for implementing quality management.
Quality Management System Audit	A functional audit where a documented activity is performed to verify, by examination and evaluation of System objective evidence, that applicable elements of the quality management system are suitable and have been developed, documented and effectively implemented following specified requirements.
Record	A document that contains objective evidence that shows activities performed or results achieved.
Significant Estimating System Deficiency	A shortcoming in the estimating system which is likely to consistently result in proposal estimates for either total cost or a major cost element which are not an acceptable basis for negotiation of fair and reasonable prices.
Specification	The document that prescribes the requirements with which the product or service has to conform.
Subcontract	Any contract as defined in FAR Subpart 2.101 and entered into by a subcontractor to furnish supplies or services for performance of a prime contract or a subcontract. A subcontract includes but is not limited to purchase orders and changes and modifications to purchase orders.
Subcontractor	Any supplier, distributor, vendor or firm that furnishes supplies or services to or for a prime contractor or another subcontractor.
Submarines Only	All ships under the responsibility of Submarine Forces, Atlantic and Pacific Fleets. Includes all submarine classes (e.g., SSN, SSBN, SSGN) and supporting activities: ARDMs, ASs, and UUVs.
Supplemental Agreement	A contract modification that is accomplished by the mutual action of the parties.

TERM	DEFINITION
Surface Force Only	All ships under the responsibility of Naval Surface Forces, Atlantic and Pacific Fleets. Includes all surface ship classes and supporting activities that are NOT under the responsibility of Submarine Forces or Naval Air Forces (e.g., Aegis Ashore, CG, DDG, ESB, LCC, LCS, LHA, LHD, LPD, LSD, MCM).
Systemic or Critical Nonconformance (Method C or Method D)	A nonconformance related to system or critical failures that require a high level of management action.
Technical Data	Recorded information (regardless of the form or method of recording) of a scientific or technical nature (including computer databases and computer software documentation). This term does not include computer software or financial, administrative, cost or pricing, or management data or other information incidental to contract administration. The term includes recorded information of a scientific or technical nature that is included in computer databases. For these purposes, technical data includes the characteristic of a particular science, trade or profession.
Termination Contracting Officer	A contracting officer who is settling terminated contracts. A single contracting officer may be responsible for duties in any or all of these areas.
Testing	A means of determining the capability of an item to meet specified requirements by subjecting the item to a set of physical, chemical, environmental or operational actions and conditions.
Unilateral Modification	A contract modification that is signed only by the contracting officer.
(V)	A symbol inserted in a Work Item to establish a point in the sequence of accomplishment of work at which time the contractor must inspect or verify and document the inspection or test. (V) inspections require verification by the trade supervisor, inspector or qualified tradesperson.
Verification	The process of confirming by examination and provision of objective evidence that specified requirements have been fulfilled.
Waiver	A written authorization to use or release a quantity of material, components or stores already manufactured but not conforming to the specified requirements.
Waterline	The term “waterline” in this manual refers to where the hull of a ship meets the surface of water when afloat.
Work	a. Any action that actually or potentially changes (including disassembly for the purposes of inspection or repair) the approved configuration of any part, component or ship’s system.

TERM	DEFINITION
	b. Any action that removes or affects the ship's ability to operate ship's systems or components following ship's systems or operating manuals or reactor plant manuals. c. Any testing or inspections required to establish, maintain or reestablish certification. d. Any design, engineering, planning or configuration management functions that involve the final review or approval of technical information. Examples of work include the following: 1. Action which disassembles or removes any part, component or ship's system. 2. Action specified in a Technical Work Document. 3. Any action that removes or affects the ship's ability to operate ship's systems or components following ship's systems manuals, operating manuals or reactor plant manuals, excluding tagout per the Tagout User's Manual, including but not limited to: (a) Component or system tests. (b) Intrusive inspections (such as breaking the plane of electrical panels requiring electrical safety). (c) Valve line ups that alter the normal system line up not governed by operating procedures. (d) Removing valve hand wheels, disconnecting of reach rods.
Work Items	Work Items are work specifications that are prepared to accomplish repair or alteration work in ship repair. These items must be locally reviewed for applicability, quality and technical requirements and tailored to suit the specific work requirements.

1.1 CONTRACTED SHIP REPAIR FUNCTIONS AND TASKS OVERVIEW. This chapter provides an overview of the Regional Maintenance Center (RMC) functions, responsibilities, standards of conduct and organizational relationships.

1.2 CONTRACTED SHIP REPAIR FUNCTIONS AND TASKS.

1.2.1 Functions. This section outlines RMC responsibilities for ship repair and modernization work that is contracted to the private sector for accomplishment. These may include:

a. Performing functions of Procuring Contracting Officer (PCO) and Administrative Contracting Officer.

b. Developing specifications necessary to solicit contract proposals and bids for assigned PCO functions and Naval Sea (NAVSEA) Systems Command procurements.

c. Providing planning and estimating, workload forecasting and oversight for planned and unplanned availabilities.

d. Conducting engineering, technical and design oversight, evaluation and surveillance.

e. Performing engineering and design services in support of waterfront (emergent) technical issues.

f. Budgeting, administering and accounting for funds.

g. Providing management coordination and oversight of contracts to ensure requisite quality, schedule attendance and cost propriety.

h. Monitoring and evaluating integrated logistics support and procurement of Government Furnished Material.

1.2.2 Mission Tasks. Other mission tasks include the following:

a. Providing guidance to area Commanders and RMCs.

b. Ensuring a comprehensive security program.

c. Performing mobilization logistics planning.

d. Training Navy reserve units for mobilization requirements.

e. Administering facilities contracts covering Government-owned materials in private shipyards as assigned.

f. Administering real property and Navy facility leases as assigned.

g. Administering Government-owned drydocks leased to private shipyards as assigned.

h. Performing berthing and messing program administration during contract execution.

i. Executing civilian personnel services as assigned.

j. Performing planning responsibilities.

k. Performing Ship Availability Planning and Engineering Center Planning Activity responsibilities as assigned.

l. Providing Contracting Officer's Representative support.

m. Developing standard specifications.

n. Performing annual inspection on Navy ship memorials as assigned.

o. Provide oversight of demilitarization and stripping of ships programmed for disposal or for sale to private concerns.

1.2.3 Procurement and Contract Administrative Functions of the Regional Maintenance Center.

a. The RMC performs the functions of the PCO for purposes of placement of job orders under the Master Agreement for Repair and Alteration of Vessels, Master Ship Repair Agreement or the Agreement for Boat Repair as described in Chapter 3 of this Volume by sealed bidding, by negotiation, reference (a) or reference (b). The RMC also exercises the options under Private Sector Industrial Activity contracts and other contracts as assigned.

b. The RMC is responsible for performing all of the contract administration services listed in reference (c), sections 201 and 302, to the extent applicable to Master Ship Repair Agreement job orders, Private Sector Industrial Activity contracts and to other contracts assigned at commercial shipyards under RMC cognizance.

c. With respect to the administration of contracts other than shipbuilding, conversion and repair, the RMC will perform contract administration functions listed in reference (c), subparts 2 and 4, when requested by the PCO. When resources are not available to

perform such functions, the RMC will advise the activity awarding the contract which functions cannot be performed and why.

1.2.4 Relationship with Contractors.

a. In official transactions with contractors, the RMC Contracting Officer is the direct representative of the U.S. Government and Commander, Naval Sea Systems Command as Head of Contracting Agency. Therefore, contractors will address any correspondence on such matters directly to the RMC Contracting Officer who, if deemed advisable, may discuss it with or refer it to NAVSEA for resolution. When making referrals to NAVSEA, the RMC will include definitive recommendations for action. NAVSEA, after resolving referrals, should keep the RMC informed of the proposed resolution prior to initiating discussions with or instructions to the contractor.

b. The RMC must ensure that contractors are not given access to Navy files, even when requested under the Freedom of Information Act, unless approved by counsel. Neither should contractors be furnished copies of correspondence or included as an addressee on correspondence pertaining to a claim, controversial subject matter or any subject matter on which it may become necessary for the command to issue instructions or render decisions.

c. RMC personnel must exercise good judgment when originating constructive changes. This refers to any communication, other than a change order or formal contract modification, received by a contractor from a representative of the Government, or as an act of omission of the Government, that has the effect of requiring a contractor to perform work different from or in addition to that which the contract prescribes. When RMC correspondence is sent to a contractor that will have a significant impact on operations, progress payments, responsibility, etc., it must be signed by a contracting officer or an authorized representative, and a receipt must be obtained for mail or hand-carried delivery.

d. Contractual direction can be given only in writing by the PCO or Administrative Contracting Officer.

1.2.5 Standards of Conduct.

a. Congress has passed numerous ethics laws such as reference (d), part 2635. The Executive branch has published Government-wide regulations addressing the standards of ethical conduct expected of Government employees, both military and civilian. Reference (e) provides more stringent guidelines and regulations that are specifically imposed on personnel who represent the Government in business dealings with representatives of industry and occupy positions of trust and responsibility that require them to observe the highest ethical standards. Practices that may be acceptable in the private business world are not necessarily acceptable for naval personnel. Acceptance of favors, gratuities or entertainment may be a source of embarrassment to the Department of the Navy and to the naval personnel involved. These favors may affect the objective judgment of the recipient and may impair public confidence in the integrity of business relations between the Department and industry.

b. No person must place himself or herself in a position in which conflict of interests might arise or might justifiably be suspected. Such a conflict might entail gratuities, entertainment of any kind or any other action that could influence or be reasonably interpreted as influencing the strict impartiality that must prevail in all business relationships involving the public interest. Favors, gratuities or entertainment bestowed upon members of the immediate household of naval personnel must be considered in the same light as those bestowed upon Navy personnel.

c. All personnel must exercise special diligence to prevent fraud, collusion, larceny, embezzlement or other improper conduct within the area of their responsibilities and must report immediately to the RMC any instance of fraud or other improper conduct they observe or suspect.

d. The RMC Commanding Officer, by means of a local instruction, must provide each of his personnel with the policy and procedures issued by the Department of War (DoW), Secretary of the Navy, and NAVSEA with respect to standards of conduct, and must establish a plan of action that institutes measures to minimize the possibility of improper conduct.

1.2.6 Fraudulent Violations or Irregularities.

a. References (f) article 1115 and (g) require Navy personnel, both military and civilian, who have any reason to suspect or have knowledge of any fraud in connection with Government procurement, to report it immediately to proper authority. Since many RMC personnel are in close contact with contractors, RMC Commanding Officers must ensure all personnel are familiar with these directives and understand that violations may be cause for appropriate disciplinary action that may include fines, imprisonment.

b. RMCs must develop and execute a plan to minimize the potential for misconduct. In formulating the plan, the following must be considered:

(1) Increasing visits to Government personnel at remote contractors' sites through unscheduled inspections of specific operations by military or civilian supervisors.

(2) Reducing tour length of Government personnel at remote sites.

(3) Requiring that preparation of a specification and inspection or acceptance of work under that specification be performed by different individuals.

(4) Auditing work authorized on-site for actual completion.

(5) Auditing accepted work for conformance to specifications.

(6) Auditing Government property administrator's decision on scrap, repairable items and mandatory returnable items.

(7) Auditing scrap materials sold to the contractors by Government property administrators to ensure that it is scrap.

(8) Being alert for signs of affluence not commensurate with economic status of Government employees.

(9) Providing for the personal attention of the RMC and first line supervision in order to indicate a command requirement for absolute adherence to the Standards of Conduct.

(10) Being observant for possible falsification of inspection records.

1.3 ORGANIZATIONAL RELATIONSHIPS FOR VESSEL MODERNIZATION, OVERHAUL, REPAIR AND MAINTENANCE CONTRACTING.

1.3.1 General. The following sections discuss the basic responsibilities of Navy and other activities as they affect the operations and functions of the contracting process and the relative position of the RMC in this organization.

1.3.2 Chief of Naval Operations.

a. The Chief of Naval Operations (CNO) is responsible to the Secretary of the Navy for the readiness, use and logistics support of all U.S. Naval Forces. As the military chief of the Navy, the CNO is the principal advisor to the Secretary of the Navy and the executive branch of the Government on naval military matters. The CNO formulates detailed strategic plans to carry out the missions assigned to the Navy. These strategic plans generate broad logistics requirements that are assigned to the several Systems Commands (SYSCOM) and offices for further implementation. In this manner, the CNO justifies and supports requests to Congress for the necessary funds to carry out specific ship modernization, repair and maintenance programs. Acting in staff capacity in the office of CNO, the Ships Characteristics Improvement Panel, which supports the Resources and Requirements Review Board, determines the characteristics of the ships which the Navy's military missions demand. These characteristics are subsequently translated into requirements that are then assigned to NAVSEA for action. After assignment to NAVSEA, proposed changes to operational requirements (military characteristics) through conversion or modernization must be approved by the CNO.

b. The CNO ship maintenance and repair policy is provided in reference (h). Policies and procedures for maintenance of ships and modernization are established in reference (i), Volumes I and II. Further information on the Navy Modernization Process (NMP) is contained in Volume VI, Chapters 3 and 36 of this manual. In establishing Navy policy for Fleet maintenance and modernization and budgeting and scheduling for ship repair and modernization availabilities, the CNO is assisted by an operating staff in the Office of Naval Operations. The Office of Naval Operations staff includes specific ship type and logistics support sponsors who consolidate budget submissions from the Fleet and assist in the overall development and administration of the Navy's maintenance and modernization budget. The platform sponsors are major participants in the development of the NMP. In the case of repair and modernization, the CNO has retained approval authority for:

(1) Establishing modernization and repair availability schedules and major changes to those schedules.

(2) Determining military characteristics of ships and of alterations that affect these military characteristics.

1.3.3 Systems Commands.

a. To provide support for the operating Fleet, the Navy has established five SYSCOMs with specific support responsibilities. These SYSCOMs are:

(1) Naval Sea Systems Command (NAVSEASYSCOM or NAVSEA).

(2) Naval Air Systems Command (NAVAIRSYSCOM).

(3) Naval Information Warfare Systems Command (NAVWARSYSCOM).

(4) Naval Supply Systems Command (NAVSUPSYSCOM).

(5) Naval Facilities Engineering Systems Command (NAVFACSYSCOM).

b. The Navy SYSCOMs establish technical requirements and meet logistics, maintenance and support requirements of Fleet Commanders in the area of new construction and ship maintenance. In addition, these SYSCOMs provide technical requirements for maintenance and conduct analyses to determine the proper balance between design improvement and logistics support to achieve the required operational availability.

1.3.4 Naval Sea Systems Command.

a. For procurement purposes, Commander, Naval Sea Systems Command (COMNAVSEA) is Head of Contracting Agency with delegated authority in the Federal Acquisition Regulation to enter into and administer contracts for materials and services for which the Commander is responsible. COMNAVSEA, in turn, has delegated this authority to the Deputy Commander for Contracts (NAVSEA 02). Delegation of authority to the RMC Contracts Department Head is addressed in the NAVSEA Contracts Handbook and in subsequent chapters of this volume. Only COMNAVSEA and individuals designated by NAVSEA 02 who are duly authorized and acting within the limits of their written delegated authority can commit the Government to any contractual action.

b. Specific NAVSEA mission functions include the provision of material support to the Navy and Marine Corps for ships and craft, shipboard weapons systems and components, ammunition, guided missiles, mines, torpedoes and all other surface and underwater ordnance expendables. Material support encompasses the complete life cycle from research and design through sustained technical direction and acquisition in support of Fleet readiness. These responsibilities include ships, submersibles and other sea platforms, except service craft assigned to the NAVFACSYSCOM and ships administratively assigned to the Military Sealift Command.

c. As the agent of the CNO, NAVSEA maintains the Maintenance and Modernization IT Systems and develops documentation for all authorized alterations. NAVSEA also authorizes and funds all program alterations not authorized and funded by the cognizant Type Commander (TYCOM). The maintenance, repair and modernization of ships, submarines, craft and boats assigned to the operating forces may be carried out by assignment of work to Naval Shipyards (NSY) or by procurement of services and material from private industry through the RMCs or Supervisors of Shipbuilding, Conversion and Repair, USN (SUPSHIP).

d. Under the CNO, NAVSEASYSCOM's basic mission as related to ship modernization, repair and maintenance is to provide acquisition, engineering, logistic and material support for the Navy. As the technical and engineering authority for ships of the Navy, NAVSEA, in support of the designated Program Executive Office (PEO), is responsible for the life cycle management of Navy ships, submarines, craft and boats, including the following:

(1) Developing Maintenance Plans for each ship class.

(2) Supporting Fleet Maintenance Officers in scheduling ships for availabilities.

(3) Managing alteration development and executing the NMP.

(4) Providing acquisition, engineering and technical authority, Occupational Safety and Health, environmental support, and Contract Administration Quality Assurance Program assistance to the Fleet Maintenance Officers and RMCs.

(5) Operation of the NSYs, SUPSHIP, and RMC Contracting Offices.

e. NAVSEA provides direct support to the PEOs who report directly to Assistant Secretary of the Navy (Research, Development and Acquisition) (ASN (RD&A)).

f. Developing, validating and maintaining Organizational, Intermediate and Depot-level maintenance requirements and tasks in the Planned Maintenance System.

1.3.5 Program Executive Office Program Offices. The Navy Acquisition Executive Responsibilities assigned to the ASN (RD&A) are contained in references (j) and (k) and include supervision of the SYSCOM Commanders (NAVSEA) and PEOs relative to Research, Development and Acquisition matters. In most cases, PEOs function in matrix type organizational structures with reporting responsibilities to both ASN (RD&A) and the Commanders of the respective SYSCOMs. The PEOs are tasked with acquisition and life cycle management of their assigned programs. Within the PEO organizational structure are the Program Management Offices that report directly to the PEO. Within each program office, an individual manager is assigned as the Ship Program Manager and is responsible for a specific ship class. The Ship Program Managers provide centralized management for assigned ship classes. This assignment may be for ship conversion, modernization, repair or life cycle maintenance.

1.3.6 Industrial Operations Directorate (SEA 04). The consolidation of the Fleet Logistics Support Directorate (SEA 04) and the Regional Maintenance and Industrial Operations Directorate (SEA 07) as well as several functions of other NAVSEA Directorates into the Logistics, Maintenance and Industrial Operations Directorate (SEA 04), was designed to strengthen and improve important headquarters functions. The organization is constituted to closely support the requirements and functions of the Deputy Chief of Naval Operations (Logistics) (N4) and Fleet Maintenance Officers as customers. The Directorate will develop policy and infrastructure associated with ship maintenance, logistics support, environmental and safety programs and related efforts.

1.3.7 The Atlantic and Pacific Fleets. The Commander, United States Fleet Forces Command and the Commander, Pacific Fleet are responsible for the readiness condition of their assigned ships. The Commanders must balance the competing needs of the operational Fleets with the

need for maintenance and modernization of the Fleet. Ships and craft under their cognizance comprise the largest portion of the repair and overhaul workload. Fleet Commanders, through their respective Fleet Maintenance Officers, are responsible for the budgeting, scheduling and execution of CNO-scheduled ship maintenance and modernization availabilities plus emergent maintenance requirements. Fleet Commanders and COMNAVSEA are actively developing new ship maintenance procedures and processes, and initiatives that are being integrated into this manual that support the concept of Continuous Maintenance. The Fleet Commanders determine ship deployment schedules and, within guidelines published by the CNO, approve changes in scheduled maintenance availability dates for their assigned ships. Through the respective TYCOMs, the Fleet Commanders provide funding for advance planning and execution of scheduled ship maintenance availabilities. In the area of new construction, Fleet activities provide input to the development of ship characteristics and become involved in final trials, delivery, Post Shakedown Availabilities and guarantee periods of newly delivered ships.

1.3.8 Type Commanders.

a. TYCOMs and RMCs are responsible for budgeting to support modernization, repair and maintenance availabilities and for the material readiness and training of their assigned ships. Under guidelines established by the CNO and Fleet Commanders, the TYCOMs and RMC manage funds for advance planning for repairs and some selected alterations, and execution of the availabilities. Within guidelines established by the CNO and Fleet Commanders, the TYCOMs in concert with the numbered Fleet Commanders (Commander, Second Fleet, Commander, Third Fleet, etc.) schedule ships for deployment and other operational assignments. In this regard, the TYCOM is one of the most important activities involved in scheduling ship repair planning activities that directly involve the ship or the ship's crew.

b. TYCOMs provide advanced planning funding to the respective ships Maintenance Team for availability planning. After the availability work package has been identified and documented, the TYCOM provides funding for accomplishment of repairs and some of the alterations. The Ashore Ships Maintenance Manager, working with their respective Maintenance Team, is responsible for management of all TYCOM advance planning and works closely with the contract administrative team to execute the terms and conditions of contracts for their assigned ship(s). The CNO has delegated authority to RMC COs to assign unscheduled availabilities for ships under their cognizance. In support of new construction, TYCOMs have a primary mission to provide input to the development of ship characteristics and become involved in trials, delivery and guarantee periods of newly delivered ships as outlined in Volume I of this manual.

1.3.9 Naval Shipyards. The NSYs are operated by Commander, Naval Sea Systems Command and report directly to NAVSEA 04 for business and technical matters. The NSYs are strategic industrial assets with mobilization responsibilities. They maintain core ship conversion, modernization and repair industrial capabilities to support national strategies for forward force projection. The core capabilities include extensive nuclear and non-nuclear ship engineering disciplines, nuclear and non-nuclear repair and productive capabilities.

1.3.10 U.S. Ship Repair Facility, Yokosuka, Japan. This U.S. Navy managed repair facility is manned by U.S. military and civilian personnel along with Japanese employees. It has the same

basic industrial capabilities as naval shipyards except that there are no nuclear maintenance capabilities.

1.3.11 User Commands or Activities (Users). Per reference (l), the CNO assigns service craft and boats to Users. These crafts and boats are maintained and overhauled from funds granted by Support Commanders to their subordinate activities that are the Users. Service craft and boats under the cognizance of the Users comprise a portion of the RMC repair and overhaul workload. For example, Naval Station Port Operations are assigned service craft that support home ported or visiting ships.

1.3.12 Naval Inactive Ship Maintenance Facilities. The RMC may be required to support the inactivation of ships scheduled for retention at Inactive Ship Maintenance Facilities. The work involved is the effort that is beyond the capability of Ship's Force and includes such tasks as hull blanking, gas freeing of tanks, hydro-blasting Collection, Holding and Transfer systems and towing preparations. The TYCOM normally authorizes the work and NAVSEA funds such work. In some cases, inactive ships may be reactivated for delivery to foreign Governments through the Foreign Military Sales Program. This work is normally authorized and funded by NAVSEA or higher authority.

1.3.13 Naval Reserve Force Vessels. Ships assigned for training Naval Reserve Force personnel comprise a portion of the RMC workload. The TYCOM, who has cognizance over these ships, authorizes and funds the repair and overhaul work.

1.3.14 Defense Finance and Accounting Service Offices. Accounting and disbursing operations in the continental United States and Hawaii are consolidated at designated Defense Finance and Accounting Service Centers and Operating Locations. All contracts, agreements and orders citing Navy appropriations and funds paid by Defense Finance and Accounting Service disbursing offices will show the appropriate paying office.

1.3.15 Defense Contract Audit Agency.

a. Contract auditing is a function of Defense Contract Audit Agency (DCAA). The DCAA has subordinate field offices including district or regional, branch, procurement liaison, contractor residency and contract audit coordination offices. The DCAA office performs these basic functions:

   (1) Advising on the allowance of costs under cost-reimbursement-type contracts.

   (2) Providing, as a minimum, quarterly advisory audit reports to assist in pricing actions under all types of contracts.

   (3) Validates the contractor's finances and accounting system that is used by the RMC's Contracts Department to establish forward pricing rates.

   (4) Performs financial capability audits when requested by the Contracting Office.

   (5) Conduct floor audits to validate personnel assignments to work sites.

b. DCAA auditors render assistance in connection with payments, termination settlement proposals, adjudication of claims and pricing of certain negotiated changes. The DCAA plays an important role in the award and administration of contracts; however, this role is that of an advisor to the RMC Contracts Department Head, with RMC retaining responsibility for subsequent contractual actions. The RMC has full

responsibility for contract administration and must make final decisions regarding advice provided by DCAA. Any departure from DCAA recommendations must be fully justified.

1.3.16 Defense Contract Management Agency Components.

a. Within an assigned area, a DoW Contract Administration Service component is responsible for the field administration of all contracts placed by DoW activities. Reference (c), section 203, identifies all Defense Contract Management Agency and other agency components engaged in the performance of contract administration services, together with their geographic or plant cognizance assignments, and the services they perform. The directory can be accessed electronically via the World Wide Web.

b. The RMC may be required to perform certain contract administration functions, such as performance of quality assurance, source inspection, etc., at a subcontractor's plant under the cognizance of another Defense Contract Management Agency component. These services are requested per reference (c), subpart 2.

c. In vessel acquisition procurements, the Defense Contract Management Agency Component usually is responsible for:

(1) Administering DoW contracts for components to be provided as Government Furnished Material to vessel acquisition contractors.

(2) Performing source inspection, progressing and expediting actions in connection with Government Furnished Material services and technical data.

(3) Acting as disposal officer in the sale of terminal inventories.

1.3.17 General Accounting Office. The General Accounting Office (GAO), although not a part of the Navy, is involved with Navy fiscal and contract matters. The GAO is entirely separate from the executive branch of the Government and acts as the agent of Congress in investigating all matters relating to Government procurement. Representatives of GAO make periodic visits to maintenance related activities. All communications to GAO on matters involving contracts will be processed per references (m) and (n).

1.3.18 Naval Reactors Representatives. A representative of the U.S. Department of Energy, entitled "Naval Reactors Representative", is assigned to each shipyard performing naval nuclear propulsion plant work. The Naval Reactors Representative reports to the Director, Division of Naval Reactors and Department of Energy. The representative performs an independent review and surveillance of all shipyard work relating to naval nuclear propulsion matters. The representative has free access to all elements of the shipyard and the RMC office that deals directly or indirectly with naval nuclear propulsion. The representative's review and surveillance does not detract from, change or diminish the existing responsibility of any shipyard or RMC officials. The Naval Reactors Representative is provided suitable and sufficient office space in the shipyard and other administrative support to carry out assigned functions.

1.3.19 Foreign Governments. RMCs may interact with foreign Governments, when requested by the CNO or NAVSEA, to procure commercial repair work to:

a. Recondition and otherwise repair Navy ships that are to be, or have been, transferred to foreign Governments.

b. Effect emergency voyage repairs or other services for vessels of foreign Governments, when approved by CNO.

1.3.20 Private Companies - Demilitarizing and Stripping. The RMC may be required to arrange for the demilitarization and stripping of ships that are programmed for disposal or for sale to private concerns. In the case of ships programmed for disposal, these functions, when not performed by the activity having cognizance of the vessel, are carried out by the responsible RMC. When the ships are sold to private concerns, the work will be performed by the purchasing contractor as a condition of sale. In these cases, the RMC will be requested to provide surveillance over the work to ensure its proper performance. Of particular concern is the compliance with Environmental Protection Agency rules and regulations where there is potential for environmental impacts resulting from work associated with disposal action.

LISTING OF APPENDICES.

A Memorandum of Understanding Between NAVSEA and NAVSUP of August 2004
B Basic Acquisition Process

2.1 PURPOSE. This chapter provides an overview of contracts and contract administration as it applies to Navy ship repair and modernization work. It is specifically intended to provide an understanding of these processes to non-contracting personnel and should not be used as a reference for contractual actions undertaken by Procuring or Administrative Contracting Officers (ACO).

2.2 OVERVIEW OF THE FEDERAL ACQUISITION PROCESS.

2.2.1 Procurement from Private or Government Sources.

a. Once it is determined that an agency is authorized to undertake certain activities, it must then be determined what the appropriate way for the agency to accomplish its particular objectives is. The authority of the agency to use contractual agreements with private sources in carrying out authorized programs is generally assumed in the absence of express statutory prohibitions or limitations. In some instances, it may be more efficient and economical for an agency to use its own employees or requisition its needs from another agency in a position to supply those needs.

b. Executive agencies have traditionally enjoyed broad discretion to achieve their objectives using Government employees or by contract with the private sector. Because of concerns that Government competition with private enterprise is inappropriate, the executive branch has an express policy that the Government should rely on the private sector to the greatest extent possible.

2.2.2 Contracting Techniques. Executive agencies generally have wide latitude in selecting the methods for awarding contracts, as well as the terms and conditions to be included. The contracting parties must be aware of the large number of statutes and regulations giving specific guidance on the techniques to be followed in entering into most Government contracts. Contracting Officers are expected to adhere to such statutes and regulations and, in most instances, the validity of contracts can be affected if they are not followed.

2.2.3 General Procurement Statutes. Congress has enacted two principal statutes establishing procedures for awarding Government contracts. The two statutes are the Armed Services Procurement Act of 1947 and the Federal Property and Administrative Services Act of 1949. These two Acts have governed the federal procurement process. They were revised by the Competition in Contracting Act of 1984, the Small Business and Federal Procurement Competition Enhancement Act of 1984, the Defense Procurement Reform Act of 1984, among other Acts. The Armed Services Procurement Act applied to purchases of the Army, Navy, Marine Corps, Air Force, Coast Guard and the National Aeronautics and Space Administration. The Federal Property and Administrative Services Act applied to purchases of the General Services Administration and other executive agencies except those covered by the Armed Services Procurement Act.

2.2.4 Procurement Regulations.

a. Regulations issued by the various executive agencies contain detailed guidance as to both procedures for award and terms and conditions of contracts. The Federal Acquisition Regulations (FAR) replaced the Federal Procurement Regulation, the Defense Acquisition Regulation and the National Aeronautics and Space Administration Procurement Regulation. The chief goal of the FAR is to bring greater simplification and uniformity to the complex body of federal procurement regulations.

b. While the policy concerning Government contracts is formulated and implemented largely within the executive agencies that enter into these contracts, such activity is also directly affected by pronouncements issued by the President and the Office of Federal Procurement Policy (OFPP). The President issues executive orders that authorize and require the use of clauses implementing various social and economic programs. As the paramount regulations in the executive branch, these orders must be complied with by the executive agencies. The Office of Management and Budget

periodically issues circulars that embody executive policy and may be directed to regulating contracting activities. As regulations emanating from the Office of the President, Office of Management and Budget circulars have a status in the hierarchy of executive regulations above the procurement regulations issued by the agencies. The OFPP was created for the purpose of providing overall direction to federal procurement policy. The OFPP has the responsibility for formulating and implementing a uniform federal procurement system that consists of a single FAR and agency regulations limited to those necessary to implement or supplement the FAR. In addition, it granted the Administrator of the OFPP, with the concurrence of the Director of Office of Management and Budget, the authority to "issue policy directives for the purpose of promoting the development and implementation of the uniform procurement system."

c. The procurement regulations and directives of major interest to contractual and technical personnel of the field office are briefly described. Specific regulations, directives and other procurement publications are also referenced throughout the text.

2.2.4.1 Federal Acquisition Regulation. The FAR is the primary regulation for use by all Federal Executive agencies in their acquisition of supplies and services. The FAR precludes agency acquisition regulations that unnecessarily repeat, paraphrase or otherwise restate the FAR and limits agency acquisition regulations to those necessary to implement FAR policies and procedures within an agency. The FAR provides for coordination, simplicity and uniformity in the Federal acquisition process. The FAR can be electronically accessed at https://www.acquisition.gov/far/.

2.2.4.2 Department of Defense Federal Acquisition Regulation Supplement. The Defense Federal Acquisition Regulation Supplement (DFARS) is issued by the Secretary of Defense and establishes uniform policies and procedures that implement and supplement the FAR for Department of War (DoW). The DFARS contains guidance and direction to DoW personnel as to which provisions, clauses, cost principles and cost accounting standards are authorized for DoW contracts and what other procedures and actions must be followed in awarding and administering DoW contracts. The DFARS contains material that implements the FAR, as well as supplementary material that is unique to the DoW. This supplement is not a stand-alone document and must be read in conjunction with the FAR. The DFARS can be electronically accessed at http://www.acq.osd.mil/dpap/dars/.

2.2.4.3 Navy Marine Corp Acquisition Regulation Supplement. The Navy Marine Corp Acquisition Regulation Supplement (NMCARS) implements and supplements the FAR and the DFARS and establishes uniform policies and procedures for the acquisition of supplies and services for the Department of the Navy. The NMCARS is not a stand-alone document and must be read in conjunction with the FAR and DFARS. The NMCARS can be electronically accessed at https://www.acquisition.gov/nmcars.

2.2.4.4 NAVSEA Contracts Handbook. The NAVSEA Contracts Handbook (NCH) is the Naval Sea Systems Command (NAVSEA) supplement to the FAR, DFARS, NMCARS and other acquisition policy and procedures for contracts, other transactions, cooperative agreements and grants. The NCH is not a stand-alone document. The NCH is authorized by reference (a), part 5201. The NCH applies to NAVSEA Headquarters, Program Executive Officers and NAVSEA field organizations and representatives including the Regional Maintenance Center (RMC)

Contracts Department Head and warranted Contracting Officers, for which Commander, Naval Sea Systems Command (COMNAVSEA) is the Head of Contracting Activity (HCA). In the event of a conflict, the FAR, DFARS or NMCARS must take precedence over the NCH. Additionally, the NCH takes precedence over the guidance provided in this manual on contractual matters. The NAVSEA Contract Policy Office (NAVSEA 021) maintains the NCH and issues changes as required. Requests for deviations from the NCH must be submitted to NAVSEA 02B via NAVSEA 021.

2.2.4.5 Other Navy Publications. Although the NMCARS is the basic procurement publication issued at the Navy departmental level, procedures are further refined in directives, instructions, notices and other publications issued by direction of the Secretary of the Navy. Distribution of these publications may differ from the distribution of the NMCARS because of security considerations and other reasons. Accordingly, they are generally not made available to organizations outside the Government.

2.2.4.6 Command Publications. Subject to the provisions of references (b), subparts 1.3 and 1.4, procuring activities may issue procurement and related directives, instructions and other publications to implement and supplement FAR, NMCARS and other departmental publications. Each Command issues directives, instructions, notices and other publications that are necessary for the efficient performance of procurement operations.

2.2.4.7 Joint Fleet Maintenance Manual Relationship to Other Directives.

a. This volume is issued per Memorandum of Understanding (MOU) between Commander, United States Fleet Forces Command, Commander, Pacific Fleet, Commander, Fleet Logistics Centers, Commander, Naval Supply Systems Command and COMNAVSEA. Additionally, reference (a), part 5201, permits procuring activities to issue directives, instructions and other publications to supplement the FAR, DFARS, NMCARS, NCH and other Navy instructions.

b. To the extent that a policy or a procedure is not addressed by the FAR, DFARS, NMCARS, NCH or other Navy and DoW Instructions, this manual provides the NAVSEA, United States Fleet Forces Command and Pacific Fleet policy and procedures concerning the contracting processes that are to be used by individual RMCs and Supervisors of Shipbuilding for procurement or administration of contracts for the conversion, modernization, repair and maintenance of ships, submarines, boats and craft, that are assigned to the respective RMC or Supervisor of Shipbuilding as the Naval Supervisory Authority (NSA). Where a policy or requirement is not established by FAR, DFARS, NMCARS, NCH or other Navy and DoW directives, this manual contains the procedural requirements for compliance. Otherwise, the FAR, DFARS, NMCARS, NCH and other Navy and DoW Directives take precedence over this manual. When a new or revised policy or requirement is issued by FAR, DFARS, NMCARS, NCH or other Navy and DoW Directives that are not consistent with this manual, the new or revised policy and requirements must be followed. Material required to be submitted to higher authority by the NMCARS or NCH must be forwarded via the RMC Contracts Department Head or Chief of the Contracting Office at Supervisor of Shipbuilding to NAVSEA 02.

c. Appendix A definitized the alignment of contracting responsibility among their subordinate commands.

2.2.4.8 Field Instructions and Notices. Each RMC is authorized to issue instructions and notices pertaining to contracting procedures that govern the internal operations of the office. Instructions may be issued to establish or explain organization, policy and procedures affecting more than one department of the RMC office and may remain in effect up to seven years. Notices may be issued to provide information of temporary interest and application to more than one department of the office. Each notice must state its period of effectiveness up to a period of one year.

2.2.4.9 Waiver of Regulations and Directives. Reference (c), subpart 201.4, identifies policy for submitting requests for deviation from the FAR and reference (d) identifies policy for implementation of the Waiver and Reinvention Laboratory Programs within NAVSEA. Fleet personnel are encouraged to identify any regulation, directive, policy or procedure that can be modified, waived or eliminated in improving or streamlining business operations.

2.2.4.10 Impact of Statutes and Regulations. Regulations are issued by many offices in the agencies of the executive branch. There is frequently a substantial question as to their legal effect. When a board or court rules that a regulation is legally binding on either a contractor or the Government, that regulation is characterized as having the "force and effect of law". In such cases, the regulation is treated in the same manner as a statute. Generally, regulations must have the force and effect of law if they are published pursuant to specific statutory authority or formulated to implement a fundamental procurement policy and are appropriately published. RMCs should obtain the assistance of legal counsel in all such matters.

2.3 BUDGET, APPROPRIATIONS AND ALLOCATION PROCESS. In order for any contract with the Government to be enforceable, it must comply with certain legal requirements that apply to all Federal Government contracts.

2.3.1 Constitutional Authority. The Federal Government must be authorized by the Constitution to engage in the activity that is the subject of a contract.

2.3.2 Statutory Authorization. Before a contract can be entered into, there must be statutory authorization for the work being performed. Most agencies have a continuing grant of general authority to work in designated areas as a part of their basic mission. The Constitution also provides that "No money must be drawn from the Treasury, but in consequence of appropriations made by law". Using this constitutional authority, Congress has prohibited the executive branch from entering into contracts prior to the appropriation of funds or in greater amounts than contained in appropriations.

2.3.3 Budget Authority.

a. Budget authority may be provided either in the form of an appropriation act or by a grant of contract authority. Contract authority is permitted by the last phrase of reference (e) and may be found in specific language in statutes authorizing programs and permitting the contracts prior to the passage of an appropriation act. Most contracting actions of the Federal Government are not based on contract authority and absence of appropriation legislation will result in the contract not being enforceable against the Government. Leases made for periods longer than that covered by

appropriated funds, and contracts made for amounts greater than appropriations, are not binding on the Government.

b. In some cases, the executive agencies enter into agreements with contractors in advance of or in excess of appropriations, making the Government's obligation contingent on the passage of an appropriation. Since such agreements are not binding obligations of the Government until the passage of the appropriation, they do not violate the restrictions of reference (d).

2.3.4 Authorization of Appropriations.

a. Prior to the passage of an appropriation act, funds for agency programs are usually "authorized" by special "authorization acts," which annually fund programs with dollar limitations. By the process of authorization legislation, the congressional committees with legislative jurisdiction over the agency conduct their initial review of the scope of agency programs and decide on the amount of funds that should be provided. This assures that these committees retain their prerogatives of control over the programs under their jurisdictions, and limits the appropriations committees to providing funds up to but not exceeding the authorized amounts. Since the authorization process is a working rule of Congress, it would seem that an appropriation, even without the required authorization, would provide the necessary authority to enter into contracts. The courts have held, however, that an appropriation is not valid if there has been no authorization legislation because Congress may not legislate through appropriations laws. Authorization may also be in the form of provisions in the general legislation of the agency authorizing expenditures up to specified limits for designated programs.

b. The legislative committees also retain control of this area in cases where "contract authority" is contained in the statute authorizing the undertaking of a program. In such cases, there is no process for review of the matter by the appropriations committees, yet the agency is authorized to enter into contracts. Of course, subsequent appropriations are necessary before the contractor can be paid, but it is assumed that such appropriations must be forthcoming without contest.

2.4 CONTRACTS. A contract is an agreement between two or more parties that is enforceable by law. It may be agreed to either orally or in writing either as bilateral (two promises) or unilateral (promise for an act or forbearance of an act). Reference (f) contains a specific definition of a contract.

2.4.1 Types of Contracts. The Government enters into many types of contracts. Reference (e), section 1535, lists the factors to consider when making a determination of what contract type best suits the specific procurement. In addition, Appendix A definitizes the contract authority for each activity's subordinate commands. Reference (e), section 1535, authorizes the use of various basic types of contracts (e.g., fixed-price, cost-reimbursement, etc.). Of these, the following are most commonly used by NAVSEA and RMCs for repair and modernization work:

a. Firm Fixed Price (FFP).

b. Fixed Price Incentive.

c. Cost Plus Incentive Fee.

d. Cost Plus Award Fee.

e. Cost Plus Fixed Fee.

f. Indefinite Delivery Type Contracts.

g. Federal Acquisition Regulations also authorizes the use of any combination of the approved contract types. A fixed-price-award-fee contract may also be used when appropriate.

2.4.2 Contract Selection. The Government's cost of an acquisition can be influenced substantially by the type of contract selected and the manner in which the contract is administered. Contract type and administrative practices can substantially influence quality and delivery. For the contractor, the improper use of contract types can result in financial setbacks or excessive profit.

2.4.2.1 Fixed Price Contracts. Fixed Price (FP) contracts usually stipulate a firm price. Under some circumstances, it may leave portions of the price open and provide for a later adjustment. The degree of risk assumed by the contractor shifts from the contractor to the Government when any variation of the FP type contract is used other than the FFP. In an FFP contract, the contractor bears the entire risk of both cost and performance. In the FP contract with economic price adjustment, the contractor bears all cost risks except that portion which is covered by the adjustment provisions. A Fixed Price Incentive contract provides for adjusting profit and establishing the final contract price by a formula based on the relationship of final negotiated total cost to total target cost, with the contractor bearing any costs in excess of ceiling price.

2.4.2.1.1 Administration. Market conditions cause contractors to submit bids well under what the work can reasonably be expected to cost in order to be the successful bidder. This "buy in" situation causes the winning contractor to aggressively seek every opportunity for contract growth and claims, and often at significantly higher cost than would normally be expected. The pre-award survey, reference (g), should screen out bids from contractors that are not responsible, meaning the contractor does not possess the managerial, financial and technical or facilities capabilities and capacities to comply with the terms and conditions of the contract. Non-responsive contractors are those that do not respond to the Invitation For Bid (IFB) in a timely manner or address the specific items of the contract in their bids. Contractors who do not have the capabilities required should not be awarded FFP contracts.

2.4.2.2 Cost Reimbursement Type Contracts.

a. Cost reimbursement contracts, discussed in reference (h) are used when the estimate of costs is as reasonable as the circumstances permit, but because of the magnitude of uncertainties involved in the procurement, the risk is too great to expect a contractor to accept a FP arrangement of any type. In the Cost Plus Fixed Fee type, the Government agrees to pay all allowable costs that are incurred under the contract, plus a fixed-dollar amount of fee. A Cost Plus Incentive Fee type contract provides for an initially negotiated fee to be adjusted later by a formula based on the relationship of total allowable costs to total target costs. Under the Cost Plus Award Fee, the allowable costs are paid plus a fee. The fee typically consists of two parts, a fixed amount that does not vary with performance, and an award amount. The award amount is based upon a subjective evaluation of contractor performance by the Government, judged in light of criteria set forth in the contract. The criteria and rating

plan should be tailored to the specific procurement in order to provide the most positive way to motivate a contractor toward improved performance.

b. In a cost reimbursement type contract actual cost, plus fee, equals price.

2.4.3 Time and Materials Contract. This contracting method provides for payment to the contractor of direct labor hours at specified fixed hourly rates that include wages, overhead, general and administrative expenses and profit and materials at cost. A labor-hour contract is a variation of the time and material contract, differing only in that materials are not supplied by the contractor.

2.4.4 Indefinite-Delivery Indefinite-Quantity Contracts. These contracts are used when there is a recurring demand for an item and the timing and extent of demand cannot be determined at the time of award. The contract establishes all terms and conditions except those to be included in orders issued there under.

2.4.5 Letter Contracts. Letter contracts are used to authorize urgent work when work must be started immediately and negotiating a definitive contract is not possible in sufficient time to meet the requirement.

2.4.6 Basic Agreements. Basic agreements are umbrella-type arrangements to affect time-savings for recurring requirements. While they are not contracts, they establish ground rules for the required and applicable clauses that must be incorporated in contracts at future dates. The Master Ship Repair Agreement and Agreement for Boat Repair are examples of agreements and are discussed in Chapter 4 of this volume.

2.4.7 Basic Ordering Agreements. Basic Ordering Agreements (BOA) resemble the basic agreement. They go further by including a description of the supplies and services to be ordered and provide methods for pricing, issuing and determining future orders under the basic ordering agreement.

2.4.7.1 Description. A BOA is a written instrument of understanding, negotiated between an agency, contracting activity or contracting office and a contractor, that contains terms and clauses applying to future contracts between the parties during its term, a specific description of supplies or services to be provided, and methods for pricing, issuing and delivering future orders under the BOA. A BOA is not a contract.

2.4.7.2 Background. BOAs may be used to accomplish procurement for research and development, studies, services and shipbuilding post shakedown availabilities and hardware. Formal current internal instructions or procedures on effective field management control are required in conjunction with the responsibilities and authority delegated to the assigned RMC. Reference (h) provides additional information on BOAs.

2.4.8 Other Contracting Methods.

a. Multi-Agency Contract means a task-order or delivery-order contract established by one agency for use by Government agencies to obtain supplies and services, consistent with the Economy Act. Contracts for information technology services are often procured as multi-agency contracts.

b. Private Sector Industrial Activity (PSIA) contracts enhance the Procuring Contracting Officer's (PCO) flexibility by allowing the PCO to package several ship repair

availabilities spanning several fiscal years into one procurement package. The cost-type contract awards the initial availability with options to execute the remaining availabilities, provided the contractor's cost and performance are satisfactory. PSIA contracts are routinely procured as cost-type contracts, although they could be procured as FP contracts.

c. Best Value Contracting. Best Value Contracting (BVC) is a DoW endorsed procurement method that presents an alternative to the traditional low-bid method of contracting. It is to be used for all procurements with an estimated value exceeding $500,000. It is a competitive contracting process requiring projects to be awarded to the contractor offering the best combination of price and qualifications instead of just the lowest bid. It is an approach for awarding contracts that, when properly designed and administered, rewards high-performance contractors who have trained, skilled workers and other essential qualifications for performing high quality projects in a safe, timely and cost-efficient manner.

(1) BVC is used in relation to Request for Proposal procedures, but it may also be referred to by other terms in the commercial business environment, such as "competitive sealed proposal contracting," or "negotiated contracting." Because the award decision is not based on price or price-related factors alone, BVC is never accomplished under Sealed Bidding (IFB) procedures.

(2) Under the BVC process, bidding is typically open to qualified contractors who submit detailed information on their past performance and qualifications in response to the Request for Proposal process. If designed properly, the BVC system should require mandatory pre-listing when a subcontractor's level of effort is expected to exceed a specific dollar threshold as set by the PCO.

d. Required information, and past performance, can include areas that have the potential to impact the success of a project. They typically include the past performance, technical expertise and management team of the general or prime contractor and subcontractors. Key craft labor issues should also include:

(1) Skill training and apprenticeship.

(2) Project staffing and labor sources.

(3) Safety initiatives.

(4) Law compliance.

e. In reviewing this information and researching past projects (Contractor Performance Appraisal Reporting System, etc.) the Government Contracting Officer must employ various types of procurement evaluation and selection procedures to assist in identifying the contractor or contracting team that offers the best combination of price and qualifications.

f. The past performance of a contractor, or proposed contracting teams, are usually rated or scored by a team of Government contracting and technical personnel, working for the PCO and using pre-established evaluation criteria. The designated evaluation team reviews submittals provided by contractor and subcontractor teams and evaluate

performance data and other relevant information from prior projects and submits their recommendations to the PCO with substantiating data to support their analysis.

g. The PCO analyzes the inputs and recommendation in relation to the terms and conditions of the contract and its scope to make the final decision as to the contractor or contracting team that has offered the best value for the Government.

2.4.9 Five (5) Elements of a Contract. Whatever form the contract takes following the solicitation, it must contain the following five elements:

a. Offer.

b. Acceptance.

c. Consideration.

d. Legal and possible objective.

e. Competent parties.

2.4.9.1 The Offer. An offer is nothing more than a promise, conditioned either upon performance of an act by the offer or upon a return promise by the offer, to perform this act. In order for the offer to be valid, the expression must be intended as an offer, it must be complete in all its essential terms, it must be communicated (in the manner intended) to the offeree and it must be clear and without ambiguities. If after the contract is formed, it is found to be imprecise or ambiguous in some minor detail so that reasonable persons could differ as to its meaning, the "Rule of Ambiguities" comes into play and the contract must be reformed at the expense of the party who drafted the contract.

2.4.9.2 The Acceptance. Acceptance is an expression of consent to the proposed contract. In order for the acceptance to be effective, i.e., to create a valid contract, it must be:

a. Clear and unequivocal.

b. Timely (i.e., it must occur before the offer is revoked).

c. In the same terms as the offer (to avoid the problem of counteroffers). If the acceptance conditions change or alter any of the terms of the offer, a counteroffer results. Once a counteroffer is made, the original offer is terminated, and the offer then has the power of accepting or rejecting the counteroffer. As it relates to Government contracts, the acceptance becomes effective on dispatch to the offer as long as it is properly addressed.

2.4.9.3 Consideration. Consideration is the price bargained for, and paid, for a promise. It may consist of an act, a forbearance of an act or a return promise. To be valid, consideration must be legally sufficient, that is, the consideration must have value in the eyes of the law. The courts must not check into the adequacy or fairness of the consideration.

2.4.9.4 The Legal and Possible Objective. The purpose of a contract (what it is the offer or is trying to accomplish) must be a legal and possible objective. If the objective is illegal, the contract is unenforceable. Likewise, impossibility can excuse performance under the contract.

2.4.9.5 Competent Parties. Both parties to a contract must have legal capacity to enter into the contract. In the Government, this must be a duly authorized and properly warranted Contracting Officer who has the legal authority to obligate the Government, using authorized funds to

comply with the agreed upon terms and conditions of the contract. Private companies are required to designate in writing the names of the individuals who are authorized to represent the contractor in contract matters and to obligate the company in writing to a promise to meet the agreed upon terms and conditions of the contract.

2.5 OVERVIEW OF CONTRACTING PROCEDURES. The two methods the Government uses to enter into its contracts are sealed bidding and negotiation.

2.5.1 Sealed Bidding. Sealed bidding, described in reference (i), was established by statute as the preferred procurement method. Sealed bidding relies wholly upon competition to obtain fair and reasonable prices for services and materials.

2.5.1.1 The Purposes of Sealed Bidding. The two main purposes of sealed bidding is: to realize the price and other benefits derived from full, free competition and to give all interested and qualified sources an equal opportunity to compete for the contract. The Comptroller General states the following: "The courts and accounting offices of the Government have frequently and consistently held that Section 3709, Revised Statutes, was designed to give all persons equal right to compete for Government business, to secure for the Government the benefits which flow from competition, to prevent unjust favoritism by representatives of the Government in making purchases for public account, and to prevent collusion and fraud in procuring supplies or letting contracts."

2.5.1.2 Success of Sealed Bidding. Achieving these goals depends entirely upon the existence of real competition among bidders and upon the integrity of the system throughout its operation. Each bidder must be put on an equal basis and given the same opportunity to develop and submit the best bid initially. Sealed bidding procedures are prescribed in detail in reference (i) and cannot be deviated from. Regardless of the strict conformity to procedure, the use of sealed bidding is not intended to prohibit flexibility nor eliminate good judgment.

2.5.1.3 Responsibilities of the Planning and Procuring Activities.

2.5.1.3.1 Requiring or Planning Activity. The activity that plans or requires the goods or services to be procured must prepare the initial request for technical support that clearly identifies the specifics of the requirement. In addition, it must provide all applicable specifications, plans or drawings. If nothing better is available, the activity will provide a purchase description that adequately specifies to the warranted buying or procuring office all the essential features of the item or service to be procured.

2.5.1.3.2 The Procuring Activity.

a. The PCO is responsible for ensuring the specifications in the offer are sufficiently descriptive to provide for maximum competition. This solicitation package is issued via an IFB. Contract law provides that, "If the specifications are not sufficiently descriptive so as to provide for full and open competition, then the offer is invalid and no award may be made."

b. The PCO is charged with the responsibility to challenge any delivery or performance schedule that appears unrealistic. The time of delivery or performance is an essential element for inclusion in a contract and must be clearly set forth in the IFB. Delivery and performance schedules that are unreasonably tight or difficult to attain are unfavorable to full competition, inconsistent with small business policies and may

result in higher contract prices. All personnel must be alert to question any requirement that does not make sense or appears to involve unnecessary or excessive costs for any reason.

c. The PCO determines whether the purchase is susceptible to sealed bidding. A purchase is susceptible to sealed bidding if all four of the following conditions are present.

(1) Time permits the solicitation, submission and evaluation of sealed bids.

(2) The award must be made on the basis of price and other price-related factors.

(3) It is not necessary to conduct discussions with the responding offerors about their bids.

(4) There is a reasonable expectation of receiving more than one sealed bid.

d. The PCO ensures that the information is transferred from the purchase description to the schedule of an IFB that must be issued in such terms that the requirements are completely defined; determines that the terms included in the schedule of the IFB fully and completely describe the needs of the Government without ambiguity; determines that the offer is responsive; determines that the company that submits the offer is a responsible entity; determines which bid actually offers the Government the lowest price; and as the legally authorized agent of the Government, awards a contract to the contractor who fulfills all of the essential provisions of the IFB and whose price is found to be fair and reasonable.

2.5.1.4 Invitation for Bid Summary.

a. Even this brief outline of sealed bidding procedures shows that it is a substantial and complex process involving considerable administrative expense. All these steps must be taken in every purchase accomplished by sealed bidding. Although this discussion has necessarily been quite general, each step of the process can be broken down into a myriad of further considerations and problems. An intricate system attempts to secure the best result for the Government by the use of widespread competition. Great emphasis must be placed on maintaining the integrity of the system to the end that the prospective bidders must know the rules in advance and must be ensured of fair and equal treatment.

b. These procurement rules have been established by the Comptroller General to protect the interests of both the bidder and the Government. Frequently, project officers and operational personnel view the process as too restrictive and would like to circumvent some of these rules. The problem is not one of changing the rules, but rather of ensuring the use of this method of procurement is appropriate for the given circumstances.

2.5.2 Contracting by Negotiation. Congress has recognized sealed bidding cannot satisfy all procurement requirements and has authorized procurement by means of negotiation per reference (j). A contract awarded by means other than sealed bid is a negotiated contract. Negotiation has an inherent flexibility that is almost completely absent from sealed bidding. Negotiated contracts can be made with or without competition, and contractors that submit an offer may or may not be aware of the presence or absence of competition when establishing their prices. The flexibility

of the negotiation provides the means of achieving a fair and reasonable pricing basis without reliance upon competitive pressure alone. Negotiated contracts are solicited through Requests for Proposals.

2.5.3 Basic Acquisition Process. Appendix B provides a simplified diagram of the major steps frequently required in the acquisition process.

2.5.4 Clearance. The purpose of a business clearance is to demonstrate that the proposed acquisition conforms to good business practice, law or regulation and to justify by written evidence that the cost and price established are fair and reasonable. In addition, a business clearance serves as the historical record of the business cost and pricing aspects of an acquisition and contains all required approvals by higher authority.

2.6 WRITING CONTRACTS.

2.6.1 Uniform Contract Format. With the implementation of the FAR, all Federal Government contracts have a Uniform Contract Format as to section headings used. This contract format consists of listed parts and sections that are found in reference (i) for sealed bids and reference (j) for negotiated procurements.

2.6.2 Standard Procurement System. DoW has mandated the Standard Procurement System must be the standard used by all services and individuals involved in the preparation of a contract. The Standard Procurement System is an automated contract writing system that standardizes procurement processes across the DoW within the Acquisition Domain. Standard Procurement System capabilities are:

a. Provide an enterprise-wide automated contract writing system for the DoW from receipt of requirements to contract closeout.

b. Used in a mobile, forward-deployed version (Battle Ready Contingency Contracting System) in support of contingency missions worldwide.

2.6.3 Procurement Deficiencies. Among the items which obscure the intent of a contract are:

a. Inadequate item descriptions, inaccurate, illogical and confusing specifications and incomplete and sometimes ambiguous requirements.

b. Unclear pricing aspects.

c. Special clauses with ambiguous or incomplete terms.

d. Related clauses and requirements in several different sections of the contract.

e. Inconsistent treatment of general provisions with regard to their preprinted forms and the applicability of clauses incorporated by reference.

2.7 CONTRACTING OFFICER AUTHORITY AND RESPONSIBILITIES.

a. The Federal Government conducts activities through employees with varying degrees of authority and responsibility. For contract administration purposes, this work is accomplished through Contracting Officers assisted by the Project Manager.

b. It is difficult to determine the exact authority of Government employees when they and contractor personnel are in frequent contact. This difficulty is compounded by the fact that the rules that govern the extent of Government employee's authority are

complicated and scattered throughout various statutes, regulations, instructions and legal principles. Problems frequently arise regarding which employees have the authority to bind the Government and what limitations, if any, have been placed on the employee's authority. The most common problems involve situations where the Government refuses payment of claims because the contractor dealt with an unauthorized agent, or where the Government seeks to revoke or countermand action taken by its employees or agents.

2.7.1 Authorized Officials.

a. Persons who have met the prerequisites and formal training requirements mandated by the Defense Acquisition Workforce Improvement Act and who possess the actual authority to contractually bind the Government are generally referred to as "Contracting Officers".

(1) "Contracting Officer" is defined as a person with the authority to enter into, administer or terminate contracts and make related determinations and findings. The term includes certain authorized representatives of the Contracting Officer acting within the limits of their authority as delegated by the Contracting Officer.

(2) "Administrative Contracting Officer (ACO)" refers to a Contracting Officer who is administering contracts.

(3) "Termination Contracting Officer" refers to a Contracting Officer who is settling terminated contracts. A single Contracting Officer may be responsible for duties in any or all of these areas.

b. Reference (b), subpart 1.6, requires that Contracting Officers below the level of a HCA must be nominated, selected and appointed by use of a Certificate of Appointment. Such appointment must state any limitation on the scope of authority to be exercised, other than limitations contained in applicable laws or regulations. Agencies sometimes impose limitations on the authority of their Contracting Officers by prescribing procedures that must be followed in order for the Contracting Officer's action to be binding on the Government.

2.7.2 Typical Contracting Officer's Representative Responsibilities. Personnel performing other functions (e.g., auditors, lawyers, engineers, shipbuilding specialist, production controllers and other technical personnel) are frequently designated as Contracting Officer's Representatives (COR). These personnel assist Contracting Officers by providing advice and frequently deal directly with contractors, but normally are not vested with contracting authority. CORs must have met training requirements and selection criteria established by higher authority per reference (k) and have a letter of appointment from the Chief of the Contracting Office entered into the contract files. Individuals authorized to be a COR have a much narrower scope of authority than the person specifically designated as a Contracting Officer. Procurement regulations usually contain express limitations on the delegation of authority to CORs. A common limitation is that CORs are not authorized to sign formal contract documents on behalf of the designated Contracting Officer. Further, CORs are not authorized to make any contractual commitments or otherwise obligate the Government, or authorize any changes that affect the contract's price, terms or conditions.

2.7.3 Typical Contracting Officer's Representative Duties. CORs are responsible for the technical aspects of the contract. This may include reviewing (and frequently preparing) the contract work statement, delivery requirements and specifications, clarifying technical requirements, preparing independent estimates, providing technical liaison with the contractor and monitoring contractor performance.

2.7.3.1 In performing these functions, a COR must:

a. Ensure that the contract does not become a personal service contract.

b. Ensure that constructive changes are avoided.

c. Control, formalize and issue technical direction.

d. Ensure necessary file documentation.

e. Monitor contractor performance regarding cost, quality and delivery.

f. Communicate with the Contracting Officer.

g. Ensure that the work being required is within the scope of the Statement of Work for the terms and conditions of the contract.

h. Certify contractor's invoices.

i. Provide reports associated with the task order.

j. Maintain the Significant Events log.

k. Provide a past performance information survey at completion of contract evaluation.

2.7.3.2 Actual Authority Required.

a. One of the concerns regarding CORs is that contractors may not understand the process necessary to create an "authorized representative". It is the ACO's responsibility to clearly articulate the authority of individuals participating in the Contract Administration Process. NAVSEA requires that proper training be completed prior to formally designating employees as CORs. There are other Government representatives who interface directly with contractors in the normal course of their duties but who are not designated as having any formal status (e.g., where technical evaluation, testing, quality control, inspections, etc., are performed by individuals other than those specifically designated as CORs).

b. Government personnel must avoid all acts that could lead the contractor to conclude that a "constructive change" has been given even though the individual has no contractual authority to do so. The ACO must clearly state to the contractor's representatives that no Government personnel and specifically the COR, personnel in the Waterfront Operations Department and Ship's Force are authorized in any form to supervise the Contractor's personnel in the performance of the terms and conditions of the contract. This action is essential because in certain cases of contractor claims the courts and boards tend to look more at the actual functions that such personnel perform than at their formal status. When they are given contract-related functions as part of their official duties, they may well be treated by the courts as authorized representatives with "implied authority" even though they are not authorized to act in a formal capacity to obligate the Government by their action.

c. Recognizing the importance of effective Government control over the conduct of its agent, the boards and courts have frequently stated the rule that the Government is not bound by the unauthorized acts of its agents even though they are acting with "apparent authority".

d. It is important to recognize that the actual authority rule does not apply to contractors (i.e., contractors are governed by the usual rules of apparent authority). This means that a contractor must normally be bound by acts of its employees with apparent authority, even though these employees may lack actual authority.

2.7.4 Implied Authority. While "apparent authority" must not be sufficient to hold the Government bound by the acts of its agents, the boards and courts have frequently granted contractors relief on the basis of "implied authority" when such authority is considered to be an integral part of the duties assigned to a Government employee. Most of the litigated cases involving implied authority arise where Government technical personnel, lacking authority to order changes, issue interpretations or give instructions which induce the contractor to perform work beyond actual contract requirements. In such cases, the boards and courts frequently hold the Government to a "constructive change" when it is found that the Government has acted to change the contract without actually going through the "Changes" clause formalities.

2.7.5 Contractually Related Functions. Successful contract performance depends heavily on the Contracting Officer and COR relationship. This relationship should be a harmonious and close partnership, where the expertise of each is best utilized, consistent with their inherent responsibilities. The authority, responsibility and duties of the COR must be clearly defined by the Contracting Officer, understood by the COR and discussed in detail with the contractor. The duties of assigned COR are to be included in the contract where feasible but as a minimum are to be reduced to writing by the Contracting Officer, with the original provided to the COR and a copy to the contractor and contract files. Since the COR functions not just as an official representative of the Government but also as the "eyes and ears" of the Contracting Officer he or she is required to interface directly with the Contracting Officer.

2.8 CONTRACT ADMINISTRATION.

2.8.1 Regional Maintenance Centers. RMCs are responsible for performing contract administration functions listed in references (a), (l), and (m). This responsibility extends to all Federal contracts awarded to contractors for whom the RMC is the designated Contract Administration Services (CAS) Activity, as designated in the Federal Directory of CAS Components.

2.8.2 Assignment of Contract Administration. An RMC performing CASs under a plant cognizance assignment may require performance of quality assurance, source inspection, etc., at a subcontractor's plant which is under the cognizance of another Federal CAS component. In such a case, the RMC is to request the responsible CAS component to perform the CAS as prescribed within reference (l).

2.8.3 Contract Manager Representatives. RMC's point of contact for general contract matters is the Fleet Support Contracts Division (NAVSEA 024) of NAVSEA Contracts Directorate (NAVSEA 02). Other Divisions of NAVSEA 02 are also available to provide assistance. They generally deal with specific programs such as NAVSEA 022 (Shipbuilding Contracts Division),

NAVSEA 025 (Surface Systems Contracts Division) and NAVSEA 026 (Undersea Systems Contract Division), etc.

2.8.4 Correspondence and Visits. Refer to reference (l) for contract administration correspondence, pertinent correspondence conducted between the Contract Administration Office (CAO) and the contractor and visits to contractor's facilities.

2.8.5 Contracting Officer Warrants. NAVSEA (SEA 02) issues all Contracting Officer warrants to RMC Contracting Officers, including Corporate ACO warrants and leasing warrants, per the provisions of reference (b), subpart 1.6.

2.8.6 Involvement. Involvement, previously called engagement, is defined as aggressive contract administration based on an in-depth knowledge of the contractor's operations, especially any weaknesses in areas such as policies, procedures and performance. Reference (n) incorporates new laws and policies, improving in the area of teamwork, with the goal of creating an acquisition system that capitalizes on the strengths of each and every participant. To implement involvement for ship repair work, RMCs must take the actions described in this section when appropriate. The complexity and duration of the work must significantly influence the extent to which these functions should be performed.

2.8.7 Special Requirements in Schedules. When the work effort is extensive or availability dates short and the work complex, PCOs may require in the solicitation that the prospective contractor submit data on the proposed manning of the ship work, by trades, and the subcontractors to be used during the contract. The docking date and date(s) for accomplishing certain test(s) may be included in the specifications, if considered necessary because of significant known or suspected work. Contract completion dates have been missed due to inadequate scheduling of tests that did not permit time to correct deficiencies or because planning for the test schedule was inadequate.

2.8.8 Communications with Fleet Representatives. RMCs should provide the Type Commanders any estimated impact on availability completion dates due to approval of new work items. Such approvals should be received early in the availability to minimize cost and impact to the schedule. Periodic meetings of RMC personnel with the ship's Commanding Officer and department heads must be held per chapters 2 and 3 of appropriate TYCOM part I, II, or II of volume II of this manual. The ship is the customer and the Commanding Officer often knows when work is not progressing properly or the quality of work is unsatisfactory. During these meetings, the Availability Project Manager must brief Ship's Force on the status of all work-by-work items and on corrective measures being taken by the contractor to advance the work or redo unsatisfactory work.

2.8.9 Communications and Familiarity with Contractors.

a. Essential information is generally provided by the contractor while briefing RMC personnel on work status and problem areas. During scheduled progress meetings, the RMC should obtain or generate a list of Government actions or inactions that the contractor claims are delaying the work (e.g., delays in receipt of Government Furnished Material or in Government authorization to proceed with new or changed work). To the extent the contractor identifies any Government action or inaction which the contractor claims is delaying work, the RMC representative must advise the

contractor to comply with the contract's notification of change requirements, advise the ACO and document the significant event.

b. Appropriate RMC personnel, especially the senior designated RMC representative at the work site, must become familiar with the contractor's Work Breakdown Structure generally used for both cost control and scheduling. The designated RMC representative should know how the contractor uses the system and what reports the system generates. Many shipyards prepare a percent for completion report and generate a report of Work Breakdown Structure items that have missed the completion date. Access to such reports should provide the RMC with the data needed to require timely corrective action by the contractor to meet the job order completion date. Information on work status, which the RMC is generally required to maintain for progressing purposes, is also provided through use of the bar charts. A missed milestone for a controlling work item should alert the RMC that corrective action might be needed.

2.8.10 Government Furnished Property. RMCs are primarily concerned with two types of Government Furnished Property (GFP): Government Furnished Material, which includes all types of tangible items (e.g., equipment, repair parts, consumables, etc.), and Government Furnished Information (GFI), which includes tangible and electronic forms of Government data, such items as plans, blueprints, test memos and technical manuals. GFP is addressed in detail in Chapters 7 and 10 of this volume.

2.8.11 Use of Change Orders and Avoiding Constructive Change Orders. RMCs must establish procedures to minimize the need for change orders, particularly in the case of FFP contracts. RMCs should always avoid creating constructive change orders. A constructive change order is an informal change to the contract resulting from Government actions or inactions that require the contractor to perform work beyond that which is required by the contract. These constructive changes can result in unauthorized commitment of Government funds, claims or litigation against the Government. RMCs must provide guidance to Ship's Force and other Government personnel to preclude intentional or unintentional creation of a constructive change order.

2.8.12 Avoidance of Delays. RMCs must establish procedures to require the designated Availability Project Manager to provide timely information to the responsible project officer. When the RMC representative at the work site judges that work progress is unsatisfactory, that test schedules are improper because they do not permit sufficient time to correct deficiencies, that open-and-inspect items are not being accomplished promptly, that the contractor is manning the job improperly, or that the procurement and receipt of contractor-procured material is delayed, the RMC representative should advise the contractor and document the significant event. Pertinent data should be communicated to the contractor and confirmed in writing through the Contracting Officer. If the contractor insists that progress, performance and scheduling are in order, the Availability Project Manager should consult the ACO for appropriate contractual action. If it appears that contract performance may be slowed because of delay in a Government approval required by the work item or because of delay in issuing a required change to the job order or other omission by the Government, the RMC representative at the work site should request that the cognizant RMC department either expedite the required approval for the change or correct the omission.

2.8.13 Improper or Unsatisfactory Work. When work performance is determined to be improper or unsatisfactory, the contractor must be so advised. Before advising the contractor, the RMC representative at the work site must review the work item to ensure that no defect in the specifications contributed to or caused the deficiency. The RMC must not include improper or unsatisfactory work in the base for computing progress payments. When a contractor disagrees with an RMC determination that corrective action is necessary, the RMC representative at the worksite must try to resolve the issue with the contractor to mutual satisfaction. If this is unsuccessful, the RMC representative must consult with the ACO. The ACO must review the RMC or contractor disagreement and direct the contractor to take appropriate corrective action, as required. See Chapter 11 of this volume for additional information concerning corrective action documentation.

2.8.14 Records. Throughout contract performance, the RMC representative at the work site must maintain written records of deficiencies in work progress and accomplishment. These records must be used for such purposes as the determination of liquidated damages and evaluation of claims. The records must also serve as the factual account for briefing higher authority if required. Written records must reflect on the deficiencies and the steps the RMC has taken to obtain corrective action including all actions the contractor takes. These records serve as input to significant events files. The use of the records for responsibility determinations is of particular importance. Government policy requires contracts be awarded to responsible contractors (i.e., contractors which can perform if awarded the contract). The RMC must maintain sufficient written records of past contractor performance to permit an informed determination of responsibility or non-responsibility to ensure an adverse determination of responsibility is not overturned by higher authority or the Small Business Administration. These records must be used to evaluate a contractor's proposal where past performance is an evaluation factor.

2.9 SOCIOECONOMIC PROGRAMS. The Small Business, Veteran-Owned Small Business, Service-Disabled Veteran-Owned Small Business, Historically Underutilized Business Zone Small Business, Small Disadvantaged Business and Women-Owned Small Business programs are founded in law and cover both prime contracting and subcontracting, for which annual goals are assigned to NAVSEA by the Office of the Secretary of the Navy. Command goals are based upon the share or percentage of total obligated dollars. As HCA for RMC contracting, the Commander, NAVSEA, is responsible for achievement of program goals and implementation.

2.9.1 Deputy for Small Business. Commanding Officers must appoint a full-time or part-time Deputy for Small Business, who must report directly to the appointing official on Small Business Program matters. The appointment should reference the pertinent responsibilities in reference (c) part 219 and reference (a) part 5219. The appointment must be per reference (o). Individuals appointed must possess business acumen, knowledge of contracting policies and procedures, and the training and background essential to accomplish the objectives of the Small Business Program.

2.9.2 Subcontracting Program Administration. Reference (c) part 219, section 705, contain the responsibilities of the Contracting Officer. These responsibilities include determining the need for a subcontracting plan and reviewing the subcontracting plan. Reference (c), part 219, section 706 contains the responsibilities of the ACO. These responsibilities include reviewing, evaluating, and approving master subcontracting plans.

2.10 PROCESSING CONTRACTUAL ACTIONS.

2.10.1 Policies. This section discusses policy concerning the processing of the more common contractual actions.

2.10.2 Forward Price Rate Agreement. A Forward Price Rate Agreement (FPRA) is a written agreement negotiated between a contractor and the Government to make certain rates available during a specified period for contractual actions. Such rates represent reasonable projections of specific costs that are not easily estimated for, identified with or generated by a specific contract, contract end item or task. These projections may include rates for labor, indirect costs, material obsolescence and usage, spare parts provisioning and material handling. Negotiation of FPRAs may be requested by the Contracting Officer, the contractor or initiated by the ACO. In determining the need for an FPRA, the ACO should evaluate whether the benefits from the agreement are worth the effort of establishing and monitoring it. FPRAs should only be negotiated with contractors having a significant volume of Government contract proposals. The responsible RMC must determine whether to establish an FPRA. Indirect costs commonly defined as overhead are defined and described in reference (p) including treatment and application of indirect costs to contracts.

2.10.3 Pricing of Deleted Work. Deletions should be based on the reasonable value of the change at the time the work would have been performed. The deletion values should not be based on itemized estimates provided by the contractor at the time of contract award. The deletion value should include all costs reasonably associated with the deleted work, including profit.

2.10.4 Awarding Job Orders. The Government uses the sealed bidding and negotiation methods of contracting in awarding contracts, including job orders. These methods of contracting are covered in detail in references (i) and (j).

2.10.5 Objective of Procurement Process and Contract Pricing. The objective of the procurement process is to acquire supplies and services of the desired quality in a timely manner at “fair and reasonable” prices. The objective of contract pricing is to establish and administer an arrangement that poses a fair and reasonable price for delivery of a product or service.

2.10.6 Pricing Responsibility. The Contracting Officer is responsible for exercising proper judgment and is solely responsible for the final pricing decision. Although the Contracting Officer is responsible for the final pricing decision, the Contracting Officer is not expected to perform all functions leading to the contractual document’s execution. Although the recommendations and counsel of contributing specialists, including auditors, are advisory only, the Contracting Officer should include comments in the price negotiation memorandum when significant auditor or other specialists’ recommendations are not adopted.

2.10.7 Adjudications on the Basis of Estimates. NAVSEA policy requires changes to be adjudicated on the basis of estimates. Adjudications must not be deliberately delayed to allow the determination of actual incurred costs from which to adjudicate.

2.11 PROPOSAL ANALYSIS.

2.11.1 Cost Analysis. The purpose of proposal analysis is to ensure that the final agreed-to price is fair and reasonable. Proposals are evaluated using price analysis or cost analysis. Price analysis, which evaluates the bottom line pricing, is the preferred method when the action is

lower than the cost or pricing data threshold per reference (j), section 15.403-4, and when information is available on which to base price analysis. Cost analysis, which evaluates each cost element of a proposal, is used when proposals exceed the cost or pricing data threshold, when no basis for price analysis exists or when deemed appropriate by the Contracting Officer. Exercising sole responsibility for the final pricing decision, the Contracting

Officer must coordinate a team of experts in such fields as logistics, finance, law and contract audit, quality control, engineering, technical and pricing to provide assistance and advice in proposal analysis, including participation in negotiations with the contractor.

2.11.2 Field Pricing Support. Field pricing support is a review and evaluation of the contractor's or subcontractor's proposal by any or all field pricing support personnel. When cost or pricing data are required, contracting offices must request a field pricing report (which may include an audit review by the cognizant contract audit agency) before negotiating any contract or modification.

2.11.3 Cost Realism Analysis. Even when adequate price competition exists, cost realism analysis may be appropriate, especially for cost-reimbursement contracts, and to ensure a reasonable expectation that proposed costs are consistent with the technical proposal. Cost realism analysis should also be used when the solicitation contains new requirements that may not be fully understood by competing contractors, when there are quality concerns, or when past experience has indicated that contractors have proposed costs which have resulted in quality or service shortfalls.

2.11.4 Subcontract Pricing Considerations. The Contracting Officer is responsible for the determination of price reasonableness for the prime contract. To make this determination, an analysis is required of all relevant facts and data, including required subcontractor cost or pricing data, results of the prime or higher tier subcontractor's analyses of subcontractor proposals, the field pricing support, if any, and historical pricing data. Even if a contractor or higher tier subcontractor has an approved purchasing system or performs an analysis of subcontractor cost or pricing data, the Contracting Officer or field pricing support team still has the responsibility of analyzing the prime contractor's submission, including the subcontractor cost or pricing data. The prime contractor or higher tier subcontractor is responsible, however, for conducting appropriate price and cost analysis before awarding a subcontract.

2.11.5 Requests for Procurement Requiring Information on Purchased Materials. Purchased materials are raw materials, purchased parts, components or end items to be delivered under a contract which are not fabricated or produced by the contractor. Timely submission of information is required by negotiators or other contracting personnel who can properly evaluate the purchased materials portion of price quotations. This information is necessary particularly when competition is lacking or is inadequate to control the prices initially proposed. The prime categories requiring treatment are new contracts where a sole source or competition is limited, re-pricing of re-determinable and incentive contracts and equitable adjustments under the Changes clause (and other clauses having similar provisions for such adjustments).

2.11.6 Price Analysis. Price analysis is the process of examining and evaluating a proposed price without evaluating its separate cost elements and proposed profit. Price is cost plus any fee or profit applicable to the contract type. The Contracting Officer is responsible for selecting and using whatever price analysis techniques must ensure a fair and reasonable price. Price analysis

must generally be used in lieu of cost analysis, regardless of the dollar amount for contracts, where the conditions of reference (j) are met (e.g., prices are based on adequate price competition).

2.11.7 Use of Independent Estimates. Independent estimates are preferred for pricing sole source contracts and contract modifications less than the cost and pricing data threshold of $700,000. An independent estimate forms the basis for pricing. Such estimates should be made without reference to the supporting or back-up cost or pricing data the contractor has, nor will such data be requested when price analysis is to be employed. When cost or pricing data is submitted or identified, a cost analysis will be performed on the data.

2.12 WORK SCOPE.

2.12.1 Reaching Work Scope Understandings. It is unusual for an RMC to have to reach a work scope understanding with the contractor for a contract itself. Such understandings are usually reached in pre-bid or negotiation conferences or other discussions. Therefore, work scope understandings are addressed in the context of contract changes. Before a contractor can prepare an estimate of the cost of a change, it first must determine the work scope of the change. There should be an understanding between the contractor and the negotiating team on the work scope before the change is adjudicated. If there is no common basis of understanding the requirements of the change, there cannot be a common basis for adjudication. Reaching an early understanding of work scope prevents later conflicts and permits the negotiating team to limit the evaluation of the contractor's proposal to the estimated cost of performance. For un-priced modifications, a work scope understanding should be reached with the contractor before issuing the un-priced modifications. Work scope understandings must be reached before completion of the technical analysis. These understandings may be accomplished by any reasonable means including work scope conferences. The difficulty in reaching work scope understandings and the need and timing for holding work scope conferences is directly related to the clarity and accuracy of the applicable specifications. When the specifications are clear and accurate, a work scope conference may not be needed, especially if the contractor's proposal raises no serious technical questions.

a. A work scope conference must be required if the specifications are not clear and accurate or if the contractor's proposal raises serious technical questions. If the specifications are not clear, the conference should be held before proposal submission. If the specifications raise serious technical questions, the conference should be held after receipt of the proposal. When there are serious disagreements about the work scope, a work scope conference should be held, preferably before receiving the proposal. The ACO must establish local procedures for reaching work scope understandings with the contractor including the use of work scope conferences.

b. When a work scope understanding is reached before proposal submission, the proposal for pricing the change is to be submitted per the understanding. The contractor's proposal must be submitted based on the work scope understanding reached. The technical analyst reviewing the work scope description prepared by the contractor or attending the work scope conference should conduct, if possible, the technical evaluation of the proposal when it is received.

2.12.2 Work Scope Conferences. The extent of participation by the Government and contractor representatives at work scope conferences must be determined based on type and complexity of work, issues for resolution and gross dollar value. Participants should be limited to necessary personnel. A work scope understanding reached by a meeting between only the technical analyst and contractor's counterpart is generally better for the participants. The negotiator, legal counsel, ACO, auditor, engineers and other specialists should also be included when there is a legitimate need for them.

2.12.3 Work Scope Data. Work scoping's must include, but not be limited to, the following data:

a. Description of the work required by the contract before the change, work that is deleted by the change and work deleted by the change that already has been completed. The description is to include a list of components, equipment and other identifiable property.

b. The status of manufacture, procurement or installation of such property is to be indicated. Personnel must furnish separate descriptions for design work and production work. Raw materials, purchase parts, components and other identifiable hardware that the change makes expendable, and which the contractor must or must not retain, are to be listed for later disposition.

2.13 TECHNICAL ANALYSIS REPORTS.

2.13.1 General. A Technical Analysis Report (TAR) must be prepared per volume VI, chapter 31 of this manual. The TAR must contain a statement of the extent to which the analyst recognized that any cost or pricing data submitted or made available by the contractor was inaccurate, non-current or incomplete.

a. When the statement advises that there was defective data, the analyst must clearly delineate how the evaluation was conducted and the effect of deficient data on man-hours or material dollars in the proposal and the analysis.

b. The TAR must clearly delineate the data not relied on during the evaluation.

c. The TAR must reflect the technical analyst's professional judgment of the reasonableness of the man-hours and material estimates in the contractor's proposal, the data accompanying the proposal and the back-up data used by the contractor in preparing the proposal when a technical cost analysis is performed.

d. The TAR must specifically address material which has been made excess or obsolete by a change and whether the Government has been given a credit or was charged for the material. The Government property administrator must be advised when title to Contractor Acquired Property is to remain in the Government at the end of the contract.

    (1) If the technical analyst concludes the contractor's proposed labor hours and material is reasonable, the TAR must state the basis for the conclusion, e.g., historical data or actual return cost data. If, in the professional opinion of the technical analyst, the contractor's labor or material estimate is too high or too low in any area, the report must indicate the exact area of the proposal or back-

up data in which the differences appear. The report also must indicate the rationale of the technical analyst and the contractor.

(2) The TAR must reference the local instructions and procedures followed in the evaluation instead of spelling out the steps in detail. When local instructions and procedures are not followed, the TAR must detail the steps taken in the evaluation and the rationale for not following the local instructions and procedures. The technical analyst must sign the TAR, which must be approved following local procedures. When independent estimates are made, the independent estimate must serve the purpose of a TAR. Technical analysts should in particular keep in mind that they should provide the negotiator with data that can be used in negotiations.

2.13.2 Local Instructions and Procedures.

a. RMCs must establish local instructions and procedures to cover the steps to take in conducting technical evaluations of various types of proposals and the preparation of TARs to submit under various circumstances. Such instructions and procedures must:

(1) Ensure practices among the technical analysts must be uniform.

(2) Ensure only essential steps and information must be included.

(3) Require formats for preparation of the TAR be standardized and simplified to the maximum extent possible.

b. Local instructions and procedures must stress that for small gross value proposals and changes which are not complex the procedural steps are to be followed with the expenditure of minimum effort and the use of spot-check techniques, where appropriate. Procedures must provide for notification of the Government property administrator when material has been made excess or obsolete by a change and the Government is charged for the material.

2.14 AUDIT EVALUATION OF CHANGE PROPOSALS AND SUBMISSION OF ADVISORY AUDIT REPORTS.

2.14.1 Audit Evaluation. This section is closely related to field pricing support described in paragraph 2.11.2 of this chapter. The key difference is that where field-pricing support envisions involving two or more Contracting Officers for a contractual action, audit evaluation envisions only one Contracting Officer (i.e., the ACO at the RMC responsible for the contractual action). Field pricing support primarily addresses the award of contracts and major modifications, while audit evaluation primarily addresses the more routine contractual modifications processed by RMCs.

2.14.2 Contractual Audit Reports. RMCs are not precluded from requesting audits regarding contractual modifications for less than the dollar thresholds of those pertaining to certified cost or pricing data where deemed necessary by the Contracting Officer. The audit evaluation to be performed by the auditor must be per the directives under which the auditor operates, the procedural arrangements made between the ACO and the head of the audit office, the contents of the TAR and the special considerations identified in the request for audit evaluation and submission of the Advisory Audit Report (AAR).

2.14.3 Advisory Audit Reports. On completion of the audit evaluation, the auditor must prepare the AAR following the directives under which the auditor operates and the procedural arrangements made with the ACO and submit the report to the negotiator. The AAR must incorporate the finding of the TAR, when provided, and address any additional items requested by the ACO or ACO representative. The ACO or ACO representative may request that a discussion of the audit findings be held prior to the release of the formal audit report.

2.15 CONTRACT MODIFICATIONS.

2.15.1 Introduction. This section covers the more pertinent regulatory requirements regarding contract modifications contained in the FAR, DFARS and NMCARS.

2.15.2 Restrictions. Reference (b), subpart 1.6, contains extensive coverage of the various types of contract modifications. The requirements apply to both new construction and repair and overhaul contracts, where appropriate, unless otherwise indicated.

a. Only Contracting Officers acting within the scope of their authority are empowered to execute contract modifications on behalf of the Government. Other Government personnel must not:

   (1) Execute contract modifications.

   (2) Act in such a manner as to cause the contractor to believe that they have authority to bind the Government.

   (3) Direct or encourage the contractor to perform work that should be the subject of a contract modification.

b. Contract modifications, including changes that could be issued unilaterally, must be priced before their execution if this can be done without adversely affecting the interest of the Government. If a significant cost increase could result from a contract modification and time does not permit negotiation of a price, at least a maximum price must be negotiated unless impractical.

2.15.3 Types of Contract Modifications. There are two types of contract modifications: bilateral and unilateral.

a. A bilateral modification (supplemental agreement) is a contract modification that is signed by the contractor and the Contracting Officer. Bilateral modifications are used to:

   (1) Make negotiated equitable adjustments resulting from the issuance of a change order.

   (2) Definitize letter contracts.

   (3) Reflect other agreements of the parties modifying the terms of contracts.

b. A unilateral modification is a contract modification that is signed only by the Contracting Officer. Unilateral modifications are used to:

   (1) Make administrative changes.

   (2) Issue change orders.

(3) Make changes authorized by clauses other than a changes clause (e.g., Property clause, Options clause, Suspension of Work clause, etc.).

(4) Issue termination notices.

2.15.4 Order of Preference for Contract Modifications. The order of preference for contract modifications is:

a. Fully adjudicated supplemental agreement.

b. Maximum or minimum priced supplemental agreement.

c. Un-priced, time-adjudicated; supplemental agreement, time only.

d. Change order.

2.15.5 Notification of Contract Changes.

a. When a contractor determines the Government has affected or may affect a change in the contract that has not been identified as such in writing and signed by the Contracting Officer, it is necessary that the contractor notify the Government in writing as soon as possible. This must permit the Government to evaluate the alleged change and perform the following:

(1) Confirm that it is a change, direct the mode of further performance and plan for its funding.

(2) Countermand the alleged change.

(3) Notify the contractor that no change is considered to have occurred.

b. The clause at reference (q):

(1) Incorporates the policy expressed in sub-paragraph a.

(2) Requires the contractor to notify the Government promptly of any Government conduct that the contractor considers a change to the contract.

(3) Specifies the responsibilities of the contractor and the Government with respect to such notifications.

2.15.6 Funding. The Contracting Officer must not execute a contract modification that causes or must cause an increase in funds without having first obtained a certification of funds availability. The certification must be based on the negotiated price, except that modifications executed before agreement on price may be based on the best available estimate of cost. The exception is for modifications to contracts that:

a. Are conditioned on availability of funds.

b. Contain a limitation of cost or funds clause.

2.15.7 Notification of Substantial Impact on Employment. The Secretary of Defense is required to notify the Secretary of Labor if a modification of a major defense contract (over $5,000,000) or subcontract (over $500,000) must have a substantial impact on employment. This requires the contractor notify the Contracting Officer when a contract modification must have a substantial impact on employment.

2.15.8 Identification of Foreign Military Sales Contract Modifications. Each Foreign Military Sales (FMS) modification must be identified by clearly stamping or otherwise indicating "FMS Requirement" on the face of the modification. It also must specify within the modification each FMS case identifier code by line or sub line item number, e.g., FMS Case Identifier GY-D-DCA.

2.15.9 Change Orders. Government contracts contain a "Changes" clause that permits the Contracting Officer to make unilateral changes, in designated areas, within the general scope of the contract. These are accomplished by issuing written change orders on Form SF 30, Amendment of Solicitation/Modification of Contract (SF 30), unless otherwise provided. The contractor must continue performance of the contract as changed, except that in cost-reimbursement or incrementally funded contracts the contractor is not obligated to continue performance or to incur costs beyond the limits established in the "Limitation of Cost or Limitation of Funds" clause. The Contracting Officer may issue a change order by electronic message under unusual or urgent circumstances provided that:

a. Copies of the message are furnished promptly to the same addressees that received the basic contract.

b. Immediate action is taken to confirm the change by issuance of an SF 30.

c. The message contains similar information to that required by the SF 30 (except that the estimated change in price is not to be indicated), including in the body of the message the statement, "Signed by (Name), Contracting Officer".

d. The Contracting Officer manually signs the original copy of the message.

2.15.9.1 Authority to Issue Change Orders. Change orders are to be issued by the Contracting Officer except when authority is delegated to an ACO. This authority has been delegated by COMNAVSEA to RMC Contracting Officers.

2.15.9.2 Change Order Accounting Procedures. Contractors' accounting systems are seldom designed to separate the costs of performing changed work. Therefore, before prospective contractors submit offers, the Contracting Officer should advise the contractors of the possible need to revise their accounting procedures to comply with the cost segregation requirements of the Change Order Accounting clause in reference (q). The following categories of direct costs can be made separate and accountable under the terms of the "Change Order Accounting" clause:

a. Nonrecurring costs (e.g., engineering costs and costs of obsolete or re-performed work).

b. Costs of added distinct work caused by the change order (e.g., new subcontract work, new prototypes or new retrofit or back-fit kits).

c. Costs of recurring work (e.g., labor and material costs).

2.15.10 Change Order Documentation. When changes are not forward-priced, they require two documents: the change order, and a supplemental agreement reflecting the resulting equitable adjustment in contract terms. If an equitable adjustment in the contract price or delivery terms or both can be agreed upon in advance, only a supplemental agreement need be issued. However, administrative changes and changes issued according to a clause giving the Government a unilateral right to make a change (e.g., an "Option" clause) initially require only one document. In situations where an un-priced or undefinitized change is issued, the change must generally be

sufficiently definitive so that the contractor is obligated to total performance within a stated period of time for a maximum not-to-exceed price that the Government can be charged under the change order. Exceeding this price is not an item subject to negotiation with the Government. The maximum not-to-exceed price must bear a reasonable relationship to the work to be performed. All such un-priced or undefinitized changes are to contain definitization schedules that provide for definitization by the earlier of two periods. The first is the end of a 180-day period beginning on the date of issuance of the change. (This period may be extended, as required, but may not exceed the 180-day period beginning on the date the contractor submits a qualifying proposal.) The second is the date on which the amount of funds expended under the change order is equal to more than 50 percent of the maximum not-to-exceed price.

2.15.11 Definitization. Contracting Officers must negotiate equitable adjustments resulting from change orders in the shortest practical time. ACOs negotiating equitable adjustments are to obtain the Contracting Officer's concurrence before adjusting the contract delivery schedule.

2.15.12 Complete and Final Equitable Adjustments. To avoid controversies that may result from a supplemental agreement containing an equitable adjustment as the result of a change order, the Contracting Officer must:

a. Ensure that all elements of the equitable adjustment have been presented and resolved.

b. Include in the supplemental agreement, a release similar to the following:

"CONTRACTOR'S STATEMENT OF RELEASE"

"In consideration of the modification(s) agreed to herein as complete equitable adjustments for the contractor's _____ (describe) _____ proposal(s) for adjustment, the contractor hereby releases the Government from any and all liability under this contract for further equitable adjustments attributable to such facts or circumstances giving rise to the proposal(s) for adjustment (except for) _____."

2.15.13 Consideration as Command Key Indicator. HCAs are to consider the backlog and age of undefinitized change orders as a command key indicator, placing routine management emphasis on undefinitized change orders.

2.15.14 Forms.

a. Except for the options stated in reference (r) section (a)(2), the SF 30, Amendment of Solicitation/Modification of Contract, must be used for the following:

(1) Any amendment to a solicitation.

(2) Change orders issued under the "Changes" clause of the contract.

(3) Any other unilateral contract modification issued under a contract clause authorizing such modification without the consent of the contractor.

(4) Administrative changes such as the correction of typographical mistakes, changes in the paying office and changes in accounting and appropriation data.

(5) Supplemental agreements.

(6) Removals, reinstatement or addition of funds to a contract.

b. The SF 30 may be used for modifications that change the price of contracts for the acquisition of petroleum as a result of economic price adjustment, termination notices and purchase order modifications as specified in reference (r) section (a)(2). If it is anticipated that a change must result in a price change, the estimated amount of the price change must not be shown on copies of the SF 30 furnished to the contractor. The Optional Form 336 (OF 336), Continuation Sheet or a blank sheet of paper, may be used as a continuation sheet for a contract modification.

2.16 CLAIMS POLICY.

2.16.1 Definitions and Approval Levels. A claim is defined in reference (a) part 5233. A written demand or written assertion by the contractor seeking the payment of money exceeding $100,000 is not a claim under the Contract Disputes Act (CDA) of 1978 until certified as required by the Act and reference (a) part 5233. The contractor must request a Contracting Officer's decision under the CDA of 1978. All claims, regardless of amounts, must be reported to NAVSEA 024 by the RMC Contracting Officer. Claims received in the field must be handled by the RMC. This includes reviewing the claims for sufficient processing, unless the specific circumstances of a claim dictate that NAVSEA Headquarters must handle these matters. NAVSEA 024 must notify the RMC in such cases. If all data necessary to adequately support the requested compensation is included in the contractor's submission, a contract modification should be executed so that payment can be made. Any submission from a contractor requesting payment beyond the obligations covered in the contract, which does not request a Contracting Officer's decision under the Disputes Act and contains the claim certification (if applicable), is considered a claim.

2.16.2 Claims Prevention. NAVSEA's policy is to try to resolve all contractual issues by mutual agreement at the Contracting Officer's level without litigation. In appropriate circumstances, the Contracting Officer should consider the use of informal discussions between parties or individuals who have not participated substantially in the matter in dispute to aid in objectively resolving the differences. Any issue that remains unresolved between the contractor and the Navy represents a potential claim. To minimize the potential for claims, Navy personnel are expected to be aware of problem areas and to keep adequate records of events, particularly significant events. Matters having potential problems raised with or by the contractor must be fully documented and brought to the attention of the responsible Contracting Officer for prompt resolution. Issues leading to claims are often based on assessments made, opinions expressed or other actions or inactions by Navy personnel that caused the contractor to perform additional work. Lack of schedule adherence or cost control by the contractor may lead the contractor to seek recovery of consequent losses through a claim. Identification of significant actions regarding contractor management and performance must be documented, including actions pertaining to manning, facilities, methods and procedures. Proper analysis of data may lead to the identification and mitigation or avoidance of potential trouble areas. In an effort to prevent claims, the RMC Commanding Officers must:

a. Ensure the participation of all departments in the identification and elimination of potential claims items throughout the procurement process.

b. Avoid, to the maximum practicable extent, all Government actions or inactions that impede contractor performance, particularly those that impede efforts to improve

productivity. Contractors should be encouraged to report any such Government conduct.

c. Monitor contractor performance and ensure that sufficient data is developed during contractor performance to enable prompt and accurate analysis of any claim. Use this same documented data to identify actual and potential problems and to defend against claims, overruns and other problems.

d. Strive to improve the ability to analyze and develop positions on contractor proposals that include delay and disruption, particularly those involving an allegation concerning cumulative effects. This requirement is closely related to the requirements regarding monitoring of contractor performance.

e. Conduct claims avoidance presentations periodically to ensure that CAO personnel are instructed in claims avoidance procedures. Emphasis should be placed on increasing the effectiveness of the local claims avoidance program.

f. Assess contractor responsibility, through pre-award surveys and records of past performance under Government contracts, to ensure that award is made only to those companies that are capable of meeting the contract requirements.

g. Maintain lines of communication with PCOs to ensure that the lessons learned while administering current contracts can be used to benefit the Navy when planning and drafting future contract actions.

h. Promptly review all new contracts assigned for administration and identify all clauses, provisions, specifications and any other contract requirements that are new to the CAO or have the potential for causing a claim if not properly administered. CAO personnel must be properly briefed. These requirements also apply to job orders and modifications, where appropriate.

i. Adhere to requirements for properly documenting significant contract events.

2.16.3 Processing Claims and Requests for Equitable Adjustment. Contracting Officers must be familiar with the CDA of 1978 which establishes procedures and requirements for asserting and resolving claims by or against contractors arising under or relating to a contract subject to the Act. The Act provides for payment of interest on contractor claims, for the certification of contractor claims in excess of $100,000, and for a civil penalty for contractor claims that are fraudulent or based on misrepresentation of fact. For claims exceeding $100,000 the Act requires the Contracting Officer's Final Decision (COFD) within 60 days or notification to the contractor of the time within which the COFD must be issued. A direct appeal to the Armed Services Board of Contract Appeals is allowed if there is an undue delay in issuance of the COFD, under such circumstances, the FAR considers such actions to be deemed denial of the contractor's claim.

a. Fleet Support Contracts Division (SEA 024) must have overall responsibility for NAVSEA claims settlement as specified here:

(1) Provide direction and assistance to field activities relative to claims and Requests for Equitable Adjustment (REA), as requested.

(2) Assign claims for processing.

(3) Process particular claims and REAs that are deemed to be of a precedent-setting nature, as determined by Headquarters.

(4) Provide technical support to field claims and REA teams, as requested.

(5) Compile and report status and statistics relative to claims and REAs which are either active, settled or under appeal.

(6) Review and approve all field-originated COFDs under disputes which are valued by the contractor at $1 million or over. Review and revision must be done in conjunction with NAVSEA 00L for evaluation of entitlement, accuracy and completeness. Following Headquarters' review and approval, the COFD must be returned to the ACO for execution and delivery to the contractor.

(7) Budget for, control and allocate the required resources for Headquarters' claims management efforts, including computer services and litigation support contracts.

(8) Support field efforts to secure funding for claim settlement.

b. RMC Contracting Officers must report all claims, regardless of amount, and REA claims of $250,000 and over to NAVSEA 024 and forward copies of all claims and reported REAs within one week of receipt. NAVSEA must report any claims in excess of $1 million to Assistant Secretary of the Navy (Research, Development and Acquisition) within one week after receipt. The cognizant RMC must be responsible for establishing a claim analysis team and for assigning to the team a Contracting Officer or negotiator to act as the Claims Team Manager, an engineer to be the Claims Team Engineer, and additional personnel (Legal, Defense Contract Audit Agency Auditor or Project Officer) as necessary for effective claim processing. The claim analysis team should be physically separate from the rest of the RMC operation and must not include personnel involved in the claim allegations.

c. REAs and claims often involve complex legal, factual and financial issues. These issues normally require extensive fact-finding and analyses. A system of checks and balances is needed to determine entitlement, if any, and any expenditure of Government funds. In REA and claim submissions, contractors often fail to differentiate between factual and judgmental assertions or fail to support all assertions with specific evidence; such submissions only serve to delay the process and frustrate the contractor and the Government. Rejection and return of the REA or claim is required should the documentation and support remain deficient. Before the claim can be evaluated and payment made for any Government-responsible costs, the contractor must provide data that illustrates that all claimed costs are accurate and the Government is responsible for the claimed costs.

d. Preliminary review of the claim must be made to determine acceptability and regulatory compliance. On REAs and claims with allegations proposing an impact of delay, disruption (local and cumulative), congestion, and acceleration and in cases involving specific constructive changes, the following or similar documentation (to the extent applicable and practicable) needs to be included in the claim or REA to enable

Government evaluation and to avoid the rejection and return of the submission to the contractor as unsupported:

(1) The assertions must be supported by specific evidence (including applicable historical evidence such as bid and planned costs supported by shop-level production data from contractor's books and records). In general, the Government must not acknowledge damages based on a reason-value or total cost concept. The contractor must establish a causal link or connection between the alleged Government-responsible act and the increased costs. Opinions, conclusions or judgmental assertions not supported by such evidence or by a sound and reasonable rationale are without probative value and are unacceptable.

(2) Claimant's documentation or charts of production manning for all trades and all projects throughout the period of performance, proposed and actual, should be available.

(3) A copy of the claimant's master schedule originally developed to support work items or packages as well as start and finish milestones must be included. Documentation supporting all updates and the interrelationship of schedule slippage with REA or claim items, sequence, data, etc. should also accompany a claim or REA.

(4) Claimant's shop manning requirements for all trades through period (proposed and actual) of performance must be provided.

(5) Contractors must provide basic bid data broken down into prime contractor hours by item with prime contractor responsibility, prime contractor material by item number, identification of material source and price bid, and the subcontracted portion of the basic bid, by item, with copies of subcontractor contracts definitizing the tasks to be performed by the subcontractors and the material to be supplied by the subcontractor as part of the basic bid. The total of all items must equal the bid price, or an explanation must be provided.

(6) Contractor must provide its planned or budgeted man-hours after contract award for each item by trade and define whether the hours were performed by the prime contractor or subcontractor at a regular or premium time.

(7) Claimant's actual man-hours expended for each work item by trade excluding modifications as performed by the prime contractor and subcontractors must also be included. Documentation needs to support the prime contractor's actual material costs for the basic job order and subcontractor costs and if the subcontractor has made a demand on the prime contractor. Hours should be broken down by straight time and premium time hours.

(8) A listing of all contract modifications by work item with the man-hours proposed, budgeted, agreed to and actually expended by modification must be provided.

(9) A breakdown of the entire claimant's overtime expended by work item or modification by trade, weekly through the contract performance period must be provided.

(10) Copies of all individual purchase orders, invoices and receipts for payment of all subcontracts and material in support of REAs or claims must be provided.

(11) A written description by sequence, providing a logical, auditable trail, of the interrelationship between the as bid, as planned, and the actual as accrued schedule by work item distinguishing item labor hour details by trade and the event causing the delay or disruption must be provided.

(12) A copy of all RMC written work authorizations ("authorized work chits") against any disputed effort included in the claim must be provided.

e. There is no privity of contract between the Government and subcontractors. Subcontractors' claims exist between the prime contractor and the subcontractor. The Government is not in a position to consider subcontractor claims that are simply passed through the prime contractor to the Government by a letter of transmittal. The prime contractor must provide the Court of Appeals certification required and submit the claim on behalf of the subcontractor in order for the Government to evaluate the claims.

f. All REAs or claims involving subcontractors must establish the prime contractor's damage, payment for damage or commitment to pay damage. Prime contractor's claims that show no commitment to pay the subcontractor do not constitute damage. The prime contractor must evaluate the subcontractor's claim, obtain objective evidence and demonstrate that cause and effect were beyond the control of the prime contractor's prudent management business practices. The prime contractor must definitize what positive management actions were taken to minimize the prime contractor's exposure. A "Reason-Value" concept must not be accepted by the Government for subcontractor submittals. Prime contractors are to be cautioned to analyze subcontractor allegations thoroughly under prime contractor certification. When a contractor submits a claim exceeding $100,000, the CDA requires the contractor to make certain representations above the claim in the form of a certification. The claim certification must be per reference (a) part 5233.

g. Certification is necessary before a Contracting Officer can consider the claim, analyze it and issue a final decision. The contractor should properly certify the claim prior to submission to the Contracting Officer. When a contractor must certify the claim, supporting data and the amount of the contractor's entitlement must also be certified. To submit a proper certification, the person who signs the certification must have authority to bind the contractor with respect to the claim. An individual SF 1411, Contract Pricing Proposal cover sheet, must be submitted for each element of the contractor's REA or claim at the time of submission, for any material revision of the REA or claim, and prior to the execution of a settlement agreement on each element.

h. According to the provisions of the CDA, the Contracting Officer must issue a decision on any submitted claim of $100,000 or less within 60 days from the receipt of a written request for a decision from the contractor. For claims of more than $100,000,

the Contracting Officer must, within 60 days, either issue a decision or notify the contractor of the time when a decision must be issued. The time established must be "reasonable", based on such factors as the size and complexity of the claim, and the adequacy of the information in support of the claim provided by the contractor.

2.17 MAINTENANCE CENTERS.

2.17.1 Regional Maintenance Center Procedures and Reports. For processing constructive changes, local instructions and procedures must be prepared and issued to ensure that the regulatory requirements are met. Copies of the local instructions and procedures, and all revisions thereto, must be submitted to NAVSEA 024. The following must be considered when preparing local instructions and procedures:

a. The occurrence of a constructive change is to be treated as a serious action similar to a violation of the administrative control of funds.

b. RMC personnel involved in planning and Quality Assurance of contracted work should be thoroughly briefed on the requirements of this chapter, with emphasis on the limitation of their authority to direct the contractor to perform work.

c. A follow-up procedure must be established to ensure timely replies for RMC correspondence to NAVSEA, contractors and other organizations when such correspondence requires action by them, and when delays could result in a constructive change if correspondence is not promptly answered.

d. Reports must be submitted by the head of a department to the RMC Commanding Officer when personnel of the department are responsible for a constructive change. The penalties to be recommended in the report should be similar to those that would be imposed for a violation of the administrative control of funds. The report must contain a complete explanation of the circumstances that led to the constructive change, the status of the vessels for which the constructive change is applicable, and an estimate of cost for the change.

e. A report must be submitted to NAVSEA 04X when NAVSEA Headquarters personnel are responsible for a constructive change. This requirement would apply, among others, to constructive changes incurred as the result of actions of audit or review teams other than RMC teams.

f. The Contracts Officer and legal counsel, when assigned to the RMC, must concur with controversial correspondence to the contractor not signed by a Contracting Officer. RMC personnel are not required to report failure of visiting personnel to send standard visit request letters prior to the visit, but must be responsible for the preparation of reports delineating the status of any unresolved problems, agreements made and dates requested from the contractor.

g. Constructive changes must be resolved as soon as is practical. In no case is a constructive change to be held for resolution as part of an overall claim under the contract or for resolution as part of final settlement, unless approved by NAVSEA. If the RMC considers that delayed resolution would be in the best interest of the Government, the prior concurrence of NAVSEA 024 must be obtained.

2.17.2 Operational Deficiencies. Local procedures for the processing of deficiency reports to identify operational deficiencies must be developed and agreed to by all parties involved (i.e., the RMC, PCO and contractor). The definition of operational deficiency must be developed by the RMC and Ship's Force. Items noted during inspection that require alterations to ship design (potential constructive changes) will be prescreened by the RMC prior to transmittal to the contractor. All personnel involved must be briefed on local procedures that govern the processing of deficiency reports. The procedures must provide for coordination with the inspections of the RMC's Quality Assurance personnel.

2.17.3 Regional Maintenance Center Authority to Formalize Identified Constructive Changes.

a. Except for contracts containing reference (q), the RMC may recognize an identified constructive change and prepare and approve a covering Supplemental Agreement or Field Modification Request (FMR) only when all of the following prerequisites have been met:

   (1) The constructive change is the responsibility of a person in the RMC office.

   (2) Reporting procedures have been complied with by the appropriate head of the department.

   (3) Funds for reservation purposes are available in RMC in the amount of the estimated cost of the change.

   (4) The work is actually beyond the contract requirements and resulted in a benefit to the Government, and the contractor didn't perform work voluntarily.

b. It must be work that would have been authorized by a contract change if proper procedures had been followed. For repair work, Supplemental Agreements may be approved by the ACO. For new construction related contracts (e.g., Post Shakedown Availabilities), only the person designated in writing may approve the change and the issuance of an FMR.

c. If the contract contains reference (q), the contractor is required to notify the Contracting Officer of the issuance of the constructive change and, other than in a situation described in the clause, is not to proceed with the change unless and until the Contracting Officer has responded to such notice per the clause. The authority to approve and issue an FMR in such a situation is the same as for Engineering Change Proposals. In addition, any prerequisite listed applies to determinations under this section.

2.17.4 Processing Identified Constructive Changes. When a constructive change has been identified, it must be processed in the format and following the procedures required for Engineering Change Proposals, unless such procedures hinder the requisite expeditious processing of the constructive changes or conflict with the stated time requirements of specific contract clauses for response to such changes.

2.18 CONTRACT CLAIMS.

2.18.1 Claims Program. RMCs must establish a claims program. NAVSEA 02 may be contacted for assistance in accomplishing this. A claims program should not be confused with

claims avoidance. Claims avoidance, although extremely important, is just one aspect of a claims program. The purpose of a claims program is to:

a. Determine the basis for claims.

b. Generate, analyze and store data related to the claim.

c. Analyze the merits of claims through the preparation of TARs.

d. Resolve claims.

2.18.2 Common Basis for Claims. The basis for claims can be broadly categorized into breaches of contract, insufficient compensation for formal change, late or defective GFP or GFI and constructive changes.

2.18.2.1 Breach of Contract. A breach of contract is defined as an unexcused nonperformance of a contract occurring when one party to a contract fails to perform wholly or in part, gives notice beforehand that the contractor will not perform the contract when the time for performance arrives (anticipatory breach) or makes performance impossible for themself or for other party.

a. A breach of contract gives the injured party the right to collect damages. Additionally, the party harmed by the breach may sometimes be excused from performing that party's part of the contract.

b. Damages are an award to compensate an injured party for the harm suffered because of the breach of contract. Damages for breach of contract are awarded to place the injured party in a position as good as it would have been in had the contract not been broken. Damages are not awarded to punish the party who has breached the contract. Therefore, if the innocent party is not ultimately harmed by the breach, the innocent party can collect only "nominal damages" (e.g., the costs of the legal action). In general, the courts attempt to fulfill the injured party's reasonable expectancy of profit or benefit from the contract.

2.18.2.2 Insufficient Compensation for Formal Change. Claims for insufficient formal change compensation may arise when contractors believe adjudicated contract modifications for formal changes have been insufficiently compensated or when an agreement with the Government on the equitable adjustments for non-adjudicated formal changes has not been reached. In the first case, contractors normally assert Government responsibility for additional impact costs such as disruption beyond that recognized in contract modifications covering formal changes. Contractors usually allege unforeseen costs and circumstances associated with implementing a particular change or cumulative effects of formal and informal changes and attack any caveats or attempt to overcome any claim release language included in the modifications. In the second case, contractors simply assert the Government's offer for equitable adjustment is inadequate.

2.18.2.3 Late or Defective Government Furnished Property and Information. When a contract obligates the Government to provide GFP and information to a contractor, the Government must provide it by the date specified, or if no date is specified, whenever the contractor reasonably requires it. Failure to do so may entitle the contractor to an equitable adjustment. The GFP or GFI must be suitable for its intended use or purpose when the contractor receives it, unless the contract provides otherwise, or the contractor may similarly be entitled to an equitable

adjustment. Late or defective furnished Government property and information ranks second only to constructive change orders as the most frequent basis for claims.

2.18.2.4 Constructive Change Orders. A constructive change order is generally recognized as an unwritten change to the contract as a result of Government actions or inactions, which the contractor did not perform voluntarily, and has the effect of requiring the contractor to perform work different from, or in addition to, that prescribed by the terms of the contract. The constructive change order doctrine is a judicially developed doctrine, the purpose of which is to achieve equity. A constructive change is generally held to have occurred when some course of conduct by the Government is treated as the equivalent of a formal change order issued pursuant to the "Changes" clause of the contract; and so the designation "constructive change order".

2.18.3 Receipt of Proposals for Changes. For change orders, the proposal is generally received after execution and issuance of the change order. For repair contracts, this receipt of the proposal is generally 10 days; for new construction contracts, receipt of the proposal is generally 45 days after receipt of the change order. However, these periods may vary or be extended by the Contracting Officer. For supplemental agreements, the time of receipt of the complete proposal must vary with the type of supplemental agreement. For example, complete proposals for fully priced supplemental agreements are received before issuing the modification, and less than a complete proposal may be received for other supplemental agreements. Less than a complete proposal, or no proposal, may be received before issuing a change order.

2.18.4 Contract Misinterpretation. The most common and earliest type of constructive change order occurs where the contractor and the Government disagree on the work necessary to meet contract requirements. In this situation, either the contractor proposed to perform the contract in a certain manner and the Contracting Officer insists a more expensive method is required, or the parties disagree on whether completed work complies with contract requirements. Contractors generally perform following the Government's interpretation to avoid the risk of default but frequently submit a claim later. The basic rule of constructive change in this area has been summarized by the Armed Services Board of Contract Appeals as:

> "Where as a result of the Government's misinterpretation of contract provisions a contractor is required to perform more or different work, or to higher standards, not called for under its terms, the contractor is entitled to an equitable adjustment pursuant to the Changes Article, including extensions of time."

2.18.4.1 Defective Specifications. A second major category of constructive change order occurs when the Government provides defective specifications and the contractor incurs additional expense attempting to perform. The Government's breach of the implied warranty of specifications information is claimed to have occurred when the contractor is required to perform work beyond that originally contemplated by the Government's design specifications.

2.18.4.2 Failure to Disclose Vital Information. Nondisclosure is a change to the contract where the contractor undertakes to perform the contract without knowledge of vital information that affects performance. In order to be liable, the Government must be aware the contractor had no such knowledge, the specifications misled the contractor and did not put the contractor on notice to make inquiry and the Government failed to provide the information.

2.18.4.3 Constructive Acceleration. Excusable delays give the contractor entitlement to schedule extensions. Constructive acceleration occurs when the Government refuses to

recognize a new contract schedule extension based upon excusable delay and demands that the contractor complete performance in advance of the original schedule or complete performance within the original schedule. Acceleration can occur even in the case of non-excusable delay if the Government directs the contractor to accelerate. The Government does have the right to terminate for default in the event of non-excusable delay. The contractor's acceleration efforts need not be successful. A reasonable attempt to meet the completion date is sufficient for recovery should acceleration be found. In some instances, a contractor may accelerate on the contractor's own initiative to assure completion within the contract schedule or even ahead of schedule. The costs of such acceleration are, of course, not recoverable from the Government.

2.18.4.4 Failure to Cooperate or Hindrance of Performance. A category of constructive changes is the failure of the Government to cooperate with the contractor or to administer the contract in such a manner that hinders, delays or increases the cost of performance. These obligations can be expressed or implied. The Government may actively interfere with the contractor, making performance more costly or difficult. If the Government's interference is justified, there is no Government liability. If the Government's action is wrongful, the Government will be held to have breached its implied duty not to hinder or interfere with the contractor's performance. When some Government action is essential for the contractor to perform, the Government will be held liable if the Government wrongfully fails or refuses to take the action. In such cases, the Government is said to have breached its implied duty to cooperate. These implied duties are a part of every Government contract.

2.18.5 Data.

2.18.5.1 Generating, analyzing and storing of data can determine the success of resolving a claim by negotiation or litigation, especially the latter. These actions are necessary to ensure effective involvement by RMCs to monitor contractors' performance adequately, regardless of whether claims are submitted.

2.18.5.2 Significant Events. One of the best approaches to ensure the generation of necessary data to analyze and resolve claims is requiring all relevant data on significant events be promptly generated. A significant event is anything that occurs pertaining to a contract, other than formal contract modifications, having a material impact on cost, quality or delivery. Normally, a separate file should be established for each significant event. An individual should be assigned to ensure that a file is established and all relevant future data is generated and properly filed. A cross-reference on the location of documents that are impracticable to include in the file should be included. Significant events can be caused by either the Government or contractors and include the following:

a. Ship delivery schedule changes or problems.

b. Drawings, designs and specifications that are ambiguous, defective or impossible to perform.

c. Differences in interpretation of contract provisions.

d. Delay and disruption of contractor effort.

e. Changes in method of sequence of work.

f. Late or defective Government-furnished material, property or information.

g. Rejections, rework, waivers and deviations.

h. Planned versus actual performance milestones.

i. Delays in Government actions such as processing engineering change proposals, consent to subcontracts and review of technical data.

j. Contractor error and noncompliance with contract terms.

k. Any other Government or contractor actions or inactions which have the effect of requiring the contractor to perform work different from the work prescribed by the original terms of the contract.

2.18.6 Significant Events Data. Data that should be generated for each significant event should include as a minimum:

a. The nature and pertinent circumstances of the event.

b. The date of the event and the identification of Government and contractor personnel involved, including the name and function of the respective individuals.

c. Identification of any relevant documents involved.

d. The substance of any oral communications related to the event.

e. A statement concerning the possible consequences or effects of the event described upon the contract cost, schedule or technical performance, including manner or sequence of performance.

2.19 RESOLUTION OF DISPUTES. NAVSEA policy is that a dispute between a contractor and NAVSEA should be resolved by the assigned CAO. NAVSEA does not serve as a higher level of appeal for contractors in the event of disagreements between the contractor and the CAO.

2.19.1 Appeals. When a contractor's appeal of a Contracting Officer's decision is received by the ACO, the appeal must be forwarded immediately to NAVSEA 00L and NAVSEA 024 with a copy to the Litigation Office, Contract Appeals Division of the Office of the General Counsel of the Navy. On notification of an appeal, the ACO must compile all documentation and files applicable to the matter appealed.

2.19.2 Negotiations with Appeal Pending. While the Navy is not precluded from seeking further agreement with the contractor after an appeal is filed, all such attempts are to follow Regulatory Requirements.

2.19.3 Third Party Lawsuits. If a third party enters a suit against a contractor who holds a cost-reimbursement or other type of contract under which the judgment of litigation fees might be reimbursable, the ACO should immediately inform NAVSEA counsel and the PCO, forwarding copies of the summons and complaint.

2.20 CONTRACT TERMINATIONS. Reference (c) part 252 grants Contracting Officer the authority to suspend or terminate contracts when it is in the Government's interest. Terminations may be either a Termination for Convenience or a Termination for Default depending on the nature of the termination. A contract may be terminated for convenience for any reason that the Contracting Officer determines would be in the best interest of the Government. Terminations for Default are also performed when it is in the Government's best interest, but the reason for the

termination is based on the contractor's actual or anticipated failure to perform contractual obligations.

2.20.1 Extent of Termination. Terminations can be either partial or complete. A partial termination means the termination of a part, but not all, of the work that has not been completed and accepted under the contract. A complete termination means the termination of all of the work that has not been completed and accepted under the contract.

2.20.2 Effect of Termination. Terminations are very serious matters. Depending on factors such as the dollar amount of the contract, the contractor's financial condition and the availability of other work to the contractor, a termination can severely impact a contractor's financial condition or even drive the contractor into bankruptcy and out of business. The contractor is not the only one hurt, however, as the contractor must terminate any subcontractors under the contract. Further, the contractor must lay off employees unless the contractor has other work to assign to employees working on the terminated contract. Such circumstances frequently result in political involvement.

2.20.3 Termination Contracting Officer. After the Contracting Officer has issued a notice of termination, a Termination Contracting Officer must be assigned to handle the termination actions. Refer to reference (p) for the details of these actions, required notifications, and procedures for negotiating settlements with the contractor.

a. Fortunately, termination of ship repair and modernization contracts is a rare occurrence. It has been necessary to terminate a ship repair contract for convenience of the Government in order to meet unplanned operational commitments. Because of the need to support impending operations, availabilities for these ships may be cancelled or completion dates were greatly accelerated. Contracts can be terminated completely for availabilities that have not begun or can be partially terminated for those availabilities where planned work has to be stopped in order to meet the revised completion date.

b. It should be noted that in the case of PSIA contracts, it is not necessary to terminate the entire contract in order to cancel work on a single availability. In this situation, it is usually a matter of not invoking the option for that availability, or if work has already begun, canceling any remaining work.

2.21 OVERTIME AND MULTI-SHIFT WORK.

2.21.1 Labor. Reference (c) part 222 prescribes contracting policy and procedures for implementing pertinent labor laws and contract clauses. References (s) and (m) also address the application of labor laws to Government acquisitions. Significant terms, as utilized in this section, are defined in reference (c) part 222 and include:

a. "Normal work week" generally means a workweek of 40 hours. Outside the United States, its possessions and Puerto Rico, a work week longer than 40 hours is to be considered normal if the work week does not exceed the norm for the area, as determined by local custom, tradition or law and if the hours worked in excess of 40 in the work week are not compensated at a premium rate of pay.

b. "Overtime" is time worked by a contractor's employee in excess of the employee's normal workweek.

c. "Overtime premium" means the difference between the contractor's regular rate of pay to an employee for the shift involved and the higher rate paid for overtime; it does not include a shift premium.

d. "Shift premium" is the difference between the contractor's regular rate of pay to an employee and the higher rate paid for extra-pay shift work.

2.21.2 Overtime. Contractors must perform all contracts so far as practicable without using overtime, particularly as a regular employment practice, except when lower overall costs to the Government will result or when it is necessary to meet urgent program needs. Any approved overtime, extra-pay shifts and multi-shifts should be scheduled to achieve these objectives. Funds must not be obligated for contingencies that may or may not occur during the performance of the associated contract. Only overtime hours included in the definitized amount for availability are those which both parties agree will be used in executing known and defined work items.

2.21.3 Procedures. Solicitations must not specify delivery or performance schedules that may require overtime at Government expense. In negotiating contracts, Contracting Officers should, consistent with the Government's needs, attempt to ascertain the extent that offers are based on the payment of overtime and shift premiums, and negotiate contract prices or estimated costs without these premiums or obtain the requirement from other sources.

2.21.3.1 Pre-Award Considerations. Regardless of contract type, when cost or pricing data has been submitted, the parties have an opportunity to negotiate the contractor's planned use of overtime. The price or estimated cost agreed to should include appropriate amounts for overtime only when it is required. If cost or pricing data has not been submitted (e.g., when sealed bidding has been used or where competitive negotiation is used, adequate price competition is expected, and the evaluation is to be based solely on price and price related factors), the Government generally does not know, nor does it need to know, what amount of overtime the contractor has planned to use. When it becomes apparent during negotiation of a cost-reimbursement contract, the amount of which is expected to be over $100,000, that overtime will be required in contract performance, the Contracting Officer must secure from the contractor a request for all overtime to be used during the life of the contract so the overtime can be estimated with reasonable certainty. The contractor's request is to contain the information required by reference (t). Based on this and other information, NAVSEA and the NSA will consider the justification for the overtime. Necessary determinations regarding premium payments to be included in the contract price must be made. These determinations are provided to the contractor and to the RMC to administer the contract. The previous requirement does not apply to a cost-reimbursement contract for the operation of vessels or a cost-plus-incentive-fee contract that will provide a swing from the target fee of at least plus or minus 3 percent with a contractor's share of at least 10 percent being contemplated.

2.21.3.2 Fixed-Price Contracts. DoW overtime and multi-shift premium regulations have been established to limit the amount of premium overtime and shift compensation that the Government may allow or consider in pricing. Overtime or shift premiums may not be authorized at Government expense when the contractor is already obligated to meet the required delivery dates without the right to additional compensation. Thus, a contractor performing under a fixed-price contract generally is not entitled, under the overtime regulations, to obtain any compensation for overtime or shift pay in addition to the original contract price. Changes under

NAVSEA fixed-price contracts are not subject to FAR requirements for overtime approval. The responsible RMC has authority to approve overtime work with adjudication of such changes.

2.21.3.3 Cost-Reimbursable and Letter Contracts. Cost-reimbursable and letter contracts require Government approval of contractor overtime and multi-shift premium payments. This contractual control is necessary since the premium payments are subject to audit and reimbursement. The contract provisions may require that all overtime and multi-shift premiums be approved by the Contracting Officer or the duly authorized representative. The terms of individual contracts must be examined to ascertain exact requirements and the applicability of the requirements to overtime and multi-shift premium work by subcontractors. When forwarding any contractor request for overtime or multi-shift premium approvals to NAVSEA, the NSA must ensure that all information necessary to make a determination is included, comment on the accuracy of the facts in the contractor's request and advise whether or not the request should be approved. The responsible Defense Contract Audit Agency office must be requested to provide advice to the RMC with respect to the contractor's request.

a. NAVSEA may authorize the ACO to make determinations and approve overtime under reference (q). When such authority is granted, the NSA is to submit a monthly report of overtime.

b. For changes under cost-reimbursement contracts requiring overtime, the amount of overtime is limited to the ceiling established by NAVSEA for the contract. Any increase in ceiling required due to the change must be authorized by NAVSEA.

c. For repair and overhaul contracts, the responsible RMC accomplishes the NAVSEA functions described, unless NAVSEA 02 has retained responsibility for these functions.

2.21.4 Approval of Overtime.

a. The Contracting Officer must review the contractor's request for overtime. Approval of the overtime may be granted by an agency approving official after determining in writing that overtime is necessary to:

(1) Meet essential delivery or performance schedules.

(2) Eliminate foreseeable extended production bottlenecks that cannot be eliminated in any other way.

b. Refer to reference (c) part 222, reference (a) subpart 5219.7, and reference (m) for additional information regarding approvals.

2.22 SUBCONTRACTS.

2.22.1 Subcontracting.

a. This section prescribes policies and procedures for consent to subcontract and for review, evaluation and approval of contractor's purchasing systems. Subcontracting policies and procedures addressed herein are based upon references (u) section 2306, (v) section 254, and (m). Subcontract consent for repair and overhaul contracts under evolving maintenance strategies require an increased effort by the Contract Administration staff due to:

(1) Even though over 50% of the dollars associated with repair and overhaul contracts are for labor, in many cases the emerging contract strategies have significantly increased the level of subcontracting by the prime contractor.

(2) Many repair and overhaul contracts are PSIA or multiple award contracts wherein the subcontractors are often parties to the Basic Agreements and Terms and Condition established in the original solicitation. For Headquarters procured PSIA contracts, the prime contractor is required to subcontract at least 40 percent of the work to small business.

b. Contractors generally attempt to award at least the major subcontracts shortly after receiving award of the prime contract. For this reason, the NSA should expect and be prepared to provide prompt service in order to avoid delaying the contractor.

c. Subcontract consent is not the sole responsibility of the Contracts Department. Other departments within the NSA should be involved to ensure that all pertinent aspects for which they are responsible are adequately covered in subcontracts. All departments involved in subcontract consent must develop and use checklists to assist in their reviews.

2.22.2 Consent Requirements. If the contractor has an approved purchasing system, consent is required for subcontracts specifically identified by the Contracting Officer in the subcontracts clause of the contract. The Contracting Officer may require consent to subcontract if the Contracting Officer has determined that an individual consent action is required to protect the Government adequately because of the subcontract type, complexity or value, or because the subcontract needs special surveillance. These can be subcontracts for critical systems, subsystems, components or services. Subcontracts may be identified by subcontract number or by class of items (e.g., subcontracts for engines on a prime contract for airframes).

a. If the contractor does not have an approved purchasing system, consent to subcontract is required for cost-reimbursement, time-and-materials, labor-hour or letter contracts, and also for un-priced actions (including un-priced modifications and un-priced delivery orders) under fixed-price contracts that exceed the simplified acquisition threshold, for:

(1) Cost-reimbursement, time-and-materials or labor-hour subcontracts.

(2) DoW, fixed-price subcontracts that exceed the greater of the simplified acquisition threshold or 5 percent of the total estimated cost of the contract.

b. The Contracting Officer's written authorization for the contractor to purchase from Government sources constitutes consent.

c. Refer to the specific contract clauses actually included in each contract to ascertain specific subcontract consent requirements.

2.22.3 Additional Regional Maintenance Center Consent Procedures. The RMC must prepare a local instruction that delineates the field activity organizational responsibilities for conducting required subcontract consent reviews.

a. ACOs must give the contractor's request for consent equal review, whether the ACO has consent authority or must endorse the request(s), to the PCO. The ACO

endorsements to the PCO must contain all necessary information and recommendations for PCO action.

b. The Subcontract clauses permit the ACO to ratify a subcontract that has been placed by the contractor even though prior consent was required. ACOs must not ratify subcontracts as a routine procedure in lieu of granting consent prior to their placement. Ratification should be the exception to the rule and should be granted only on a case-by-case basis. If it appears that the ultimate cost to the Government may have been increased by the placement of the subcontract without consent, the ACO must consult with counsel about placing the contractor on notice that the Government must not be liable for such an increase. If it appears that a change in the contractor's procedures is required to preclude further placement of subcontracts prior to consent, the ACO must direct the contractor to take corrective action.

MEMORANDUM OF UNDERSTANDING
AMONG

COMMANDER, U.S. FLEET FORCES COMMAND (N43)
COMMANDER, U.S. PACIFIC FLEET (N43)
COMMANDER, FLEET AND INDUSTRIAL SUPPLY CENTERS
DEPUTY COMMANDER FOR CONTRACTS, NAVAL SEA SYSTEMS COMMAND
AND
DEPUTY COMMANDER, CONTRACTS, NAVAL SUPPLY SYSTEMS COMMAND

Subj: MEMORANDUM OF UNDERSTANDING

1. PURPOSE: The purpose of this Memorandum of Understanding (MOU) is to definitize implementation of the Commander, Naval Sea Systems Command (COMNAVSEA) and Commander, Naval Supply Systems Command (COMNAVSUP) MOU signed 25 June 2002, for afloat Fleet assets. The MOU required local offices to develop a plan to align contracting responsibility in the most efficient manner. This MOU covers the management of boat, service-craft, ship and all other classes of water-borne vessels that come under the program management of the Naval Sea Systems Command and affiliated Program Executive Offices (PEOs).

2. BACKGROUND: NAVSEA and NAVSUP have developed expertise in various areas of contracted Fleet support. NAVSEA and NAVSUP have partnered to align contracting responsibility within organic shipyards. This MOU aligns Fleet contracting functional responsibility in order to capitalize on the expertise of each organization's skills, to reduce redundancies and overall cost to the Navy, while ensuring conformance with NAVSEA's responsibility for ship contracting and technical authority.

Repairs and alterations aboard ship require: schedule coordination of the contracted and organic workforce; direction and compliance of the technical authority; and processes to ensure quality assurance of services performed. The Regional Maintenance Center (RMC), merging Supervisor of Shipbuilding

Subj: MEMORANDUM OF UNDERSTANDING

(SUPSHIP), and Fleet maintenance activities, is responsible for repairs and alteration of ships and is the principal on-site manager for efficient and effective work, resolution of technical issues and assurance of the delivery of required quality. The complexity of ship repair and maintenance necessitates adherence to the policy that private sector repair contracting requirements identified are contracted for and administered by the RMCs.

3. SCOPE: The scope of this MOU is contracting and execution of commercial ship repair and modernization requirements for all Navy vessels during planned and emergent availabilities.

4. DELINEATION OF CONTRACTING RESPONSIBILITIES:

Headquarters Contracting Authority (HCA) exists in both NAVSEA and NAVSUP for material and services that support ship repair and maintenance. Since HCA may be delegated to a field contracting office, and since functional consolidations are taking place among NAVSEA, NAVSUP, and Fleet activities, appropriate alignment of contracting functions is needed to support the consolidated waterfront effort. The following bullets delineate organizational responsibilities for ship maintenance and modernization contract support.

- RMC serves as the PCO and/or ACO for execution of all shipboard repairs and modernization accomplished by the private sector.

- FISC contracts for government furnished material and engineering/technical services using consolidated contracts with technical requirements established by cognizant technical authority. RMC serves as the ACO for all orders for government furnished material and shipboard services issued by the RMC under contracts awarded by FISC.

- RMC serves as the ACO for private shipyards within the respective regions.

- FISC contracts for habitability and assigns ACO responsibility to the RMC.

Subj: MEMORANDUM OF UNDERSTANDING

- All orders for regional services against the consolidated FISC contracts are originated by an RMC ordering officer formally designated in the contract.

- Regional services provided by FISC contracts under orders issued by the RMC will be accepted by a COR who is formally assigned by the RMC designated ACO.

- If a consolidated FISC contract supporting necessary regional services exists, respective RMCs should utilize that contract. If a consolidated contract does not exist, the RMCs should coordinate with the local FISC to determine the optimal approach to contracting for those services.

- NAVSUP will continue to manage the component depot overhaul programs for non-consumable supply items where a carcass turn-in is involved.

- Contract support for organic shipyards and IMFs will be accomplished in accordance with existing FISC/Shipyard and/or SUPSHIP/Shipyard agreements.

- Ship repair efforts other than in CONUS and Hawaii will continue to be contracted for by the supporting FISC/NRCC under the technical cognizance and quality assurance of the numbered Fleet Commander's maintenance organization.

Questions regarding performance of the contract function will be resolved at the regional level. In the event a resolution cannot be affected at the regional level, the issue shall be raised to NAVSEA 02 and NAVSUP 02 to coordinate resolution.

5. PARTIES TO THE MOU: FFC N43, PACFLT N43, COMFISCS, NAVSEA 02, and NAVSUP 02 are the parties to this Memorandum of Understanding. The MOU is established to strengthen the professional cooperation among their subordinate contracting activities, reduce overlap of contracting responsibility, and achieve contracting efficiencies.

6. EFFECTIVE DATE: This MOU is effective upon the date signed by all parties and shall remain in effect until changed by mutual agreement of the parties.

Subj: MEMORANDUM OF UNDERSTANDING

7. APPROVING OFFICIALS:

Director, Fleet Maintenance,
U.S. Fleet Forces Command

Deputy Chief of Staff for
Fleet Maintenance,
U.S. Pacific Fleet

Commander,
Fleet and Industrial Supply
Centers

Deputy Commander for Contracts
Naval Sea Systems Command

Deputy Commander for
Contracting Management
Naval Supply Systems Command

LISTING OF APPENDICES.

A Master Ship Repair Agreement
B Agreement for Boat Repair

3.1 PURPOSE. The purpose of this chapter is to describe the two primary contracting methods generally employed by the Navy for the procurement of ship repair and modernization work in the private sector.

a. Procurement of individual contracts for each ship repair availability through the use of firm fixed-price contracts awarded under a Master Agreement for Repair and Alteration of Vessels. These agreements exist as either a Master Ship Repair Agreement (MSRA), Appendix A, or an Agreement for Boat Repair (ABR), Appendix B.

b. Procurement of a single contract for multiple availabilities on multiple ships through the use of cost reimbursable contracts. These Private Sector Industrial Activity (PSIA) contracts are usually procured to support several ships of the same class within a specific port.

3.2 POLICY.

3.2.1 Policy Sources. Basic policy is established by references (a) and (b). Reference (a) addresses only the MSRA, while reference (b) addresses both the MSRA and the ABR. Reference (c) provides additional policy established by Naval Sea Systems Command (NAVSEA) 02.

3.2.2 Defense Federal Acquisition Regulation Supplement 217.7102 Policy.

a. The MSRA must be entered into with all prospective contractors, located within the United States, that request ship repair work and possess the organization and facilities to perform such work satisfactorily. Issuance of the MSRA does not indicate approval of the contractor's facilities for any particular acquisition. Activities may also use the MSRA in selected work with prospective contractors located outside the United States, its possessions or Puerto Rico.

b. The Government may issue job orders referencing or by attaching the MSRA for repairs, alterations or additions to vessels belonging to foreign governments, however, there are specific directives that should be referred to concerning repairs to foreign vessels. When repairs and alterations to foreign government vessels are to be acquired under the MSRA, the contracting officer will comply with the Federal Acquisition Regulation (FAR) and Defense Federal Acquisition Regulation Supplement (DFARS), addressing foreign military sales regulations, or other governing provisions of law. The solicitation and job order will identify the vessel and the foreign government.

3.3 AGREEMENTS.

3.3.1 Master Agreement for Repair and Alteration of Vessels. The Master Agreement for Repair and Alteration of Vessels, per reference (a), provides the authority for the Navy and other agencies to utilize special contracting methods for the repair and alteration of vessels. The authority and prerequisites related to obtaining special agreements are identified in reference (a), subpart 71. It is a written agreement, negotiated between a contracting activity and a contractor containing contract clauses, terms and conditions applying to future contracts for repairs, alterations or additions to vessels. The agreement contemplates separate future contracts that will incorporate, by reference or attachment, the required and applicable clauses agreed upon in the master agreement. It is not a contract.

3.3.2 Job Order. A "job order" is a fixed price contract incorporating, by reference or attachment, a Master Agreement for Repair and Alteration of Vessels. It may include clauses pertaining to subjects not covered by the master agreement, but applicable to the job order being awarded. It applies to a specific acquisition and sets forth the scope of work, price, delivery date and other appropriate terms that apply to the particular job order.

3.3.3 Clauses. Appendices A and B are identical in form and content except for the cover sheet and preface. Each must be approved by NAVSEA 02. Appendices A and B are agreements, not contracts, and contain no specifications or statement of work. These two agreements are primarily a compilation of required clauses which are peculiar to ship repair and modernization work and certain general terms and conditions under which the Navy or any other Department of Defense agency can issue firm-fixed-price job orders for efforts involving repairs, alterations or additions. The clauses which are to be included in each agreement are listed in reference (a), subpart 7104. Only firm fixed-price job orders may be awarded in conjunction with these agreements, and the associated job orders may only be issued to contractors who hold a current NAVSEA approved "Agreement". The job order applies to a specific acquisition and describes the scope of work, price, delivery date and additional matters peculiar to the requirements of the specific acquisition. The job order incorporates the clauses from the applicable agreement as well as all the other contract clauses and terms and conditions which are appropriate for the specific contract effort by reference or appendage. The Deputy Commander for Contracts, NAVSEA 02, has issued and maintains a standard solicitation package that is mandatory for use

by the NAVSEA Designated Certifying Official and by the Contracting Officer at the Regional Maintenance Centers (RMC) when processing an application for the agreements. Contracting Officers must ensure that the applicants' responses to the standard solicitation package follow NAVSEA 02 direction.

3.4 ELIGIBILITY REQUIREMENTS FOR MASTER SHIP REPAIR AGREEMENT AND AGREEMENT FOR BOAT REPAIR PROGRAM.

3.4.1 Major Requirements for a Master Ship Repair Agreement Certification.

a. The most significant eligibility requirements set forth in reference (b) are that a Contractor must:

(1) Be capable of accomplishing a Selected Restricted Availability on a FFG 62 class ship or larger.

(2) Have the capability to perform at least 55% of a Selected Restricted Availability on a FFG 62 class ship using their own facilities and their own workforce.

(3) Possess or have access to a pier with the requisite support and technical services available. (There is no requirement for a dry dock.)

b. While it is not a specific requirement for obtaining an MSRA, the contractor must be capable of providing a "Remote Site Work Performance Plan" to the Contracting Officer prior to issue of the job order that permits the start of the work performance period.

3.4.2 Master Ship Repair Agreement Requirements. The complexity of ship repair and the conditions under which work is performed require that NAVSEA contract only with ship repair companies that are fully capable of conducting most aspects of shipboard work. The compact arrangement of machinery and systems aboard ship, the sophistication of systems installed in Navy ships and the Navy's absolute requirement for reliable operation create a unique repair environment that demands special experience and capability.

a. A thorough understanding of these effects and the ability to manage shipboard work as an integrated package are absolutely essential. Naval ships are designed and built with a high degree of interaction among components and systems. Repairs or modifications to a single system or component may have widespread effects on the operation of many other systems or components that are physically remote from the one being repaired.

b. The ability to co-ordinate a wide variety of concurrent tasks among numerous people with a wide mix of skills. These tasks may include:

(1) Advance planning and scheduling.

(2) Engineering.

(3) Subcontractor management.

(4) Material identification and procurement.

(5) Material or Integrated Logistics Support management.

(6) Manpower scheduling.

(7) Work site preparation.

(8) Ripping out and removal of interferences.

(9) Handling, removal and disposal of hazardous materials or wastes.

(10) Removal, disassembly, repair and reassembly.

(11) Reinstallation and test.

(12) Restoration and test of interferences.

(13) Work site restoration.

(14) Quality assurance.

(15) Integrated system testing.

(16) Correction of documentation.

c. Timeliness and quality control are of utmost importance in ship repair so that a ship may return to and remain in a mission-ready state until the next scheduled maintenance.

d. Limits on Navy resources affect the ability of RMCs to coordinate the work of multiple contractors during an availability on the same ship. If the work is subdivided among several contractors, the Navy must either perform this coordinating role or schedule the work sequentially, which may increase the overall time required for repairs. Time and quality considerations require that prime contractors who are capable of managing the whole job be given full responsibility, which includes managing subcontracted work.

3.4.3 Additional Requirements. MSRA contractors are required to be capable of utilizing their own facilities and work force to perform 55 percent of a Selected Restricted Availability work package on a ship of FFG 62 Class size or larger when the ship is located at a contractors' own or leased facilities or at government provided piers or drydock. Further, the MSRA contractor must be capable of subcontracting for those elements beyond their managerial, technical or physical capability or capacity. MSRA contractors must also manage and assume full responsibility for the integrated scheduling, cost and quality of subcontractor performance.

a. The MSRA contractor must be a company recognized as engaged in ship repair work. The MSRA contractor must possess an organization capable of the full scope of planning, engineering, quality control, shipboard or off-ship production, ship and crew security and component/system testing and trials.

b. A competent contractors' organization must include the established organizational elements as set forth here. These characteristics will be evaluated during the application process to determine a firm's eligibility for an MSRA and periodically after the Agreement is in place:

(1) Administration or Management Control.

(2) Financial Control (evaluated by the Defense Contract Audit Agency).

(3) Production Control.

(4) Production Technical Support.

(5) Material or Procurement Control.

(6) Subcontractor Control.

(7) Quality Control or Test and Trials.

(8) Safety.

(9) Security in compliance with Force Protection Mandates.

(10) Hazardous Material or Waste Control.

(11) Facilities. Although facility requirements may vary with the work authorized for a specific ship, the MSRA holder must be a ship repair company that possesses or has available the following facilities:

(a) Pier, with services in place in the immediate homeport area which a FFG 62 Class size ship can access and at which it can be berthed.

(b) Structural Shop.

(c) Machine Shop.

(d) Pipe Shop.

(e) Electrical or Electronics Shop.

(f) Carpentry Shop.

(g) Rigging Equipment.

c. Further, ship repair firms are evaluated on their ability to accomplish several kinds of work. These include, shipfitting types of work, sheet metal work, welding, pipefitting, machinist or mechanical (shop and marine) work, electrical work, electronics, woodworking and rigging.

3.4.4 Remote Site Work Performance Plan. To enable an MSRA holder to be awarded a job order to work at a site other than the home location, the MSRA holder must submit a remote site performance plan acceptable to the responsible RMC Contracting Officer located in that remote site. The plan must address management of the effort, production control, hazardous waste and material control, technical support, material procurement and control, subcontracting, safety, security and quality control. The plan must also include a hazardous waste generator number issued to the MSRA holder for that specific remote site.

3.4.5 Agreement for Boat Repair Requirements.

a. To qualify for an ABR, a contractor must be primarily engaged in ship, boat or craft repair.

b. Reference (d) lists codes “for use in the classification of establishments by type of activity. Each establishment is assigned an industry code on the basis of its primary activity”.

c. Prospective ABR contractors must provide sufficient documentation to the responsible RMC to indicate that they meet the general criteria of one of the following applicable reference (d) codes. (Documentation can include the contractor's listing, including one of the listed Standard Industrial Classification codes, in the latest editions of Standard and Poor's Register of Corporations, Dunn and Bradstreet Reference Book or any similar publication.)

3.4.6 336611 Ship Building and Repairing. This code involves establishments primarily engaged in building and repairing ships, barges and lighters, whether self-propelled or towed by other craft. This industry also includes the conversion and alteration of ships and the manufacture of offshore oil and gas well drilling and production platforms (whether self-propelled or not). Establishments primarily engaged in fabricating structural assemblies or components for ships, or subcontractors engaged in ship painting, joinery, carpentry work and electrical wiring installation, etc., are classified in other industries.

3.4.7 336612 Boat Building and Repairing. This code involves establishments primarily engaged in building and repairing boats.

a. In addition to meeting the general criteria of either reference (d) codes, an ABR contractor must possess the same basic characteristics listed for MSRAs, but to a lesser degree. Reference (b) clearly delineates these characteristics.

b. Since ABR firms have the potential to perform a diverse scope of repair work, from boat or craft overhauls to selected topside repairs to major vessels, ABR firms will also be evaluated on their ability to accomplish the following: shipfitting type work, sheet metal work, welding, pipefitting, machinist or mechanical (shop and marine), electrical, electronics, woodworking and rigging.

c. ABR Contractors are required to have a "Remote Site Performance Plan" if they intend to work at a site other than their home location.

3.5 RESPONSIBILITIES APPLICABLE TO THE MASTER SHIP REPAIR AGREEMENT OR AGREEMENT FOR BOAT REPAIR PROGRAM.

3.5.1 Contractors. Contractors that do not hold an MSRA or ABR, but have the managerial, technical and facilities capabilities and capacities to conduct ship or boat repairs may make application to NAVSEA through the responsible RMC. The basic application package consists of two standard forms:

a. Facilities Available for the Construction or Repair of Ships, SF 17.

b. Solicitation Mailing List Application, SF 129.

3.5.2 Contracting Officers at Regional Maintenance Centers.

a. Ensure that all private shipyards, in their respective area of cognizance, that are applying for an MSRA or ABR understand the requirements of reference (b).

b. For all new applicants, contact the responsible Defense Contract Audit Agency. Request that a formal financial capability evaluation be conducted which at a minimum should provide an evaluation of the firm's accounting system, its ability to segregate costs, determine current and acid test ratios, credit availability and whether accounts payable are aging.

c. After verifying that the application is complete and obtaining the Defense Contract Audit Agency Audit, forward the application for an MSRA or ABR to NAVSEA 04Z, with a copy to Mid-Atlantic Regional Maintenance Center, Code 400.

(1) Inform the contractor by means of a separate letter that the application has been sent to NAVSEA.

(2) Upon request from the NAVSEA Designated Certifying Official, provide team members in support of MSRA or ABR certification and recertification surveys.

d. Recommend to NAVSEA 04Z and 024 that an existing Agreement be cancelled based on the events noted in paragraph 3.6.1 of this chapter.

3.5.2.1 Mid-Atlantic Regional Maintenance Center (Code 400).

a. As the NAVSEA Designated Certifying Official, plan, schedule, coordinate and conduct MSRA or ABR certification and recertification surveys, with NAVSEA 04Z concurrence, and liaison with the RMC to obtain survey team members.

b. Notify the RMC of pending survey schedules so they may provide adequate notice to contractors of the site survey date.

c. Document the site survey findings, develop the survey team recommendation, draft the formal survey report and forward it to NAVSEA 04Z.

d. Maintain the necessary documentation and backup data to support survey team recommendations in the event of contractor debriefings, media inquiries or Congressional correspondence.

3.5.2.2 NAVSEA Director, SUPSHIP Management Group (NAVSEA 04Z).

a. Review all MSRA and ABR survey results to ensure consistent application of the eligibility criteria, provide a recommendation and forward the package to NAVSEA 024.

b. If the recommendation is to cancel an existing MSRA or ABR, obtain NAVSEA 04 concurrence prior to forwarding the package to NAVSEA 024 and 02 for concurrence and forwarding to NAVSEA 00 for approval.

c. Conduct debriefings with MSRA or ABR applicants on survey results and respond to media and congressional inquiries on MSRA or ABR program non-contractual issues.

d. Act as the point of contact and liaison with other agencies such as the Maritime Administration, Military Sealift Command, United States Coast Guard and the Army for MSRA and ABR contractual issues.

3.5.2.3 NAVSEA Fleet Support Contracts Division (NAVSEA 024).

a. Review all MSRA and ABR applications and the recommendations forwarded by NAVSEA 04Z.

b. If the recommendation from 04Z is to cancel an existing MSRA or ABR, obtain NAVSEA 02 concurrence prior to forwarding the package to NAVSEA 00 for approval.

c. As NAVSEA Contracting Officer, issue all MSRAs or ABRs that have been jointly approved by NAVSEA 04Z, and issue correspondence on recertification and denials.

d. Act as the point of contact and liaison with other agencies such as Maritime Administration, Military Sealift Command, the Coast Guard and the Army for MSRA and ABR contractual issues.

e. Provide NAVSEA 04Z and the Contracting Officer at the responsible RMC with copies of the correspondence from NAVSEA 02 to the Contractor.

3.6 PROCEDURES FOR MASTER SHIP REPAIR AGREEMENT AND AGREEMENT FOR BOAT REPAIR.

3.6.1 Period of Agreement.

a. Per reference (a), subpart 71, either party to the Agreement will have the right to cancel the Agreement without affecting the rights and liabilities under any job order in existence at the time of cancellation by giving 30 days written notice. The contractor will perform and complete all work covered by any job order and any modifications entered into prior to the effective date of cancellation. The Agreement will remain in force until canceled by either party. NAVSEA policy requires that the RMC Contracting Officer consider recommending to NAVSEA 04Z and NAVSEA 024 that an Agreement be cancelled for any of the following reasons or events:

(1) Bankruptcy.

(2) Change of firm's name, management or owner.

(3) Default under a job order.

(4) Inclusion in List of Parties Excluded from Federal Procurement and Non-Procurement Programs compiled by the General Services Administration.

(5) Removal or sale of facilities.

(6) Merger.

(7) No longer meeting the standards for award of the agreement.

b. If NAVSEA cancels an Agreement, NAVSEA 02 will issue notification of cancellation upon approval by NAVSEA 00. Likewise, if a contractor cancels an Agreement, NAVSEA will acknowledge the cancellation by letter. (Originals will be sent directly to the Contractor.) NAVSEA 024 will provide copies of letters to the cognizant RMC and NAVSEA 04Z. The RMC will make additional distribution to notify all other interested parties.

3.6.2 Solicitations for Job Orders Outside of Existing Contracts. Per reference (a), subpart 71, when a requirement arises that is determined to be beyond the intended scope of an existing PSIA or similar contract, and the requirement is determined to be for the type of work covered by the MSRA or ABR within the United States, bids, proposals or quotes will be solicited by the RMC Contracting Officer from prospective contractors who have previously executed an MSRA or ABR. If time permits, solicitations can be issued to prospective contractors who have a pending application for an MSRA or ABR, who potentially possess the necessary qualifications to perform the work, and who has requested to participate in the solicitation process.

a. The RMC Contracting Officer will ensure that solicitations are prepared in the Uniform Contract Format and that they comply with reference (c), Sections 14 and 15, and the NAVSEA Standard Solicitation package, as applicable. When the Government invites a contractor to submit a bid or proposal for the repair, conversion, alteration of, or addition to a vessel, the RMC Contracting Officer will include in the solicitation the nature of the work, the date the vessel will be available to the contractor and the date the work is to be completed. The notice will state when bulk ammunition is aboard the vessel.

b. Where practical, the contractor will be given an opportunity to inspect the items of work to be accomplished on the vessel. The contractor will submit a bid, proposal or quotation as requested by the RMC Contracting Officer for the performance of the work described in the solicitation.

3.6.3 Pre-Award Survey for Job Orders and Determination of Eligibility. The Contracting Officer at the RMC will apply the standards set forth in reference (e), subpart 1, for making the determination of responsibility. A pre-award survey of the contractors' operations, including any analysis of the contractors' proposed subcontractors, may be directed before making a responsibility determination. A pre-award survey should be used if there is a concern with the adequacy and suitability of facilities, contractors' management, financial capability and Quality Assurance system, including safety standards, fire protection, hazardous materials and waste control, adequacy of facilities for the health, comfort and welfare of the crew and sufficient plant protection to safeguard the vessel and government property plus other issues at the discretion of the Contracting Officer. To be determined responsible, a prospective contractor must possess the following capabilities under reference (e), subpart 1:

a. Adequate financial resources to perform the contract, or the ability to obtain contracts.

b. Ability to comply with required or proposed delivery or performance schedule, taking into consideration all existing commercial and governmental business commitments.

c. Satisfactory performance record. A prospective contractor must not be determined responsible or non-responsible solely on the basis of a lack of relevant performance history, except as provided in reference (e), subpart 1.

d. Satisfactory record of integrity and business ethics.

e. Necessary organization, experience, accounting and operational controls, and technical skills or the ability to obtain them (including, as appropriate, such elements as production control procedures, property control systems, quality assurance measures and safety programs applicable to production of materials or performance of services by prospective contractor or subcontractor).

f. Necessary production, construction, and technical equipment and facilities or the ability to obtain them.

g. Other qualifications and eligibility to receive an award under applicable laws and regulations.

3.6.4 Award of a Job Order. Per reference (a), subpart 71, Job Orders are to be awarded per reference (f) subpart 4, or reference (g) subpart 5. After the receipt and evaluation of bids or proposals and selection of the contractor, the price for the work and other pertinent data will be

set forth in a job order. This job order is subject to the provisions of the MSRA or ABR. When the acquisition solicitation process has been made under sealed bid procedures, issuance or award of a job order may be accomplished by a warranted contracting officer's signature. When discussions have been held on a negotiated procurement, the job order must be signed by the contractor and returned to the contracting officer for signature prior to award. NAVSEA 02 has determined that all of its purchase activities will use the Uniform Contract Format. When using sealed bidding procedures, RMCs will use Form SF 33, Solicitation, Offer and Award as an award sheet for job orders issued under the MSRA and ABR. Electronic copies of SF 33, along with instructions for completing these forms, are available at the FAR and DFARS web sites.

3.6.5 Emergency Work. As outlined by section 6.302-2 of reference (c), the RMC Contracting Officer may issue a written order for work to a contractor who has previously executed an MSRA without inviting bids or proposals when a vessel, its cargo or stores would be endangered by delay in performing necessary repair work or when military necessity requires immediate work on a vessel. As soon as practical after the issue of such an order, the parties are required by the MSRA to negotiate a price for the work. When agreement is reached upon a price, the responsible contracting officer will issue a job order pricing the work.

a. When emergency work or voyage repairs are necessary and fully justified by the Type Commander, reference (h), subpart 302-2 exception allows a waiver from the requirements of full and open competition "because of unusual and compelling urgency". Reference (i), subpart 302-2, states that the urgency exception may be cited for essential equipment or repair needed at once to comply with orders for a ship when such equipment or repair is required to meet the operational commitment or deployment message of the ship.

b. The procuring activity must prepare a Justification and Approval. The standard format is reference (c) section 53.6-1, Justification and Approval to Approve Other than Full and Open Competition and it can be tailored to local requirements. The requiring activity must certify the requirement and provide data, estimated cost or other rationale on the extent and nature of the harm to the Government if the number of sources is limited due to urgency. The Justification and Approval may be written and approved after contract award when preparation and approval prior to award would unreasonably delay the acquisition. For contract actions over $1 million to be performed under the urgency exception, authorization to proceed will be obtained from NAVSEA 00, Head of Contracting Activity, through NAVSEA 02.

3.6.6 Modification of Master Agreements. Each Master Agreement will be reviewed per reference (a), subpart 71, at least annually before the anniversary of its effective date and will be revised to incorporate all changes made necessary by the revision of the FAR or DFARS. Statutory or other mandatory changes may require review and revision earlier than one year. The agreement, however, may be modified only by mutual agreement of the parties. The Government has the right to cancel the agreement on 30 days written notice when the parties fail to agree on a modification to the Agreement, which is required by statute, Executive Order, FAR or DFARS. A modification to a Master Agreement will not affect any job order issued before the effective date of the modification.

3.6.7 Resolving Inconsistencies Between Master Agreements and Job Orders. The rights and obligations of the parties to a Master Agreement will be subject to and governed by the

provisions of the Master Agreement, the provisions of job orders issued under the Agreement and the drawings, designs, plans and specifications. To the extent of any inconsistency between the Agreement and a job order, including any drawings, designs, plans and specifications, the provisions of the Agreement will govern.

3.6.8 Transfer of Master Agreements. Master agreements are not transferable when a repair yard is sold or undergoes a transfer of title regardless of whether a name change occurs or not. When such a sale or change of title takes place, the Master Agreement may be canceled. If the new owner desires a Master Agreement, the new owner may make application to NAVSEA 04 via the RMC in their geographic region. Previous qualifications of a repair yard for a Master Agreement do not always indicate that the shipyard will be qualified under the new ownership, since different financial and management considerations may be present.

3.7 PRIVATE SECTOR INDUSTRIAL ACTIVITY.

3.7.1 Private Sector Industrial Activity Contract. This specific cost reimbursable contract strategy is addressed in a stand-alone discussion primarily because it is a component of the evolving Fleet Maintenance Strategy and is the contractual instrument that has been approved by higher authority to meet the long-range maintenance and modernization requirements and Force surge requirements to response to Request for Procurement objectives. The goal of the PSIA contract is to provide a maintenance alternative and readily available qualified resources from the Maritime Industrial Base that can be rapidly activated to respond to Fleet surge requirements in addition to supporting scheduled availabilities and continuous maintenance objectives. The PSIA Contractor and approved subcontractors are key "team players" in improving depot level work scheduling, maintaining qualified production skills while focusing on production efficiency through proper work loading. The PSIA Contract is coupled with the End-to-End Maintenance and Modernization Process for sustaining the level of readiness of the Force as directed by Commander, United States Fleet Forces Command and the Commander, United States Pacific Fleet.

3.7.2 Requirement. Surge maintenance requirements and the Fleet Response Plan required re-evaluation of the Fleet maintenance and modernization strategy to meet National Strategy Tasking. Evaluation of the multiple options available to obtain the services of the Nations ship repair base led to the decision that a Navy and Contractor "teaming arrangement" to meet fleet readiness goals should have significant benefits for all parties in addition to contributing to the benefits that are derived from the learning curve process while reducing the overall cost for maintaining the Force. To achieve these goals, PSIA Contracts are being awarded.

3.7.3 General Contract Structure. The PSIA Contract is typically awarded as a Cost Reimbursable, Incentive Fee (or similar) Contract, as the preferred most responsive contractual document that can be used to achieve the Fleet Response Plan surge requirements (it can also be a fixed price contract). The PSIA Contract consists of a pre-selected grouping of ships by class that is awarded, using the best value basis, to a single contractor for a base year with several year options. Additionally, the contract contains Contract Line Item Numbers for numerous scheduled availabilities plus Continuous Maintenance and Emergent Maintenance on several different ships. The contract is used to obtain as a minimum: the Contractors advice on depot level work item scheduling to maximize efficiency to reduce cost, provide ship specific technical expertise, perform work item planning support, provide production support services including material management and assist in effectively work loading depot level maintenance trade skills.

The PSIA Contractor, with qualifications in line with those required of a MSRA holder, teams with each ship's Maintenance Team (MT) to provide long-term support and commitments to meet Fleet Maintenance and Modernization Strategic Plans.

3.7.4 Pre-Availability Planning. The advanced planning processes in volume II, TYCOM specific part I ,II, or III, and volume VI, chapter 31 of this manual detail the planning requirements in preparation for repairs and modernization when the work is to be performed using the resources available through the private sector industrial base for Chief of Naval Operations scheduled availabilities plus Continuous Maintenance Availabilities. Through the PSIA Contract the government engages the contractor to plan the work, write detailed specifications and proposals and takes advantage of the best available and appropriate level of repair capabilities. The Contractor also establishes relationships with proven vendors on a long-term basis to assist in reducing costs because the contract requires that 40 percent of the work must go to subcontractors. The Contractor prepares specifications for the work candidates that are brokered for inclusion in the work item package. The ship's MT validates the Contractor prepared work item specification packages in relation to the Technical Analysis Report that is prepared for each work item (developed by RMC Technical Analyst) that is developed in response to the contractor's proposal(s). The terms and conditions as agreed upon in the MT authorized work package and the scheduled performance period are solidly defined by the warranted RMC Contracting Officer who authorizes the Contractor to proceed with the repair and modernization work as approved and outlined in each work item specification.

3.7.5 Availability Oversight. After defining the work package between the government and the PSIA Contractor, the Project Manager and Contracting Officer are charged with the responsibility and authority associated with their positions to perform Contract Administration with their assigned Availability Management Team. Project Management Team representation and responsibilities are as outlined in chapter 7 of this volume.

3.7.6 Growth and New Work. It is the responsibility of the Project Team, using the Maintenance and Modernization Business Plan as the guide, to authorize the Contracting Officer to commit funds for any growth or new work.

3.7.6.1 Growth or New Work Proposals. The MT will evaluate the Technical Analysis Report prepared by the Technical Analyst for each work item submitted by the contractor. The Technical Analysis Report examines and evaluates the contractor's proposal to determine the reasonableness of the contractor's estimates and overall proposal. The Analyst examines all aspects of the proposal including labor, material and subcontractor or teaming members' pricing.

3.7.6.2 Business Case Analysis. A cost or benefit-based evaluation may be performed by the MT to determine if growth and new work should be accomplished in an ongoing availability as required by volume VI chapter 31 of this manual. The Business Case Analysis performed by the MT is not a specific, formatted process but rather a deliberate, thoughtful decision process used whenever growth and new work is identified. This thought process should weigh the additional costs (premiums) against operational requirements. In some cases, it may be advantageous to complete the growth or new work during the availability; in other cases, it may make more sense to defer the work to a follow-on Continuous Maintenance period. The MT should consider all premiums associated with adding the work to the availability including the effect on the contractors' workload and the premium associated with the late addition of work.

3.7.6.3 Maintenance Figure of Merit. In addition, the MT will utilize the Maintenance Figure of Merit to validate that new work most critical to mission accomplishment receives priority when allocating maintenance resources. Maintenance Figure of Merit does not apply to modernization items.

3.7.6.4 Option Items. In some cases, the added work may have been covered by an option item that was included in the contract as a stand-alone work specification with a defined work scope that is not to be accomplished unless specifically invoked. Option items are used when there is uncertainty at the time of availability package lock as to whether or not specific, defined work is required. Requirements for use of option items are the same as those for Firm Fixed Price Contracts as defined in volume VI chapter 31 paragraph 31.5.3 of this manual.

APPENDIX A

MASTER SHIP REPAIR AGREEMENT

This AGREEMENT is entered into this____ day of _____ by the UNITED STATES OF AMERICA, hereinafter called the "Government," represented by the Contracting Officer, Naval Sea Systems Command, Washington Navy Yard, DC 20376 and _____, a corporation organized and existing under the laws of the State of _____, (the "Contractor").

The purpose of an MSRA is to provide a contracting vehicle for the issuance of job orders for the repair and overhaul of ships. The specific qualification requirements governing MSRAs are contained in the latest version of NAVSEAINST 4280.2. This Master Agreement does not indicate approval of the contractor's organization and facility for any particular acquisition and is not an affirmative determination of responsibility under FAR Subpart 9.1 for any particular acquisition.

The clauses in this Agreement will be incorporated, by reference or attachment, in job orders issued under this Agreement to affect repairs, alterations or additions to vessels.

By giving 30 days written notice, either party to this Agreement has the right to cancel it without affecting the rights and liabilities under any job order existing at the time of cancellation. The contractor will perform, under the terms of this Agreement, all work covered by any job order awarded before the effective date of the cancellation.

This Agreement may be modified only by mutual agreement of the parties. A modification of this Agreement will not affect any job order in existence at the time of modification, unless the parties agree otherwise.

The rights and obligations of the parties to this Agreement are set forth in this Agreement and the clauses of any job orders issued under this Agreement. In the event there is an inconsistency between this Agreement and any job order, the provisions of this Agreement will govern.

This Agreement will remain in effect until canceled by either party.

THE UNITED STATES OF AMERICA

(Title)

The RMC Contracting Officer will insert the following required clauses in all job orders awarded under this Agreement:

(1) 252.217-7003 Changes

(2) 252.217-7004 Job Orders and Compensation

(3) 252.217-7005 Inspection and Manner of Doing Work

(4) 252.217-7006 Title

(5) 252.217-7007 Payments

(6) 252.217-7008 Bonds

(7) 252.217-7009 Default

(8) 252.217-7010 Performance

(9) 252.217-7011 Access to Vessel

(10) 252.217-7012 Liability and Insurance

(11) 252.217-7013 Guarantees

(12) 252.217-7014 Discharge of Liens

(13) 252.217-7015 Safety and Health

(14) 252.217-7016 Plant Protection, as applicable. (Use this clause in job orders where performance is to occur at the contractor's facility.)

The RMC Contracting Officer will insert in all job orders any other clauses on subjects not covered by this Agreement, but applicable to the job order to be awarded.

This Agreement is applicable to job orders awarded by either the Naval Sea Systems Command or the Military Sealift Command.

Each job order awarded under this Agreement will specify the Contract Administration Office.

APPENDIX B

AGREEMENT FOR BOAT REPAIR

This AGREEMENT is entered into this____ day of _____ by the UNITED STATES OF AMERICA, hereinafter called the "Government," represented by the Contracting Officer, Naval Sea Systems Command, Washington Navy Yard, DC 20376 and _____, a corporation organized and existing under the laws of the State of _____, (the "Contractor").

The purpose of an Agreement for Boat Repair (ABR) is to provide a contracting vehicle for the issuance of job orders for boat/craft overhaul/repair work, and/or selective component, and/or selective ship repair work. The specific qualification requirements governing ABRs are contained in the latest version of NAVSEAINST 4280.2. This Agreement for Boat Repair does not indicate approval of the contractor's organization and facility for any particular acquisition and is not an affirmative determination of responsibility under FAR Subpart 9.1 for any particular acquisition.

The clauses in this Agreement will be incorporated, by reference or attachment, in job orders issued under this Agreement to affect repairs, alterations and/or additions to vessels.

By giving 30 days written notice, either party to this Agreement has the right to cancel it without affecting the rights and liabilities under any job order existing at the time of cancellation. The contractor will perform, under the terms of this Agreement, all work covered by any job order awarded before the effective date of the cancellation.

This Agreement may be modified only by mutual agreement of the parties. A modification of this Agreement will not affect any job order in existence at the time of modification, unless the parties agree otherwise.

The rights and obligations of the parties to this Agreement are set forth in this Agreement and the clauses of any job orders issued under this Agreement. In the event there is an inconsistency between this Agreement and any job order, the provisions of this Agreement will govern.

This Agreement will remain in effect until canceled by either party.

LISTING OF APPENDICES.

A Not Used
B Not Used
C Not Used
D Not Used
E Procedures for the Preparation and Use of Work Item Specifications for Ship Repair
F Work Package Integration Conference Agenda and Check List

4.1 PREPARATION OF SPECIFICATIONS AND ESTIMATES OF COST.

4.1.1 Purpose. This chapter provides a general discussion and specific guidance for the preparation of specifications that are developed for specific work items or ship alterations brokered for accomplishment by the private sector. The specification must be integrated into a solicitation work package that upon contract award forms the basis for supervising and administering the agreed upon terms and conditions of the contract.

4.1.2 Scope. Contracts with commercial shipyards follow the Uniform Contract Format as specified in reference (a), section 201.1 and 204.1. The Navy uses a variety of contract types, as stated in chapter 2 of this volume, to obtain the required services, products, material and Integrated Logistic Support for the repair and modernization of Surface Force ships, aircraft carrier and submarines. The substance of these contracts depends upon clear, well-defined specifications developed for each specific repair work item or alteration included in the work package accompanying each solicitation or job order presented to the contactor for use in preparing an offer. A job order is the contractual vehicle that is used under the Master Ship Repair Agreement or Agreement for Boat Repair as addressed in chapter 3 of this volume. The Master Agreement for

Repair and Alteration of Vessels as authorized by reference (b), subpart 71 applies. If naval standards are required for proper accomplishment of the work by the contractor, the specifications prepared by the work item planner must invoke these requirements.

a. The Navy Modernization Program is discussed in volume VI, chapters 3 and 36 of this manual. The end product of the processes must fully support the development of well-defined technical specifications, associated guidance, identification of Long Lead Time Material, installation drawings, etc., that are prerequisites for developing an effective specification.

b. The validation of work items identified in the Current Ships Maintenance Program and the associated planning processes addressed in this manual are critical to the work item planner tasked with the responsibility for development of each individual specification.

c. To facilitate the development of work items and modernization packages in support of contracted ship maintenance, long-range planning and action milestones are required. Typical availability planning milestones for Chief of Naval Operations (CNO) availabilities for Submarines, Surface Force and Aircraft Carriers can be found in volume II of this manual.

4.1.3 Design Versus Performance Specifications. Well-written specifications are a prerequisite to successful repair and modernization work. The two major benefits resulting from well-written specifications are reduction in costs and higher standards of workmanship. Unlike job orders prepared for use at Naval Ship Yards, specifications used by commercial shipyards must not only describe the work to be accomplished, but must clearly outline the contractual obligations and responsibilities of the repair contractor. It is particularly important that specifications be clear, concise, complete and definitive since unclear specifications not only cause technical questions and difficulties but also result in higher prices and scheduling problems. The Government assumes the risk of contractor performance when the specifications it furnishes are not suitable for their intended purpose. Specification adequacy arises only when the Government furnishes a specification, which only provides for the accomplishment of end results.

a. A design specification details the manner or method of contractor performance. The implied warranty of specification usually includes precise measurements, tolerances, required processes and finished product tests. The contractor is bound to follow all of the Government's directions in a design specification. If the contractor follows these directions and is unsuccessful, the Government has assumed the risk, and as a result, the Government has breached the implied warranty of specification adequacy.

b. A performance specification provides for the operational requirements and only dictates end results. The contractor assumes the risk of choosing its method of achieving the end results in a performance specification. If the contractor fails to achieve the end results in a performance specification, and the specification is neither impossible nor commercially impracticable, the Government has not breached the implied warranty of specification adequacy.

c. Many Government specifications are a combination of design and performance specifications. Accordingly, it must be determined which requirement has caused the problem, if any, and then that requirement must be analyzed using the rules provided.

It is recommended to confer with responsible contract personnel and legal counsel when addressing problems associated with alleged implied warranty of specification adequacy.

d. Determining if a specification is performance-based is difficult. Specifications in which the vast majority of requirements are performance-based and contain a design definition appropriate for the particular phase of the effort should be considered compliant with Department of War (DoW) policy.

e. Specifications are composed of a set of requirements statements. Requirement statements contain the word "must". Any statement that is not mandatory should be reviewed only from the standpoint of clarifying to the requirement definition. The review of specifications consists of locating the requirements ("must") statements and assessing whether those statements are performance-based.

f. Performance-based requirements statements should bring about a solution at a very high level, whereas detail requirements statements should constrain the solution at a very low level (most often only a single or preferred option for resolution). Determining whether a requirement statement brings about a solution at a "high" or "low" level is judgmental.

4.1.4 Regulatory Requirements for Specifications. Important considerations for the specification writer are derived from the Federal Acquisition Regulations (FAR) and the Defense Federal Acquisition Regulation (DFAR) Supplements. The FAR defines a specification as a description of the technical requirements for materials, products or services that includes the criteria for determining whether these requirements are met.

a. The FAR further requires that specifications state only the Government's actual minimum needs and be designed to promote full and open competition. The FAR has the force of law and must be followed. Therefore, anyone preparing specifications must necessarily understand certain regulatory requirements. Reference (c) contains the regulations that govern specifications, standards and other purchase descriptions. These regulations should be read carefully and understood by any specification writer.

b. To achieve the contract objectives of obtaining satisfactory performance and full and open competition, certain basic standards in drafting specifications must be observed. They must be drafted in a clear, well-defined manner. Less than clear provisions may limit full and open competition in the acquisition process by preventing those making offers from competing on a "common" or equal basis. This occurs when those making offers interpret the specifications and arrive at different reasonable conclusions about what kind of performance they will be required to render. The result is that they submit offers reflecting different kinds of performance. In sealed bid acquisitions, bidding on an equal basis has generally been considered to require bidding documents that are so clear and precise that all bidders are offering essentially the same product or service. The outcome is that bids can be compared and selection for award made solely on the basis of price and other price-related factors. In negotiated acquisitions, which sometimes involve a balancing of technical merit and price, those making offers may submit markedly different technical proposals to meet the Government's needs. Competition on an equal basis generally means that specifications must be sufficiently

clear and complete to afford all potential bidders an equal basis to understand the Government's basic requirements.

4.1.5 Restrictive and "Brand Name or Equal" Specifications. Specifications also must be written in an "unrestricted" manner. Specifications are "restrictive" if they include requirements that limit competition and are not necessary to ensure satisfaction of the Government's basic needs. This kind of restrictiveness of competition may favor one contractor over another and it may also prevent the Government from getting the kind of performance which can best satisfy its needs at the most reasonable price. Where the contractor supplies ship repair materials or equipment, the work item planner should not specify the products of individual manufacturers. Instead, the work item planner should describe the technical specifications which the material or equipment must meet to obtain satisfactory performance. This will ensure free and open competition among suppliers and subcontractors and, ultimately, will result in lower costs for the Navy. If it is difficult or impossible to give suitable specifications for materials or equipment, the work item planner may stipulate that the contractor supply a specific manufacturer's model "or equal" and state the salient characteristics that make it "equal" pursuant to reference (d), section 104.

4.2 WORK PACKAGE DEVELOPMENT.

4.2.1 Work Packages for Non-Private Sector Industrial Activity Contracts. In writing work item specifications, the Executing Activity planner(s) may frequently include requirements from multiple Expanded Ship Work Breakdown Structure (ESWBS) or Ship Work List Item Numbers (SWLIN) in a single work item. Conversely, work requirements of a single ESWBS or SWLIN may be included in multiple work items; however, the most common and most desirable practice is to prepare a single work item to include all work requirements of a single ESWBS or SWLIN. During review, the specification must be checked to ensure that each ESWBS or SWLIN work requirement authorized for shipyard accomplishment is contained in the Specification Package. Work items normally specify only what the contractor is to do rather than how to perform the work. There may be instances when adherence by the contractor to a specific manner of accomplishing the work will be required because of a requirement in a Navy document or manual. The procedures must be clearly defined for the performance of the work. Specifications must be written in a logical sequence of work operations (i.e., remove, disassemble, inspect, report, repair, reassemble, shop test, reinstall and ship test). Each specification must clearly define the work requirements and be as self-contained as possible to enable the contractor to understand the requirements without having to research referenced data. Specifications must never upgrade equipment and installations to exceed the existing configuration of the ship. Furthermore, material requirements will be equal, as a minimum, to the original installation and service requirements. Appendix E provides guidance for work item planners charged with development of ship repair and modernization specifications.

4.2.2 Work Packages for Private Sector Industrial Activity Contracts. Work Package Preparation is discussed in volume II, TYCOM specific part I or II, chapter 5 of this manual.

4.2.3 Naval Sea Systems Command Standard Specification Program.

a. Under reference (e), the Standard Specification for Ship Repair and Alteration Committee (SSRAC) is responsible for the generation, revision and control of Naval Sea Systems Command (NAVSEA) Standard Items (SI) commencing with SI-009-01

and Standard Work Templates (SWT). The SSRAC meets annually to review and approve changes to NAVSEA SI, SWT, and procedures for preparation and use of work templates. Specification improvement recommendations are welcomed and must be provided to the SSRAC.

b. Work items must be written consistently so that identical work activities and requirements are specified at the same time they are included in a contract specification. Consistent language throughout a contract makes it easier to understand. Through continuous use, the phrases used take on a special meaning and gain acceptance within the industry. The SSRAC develops and publishes Standard Phraseology yearly. Specification writers should become familiar with the procedures in Appendix E. It must be consulted frequently to ensure Standard Phrases are used properly. Like SI, Standard Phrases are published by fiscal year designation. Specification packages must be prepared using the standards when they are issued by the SSRAC chairman regardless.

4.2.4 Standardization Usage. Once a work item specification has been prepared, as is the case with the Master Specification Catalog, to address a specific set of SWLIN requirements, it must be used whenever the same requirements are authorized for accomplishment on another ship of the class. In most cases, an original work item has the greatest chance of resulting in a contract change. The fundamental thrust of the NAVSEA standardization program is that tried and proven contract requirements are generally superior. Standardization and consistent usage of approved standards tends to strengthen the quality of specification packages over time by improving the ship repair industry acceptance of the standards used.

4.3 SPECIFICATIONS.

4.3.1 Preparation of Specification Work Items. All specification work items must conform to the same basic format and will comply with the requirements and policies established by reference (e) and amplified by Appendix E. These documents establish the organization and responsibilities for development, revision and control of standard specifications. Specification work items are written to convey the Government's requirements to the contractor. They are extremely important for several other reasons. The specifications are the heart of the contract and serve as the basis for the formation of offers by the shipyards, the baseline for the evaluation of offers and, after award, the means for binding the contractor to required performance. In judging acceptable performance, the Government is bound by the contents of the specifications when testing or inspecting the contractor's work results. The specifications serve as the basis for determining whether desired work is a change to the contract or is already required.

4.3.2 The Specification Package. The specification package may consist of applicable NAVSEA SI, SWT and unique templates, as discussed in chapter 2 of this volume, that are contained in the Master Specification Catalog, resident in the Navy Maintenance Database (NMD) in the Planning Module. These Items and Templates are written to standardize the requirements across the Maritime Industry to specify action that is required by the contractor to accomplish the intent of the work authorized for shipyard accomplishment.

4.3.3 Master Specification Catalog. Master Specification Catalog is discussed in volume II, TYCOM specific part I or II, chapter 5 of this manual. Planning Activities or Executing Activities Planning who are responsible for the preparation of work item solicitation packages

must use the Master Specification Catalog databases to the maximum extent possible when planning assigned work using NMD and other Maintenance Automated Information System. Additionally, they must also provide input to the Master Specification Catalog gatekeepers for improvement of the existing catalog or to propose new candidates for the catalog.

4.4 PREPARATION.

4.4.1 Steps in Preparing a Work Item Specification. Unless clearly unnecessary, the steps to follow in preparing a specification are:

a. Determining the Government's requirements and a preliminary understanding of what the contractor must do in order to satisfy these requirements.

b. Research, data gathering and analysis.

c. Preparation of a detailed outline.

d. Preparation of the initial draft.

e. Review and editing by the writer.

f. Team review and modification.

4.4.2 Determining Requirements and Understanding What the Contractor Must Do. The specification writer must begin with obtaining a clear and full understanding of the Government's requirements through the use of on-site ship checks, validation of the work candidate against the system or equipment operating conditions and discussions with the point of contact or those familiar with the work request. Failure to do so will at best result in less than the Government wanted and at worst a useless product. Once a clear and full understanding of the Government's requirements is obtained, the specification writer must determine what the contractor must do to satisfy the requirements. In some instances, this determination will only be a preliminary one, as the performance of subsequent steps will frequently result in changes to the original determination.

4.4.3 Research, Data Gathering and Analysis. Part of the first step frequently involves research and data gathering. The specification writer should avoid believing that everything one needs to know to write a proper specification is readily available.

a. After reviewing the requirements of a brokered Work Notification , the best place to start the research needed to support Work Item development is the Master Specification Catalog (MSC). MSC Templates are maintained by the Master Specification Catalog Maintenance Office, which ensures current technical (NAVSEA SI) and contractual (Appendix E) standards are incorporated along with availability lessons learned.

b. If a MSC Template does not exist for the ESWBS being addressed by a tasked Work Notification, previously executed WIs for the same or similar work may be reviewed as a starting point. Investigate changes to the Work Item, by reviewing associated Request for Contract Change and Contractor Furnished Reports.

c. Where sufficient information does not exist, the specification writer should not be hesitant to contact other agencies for information (e.g. Army Corps of Engineers, Environmental Protection Agency)

d. Previously used specifications, regardless of their source, must never be used without reviewing for current applicability. Regulations, processes and procedures frequently change. In addition, Government requirements sometimes change, capabilities between contractors are widely variable and the unedited use of previously used specifications may cause the recurrence of mistakes or deficiencies in the specification.

e. There are many other potential sources of information (e.g., textbooks, commercial associations, Federal and military specifications and standards, manufacturers' catalogs, periodicals, microfilm files and society publications such as American Society for Testing and Materials and the American National Standards Institute).

f. Federal specifications should be selectively applied and tailored to their application. ("Selective application" is the process of reviewing specifications, standards and related documents to ensure that only those that have application to a particular acquisition are included or tailored in the solicitation.) A number of existing specifications may be included in the contract specification.

g. "Tailoring" is the process by which individual sections, paragraphs or sentences of the selected specifications, standards and related documents are reviewed and modified so that each one selected states only the Government's minimum requirements.

h. The American Bureau of Shipping Rules and U.S. Coast Guard Regulations provide specific direction. American Bureau of Shipping and NAVSEA have an active program to develop Naval Vessel Rules that will have future application.

4.4.4 Availability of References. Contractors are required to obtain, from sources designated as repositories, copies of standard Navy drawings, referenced specifications and standards. Other required references are provided by the planning activity or Primary Contracting Officer (PCO) with the solicitation package or are made available for examination at a designated location. Required references not made a part of the solicitation package are turned over to the successful contractor at award. The work item planner ensures the requirements specified for each work item adhere to prescribed technical standards of work. These technical standards are included in publications such as:

a. Naval Ships' Technical Manuals cover general operating and maintenance instructions on shipboard systems, equipment and material under the cognizance of NAVSEA.

b. Military and Federal specifications provide uniform standards and specified tests for materials, products, or services used by the military services. Specific data on particular designs of equipment set forth in equipment technical manuals, manufacturer's instruction books and manufacturer's drawings.

c. Specific data for particular ship system applications set forth in the Ships Information Books, General Information Booklets, Piping Systems Instructions Book, etc., as appropriate to a particular ship and item.

d. Specific details on electronics installations, maintenance standards and procedures as set forth in the Electronics Installation and Maintenance Book.

e. The Planned Maintenance Subsystem supplied to the ship for scheduled preventive maintenance.

f. NAVSEA and other Systems Commands directives applicable to specific processes, procedures or standards.

g. Master Specification Catalog containing D-Level work item templates for multiple ship classes planned in NMD.

h. Locally prepared drawings, sketches, design instructions and similar data.

i. The General Specifications for Overhaul of Surface Ships.

j. The General Specifications for Ships of the U.S. Navy.

k. Deep Diving General Overhaul Specifications.

l. American Bureau of Shipping Rules.

4.4.5 Preparation of a Detailed Outline. After completion of the first two steps, it may be helpful to arrange the data selected for use into an organized format that identifies the key areas to be covered. This step may not be necessary for easier specification preparation efforts but will be very useful for more complex efforts. A detailed outline approach is recommended. To prepare the outline, the data accumulated in the preceding steps should be further analyzed, organized and presented in chronological order and desired format. The outline should consist of the key words and skeleton phrases of the proposed specification. The outline is sufficiently detailed, contains all key aspects and be organized properly to be as useful as possible. Once complete, the outline serves as a "road map" for the specification writer. It allows the writer to expand and fill in necessary details without being overly concerned about the organization of the specification. Such an approach will make the task of writing the actual specification less difficult and enhance the quality of the specification.

4.4.6 Preparation of the Initial Draft. Once the detailed outline is complete (if determined necessary), the initial draft of the specification should be written. The difficulty of this step will depend primarily on how well the preceding three steps have been performed. If they were adequately performed, the preparation of the initial draft should not be overly difficult. The experience and other pertinent qualifications of the writer will also determine the difficulty of the effort. The draft should closely parallel the outline unless deficiencies are discovered. By using the outline, the writer should be able to write quickly and not ponder over those aspects already considered in the outline.

4.4.7 Material Requirements. The contractor must furnish material required for the performance of any contract unless provided as Government Furnished Material (GFM). Any other material required for performance is Contractor Furnished Material. In contracts, it is Government policy, in accordance with reference (f), section 303 for contractors to supply all labor and material required for performance of the terms and conditions of the contract. One exception is the Government has the right to provide material as GFM whenever it is determined to be in the best interest of the Government. Long Lead Time Material should be provided as GFM. This material is defined as that which is not commercially or otherwise available to the contractor in time to support the performance schedule. The following material should be considered GFM:

a. Parts unique to or obtainable only through the Government.

b. Standardization material (System Procured Material or Contractor Procured Material for Alterations) (for configuration consistency).

c. Long Lead Time Material (including any material not available in time to support production).

d. Parts requiring provisioning of technical documentation (new components not supported in the Navy supply system).

e. Stocked material: In long supply (supplies far in excess of demand), expiring shelf life (material in stock will expire if not used) or Class Maintenance Plan programmed material (pre-positioned for special Class Maintenance Plan programs).

f. Whenever it is in the best interest of the Government.

4.4.7.1 Qualified Products Lists. It is required that some materials of a specialized nature be procured only from suppliers who have been found qualified to produce or install these materials to Navy standards. Contractors so qualified are identified on Qualified Products Lists (QPL). The QPLs contain lists of all items for which qualified suppliers are required, arranged by military specification number, and indicate the qualified suppliers for each item. In preparing descriptions for work items which will require use of materials shown on a QPL, the planner should specify that the contractor will obtain these materials from a supplier on the QPL and should provide a list of the qualified suppliers from whom the contractor may obtain these materials.

4.4.7.2 Turnaround Items. Work items may require the contractor to remove certain items of equipment and ship them to specific Government activities for necessary repairs. These "turnaround" procedures are frequently desirable in the case of highly technical equipment such as gun sights and gyroscopes. They must be used, however, only when specific activities have been designated to repair or service such equipment. They must not be used when equipment is to be shipped to subcontractors selected by the prime contractor for the performance of specialized work. The work items may require that the contractor provide the services of a manufacturer's field representative to supervise and instruct contractor personnel in the performance of repair work on specific equipment produced by that manufacturer.

4.4.8 Tests, Inspections and Performance Criteria. Inspection and test requirements in work items must be equal to the level of criticality of the work to be performed and must be included in all specifications in accordance with the information provided in and the guidance for Appendix E Specifications. The work item planner must be thoroughly familiar with the requirements outlined in volumes IV and V of this manual that specifically address the minimum tests and inspections that are to be accomplished in association with various types of availabilities.

a. After specifying acceptable performance requirements, equally acceptable performance criteria, if different, must be stated. The criteria must be definitive and reasonable. The work item should contain simple performance criteria that can be used to prove the contractor's compliance with the specifications. The criteria should be precisely stated to satisfy the minimum needs of the Government for the work. Vague, nebulous or indefinite criteria must be avoided. The performance criteria must be based on applicable reference documentation. Performance standards are prescribed for many ship repair requirements in various publications and drawings and these standards should be used in performance criteria. Cleanliness standards, machined surface standards, non-destructive testing standards and numerous other

standards unique to trade groups, processes or materials must be used wherever possible.

b. When a well-established standard cannot be identified for use in specifying performance criteria, a simple test can be created to prove the contractor's work. In devising such tests, tolerances may be all that are required. A minimum, a maximum or a range of tolerances may be sufficient to prove performance. Simple tests can be performed such as hydrostatic tests, weight tests, pressure tests or pull tests. In more difficult situations, it may be necessary to require an engineered test to prove satisfactory performance.

c. When tests are required for equipment after repair, such tests must be fully described and set forth in the work items. Work items may specify certain tests are to be conducted during normal working hours. For a critical test and inspection, it may be necessary to ensure that the Regional Maintenance Center (RMC) quality assurance representative or a cognizant government representative be available to simultaneously witness the event normally called out as a Government required "G" inspection or observation check point. Where tests will be elaborate or complex, the work item planner may obtain test memoranda from the appropriated RMC or naval shipyard design engineers that describe the tests conducted. The planner then incorporates these memoranda in the appropriate work item.

d. If appropriate Technical Authority requires dock trials or sea trials, the trials will be specified in the job order. The specifications will include requirements for such trials if they are considered necessary and authorized by the Type Commander (TYCOM) or NAVSEA. For sea trials, the ship is normally operated by the Ship's Force and the contractor provides a specified number of personnel by trade to be aboard the ship during the trial. RMC should provide the ship with the list of personnel who will be aboard. Reference (g) contains further information on dock trials and sea trials. The requirement for trials specifies a scheduled number of days before the completion of work. Normally, the sea trials are scheduled from 4 to 7 days before the job order completion date to allow for adequate adjustment and correction of defects found during the trial. For similar reasons, the dock trial should be scheduled from 2 to 3 days before the sea trial.

4.4.9 Split Repair Responsibility. To avoid doubts about responsibility for completed work and to minimize physical interference and safety hazards, ship's personnel should not work on any unit or system on which the contractor is also working. Work items, to the maximum extent possible, must not be written to require the performance of work by both the Government Personnel or Government obtained Third Party Contracts or Vendors and the executing contractor on the same unit or system.

4.5 SPECIFICATION REVIEW.

4.5.1 Review and Editing by the Writer. After the initial draft of the specification is complete, the writer will need to review and edit it. Organization, content, format and sequence or chronology will need review. Poor grammar and punctuation, ambiguities, gaps or omissions, wordiness and clerical errors should be corrected. The applicable Fiscal Year "Depot Level Work Item Specification 4E Review Checklist" will be utilized when reviewing Work Item

Specifications. These checklists are maintained to SSRAC requirements contained in JFMM volume VII chapter 4 Appendix E. CNRMC led Standards Management Reconciliation Team (SMRT) completes annual updating of the Fiscal Year "Depot Level Work Item Specification 4E Review Checklists." SMRT includes updated Fiscal Year "Depot Level Work Item Specification 4E Review Checklists" in its annual issuance of the "Government Planners Handbook and Estimating Guide." Government Planners Handbook and Estimating Guide s for the current and two previous Fiscal Years are posted to the SMRT SharePoint Page https://flankspeed.sharepoint-mil.us/sites/NAVSEA_TeamShips_SEA21_ST1/SitePages/SMRT.aspx. The checklist contains a listing of each element of the work item heading and each paragraph of the work item. Under each listing, a description of applicable requirements from the regulations is provided with a block to check for each element. This checklist is a consolidated listing of things to look for during the review. Work item specification reviews must be performed within NMD. Concerns found while conducting a Work Item Specification Review will either be corrected within NMD directly or recorded for further study and future correction by the Planning Floor and Project Team. Other questions useful to the specification writer in determining the adequacy of the efforts are:

a. Does the specification clearly tell the contractor what is required?

b. Is only information necessary to assist the contractor in understanding what is required included (e.g., have the "nice to have" items been eliminated from the "essential" items)?

c. Will the Government and contractor be able to achieve reasonable pricing?

d. Will the contractor's tasks, when accomplished, produce results consistent with contract objectives?

e. When appropriate, does the specification clearly tell the contractor how to perform?

f. Can the Government representative who accepts the required supplies or services tell whether the contractor has complied with contract requirements (e.g., are standards for measuring performance clearly stated)?

g. Is the specification sufficiently detailed to permit the Government and the contractor to identify manpower resources, special facilities, equipment, subcontracts and similar requirements?

h. Is information differentiated so that background information, suggested procedures, etc. are clearly distinguishable from contractor responsibilities? (Statements that do not directly contribute to an understanding of requirements should normally be avoided since they may create ambiguities, confusion and greater costs.)

i. Are reference documents (e.g., specifications, standards and exhibits) properly shown and cited? Are they pertinent to the task(s)? Do they fully apply or only partially?

j. Are milestone completion or delivery dates appropriately established? If "elapsed" time is used, is it clear concerning calendar days or workdays?

k. Are proper quantities shown?

l. Have data requirements (e.g., technical, financial and progress reports) been properly identified for such things as frequency, content, format and place of submission?

4.5.2 Review and Editing by Someone Other Than the Writer. Once the writer has completed the preceding step, it is a good practice to have someone else who has the necessary technical qualifications or editing skills, review, edit and critique the draft specification. The technical review and editing functions may be performed by different individuals.

4.5.3 Team Review and Modification. The last step is team review and modification. In many cases, this will be performed by the Ship's Maintenance Team, the Government Availability Planning Manager, and other government representatives as appropriate. The completed draft may be routed for review by contracting, legal and other personnel, as appropriate, and depending in part on the complexity or government's and contractor's liability or risk associated with the contractor's performance in complying with the specification. Contracting and legal personnel often identify language or other aspects of the specification they know from prior experience will cause problems. The technical content must not be adversely affected by recommended changes to the specification. The process of team review and modification may be required a number of times before all recommendations and comments are adequately resolved. Once all necessary modifications to the specification are made, it is finished and ready for insertion into the solicitation work package and for the PCO's action.

4.5.4 Government Check Points. During the Team Review and modification process, the need for additional Government check points (G-Points) in the work item will be conducted. The MT will use prior experience, lessons learned from similar work items on previous ships, and RMC leadership input to determine the amount and location of additional oversight required for each work item.

4.6 OTHER FUNCTIONS OF THE WORK ITEM PLANNER. In addition to writing work items and preparing cost estimates for them, the planner is responsible for starting other actions for successful performance of proposed modernization and repair work.

a. The work item planner must determine the drawings and technical instructions (e.g., manufacturers' technical manuals) which will be required for preparation of the work items and for the contractor's guidance in accomplishing the required work. The planner must initiate requisitions for these publications sufficiently far in advance of the specifications' cut-off date to permit their use.

b. The work item planner is responsible for determining the ship repair materials and the GFM provided as alteration materials, if any, which the Government will provide the contractor. The purpose is to initiate requisition actions for these materials sufficiently far in advance of the overhaul period to allow for their timely receipt by the contractor.

c. After award, a work item planner (or other cognizant RMC personnel) may have to secure for the contractor certain items of GFM which, because of changes to the job order, were not set forth in the original specifications. In addition, certain items that were available from commercial channels at the time the job order specifications were prepared may not be available when the contractor actually attempts to procure them. In such cases, the material may be obtained from Navy supply channels. However, it is preferable that the contractor procures the material from the Navy on a cash sale

basis rather than the RMC provide it to the contractor as GFM. In a cash sale, the contractor maintains complete responsibility for procuring the items from the appropriate Navy supply activity. The RMCs' only function is to certify that the material is not, in fact, available to the contractor through commercial sources and that it is required for accomplishing the job order.

d. To obtain material from the Navy Supply System, the contractor is required to submit a request to the RMC procurement personnel for requisitioning the material in accordance with reference (h). Detailed instructions for the assignment of a priority to a requisition are in reference (i).

4.7 PLANNING REVIEW. After completion by work item planners, the work items and cost estimates are assembled and reviewed by the Technical Analysis Report Analyst. The work items should be subjected to a close "technical and contract review" to ensure that:

a. Coverage of work conforms to that authorized for the availability or project.

b. All technical aspects of the work are itemized and conform to requirements established by NAVSEA technical instructions and other publications.

c. All necessary drawings and instructions are referenced. All Zero-tier references must be listed in paragraph two and called out in paragraph three, these are mandatory for use by the contractor. First-tier references that are cited within Work Item zero-tier references are mandatory for use by the contractor. All lower-tier references must be used for guidance only. If those lower-tier references are needed for Work Item accomplishment, they must be listed in paragraph two and called out in paragraph three of the Work Item. Only references required to accomplish the requirements of the Work Item should be listed.

d. Identical work (such as cleaning and painting in identical areas) is not set forth in two or more work items.

e. Work items are definitive, clear and explicit, and conform to quality assurance requirements.

f. Work items meet the requirements of Appendix E.

g. The Government will provide the proper documentation to support the contractor's preparation of the proposal. The PCO will designate the method and number of drawings and specifications for distribution. Ensure that the Ship's Force and Maintenance Team is provided with a set of specifications and references as soon as possible and in no case later than the date the solicitation is issued.

h. Appendix F provides the Work Package Integration Conference Agenda and Checklist. This conference may be performed as the Work Package Integration Review for Private Sector Industrial Activity Contracts.

4.8 NON-SCHEDULED AVAILABILITIES. One of the RMC's most important functions is to provide a process for performance of emergency work on Navy ships or work which cannot be delayed until the ship's next scheduled availability. This work may be accomplished during any of the availabilities listed in volume II, part I, chapter 2, volume II, part II, chapter 3 volume II, part III, chapter 3 of this manual.

4.8.1 Special Planning Procedures. While some non-scheduled availabilities can be handled the same way as scheduled availabilities, others present severe planning problems for RMC personnel. For example, the Maintenance Team and work item planner will frequently not have an opportunity to make a planning inspection of the work on the ship but will have to prepare work items or estimated costs solely on the basis of the ship's work requests or from descriptions of the work contained in dispatches from the ship. Where it is not possible to perform an inspection of the work item, the port engineer may find it necessary to telephone the RMC technical codes and describe the work to be set forth in the work items in order to minimize planning time. At this time, the planner should also begin priority procurements, if required, for GFM and drawings. In addition, the planner should check to see if the job or similar work descriptions already exist in the technical library. Unscheduled maintenance requirements mandate the establishment of special procedures. Frequently, the first notice of a non-scheduled availability will come in the form of a telephone call from the cognizant TYCOM or Operational Commander. If time is short, the available members of the ship's Maintenance Team together with the RMC representatives and planner should obtain the following information during this call:

a. As complete a description as possible of the nature of the difficulties.

b. Present location of the ship.

c. Nature and urgency of the ship's current operating commitments.

d. Whether the ship is disabled or can move to the repair yard under its own power.

e. Whether "hot work" (such as welding or burning) will be required, and whether this will require off-loading of fuel or ammunition (if off-loading is required, it should be accomplished before entering the contractor's yard).

f. Whether the ship has suffered underwater damage which will require dry-docking and, if so, if other routine dry-dock work can be done (such as the renewal of zincs, bottom cleaning and painting, sea chest or sea valve repair and repairs to underwater sound equipment).

4.8.2 Other Non-Scheduled Work. RMCs may from time to time receive work requests from ships under the management control of miscellaneous user activities. Examples include service craft and boats (under the cognizance of a USER command) and inactive ships in Inactive Ship Maintenance Facilities (under the cognizance of the Inactive Ship Maintenance Facilities Officer-in-Charge). The information provided would be similar to that described. Appendix E is not applicable to service craft and boats unless specifically invoked by the custodian.

a. In accordance with reference (j), RMCs may be requested to provide technical assistance and advice for the preparation of work lists, overhaul schedules and cost estimates for service craft and boats. If the RMC personnel are available for the task, every effort must be made to fulfill such requests.

b. Preparation of clear, comprehensive and accurate work requests by the user activity is a prerequisite to successful overhaul and repair. On the basis of these work requests, the RMC planner must prepare the work items for the work to be performed, estimate the costs and time required for the work and determine and order the necessary plans and material which the Government will furnish to the contractor. While the planner,

whenever possible, will inspect the work to be accomplished, inadequate work requests will make it impossible to perform advance-planning functions such as obtaining necessary drawings and technical manuals. Adequate work requests are particularly important when, because of operating commitments, it is necessary to delay the planning inspection beyond the desired time or to omit it completely.

4.9 REGIONAL MAINTENANCE CENTER ACTIONS UPON RECEIPT OF WORK REQUESTS. Upon receipt of a work request from another government agency, the RMC Planning Supervisor or the individual designated by the Planning Supervisor, as the potential project coordinator, will distribute copies to individual planners who have previously been assigned cognizance over repair work in specific trade categories (e.g., hull, machinery, etc.) for the specific ship. The work item planner should initiate action at this time to obtain required drawings and other technical information necessary for the preparation of work item specifications or for inclusion in the work package that will be issued in the job order. In many cases, it will not be feasible to do this until after the planning inspection when the planner determines the drawings or technical information that will be required based on inspection of the equipment.

a. When the scope of work can be anticipated with reasonable accuracy before the planning inspection, the planner may be able to utilize the Master Specification Catalog to prepare the specification and initiate advance requisitions for GFM required for the work. As in the case of drawings and technical information, however, it will often be difficult to make a final determination in this respect until after the planning inspection.

b. The planner must review previously prepared work items to ascertain if any work item is similar to the work requested. If the unit has previously been through an availability, a review of the work items accomplished during that availability could be of assistance in determining the extent of work which may be required to repair a system or a piece of equipment. This is especially true if a piece of equipment must be opened or a system tested by the contractor to ascertain the extent of the repairs. As a result of this review of prior work, “open and inspect” or “test and report” work items can be minimized.

PROCEDURES FOR THE PREPARATION AND USE OF WORK ITEM SPECIFICATIONS FOR SHIP REPAIR

This appendix is provided and maintained by the Standard Specification for SSRAC in accordance with NAVSEAINST 9070.1. Due to its size and need for annual updating, it is not practical to enclose the contents of SSRAC in this manual. In this regard, revisions or updates will be issued as an enclosure to the report of annual SSRAC meetings. When the results of the annual meetings are finalized, the website will be updated. It typically takes about 90 days to process the changes and post the update.

NOTE: THIS APPENDIX IS NOT APPLICABLE TO SERVICE CRAFT AND BOATS UNLESS SPECIFICALLY INVOKED BY THE CUSTODIAN.

Appendix E can be located on the SSRAC website, https://www.navsea.navy.mil/Home/RMC/CNRMC/Our-Programs/SSRAC/ or copies can be obtained by e-mail request to the SSRAC Coordinator at SSRAC@navy.mil.

CONFERENCE AGENDA

A. REVIEW HABITABILITY ISSUES

1. DISCUSS HABITABILITY IMPACT
2. DISCUSS OFF-SHIP MESSING/OFF-SHIP BERTHING REQUIREMENTS
3. DISCUSS AVAILABILITY OF BERTHING BARGE
4. DISCUSS HABITABILITY "WORK AROUNDS" IF NO BERTHING BARGE WILL BE PROVIDED
5. FOR BOQ/BEQ, VERIFY QUANTITY OF SHIP'S FORCE PERSONNEL

B. REVIEW CRITICAL PATH / CONTROLLING ITEMS

C. IDENTIFY REQUIREMENTS THAT THE SHIP MUST MEET PRIOR TO AVAILABILITY START

1. DISCUSS AMMUNITION OFF-LOAD
2. DISCUSS FUEL OFF-LOAD/ON-LOAD
3. DISCUSS DEWATERING (COMPENSATED FUEL SYSTEMS)
4. DISCUSS REEFER / STORES OFF-LOAD

D. DISCUSS NEW WORK, DELETIONS OR MAJOR REWRITES

1. OBTAIN 2-KILOS FOR NEW WORK
2. DOCUMENT SPECIFICATION DELETIONS
3. IDENTIFY MAJOR SPECIFICATION REWRITES

E. REVIEW ALTERATION INSTALLATION TEAM (AIT) REQUIREMENTS

1. REVIEW QUARTERLY AIT SCHEDULE
2. IDENTIFY AIT INSTALLATIONS SCHEDULED DURING AVAILABILITY
3. OBTAIN 2-KILOS FOR ANY OUTSTANDING AIT SERVICES AND SUPPORT REQUIREMENTS

F. REVIEW AIT INTERFACE PROBLEMS

G. REVIEW POTENTIAL IMA AND SHIP'S FORCE INTERFACE PROBLEMS

1. PORT ENGINEER RESOLVE POTENTIAL CONFLICTS

H. REVIEW EARLY START AVAILABILITY REQUIREMENTS

1. TYCOM ISSUE AVAILABILITY MESSAGE (IF REQUIRED)

I. IDENTIFY ANY WORK ITEMS IN JEOPARDY

1. GFM NOT AVAILABLE
2. CUSTOMER FUNDING NOT AVAILABLE
3. DRAWINGS / REFERENCES NOT AVAILABLE
4. SCOPE OF WORK NOT DEFINED
5. INSUFFICIENT AVAILABILITY DURATION

J. DEFINE WORK THAT MUST BE STARTED BY A CERTAIN DATE (OTHER THAN OPTION ITEMS)

1. IDENTIFY WORK START DATES

K. DEFINE WORK THAT MUST BE ACCOMPLISHED BY PRODUCTION COMPLETION DATE (PCD)

1. REVIEW AND SIGN LOA/PCD MILESTONE SHEET

L. REVIEW TESTING REQUIREMENTS

1. COMBAT SYSTEMS TESTS
2. HM&E TESTS
3. SPECIAL TEST/CERTIFICATION REQUIREMENTS

M. REVIEW OPTION ITEMS AND INVOKE NLT DATES

N. REVIEW LIST OF PRORATED WORK ITEMS

O. REVIEW AVAILABILITY DURATION REQUIREMENTS

1. REVIEW CONTRACT AND CNO DATES
2. DETERMINE IF THERE IS SUFFICIENT TIME TO ACCOMPLISH SHIPALTS, MAJOR REPAIRS AND LOA REQUIREMENTS

P. REVIEW REMAINING ADVANCE PLANNING AND CONTRACTING MILESTONES

1. PLANNING ACTIVITY PROVIDE COPY OF AVAILABILITY STATUS REPORT (ASR)

Q. REVIEW STATUS OF ANY OUTSTANDING CUSTOMER FUNDING REQUIREMENTS

R. REVIEW UNRESOLVED BID SPEC REVIEW (BSR) REQUIREMENTS

S. ASSIGN ACTION ITEMS AND COMPLETION DATES

T. PROVIDE ALL WPIC ATTENDEES A COPY OF THE CONFERENCE ATTENDANCE LIST

LISTING OF APPENDICES.

A Standard Cost Estimate
B Estimating Check-Off List
C Category I Standard Item Hard-Core Labor Considerations
D Excaliber Contractor Other Direct Labor Factor Calculation (6 Month Period)

5.1 INTRODUCTION. The Federal Acquisition Regulation establishes the requirements for proposal evaluations. An independent Government cost estimate is one method that can be used in the evaluation of bids and proposals. Cost estimates form the basis for management decisions by Fleet and Naval Sea Systems Command (NAVSEA) customers in the planning, programming and budgeting of repair and modernization work, including repair work brokering decisions, and in determining the developmental costs for ship alterations. Contracting activities require cost estimates for new procurements prior to issue of a solicitation, for modifications to a contract after award, for resolution of entitled claims and to close out contracts that have been terminated.

5.2 TYPES OF ESTIMATES. There are five types of estimates that Regional Maintenance Centers (RMC) commonly produce in conjunction with ship repair and modernization contracts. These include Pre-Contract Award, Post-Contract Award, Preliminary Costs, Contract Costs, Predicted End Costs and Costs for Contract Modifications.

5.2.1 Pre- and Post-Contract Award Estimating. Pre-award estimating can be associated with either competitive or noncompetitive procurements. Estimating non-competitive procurements is less complex because the identity of the contractor is known prior to award. Estimating for competitive awards can be more complex because of the uncertainty associated with the identity of the contractor. Estimates prepared for either competitive or noncompetitive procurements will be made using the Standard Government Estimating System. In both cases, the approach to preparing the labor hours and material estimate is the same.

5.2.2 Preliminary Cost Estimate. The preliminary cost estimate is the estimate prepared in terms of labor and material quantities required, without reference to labor rates or the cost of materials. This is the estimator's fully refined estimate, normally expressed in terms of man-hours and

material required to accomplish the specific work identified in the work item. Contingencies for growth and other uncertainties are not considered in the estimate. To get the contract cost estimate, labor and material costs must be incorporated into the preliminary estimate. Material rates to be applied to material quantities required should be based on current prices. The rates to be applied to the labor estimate are dependent on the competitive environment. In the case of noncompetitive procurements, the rate used is that applicable to the contractor who will do the work. In the case of competitive procurements, a composite rate must be determined.

5.2.3 Contract Cost Estimate. Prior to award of a contract, the Contracting Officer must be satisfied that the contract price is fair and reasonable. An integral part of this process is comparing and analyzing the contractor's price to an independent estimate prepared by the Government. This estimate is referred to as the Government estimate for the contract or the "Contract Cost Estimate" and is determined by adjusting the composite rate to reflect current market conditions. The Contract Cost Estimate is determined by applying the appropriate composite rate to the preliminary labor estimates and current material prices to required material quantities. The composite rate must be adjusted to reflect current market conditions as discussed. The sum of the labor and material estimates is the Contract Cost Estimate.

5.2.4 Final Cost Estimate. The original Contract Cost Estimate is retained as a part of the contract file. After contract award, the Contract Cost Estimate is adjusted to reflect the successful contractor's current labor rates. The contracting officer will determine the current Other Direct Labor Factor (ODLF) applicable to the contractor and apply it to the contractor's current forward pricing rate to determine the labor rate to be used in establishing the Final Cost Estimate. This labor rate, in lieu of the competitive composite rate, is applied to the Preliminary Cost Estimate to calculate the Final Cost Estimate. The difference between the Final Cost Estimate and the contract award price represents the potential profit or loss of the contractor that should be maintained throughout the performance period, as stated in the Doctrine of Equitable Adjustment. A contractor that "buys-in" to a contract should not be allowed to recover the loss through excessive prices in contract modifications after award. Likewise, the Government must not attempt to reduce the contractor's potential profit by allowing insufficient consideration for changes after award.

5.2.5 Predicted-End-Cost. The Predicted-End-Cost (PEC) is the RMC's estimated cost of all ship work, which consists of several factors. PEC equals the Award Price or Base Cost plus the estimated cost of other items that are not covered by the Award Price or Base Cost. Other items can include such elements as fees, growth, new work, Government Furnished Material (GFM), messing and berthing and boat repairs, if these were not included in the Award Price or Base Cost. Advance planning funds or funds that are provided to other activities should not be included in the estimate. The PEC does not establish financial obligations on customers, but rather is the RMC's estimate of what the availability is most likely to cost. The RMC may be required to adjust the PEC when it is obvious that circumstances (i.e., buy-ins, potential for major growth or new work, etc.) exist that would inhibit the determination of a realistic PEC. These extenuating conditions must be clearly reported, documented, assigned a dollar value and considered in the computation of a realistic PEC.

5.3 CLASSIFICATION OF COST ESTIMATES. There are five classifications of cost estimates: Class A, C, D, F and X.

5.3.1 Class A - Detailed Cost Estimate. An extensive cost estimate based on detailed engineering drawings, material lists and man-hours by required skills and trades. The level of detail addressed in a Class A estimate should be to the maximum extent feasible. It is comparable to a fixed-price offer developed by a Naval Shipyard (NSY) or a manufacturing estimate prepared in private industry. Variance is not expected to exceed 10 percent.

5.3.2 Class C - Budget Quality Estimate. Class C estimates are considered to be the best-cost estimate attainable for ship repair. It is the recommended level of estimates of cost developed by a field activity to be used in budget submissions. They are normally prepared for ship repair work prior to the start of availability. Variance is not expected to exceed 15 percent. Class C estimates are the expected level of estimation by both the Private Sector Industrial Activity contractor and the Government Planning and Estimating Teams supporting the Independent Government Estimate, Continuous Execution Increment Planning and Review Process, Technical Availability Repair and Definitization processes. As a result, the Private Sector Industrial Activity planning floor, Shipbuilding Specialists and Planning Yard Representatives must provide Class C estimates.

5.3.3 Class D - Feasibility Estimate. Class D estimates are required prior to completion of the design or preparation of detailed specifications, reflecting the uncertainty associated with having incomplete information available for estimating purposes. It is usually exploratory in nature and is prepared to perform trade-offs and cost effectiveness analysis. Variance is not expected to exceed 20 percent.

5.3.4 Class F - "Ballpark" Estimate. Class F estimates are known as "ballpark" estimates. This is a quick cost estimate prepared in the absence of minimum design and cost information and is based on gross approximations. It is calculated by escalating previous costs to current dollars, using empirical costs for similar work and adding factors for expected changes in design, processes procedures and other economic considerations. Acceptable when higher-level estimates are not possible due to insufficient time or incomplete information. Variance is not expected to exceed 40 percent.

5.3.5 Class X - Directed or Modified Estimate. An estimate provided by other Government activities or as directed by higher levels of authority. It is generally a total cost restriction without a developed design, engineering or a detailed cost estimate. A directed estimate is also a modification of any previous cost estimate, Classes A through F, to conform to budget reductions or restrictions on cost which is not based on a change in the scope of work required.

5.4 STANDARD ESTIMATING.

5.4.1 Average Contractor. In a competitive procurement, the identity of the contractor cannot be determined until after contract award. Therefore, some assumptions must be made about the contractor in order to define the estimating environment. For estimating purposes, the planner assumes that an average contractor under average conditions will perform the work. This assumption, however, also leads to problems since it is difficult to define an "average" contractor; i.e., one that possesses average facilities, equipment, tools, work force, etc. To address this problem, United States Fleet Forces Command has directed that estimates for competitive procurements be prepared on Appendix A. This chapter, together with the "average contractor" and "average condition" assumptions, defines the framework for Standard Estimating for competitively awarded ship repair work. To ensure the validity of estimates, labor rates

applied to labor estimates must be consistent. This requirement derives from the basic accounting requirement that estimating systems be consistent with applicable accounting systems.

5.4.2 Elements of Standard Estimating. Appendix A requires that estimates be prepared for only 13 labor elements and quality assurance personnel. These labor elements can be categorized as "hard-core" direct labor elements. These labor category titles, as shown in Table 5-1, are general descriptions of labor categories that would be found in any ship repair facility. The titles in the formal contractor chart of accounts will vary from contractor to contractor. However, the work performed by personnel in those labor categories is always charged as direct labor. For this reason, these labor elements are defined as "hard-core" labor elements in all discussions regarding estimating systems. In Standard Estimating, the hard-core labor elements are the only labor elements estimated by the estimator. All other labor required to perform the work being estimated is considered to be overhead labor or "other direct labor." Neither overhead nor other direct labor is ever estimated by the estimator. These two elements, "overhead" and "other direct labor," are accounted for by applying factors for overhead and other direct labor to the total hard-core labor estimate. See section 5.10 of this chapter for an example of the labor rate determination process.

5.4.3 Standard Estimating Example. Contractors are required to estimate work requirements using a method or system consistent with their accounting system. It has been shown through audits of contractors' accounting systems that the hard-core labor elements identified in Appendix A are always charged as direct labor. It is also true that all contractors have other direct labor elements in the chart of accounts that must be considered in estimating work to be performed. Table 5-1 shows two sample charts of accounts for contractor direct labor. In these two samples, an asterisk notes those direct labor elements that are comparable to the Standard Estimating hard-core labor elements. The determination of which labor categories are hard-core is a matter of judgment. Any contractor labor category judged to be comparable to a labor category listed in Table 5-2 is designated as a hard-core labor element. The remaining labor categories are included in the term "other direct labor." The factors to be applied to Government estimates are based on actual audit of contractors' accounting systems. For example, based on past accounting data for all direct labor charges in a contractor's accounting system, other direct labor requirements are computed as a percentage of the direct labor charges covered by the hard-core direct labor elements. Typically, a Government estimate of 100 man-hours would be comparable to 140 man-hours in the contractor's estimating system where the other direct labor factor was computed to be 40 percent of the hard-core charges. The key to achieving equity in estimating for a particular estimating system is to determine the appropriate factors to be applied to the Government estimate. The fundamental principle of estimating in Standard Estimating is for the estimator to estimate only those direct labor elements necessary to satisfactorily complete the task requirements, such as those listed on Appendix A.

Conversely, consideration of overhead and other direct labor is accounted for by applying the proper factors for overhead and other direct labor. It would be improper to estimate the cost of supervision, scheduling, material handling, fire watches and the like when those labor elements are properly accounted for in the labor rate applied to the labor estimate.

5.5 ESTIMATING ENVIRONMENT.

5.5.1 Environment Defined. An estimating environment is defined as the estimating system and that collection of facilities, tools, equipment, materials, labor, skills, procedures, environment and other factors that may impact on the cost of performance of the activities estimated. Knowledge of the estimating environment as a frame of reference for the estimator is one of the fundamental prerequisites for estimating. In a NSY, this requirement is met as a natural consequence of the way business is conducted, while in the RMCs the estimator may be estimating for work that will be awarded competitively to a contractor whose identity is not known. Where contracts are sole-sourced, the estimator does have the opportunity to adjust the estimating to match the contractor's estimating environment.

5.5.2 Cost Accounting Standards. Most contractors will prepare cost estimates using an estimating system consistent with the contractor's accounting system. For large commercial contractors subject to the Cost Accounting Standards (CAS), the contractor is required under reference (a) to use an estimating system consistent with the methods used for recording or accounting for costs and to submit a formal CAS Board Disclosure Statement showing the chart of accounts used for all direct and indirect costs and the methods used to account for those costs.

a. Small contractors and those not subject to CAS are required to use an accounting system which meets generally acceptable accounting standards. The Defense Contract Audit Agency (DCAA) periodically audits contractor's records to determine that the actual practices of estimating costs are consistent with the accounting system.

b. Contractor estimates are generally consistent with the contractor's accounting system. In the case of businesses where the company owns two or more contractors, the estimating systems used in all contractors are similar since all use the same accounting system. The charts of accounts used to identify direct and indirect cost centers and accounting practices are essentially the same at all of the company's contractors. However, estimates from one of the contractors may not be valid in any of the other company contractors, since estimating is a function of more than the accounting system. For example, estimating is also a function of facilities, tools and equipment available to the work force for performance. If one contractor uses a state-of-the-art

end-prep machine to machine piping joints for welding and another uses a hand grinding tool, the estimates of labor hours required may vary by as much as 400 percent for the exact same scope of work. Likewise, the use of precise numerically controlled machine tools is more efficient than the use of manually operated machine tools. Generally speaking, the use of new, modern facilities improves performance when compared to performance in older, obsolete facilities. In a contractor's accounting system, however, the cost of new, modern facilities and state-of-the-art machinery and tooling will increase the indirect cost factors used to determine the billing rate applied to direct labor hours. No two contractors have the same collection of facilities, tools or equipment available for performance and, therefore, there may be differences in estimates among contractors owned by the same company.

5.5.3 Other Factors Affecting the Contractors' Estimating Environment. Contractor estimating is a function of the labor skills available, the experience of the work force and the workload. Highly skilled employees can perform more efficiently than unskilled employees, but at a higher wage rate. A contractor work force experienced in overhaul of a particular ship class benefits from the learning experience and can perform more efficiently on subsequent ships of the same class. Other considerations, such as the ship repair market and level of work backlog, also play an extremely important role in estimating for competitive procurements. For example, market conditions may dictate a contractor estimate that can be significantly at variance with the estimate of actual costs. If the market is saturated, that is all contractors are at capacity or are operating with a significant backlog of work, the contractor does not need additional work. The addition of more work under these conditions may be very disruptive to ongoing work and the disruptive effects would have to be considered in estimating the costs of more work. Under these conditions, contractors may also seek higher profits to compensate for the added disruption. Therefore, any precise estimate of total costs based on work scope and labor rates would be overridden by an increase to account for the market being at, or in excess of, capacity. Conversely, when there is not enough work to keep all contractors busy, the marketplace becomes more competitive. Under this condition, contractor management will normally undercut well-conceived estimates in order to remain competitive. A basic principle of estimating is that an estimate prepared for any one contractor will not be valid for any other contractor. The estimator must know the estimating environment that is used and estimates must be prepared to reflect the total environment of where the work is to be performed.

5.5.4 Regional Maintenance Center Estimating Instructions. For each contractor actively performing a Master Agreement Job Order, the Administrative Contracting Officer (ACO) will identify to RMC estimators the set of direct labor categories to be estimated. No other estimates for labor will be provided. Indirect labor costs (overhead) and all other direct labor required for performance will be accounted for in the labor rate to be applied. The ACO or Procuring Contracting Officer (PCO) will determine through understandings with contractors, and as audited by DCAA, the appropriate rates and factors to be applied to ensure that Government estimates and rates are consistent with the contractor's accounting and estimating system. To the maximum extent possible, RMC estimates will be prepared using Appendix A. Where changes in the labor categories to be estimated are required, the ACO will provide written direction as to the changes to be made. Once the changes are made, all estimates for changes with that contractor will be made using the modified Appendix A. No other direct labor will be estimated. In all cases, independent Government estimates for changes will be prepared by consistently

estimating direct labor only for the direct labor categories identified by the ACO or PCO. All other labor required for performance will be accounted for as a subcontracted effort or in the labor rate overhead applied to the direct labor cost estimate. Individual estimators are not authorized to change the labor categories on the Cost Estimate Sheet except as directed by the ACO or PCO.

a. For those contractors who do not establish an understanding with the ACO about the contractor's estimating system, the ACO will establish appropriate rates and factors for use in Standard Estimating. If time and resources are available, this can be achieved by RMC examinations of the contractor's chart of accounts to identify hard-core and other direct labor categories, and then requesting audit by DCAA to establish the other direct labor factor as addressed earlier and in reference (a).

b. If audit resources are not readily available, the ACO will establish in advance, from the contractor's chart of accounts, a listing of all hard-core and other direct labor categories as defined earlier. The ACO may request the contractor to prepare accounting records detailing the actual man-hour expenditures in specific direct and other direct labor categories to support DCAA audits. Accounting records may be requested for periods not less than the preceding six months nor greater than the preceding three years. From this data, DCAA will compute and recommend to the ACO an appropriate ODLF. Labor rates used for pricing changes must be consistent with the factors determined.

c. The contractor's estimating system must provide for reaching work scope understandings with the RMC when required. The parties must have a common understanding of the work requirements in order that the contractor's estimates and subsequent analysis by RMC will be made on the same basis. That portion of the estimating system dealing with the definition of work scope should cover the disposition of material made obsolete or excess as the result of the change.

d. The understanding to be reached with the contractor must include provisions for the contractor to submit proposed revisions to procedures and practices which involve an understanding previously reached, in order that they may be evaluated and a new understanding reached. Periodic reviews will be made by the ACO and the audit office to see that the contractor's written procedures and practices are current.

e. Any deviation from the estimating system must be clearly supported. Any estimate based on standards is designed to give reasonable figures on the average. To argue in any given case that a standard results in too many or too few man-hours will probably open up arguments on other standards or other cases. There is one important exception to the need for consistency; if actual costs, hours, overhead, etc. are known, they must be used.

f. The contractor's estimating system should provide for periodic adjustments in the labor and overhead rates to be applied in establishing estimated costs. The system should also provide a means for the contractor and the ACO to reach an understanding on the rates to be applied for work performed or to be performed during specified periods. Such rate understandings and the consistent use of the rates by the contractor in preparing change proposals will expedite proposal evaluations and negotiations.

g. In establishing rates, factors and percentages to be used in estimating systems, it is essential to remember that the mix of overhead and direct labor skills will change with different kinds of work. Contractors that perform a variety of work for the Navy may require that multiple rates, factors and percentages be prepared for each type of work performed by the contractor. For example, a contractor that builds and repairs ships would require different rates, factors and percentages for construction, repair and for each type of ship (e.g., submarines, aircraft carriers or Surface Force ships).

h. In achieving understandings with contractors, the ACO must consider that many contractors will not have established estimating systems, nor can small businesses be required to establish formal estimating systems. Therefore, the ACO will be required to provide guidance and suggestions to the contractor to establish a mutually agreeable and beneficial system for both parties.

i. Estimates developed on the basis of judgment without any analytical support must be reconciled with historical costs. Therefore, contractors should be encouraged to develop procedures for comparing estimates to the cost of performance as a basis for assessing the accuracy and reliability of their estimating practices.

j. For pricing actions exceeding $700,000, the Federal Acquisition Regulation requires that the contractor certify that their proposal is current, accurate and complete. If a contractor's estimating system, procedures and practices are inadequate, the proposal will be considered unacceptable. The ACO will require the contractor to correct the unsatisfactory elements or performance prior to completing the work package negotiations. For pricing actions less than $700,000, the ACO should require that the contractor correct the unsatisfactory performance and revise the estimating system in order to resolve the problems prior to completing work package negotiations.

k. The RMC estimator is responsible for the preparation of the following cost estimates, either concurrently with or subsequent to the preparation of the work item:

(1) Direct labor hours.

(2) Direct labor overtime hours.

(3) Direct material cost, including subcontracts which the prime contractor will have to procure. Subcontractor costs will not be estimated for competitive procurements except where a directed subcontractor is specified in the work item.

5.6 COST ESTIMATING METHODS, STANDARDIZATION AND STANDARDS.

5.6.1 Variables. A number of estimating methods and techniques have evolved which are applicable only under particular conditions. Cost estimates must take into consideration the current estimating environment, market conditions, weather, and any other factors that influence the labor hours and material costs associated with a cost estimate. In preparing detailed cost estimates for work activities, the estimator must always use the best information available. Where standards are available and applicable, they must be used. Where the estimator lacks experience or knowledge of the work being estimated, it is essential that other sources of information be examined. These sources include the following:

a. Government Planner's Handbook and Estimating Guide (Primary source for surface ships).

b. Master Specification Catalog.

c. Other estimators who have longer service or experience.

d. Engineered labor standards prepared by naval or private contractors.

e. Material catalogs from industry vendors.

f. Contract files for similar work packages.

g. Personal records made from past jobs or negotiations.

h. Other Government agencies that have performed similar work.

i. Personal observations made during job execution.

j. "Rules of Thumb".

k. Historical data.

5.6.2 Standardization of Cost Estimates. Original work items customized by a planner frequently result in contract changes. For this reason, planners should utilize the proven Standard Work Templates (SWT) found in the Navy Maintenance Database (NMD) or Master Specification Catalog (MSC)whenever possible. Standardization of work items is coordinated by the Standard Specification for Ship Repair and Alteration Committee described in reference (b). The planner must use an applicable Class Standard Work Template if possible to prepare a work item addressing an authorized Ship Work List Item Number (SWLIN). If an applicable Class Standard Work Template is unavailable, an applicable SWT should be tailored to the SWLIN item requirements. If an SWT is unavailable, a Local Work Template (LWT) should be tailored to the SWLIN requirements. As a last resort, the planner should develop an original work item, using current standard phraseology and applicable Category II NAVSEA Standard Items (SI). Estimates should be standardized to the maximum extent possible. When estimating work items to be used in a competitive environment, previous estimates used for the same item should be modified only after a careful justification and then only to reflect changes in scope or changes in the estimating system. When a previously used work item is tailored to meet a new SWLIN item requirement, the previously used estimated should also be tailored to meet the new requirements.

5.6.2.1 Estimating Standards. Estimating standards are established by relating labor and material costs to specific characteristics of products or services delivered. The use of estimating standards is designed to save time in estimating and is particularly effective in estimating the costs of recurring work. Estimating standards are used to estimate the cost of a single material item required for the work in question or the cost of a single labor operation, (e.g., welding rods per ton of steel, labor hours per linear foot of weld, gallons of paint per square feet or surface area, etc.). More complex estimating standards may also be used to estimate the costs of groups of materials or components or broader classes of labor operations. Estimating standards used must be consistent with the estimating system used to develop estimates. Standards derived from industry-wide statistics are generally applicable industry-wide. Standards that include contractor-specific procedures are applicable only in that contractor's estimating system. The use of such standards is limited to the environment where the standard was developed. When

estimating for changes where the contractor is known, any approved engineering standards applicable at the contractor's plant should be used by both the contractor and the Government in developing estimates for the work. Large numbers of Engineered Standards and other standards have been developed by both naval and private contractors. Many of these standards contain basic charts and tables that depict labor and material allowances for various work elements. These allowances are then modified by unique factors to reflect skill levels of workers, facilities and tools available, etc. Some of these standards can be adapted for use in any contractor's facility, provided appropriate factors are used to modify the standard allowances.

5.6.2.2 Government Planner's Handbook and Estimating Guide. The Government Planner's Handbook and Estimating Guide, which must be used as the primary source for estimating on surface ships, will be maintained by the Standards Management and Reconciliation Team. The Standards Management and Reconciliation Team will convene a group annually to review and update this guide after Standard Specification for Ship Repair and Alteration Committee (SSRAC) has issued changes to the NAVSEA Standard Items and Appendix E of volume VII, chapter 4 of this manual.

5.6.2.3 Naval Shipyard Labor Standards. Standards applicable to all NSYs are categorized as Uniform Engineered Methods and Standards, while yard-specific standards are categorized as Engineered Methods and Standards. Estimating standards must be changed whenever any prime element affecting the standard changes. Engineered Standards are developed using industrial engineering techniques to estimate a repetitive item of work in a stable environment. Development of such standards involves such things as time and motion studies, application of fatigue and lost time factors, etc. The prerequisites for an engineered standard are:

a. Specific method.

b. Actual time for accomplishing the task or operation must be observed and recorded.

c. Performance of the individual(s) is leveled by a performance rating technique applicable to the contractor.

d. Allowances for personal needs and any special circumstances must be identified.

5.6.3 Detailed Estimating Techniques. Inherent in the concept of detailed estimating is a requirement that the estimator know how the work being estimated is to be accomplished. The "how" of work accomplishment is always unique at any contractor and it may also vary with time, workload and other considerations. The method of accomplishing the work must be consistent with the applicable estimating system. Detailed estimating requires that an estimate for hard-core labor and material for each activity of work required be developed and summed to obtain the total hard-core item estimate. This type of estimate can be referred to as a detailed estimate because the work required is broken down into as many detailed activities as needed to facilitate the estimating. A detailed estimate is built from the bottom up, starting with the lowest element of work required and building on it until the total job is estimated. The greater the level of detail, the greater the refinement is possible.

5.6.4 Use of Historical Data. When historical data has established a standard allowance in labor and material for a work item, that standard will normally be used when estimating that item of work. The estimated cost will change, because labor rates and the price of materials change with time. The labor-hours and material quantities should remain constant, except for changes in work scope or the estimating system. The use of such historical standards should be validated

with each use to ensure that new technology and work practices have been properly considered and that they are representative of the actual cost elements being estimated. When collecting and analyzing cost data, care should be used to distinguish between estimated costs and return or actual reported costs. When using return costs in historical files, an effort should be made to make adjustments to eliminate the excess costs that can be attributed to inefficiencies or other factors that are unique to the availability and the way the work package was executed. Use of return cost data in historical files without appropriate adjustment causes inefficiencies in performance to be extrapolated needlessly into future cost estimates. For this reason, historical files based on estimated costs are generally preferred over files based on return cost. Historical files can incorporate both estimated and return cost, but any return cost used should be properly adjusted.

5.6.5 Parametric Cost Estimating and Cost Estimating Relationships.

a. Parametric cost estimating is broadly defined as a technique employing one or more Cost Estimating Relationships (CER) for the estimating of costs associated with work to be performed or products to be delivered. In this sense, CERs represent the relationships between the cost of materials, labor or services and the products delivered or work performed. Simple CERs can be derived arithmetically from historical data. For example, examine the cost of quality assurance in performing machine shop work. If historical records show that the costs of quality assurance over the last six months of operations amount to 10 percent of the total effort expended in the direct labor pool, then it would be safe to use a CER which projects the cost of quality assurance as 10 percent of the total effort required in operations over the next six months, unless some prime condition changes which may impact the overall cost of performance. It is difficult to use sophisticated CERs in ship repair estimating because of the nonrecurring nature of most ship repair work. CERs are more useful in estimating manufacturing and construction costs as opposed to repair, overhaul or modernization costs. This does not mean, however, that simple CERs cannot be effectively used. They are used frequently, but they are generally referred to as “Rules of Thumb.” Experienced estimators who have observed and recorded the results of prior estimates and adjusted them for changing conditions have developed many “Rules of Thumb” over the years. “Rules of Thumb” allow for estimates to be made on the basis of such concepts as cost per pound or hours per foot or unit. As with all CERs, “Rules of Thumb” are subject to change and, therefore, should be used in an informed manner. When changes occur in technology, procedures or other areas of cost affecting a CER, it should be modified to reflect the impact in cost expected.

b. The first step in developing a CER is to determine its need and usefulness. Applications for CERs can be readily identified through logical reasoning and hypothesizing about the factors affecting the costs of performance. Once a need has been identified, the next step in developing the CER is to determine what it is that will be estimated and how it will be estimated. If labor hours are the desired items to be estimated, which categories of labor will be included, is there a fixed ratio of one category to another or which labor categories are to be excluded? The next step is to determine which factors will be used to estimate or drive the CER. All significant factors that cause costs to be incurred such as specific material quantities and prices, procedures or processes applicable, environment, etc., must be identified. Of these

factors, isolate those that make the most significant cost contribution. The number of factors selected should be the smallest number possible to make the CER understandable and effective in producing the required estimates. Next, obtain historical data on both the cost variable being estimated and all the driving factors selected for use in the CER. The data collected must be consistent with the CER parameters isolated for analysis and must be extensive enough to represent a broad sampling of the costs expected under normal conditions when the CER would apply. Next, the data must be analyzed to determine the relationships that exist and the usefulness of those relationships in determining a CER. Then the relationship that best describes the data used is selected. The CER is quantified for use by providing a description of the CER, the independent variable or variables that are used and the method to predict the cost of the dependent variable.

c. CERs may be presented in many forms, such as graphs, tables or charts. They may be based on relationships from simple straight-line (one-to-one correspondence) to complex multivariable non-linear relationships. CERs, like most tools used in estimating, must be tempered by good judgment. The data used to develop CERs must be viewed in light of current conditions. New processes, technology or other factors may make CERs obsolete. It is necessary that estimators have some knowledge of the factors involved in CER development. Blind application of CERs can lead to disastrous results.

5.6.5.1 Return Cost Statistics. It is easy to accept a running average of historical return costs as the best estimate of future costs for the same or similar requirements. This practice does not always give the best estimate possible. This estimating technique may easily incorporate prior inefficiencies that have persisted unchecked. Worse yet, historical files based on return costs run an even greater risk of perpetuating erroneous estimates because of inaccuracies in reporting those costs and a lack of consistency in execution. The actual cost of performance of a job is a function of time as much as it is the hard-core cost elements of labor and material. Collecting actual cost data in a contractor cost accounting system is a requirement for all ship repair contractors and NSYs. The data collected does not always reflect the actual work accomplished. This can happen when workers erroneously charge labor to the wrong job order number or to the wrong contract. In private sector availabilities executed under a Master Ship Repair Agreement, return costs reported on departure reports are usually based on a prorated share of the contract price plus the negotiated costs of applicable contract modifications. The basis for the proration is the Government estimate of each work item. Thus, a return cost based on a substantial buy-in by a contractor would be terribly misleading when applied to a sole source negotiation or at a time when the market is saturated. For these and other reasons, return costs should be used only with great care in developing standard estimates for future work.

5.6.5.2 Estimated Cost Statistics. The best estimate of future costs is the statistical mean of a number of independent estimates for the same requirements. Even in the case of standard estimates derived from independent estimates, the standard must be reviewed periodically to challenge its validity in all elements of cost estimated.

5.6.5.3 Adjustments to Historical Cost Data. When collecting completion cost data for historical files, acceleration, disruption and delay costs should be subtracted before entering the cost

figures into the files. These costs are unique to a specific availability and should not be extrapolated for use in future availabilities.

5.7 PREPARING THE COST ESTIMATE.

5.7.1 Preparation. Estimates for labor required are limited to those direct labor categories contained in Appendix A. The form was designed for use in preparing work item estimates for both competitive and noncompetitive procurements, as well as contract modifications after award. In the case of estimating for a work item, the estimate is broken down by paragraph number in the work items and by Category I Standard Items, where applicable. In estimating for work items, the material requirements are designated as Contractor Furnished Material (CFM) or GFM. The form is designed to show only CFM requirements in the estimate breakdown by paragraph. The GFM requirements are estimated separately.

5.7.2 Developing the Estimate. In the estimating process, the estimator describes in broad terms the sequence of activities required to accomplish the work being estimated. Typical repair sequences are shown in Table 5-3. Next, each of these activities is further broken down to the lowest level of detail necessary to facilitate the estimating process. For example, in Sequence B of Table 5-3, the "inspect" activity may require a detailed inspection of a specific set of internal components. Each of the inspections may require a unique set of activities and measurement criteria. Thus, each component inspection could be estimated as a separate activity.

a. In quantifying the work required, the estimator should envision what is to be done, as in a mental time and motion construction of the physical activity required to accomplish the work. Inherent in this task is a requirement that the estimator know the details of the work to be performed. If the estimator is unsure of the work activities required, a knowledgeable person should be consulted to determine the applicable requirements. It is essential that the correct processes, technology, tools and sequence of work activities be considered in developing a detailed estimate.

b. After the mental time and motion analysis is complete, the estimator prepares a detailed listing of all activities that are to be estimated separately. The level of detail should reflect that level needed to support the estimating requirement. Experienced estimators do not normally need to break the work down into as many activities as an inexperienced estimator. In determining the activities to be considered in the estimate, it is helpful to use a check-off list of typical requirements in ship repair. The estimating check-off list shown in Appendix B is provided as an example and can be modified as necessary to suit particular situations. Using the check-off list will prevent inadvertent omissions of incidental support requirements for the major activities of work required, (e.g., assist trades, rigging, staging, temporary lighting and ventilation).

c. In developing the estimate activity list, examine each major activity in the repair sequence, shown in Table 5-3, to determine whether or not a further breakdown is needed and to identify the sublevel activities. Each of the new activities identified may also require further breakdown until the level of activities is detailed enough to develop a reasonable estimate.

d. Once all of the activities to be estimated have been identified, the estimator has to assign labor-hours for each trade and support craft needed to accomplish each activity.

The cost of material to support required work is also estimated for each activity. The work item estimate is the sum of all labor-hours and material cost estimates. Work item estimates of labor are normally expressed in terms of man-days rather than man-hours (one man-day being equal to eight man-hours). Labor estimates for contract modification are normally expressed in man-hours vice man-days.

Table 5-3

TYPICAL REPAIR SEQUENCES				
WORK ACTIVITY	SEQUENCES			
	A	B	C	D
1	REMOVE	OPEN	PREP AREA	RIP OUT
2	DISASSEMBLE	INSPECT	MASK	FOUNDATION
3	INSPECT	REPAIR	PAINT	LAND EQUIP
4	REPAIR	CLOSE	CLEAN	HOOK UP
5	TEST	TEST	TOUCH-UP	COLD CHECK
6	REINSTALL		CLOSE OUT	HOT CHECK
7	TEST			TEST

5.7.3 Quantification of the Labor Estimate.

a. Most work activities are estimated on the basis of the estimator's judgment and experience. Even in the absence of experience, the estimator can still assign reasonable estimates based on good judgment and knowledge of the work being estimated. By mentally going through each step of the work required, the estimator can assign a labor estimate based on judgment of the time required to accomplish each step of the work process. Such detailed estimating can parallel the industrial engineering methods used to develop estimating standards for repetitive type work. Industrial engineering standards are the result of comprehensive time and motion studies of a work process. The time required to perform each operation is measured repetitively. Through analysis, a standard is developed for each step, allowances are made for distractions and rest periods and a standard allowance is made by summing the standard for each step plus other applicable allowances. In mentally paralleling this process, the estimator is providing the time for each step or motion required. The estimates for each step are summed and additional allowances are added for distractions, rest periods and other possible considerations. The other considerations include such items as the following:

(1) Location of Work: Estimates for a work operation should be greater when the operation is performed in a congested area. For example, repairs to a water fountain in a congested machinery space with other work in progress would be more time-consuming than the same repairs to a similar water fountain located on the mess decks, in the absence of other work. Work operations of any kind are more time-consuming when performed in conjunction with other work

(mutual interference) or when performed in a cramped or congested area. Likewise, estimates should be escalated for work performed in a hostile environment such as in tanks or voids, in poorly ventilated spaces, in hot or cold spaces, in contaminated atmospheres, etc.

(2) Ship's Force Work: When work is being performed on the same equipment or system by both the contractor work force and the Ship's Force, there is normally an added degree of mutual interference to be considered. Even when the two work forces are not in the same space, the mutual interference may lead to inefficiencies that should be considered in estimating the contractor work.

(3) Prevailing Weather: When the geographic area for an assigned availability is known, the geographic weather pattern should be considered. Likewise, if the time of year is known, the seasonal weather should be considered. For example, it is normally more costly to blast and paint the underwater body of a ship hull in below freezing weather than in milder weather. Similarly, the weather may also impact paint curing times and other time factors considered.

(4) Ship's Material Condition: Estimating Standards, historical estimates, "Rules of Thumb" and other estimating tools available for use are generally applicable under "average" conditions. Estimates for many work operations should be factored to reflect the material condition of the ship. If the ship is in average condition, the standards need not be factored. If the ship is new, then the standards should be reduced to reflect the better than average material condition. If the ship is in very poor material condition, the estimate should be increased. Not all work operations are affected by the ship's general material condition; however, many are, such as surface preparations, painting, insulation and lagging, structural repairs, etc.

(5) Category I Standard Items: The NAVSEA Category I SIs are invoked in work packages following the guidance provided by the Standard Specification for Ship Repair and Alteration Committee. When invoked in a job order, the provisions of the Category I SI apply for the duration of the availability without further reference. The estimator must know which Category I SI is applicable for the work and what the direct, hard-core labor cost impact of each SI is on the work required. Each time the provisions of the Category I SI are applicable in a work item, an allowance should be made to accomplish the hard-core labor requirements of the SI. An SI will be invoked if any work in the areas addressed in the SI is likely in the work package. Not all Category I SIs will have a direct hard-core labor cost impact. Those that do are discussed briefly in the following sections.

(a) SI 009-04: Quality System; provide. Invoked for all significant availabilities. This item requires the contractor to develop and use an inspection system acceptable to the Government. The contractor must develop an inspection plan for each item and record inspection results. This plan must provide for a corrective action program to correct defective or non-conforming work, maintain a calibration system for

test equipment, control non-conforming material, conduct periodic quality reviews and provide notification to the Government for each CHECKPOINT. When this SI is invoked, nearly every work item should have approximately 10 percent of the effort allocated to Quality Assurance and NDT.

(b) SI 009-07: Fire Prevention and Housekeeping; accomplish. Invoked for all manned vessels, unless the Type Commander (TYCOM) requests SI 009-35. This item requires the contractor to provide acetylene or gas supply manifold systems off the ship with shutoff valves to gas supply on the pier. This requirement should be considered in each instance of gas use. When SI 009-07 is invoked, approximately 25 percent of the hot work effort should be allocated for estimating fire watch requirements.

(c) SI 009-10: Shipboard Asbestos-Containing Material; control. Invoked when any machinery, piping and compartment insulation and lagging may be removed. Under this item, the contractor is required to provide a process control procedure for the control of asbestos-based insulation and lagging materials. All insulation and lagging materials are assumed to be asbestos-based until shown to be otherwise. Work accomplished must conform to Occupational Safety and Health Act requirements regarding insulation removals, work zones, protective equipment and clothing, and disposal of insulation. Compliance with these requirements is a labor-intensive operation that must be considered for each time and place the work is required. When SI 009-10 is invoked, approximately 33 percent should be added to the insulating and lagging estimate of the work item.

(d) SI 009-24: Isolation, Blanking and Tagging Requirements; accomplish. Invoked when equipment, systems, piping or circuits require isolating, blanking and tagging for safety or cleanliness and to prevent operation of a system or equipment while work is being accomplished. Under the requirements of this item, the contractor is required to comply with the Ship's Force system for isolation, blanking and tagging of equipment or systems in the performance of required work. The contractor has to notify Ship's Force in each instance of starting or completing work and a contractor representative must sign the ship's tag out log. Further, the contractor has to provide, install and remove blanks on piping, valves, equipment and components that are isolated or removed during performance. Items removed must be tagged with metal tags. Electrical cables disconnected must be insulated and taped. Each of these requirements requires hard-core labor for accomplishment and must be considered as part of the work activity even though not specifically spelled out in the work item (2-Kilo). When invoked, approximately 5 percent of the trade hours should be added to the estimate to cover the requirements of SI 009-24.

(e) SI 009-61: Shipboard Use of Fluorocarbons; control. Invoked for all specifications. Under this item, the contractor is required to develop and use a process control procedure to govern control of shipboard use of fluorocarbons. The contractor must notify the Government in each instance of use of fluorocarbons and must provide ventilation and telephonic communications for transfer operations, suspend hot work in spaces affected by atmospheric fluorocarbons, use at least two people for quantities in excess of 10 pounds and vent gases to ship exterior atmosphere. These requirements must be considered in all estimates involving the use of fluorocarbons. Approximately 20 percent should be added to the estimate to cover the requirements of SI 009-61.

(f) SI 009-65: Polychlorinated Biphenyls (PCB); control. Invoked for all specifications. Under this item, the contractor is required to develop and use a process control procedure for control, clean up and disposal of PCBs. The contractor must inspect each equipment or component containing PCBs and make a report. These requirements must be considered in any work estimate where PCBs are involved.

(g) SI 009-73: Shipboard Electrical, Electronic, Fiber Optic Cable; remove, relocate, repair and install. Invoked for all specifications requiring electrical work. Under this item, the contractor is required to remove completely all electrical cables no longer necessary due to work required in the job order. Work required includes blanking bulkhead and deck penetrations, removal of unused hangers and installation of new banding for remaining cables. Relocation of existing cables and installation of new cables requires banding, installation of hangers, deck and bulkhead penetrations and connection of cable leads to components or equipment. These requirements must be included as work activities in all work on shipboard electrical cables.

(h) SI 009-106: Work Authorization and Control Process; accomplish. Invoked for all specifications. This requires the contractor to comply with volume IV, chapter 10 of this manual regarding work authorization. Specifically, the contractor is required to submit a Work Authorization Form to the designated representative of the ship's Commanding Officer for authorization to start work on each Work Item in the Job Order. This is considered an overhead or indirect charge so no direct labor charges are included in any estimates.

b. References (b), (c) and (d) also can have significant labor impact. Appendix C is provided as a check-off list to assist the estimator in properly considering the impact of Category I Standard Items. Each of these SIs must be fully understood before an estimator can properly allow for the cost impact in performance of the work required. Those items characterized as "labor intensive" must have detailed estimates prepared to reflect the scope of work required. The scope of work will vary significantly from job to job.

5.7.4 Material Estimating.

a. The material estimate usually receives the least attention of all the estimates provided. This may not significantly affect a small job, but the accumulation of small errors on a large package can affect the total estimate considerably. When estimating material costs, the following must be considered:

(1) The kinds and quantity of each material required to accomplish the work.

(2) Whether the materials are procurable or will be manufactured.

(3) The "lead time" for procuring the material.

(4) Is the material commercially available?

(5) The current or future price for the material.

b. The estimator is not expected to be as familiar with the material pricing as a purchasing agent, but should be familiar with the market, should know what is scarce and what is not available from commercial sources and should keep up with current prices and availability. The estimator should also use drawing material lists, equipment technical manuals and Allowance Parts Lists to determine material requirements. Cost estimates are then based upon records of previous recent purchases, current Government and vendor catalogs and consultation with Government and commercial sources.

5.7.4.1 Contractor vs. Government Furnished Material. In estimating material costs, no distinction is made between CFM and GFM. All material will be priced the same way using either Government or commercial prices, whichever is most readily available and appropriate. Generally speaking, because the Government purchases supplies in large lot quantities, the cost to the Government will be less than it would be to a private contractor making single item or small lot purchases. For this reason, Government prices should not be used when estimating costs for CFM in a work item, however, because the allowable variance in Class F estimates is 40 percent, it is permissible to use either commercial or Government material prices for Class F material estimates. This estimate should not include the cost of material to be provided as Special Program Material or Centrally Procured Material in support of the Navy Modernization Process (NMP). Likewise, the cost of repairable items under special turn-around programs should not be included in the work package. In developing estimates for work items, a decision about CFM vs. GFM must be made before the estimate can be finalized. CFM estimates are provided on the reverse side of Appendix A. It is general Department of Defense policy that contractors provide all material necessary for performance. That means simply that all material should be CFM except where it is in the best interest of the Government to provide material as GFM. Exceptions to the CFM policy include:

a. Items in long supply in the Navy Supply System (i.e., items stocked far in excess of expected item demand) should be provided as GFM since it would be wasteful to require contractors to buy such materials.

b. Items with a set shelf life that will expire before normal draw down in the supply system should be issued as GFM if such usage remains within the shelf life requirements.

c. Long Lead Time Material should be provided as GFM. In Government procurements, items that are not commercially available within the time period after contract award and the time the contractor needs the material for production should be considered as Long Lead Time Material.

d. Standardization material should be provided as GFM. This material is the Special Program Material and the Centrally Procured Material purchased in support of the NMP.

e. Material requiring Provisioning Technical Data should be provided as GFM. Normally, repair material does not require Provisioning Technical Data because it is already stocked in the supply system.

f. Material items to be changed out under special turnaround or repairable programs should be provided as GFM.

g. Material for contractor work performed outside of the U.S. Overseas contractors may not have ready access to materials meeting Navy specifications and are often procured as GFM.

5.7.4.2 Sources of Pricing Information. The most important source of pricing information for ship repair material is the Navy price list for stocked supplies and repair parts. This pricing information, when used in estimating, is adequate for pricing material requirements. Navy stock prices should not be used for estimating the cost of CFM in work items because the cost to industry for the same repair parts and supplies can be considerably higher. When the use of Navy pricing information is not appropriate or when the required pricing information is not available, the best source of current pricing information is the manufacturer or dealer who is in the business of distributing the materials or parts needed. Every estimator should maintain a listing of vendors, manufacturers, distributors, etc., that can be consulted to obtain current pricing information. Where available, catalogs of pricing data should be ordered and maintained in a central repository for reference by all estimators who may require the pricing information. Each RMC should maintain a library of current material pricing data for materials frequently required in typical ship repair activities estimated by the RMC.

5.8 ESTIMATING FOR CONTRACT MODIFICATIONS.

5.8.1 Contractor Modifications. For contract modifications, including Master Agreement Job Order modifications and for noncompetitive procurements, estimates must include allowances for known conditions in the estimating environment. The scope of the modification estimate must include consideration of additions and deletions required by the change, the impact on completed work by the change and the current status of materials made obsolete by the change. The cost estimate must consider the means of performing the work, the completion date and other factors impacting on performance such as delay, disruption or acceleration. These cost elements must be identified, quantified and included in any cost estimate. In considering the means of performance, due consideration must be given to the contractor's normal operating procedures. The estimate should be prepared based on the methods, procedures, facilities, equipment and employees available to the contractor. In such a sole source environment, it is unfair to the contractor to negotiate changes on any basis other than those that impact on the costs of performance by the contractor. Estimates for changes must be prepared based on the way the contractor would perform the work, considering current workload as well as contractor

inefficiencies and disruptions that may result from the change. The estimate must also consider the timing of the work to be done. Change work authorized early in availability is less costly than change work authorized later. For example, work in a propulsion space, authorized three weeks prior to a Light Off-Examination by the Afloat Training Group could easily be three to four times the cost of the same scope of work authorized a week or two after the start of an availability.

5.8.2 Acceleration. Acceleration should be considered in developing estimates for contract modifications that increase the scope of work. Simply defined, acceleration is a speeding up of the work in an attempt to complete performance earlier than otherwise anticipated. Acceleration consists of such items as increased manning, added shift work, overtime, rescheduling of work force, new hires, new subcontracting, etc. Acceleration, when required, must be considered in any estimate for changed work in a job order. Acceleration costs will nearly always be incurred when significant growth or new work is added to a work package that is to be completed in the original contract performance period. A contract is also "accelerated" if the original performance period is decreased without an accompanying decrease in the scope of work. When acceleration is required, it must be identified in the contract modification (scope of work) and estimated as any other work element is estimated.

5.8.3 Disruption. Disruption costs should also be considered in developing cost estimates for contract modifications. It is the cost of the man-hours, materials and other costs that are expended to offset inefficiencies experienced as a result of Government-caused or contractor-caused changes or other departures from the original schedule that includes the effect of changed work on unchanged work. It is also the process by which the inefficiencies in the performance of contract work are created. Disruption, when it can be identified, must be quantified and accounted for in any contract modification estimate prepared. As with most estimating, quantifying disruption is an inexact process and there are few official guidelines to draw on for assistance. The real requirements to be kept in mind are that it must be considered in determining the scope of work and, if present, the contractor must be compensated for disruption attributable to the change. Disruption attributable to the contractor's past performance, without regard for the change, must not be considered.

5.8.4 Delay. When a contract change affects the completion of the contract, a contractor may request additional compensation for this "delay". Delay can also be an element of the contractor's cost estimate when other Government action or inaction causes a delay to the contractor's efforts. Delay is defined as that period of time a contractor is required to perform beyond the planned delivery or completion date, due to contractually remediable Government action or inaction (e.g., changes, stop work orders, suspension or late or defective GFM). Delay must also be considered whenever any time-oriented event affects the length of or causes a suspension in scheduled contract work. As with any other cost element, if present, it must be identified, quantified and accounted for in any estimate provided. Delay attributable solely to the contractor's execution of the job order is not considered in any estimate for a contract modification.

5.9 SHIP CHANGE ESTIMATES.

5.9.1 Navy Modernization Process. Reference (e) defines policies and procedures and assigns responsibilities for the establishment and revision of man-day estimates, man-day cost estimates and material cost estimates for Ship Change (SC) installations. Realistic estimates of required

man-days and correct application of man-day rates are important in programming and budgeting for the NMP. Additionally, capturing post-availability return costs for SCs, particularly when available in terms of both labor hours and material costs (as in the case of Cost Reimbursable contracts), provide a valuable resource to NMP managers in refining cost estimates for future installations.

5.9.2 Classification of Ship Change Estimates. SC estimates are usually prepared at either the Class F or Class C level. When Class C estimates have been previously prepared for a specific SC, that estimate, or the historical average of the estimate, should be used as the estimate for that work when it is authorized in future SCs. Recall that Class F estimates are "ballpark" estimates prepared in the absence of detailed design or engineering data, repair instructions and detailed material requirements. Before preparing such an estimate, all other sources of estimating data must first be exhausted.

5.9.3 Sources of Ship Change Estimating Data. The preferred way to estimate a SC is to use the historical estimate for that item if it has been previously estimated. Generally, historical estimates are preferred over actual return costs. In both cases, differences in ship conditions (e.g., docking vs. non-docking availability) and the nature and location of other repair and modernization work performed on the ship during a given availability can significantly influence the return costs of the work performed. Selection of the best estimate source is a matter of good judgment based on the pertinent facts. If historical estimates or return costs are not available, the next preferred approach is to examine the estimates or return costs for similar work. By making adjustments to account for the differences in the actual work required, those estimates can be used as the basis for a new estimate.

5.9.4 Ship Change Estimating Techniques. When historical estimates or return costs are not available for use in SC documents, a Class F or Class C estimate must be prepared based on the SC work scope descriptions and estimating data available. All of the techniques available for estimating repair work items are also applicable in developing SC estimates. The basic difference between developing a SC estimate and an estimate for a repair work item is that repair work generally has more detailed information available in the work statement. In estimating a SC, the work scope statement is often a relatively simple direction to install per drawings. Particularly in the case of a first-time SC, the challenge for the estimator comes from a detailed review of what is required to accomplish the requirements of the SC drawings and any associated technical manuals and bills of material. The approach to estimating and the techniques used should still closely parallel those that would be used to estimate repair work. The work scope should be broken down into logical elements that can be estimated readily. The estimates for each element are then added together to obtain the total estimate.

5.9.5 Prorated Cost Estimates.

a. In the preparation of total availability budgets and cost projections, as well as preliminary and final review estimates for SCs, it is necessary to identify each funding activity's (e.g., TYCOM and NAVSEA) share of the proratable costs associated with the availability. Proration costs will vary between availabilities depending upon the relative magnitude of the work package under each customer funding account. Only those general type services that apply to more than one customer and are performed during an availability are proratable, (e.g., temporary services, crane services, docking services, guarantee engineer, etc.). Services that are performed in support of a specific

job are not proratable. As an example, consider an access cut for removals in a machinery space where both repairs and alterations require removals. In this case, the cost of the access should be prorated. In the case of an access cut solely to support repair work, the cost of the access cut is not proratable and the cost would be borne by the TYCOM. Labor elements and other direct costs not estimated in the Government estimating system should not be considered in the cost to be prorated. These elements are accounted for in the Overhead (OH) or Other Direct Labor (ODL) categories of the labor rate used for the cost estimate. These costs include such items as the costs associated with scheduling, material handling, fire watches, etc.

b. In general, the actual Direct Labor (DL) hours charged to the Government and attributable to a benefiting customer should be used as the basis to prorate service costs. In those cases where these costs are not available, it is appropriate to use the estimated labor hours to be funded by a benefiting customer as the proration basis.

5.10 LABOR RATE ESTIMATING.

5.10.1 Projections. Each fiscal year within the Department of Defense Planning, Programming and Budgeting System, the Navy is required to submit proposed changes to the Future Year Defense Plan that represent the proposed pricing of approved programs. This process forms the basis for the Navy budget. Each year in support of this budget request, NAVSEA will issue a call to the RMCs for projections of private contractor labor rates for the current fiscal year and five future fiscal years. The TYCOMs and NAVSEA Project Managers use this data in developing maintenance budgets. The following discussion related to labor rates addresses the importance and variability of labor rates used in estimating for ship repair:

5.10.2 Labor Rates. The term “labor rate(s)” is not used to denote just wage rates, but all costs except material (and profit, in the case of private contractors).

5.10.2.1 Private Contractor Labor Rates. Reference (e) directs RMC Contracting Officers to identify labor rates for the current fiscal year and to project labor rates for the next five future fiscal years for each active ship repair contractor. NAVSEA publicizes this information for use by Office of the Chief of Naval Operations sponsors, NMP sponsors, Fleet Maintenance Officers, TYCOMs, RMCs, Supervisors of Shipbuilding, Conversion and Repair, United States Navy (SUPSHIP) and Ship Availability Planning and Engineering Center planning activities. The information should be used in advance planning work definition and authorization, in pricing of solicitation work packages and in budgeting for pricing of approved maintenance projects.

5.10.2.2 Other Direct Labor Factor. ODLF is that factor which accounts for all direct labor charged by the contractor that is not identified and accounted for on Appendix A. A sample calculation is described in paragraph 5.10.2.4 of this chapter.

5.10.2.3 Labor Rate Determination.

a. In determining private contractor labor rates, the RMCs and SUPSHIPs obtain accounting data from DCAA and each contractor. This data is analyzed to compute the ODLF required to make estimates prepared in the Standard Government Estimating System comparable to estimates prepared in the contractor’s estimating system. The ODLF will range from 10 percent to as much as 80 percent or more, with the average being between 30 percent and 40 percent. What this means is that for the

same scope of work, the Government estimate will always be less than the contractor's estimate because the contractor's estimate will contain labor hours for the ODL categories that are not estimated in the Standard Government Estimating System. To account for the differences in the estimating systems, two approaches can be taken. The Government man-hour estimate can be inflated by the ODLF and be used with the contractor's current forward pricing labor rate or the contractor's labor rate can be inflated by the ODLF to obtain a new labor rate which is used with the Government man-hour estimate to obtain costs. For budgeting purposes, the latter course of action is directed by NAVSEA. This method of equating the estimating systems is also recommended for other Government estimating. In any case, it is inequitable to apply the contractor's labor rate to the Government estimate to project expected costs. This method will always result in understated costs.

b. For a variety of reasons, including the many variations and complexities in contractors' accounting systems, there are many different approaches to labor rate determinations. Indeed, the terminology varies as well with local customs and the vernacular. Labor rate determinations for contractors can be very simple or very complex, depending on such things as the size of the contractor's work force and the sophistication of the contractor's accounting system. The contractor's labor rate is a function of many things related to the contractor. For example, the efficiency and skill of the work force, the mix of trade categories required to perform the work, the facilities and tools available and other factors will impact the rate. Further, the rate will differ for different kinds of work. For example, work on nuclear power plants requires more inspection and verification than conventional power plant work. For this reason, the factors developed must be applicable to the type of work contemplated. Some contractors will require that factors be developed for each category of work performed (i.e., submarines, Surface Force, aircraft carrier or barge and boat work). An example of a typical rate determination is:

   Accounting data for a representative period, usually the firm's accounting year, is examined and after elimination of non-allowable costs, the costs in the various categories are computed. In this example, the cost categories are identified as DL, OH, and General and Administrative (G&A). The total DL hours computed to be worked are divided into the total wages computed to be paid for DL (excluding overtime premium) to determine the average DL wage rate. The OH and G&A rates are determined essentially the same way. However, DCAA may make other recommendations. The OH rate is divided into variable and fixed components. The variable portions such as certain fringe benefits vary with changes in the DL base hours worked, whereas the fixed portion does not change (within certain limits). The DCAA examines the contractor's rate proposal in conjunction with the ACO, discusses issues with the contractor and forwards the rate proposal to the ACO with recommendations for approval or partial approval where some data is unacceptable. The ACO then establishes a labor rate based upon the DCAA audit report results and discussions with the contractor. This composite rate is the sum of DL, OH, and G&A.

5.10.2.4 Sample Other Direct Labor Factor and Labor Rate Determination. A sample computation of a contractor's labor rate determination is:

a. For simplicity, assume this contractor does not have G & A and melds those costs into OH such that variable and fixed costs for the OH associated with 130,000 DL hours worked are:

Variable	$700,000
Fixed	$600,000
Total	$1,300,000

The OH rate is then $\frac{\$1,300,000}{130,000 \text{ hr}} = \$10.00$ per hr (assuming the contractor allocates OH on a direct labor hour basis)

b. The direct labor wages paid are $2,600,000 and the average DL rate is

$$\frac{\$2,600,000}{130,000 \text{ hr}} = \$20.00 \text{ per hr.}$$

c. The rate then becomes: DL Rate + OH or 20 + 10 = $30.00 per hr.

d. Now using the sample figures shown in Appendix D, calculate the ODLF, which when applied to the contractor's forward pricing rate will make the rate applicable to estimates prepared in the Standard Estimate. The ODLF is ODL expressed as a percentage of the Total Direct Labor or:

$$\text{ODLF } \frac{\text{ODL}}{\text{TDL}} \text{ x } 100$$

e. The contractor's forward pricing rate is increased by this percentage to make it applicable to Government estimates prepared on the Standard Cost Estimate Sheet. According to the totals in Appendix B, the TDL is 130,090 man-hours. The total hard-core labor is 101,010 man-hours. The ODL is 29,080 man-hours. Therefore, the ODLF is:

ODLF = 29,000 / 101,000 x 100 = 28.71%

f. Thus, the forward pricing rate of $30.00 per hr is factored by 1.2871 to yield $38.61 per hr. Add to this a profit factor of 10 percent to yield $42.48 per hr. This hourly rate converts to a daily rate of $339.80, which is the rate applicable to estimates prepared by the Government. It is also the rate reported by the RMCs and SUPSHIPs to NAVSEA 017 for use in the Planning, Programming and Budgeting System. Where contractors apply variable OH rates for different kinds of work, a labor rate must be established for each different category of work performed. For example, it is usually true that factors for new construction and repair would be significantly different. Likewise, rates could differ appreciably for nuclear or non-nuclear plant work or Surface Force ship, aircraft carrier or submarine work. For contractors that do different kinds of work such as new construction and repair, nuclear or non-nuclear work or surface ship or submarine work, specific rates should be determined for each category of work contemplated in the Future Year Defense Plan.

5.10.2.5 Contractor Rate List.

a. NAVSEA collects the rate data from all RMCs and SUPSHIPs for all contractors and prepares a contractor rate list. Table 5-4 is a sample of the contractor rate list.

Table 5-4

	SUPSHIP SAMPLE				
	FY97	FY98	FY99	FY00	FY01
Contractor "A"	$300	$305	$310	$315	$320
Contractor "B"	$305	$315	$326	$337	$349
Contractor "C"	$308	$318	$329	$341	$353

b. In addition to the listing of contractor labor rates for each RMC and SUPSHIP, a composite labor rate for each port is developed to reflect the average labor rate for the area. Table 5-5 is a typical port composite labor rate projection for the West Coast.

Table 5-5

	PORT COMPOSITE LABOR RATE (WEST COAST)				
	FY97	FY98	FY99	FY00	FY01
San Diego	$300	$305	$310	$315	$320
Long Beach	$310	$325	$342	$359	$377
San Francisco	$326	$342	$359	$377	$396
Seattle	$325	$341	$358	$376	$395
Pearl Harbor	$350	$367	$386	$405	$425

c. And finally, a composite coast labor rate for each coast is developed to reflect the average labor rate of all the major private contractors on that coast. Pearl Harbor is not included in the West Coast composite labor rate since West Coast solicitations are restricted to the Continental United States. Table 5-6 is a typical coast-wide composite rate projection.

Table 5-6

	COAST COMPOSITE LABOR RATE				
	FY97	FY98	FY99	FY00	FY01
WEST	$325	$341	$358	$376	$395
EAST or GULF	$275	$289	$303	$318	$334

d. The solicitation area must be considered in making the decision on which labor rate to use. Some of the choices to consider are:

(1) A single contractor's labor rate can be selected if it is probable this particular contractor will be awarded the contract.

(2) A port composite labor rate can be selected.

(3) The coast composite labor rate can be assigned.

5.10.2.6 Labor Rate Evaluation for Competitive Procurements. Competitive procurements require at least two or more contractors be considered as "competitive" for the procurement. To be considered competitive for a procurement, a contractor must be capable of doing the work required by having requisite facilities capacity and, more importantly, the interest in responding to the solicitation. All contractors in the solicitation area may be interested in the solicitation, but some may not be competitive. The Government must assess the competitiveness of each contractor in order to determine an appropriate labor rate, which is representative of the net competitive environment to apply to the preliminary cost estimate.

5.10.2.7 Labor Rates for Noncompetitive Procurements. In noncompetitive procurements, the contract price is negotiated on a sole source basis with the contractor. The contractor labor rate can be computed to be consistent with the Government Estimating System or if the Government agrees with the contractor to use another estimating system, then the labor rate must be compatible with that system.

5.10.2.8 "The Right Labor Rate" Determination. Meaningful estimates depend on the prediction of the labor rate to be used in determining the dollar value of the estimate in question. In order to accurately predict the labor rate, it is necessary to identify the contractors within the solicitation area likely to be awarded the contract. A "composite rate" is computed from the contractors' labor rates and an evaluation of the "net" competitive situation. This evaluation should include consideration for:

a. Solicitation area contractor attitudes, competitive assessment, recent award prices for similar types of work, other commercial and Navy workload, contractor profit considerations and other market conditions.

b. Technical and production "risk" analysis of the availability work package.

c. Input from other Government activities (Military Sealift Command, United States Coast Guard, DCAA).

5.10.2.9 Market Conditions Assessment. Cost estimates must be realistic if they are to be of use for the purpose for which they are intended. To be realistic, cost estimates must be based on present market conditions, which, in turn, must be related to the procurement in-hand and to the conditions in the private contractors being solicited. Cost estimates predicted solely on man hour and material estimates without considering current market conditions are unrealistic and may result in bids or proposals received for ship repair work that are too high or too low when compared with Government estimates. In assessing the impact of market conditions, the following elements are generally considered:

a. When most yards are at full capacity the composite rate is adjusted upwards, somewhere between 10 and 30 percent, depending on the surge capacity of labor resources in the solicitation area.

b. When most yards are below capacity the composite rate is adjusted downwards, depending on the extent of excess labor resources available. Potential "buy-ins" must be anticipated. The downward adjustment may be as great as 50 percent of the Government estimate.

c. When making adjustments in rates, the nature of the work required is also considered. For highly technical or new, complex work, the larger yards should be more competitive.

d. For well-written, tight specifications, where little or no growth or new work is anticipated, a composite rate as close as possible to the expected actual rate is used.

e. For loosely written specifications with great potential for growth and for new work after award, a "buy-in" should be expected and the estimate should be adjusted downward at least 30 percent to 40 percent.

f. In a very competitive market, award prices in the recent past for similar work packages in the same area are examined. The composite rate is adjusted to be somewhat less but comparable to the average of the rates that is determined by dividing the award prices by the total labor hours (or man-days) estimated for the work packages awarded.

5.11 FORWARD PRICING RATES. A forward pricing rate is a written agreement negotiated between a contractor and the Government to make certain rates available during a specified period for use in pricing contracts or modifications. Such rates represent reasonable projections of specific costs that are not easily estimated or identified. Generally, the RMCs and other administrative contracting officers will annually (or more frequently as needed) negotiate a forward pricing rate with contractors awarded Government contracts. Contractors and the Government can facilitate forward pricing of contract modifications by reaching an understanding regarding the estimating system and forward pricing rates to be used. Reference (e) allows contractors to propose forward pricing rate agreements or formula pricing agreements to incorporate cost-estimating relationships which will reduce proposal documentation efforts and enhance the ease with which Government personnel can understand the contractors' estimating system. The RMC Contracting Officers normally negotiate with the ship repair contractors at least every six months to determine forward pricing rates. As with competitive labor rates discussed in earlier sections, forward pricing rates for labor calculations generally include projected workload (direct labor), total overhead, labor costs and profit. An example of the calculation is shown in Table 5-7.

Table 5-7

FORWARD PRICING RATE CALCULATION	
DIRECT LABOR (HOURS)	100,000.00
FIXED OVERHEAD ($)	200,000.00
VARIABLE OVERHEAD ($)	800,000.00
TOTAL OVERHEAD ($)	1,000,000.00
OVERHEAD RATE ($ per HOUR)	$10.00
DIRECT WAGES ($)	$1,400,000.00
DIRECT LABOR RATE ($ per HOUR)	$14.00
TOTAL HOURLY RATE ($ per HOUR)	$24.00
PROFIT @ 10 PERCENT	$2.40
HOURLY RATE WITH PROFIT ($ per HOUR)	$26.40
	x 8
FORWARD PRICING LABOR RATE (Man-day)	$211.20

*For simplicity, it is assumed that G&A is included in OH and ODL is included in DL.

5.12 MASTER SPECIFICATION CATALOG TEMPLATE PRELIMINARY ESTIMATES.

5.12.1 MSC Template Preliminary Estimate Process.

a. MSC Maintenance Office (MSCMO) will prepare Preliminary Estimates for each Master Specification Work Template, Class Standard Work Template and Standard Work Template (SWTs) developed and managed. Template Preliminary Estimates will document the direct production labor-hours and Contractor Furnished Material (CFM) needed to accomplish the requirements as detailed within the template. No reference will be given to a labor rate and no contingencies for growth or other uncertainties will be considered within Template Preliminary Estimates.

b. Navy ship repair standard direct labor elements as identified on NAVSEA Form 4710/7 (Standard Cost Estimate) will be used to build the Template Preliminary Estimates. These direct labor elements include ship yard trades (e.g. Shipfitter, Welder, Burner, Inside and Outside Machinist, Boilermaker, Electrician, Pipefitter, Insulator Lagger, Carpenter Shipwright, Electronics, Ordnance, Sandblasters Painters and Rigger) that will be used to document the direct production labor hours required to complete MSC Template requirements as well as the invoked Utilization Category II NAVSEA Standard Items (CAT II NSI) therein.

c. Requirements of Utilization Category I NAVSEA Standard Items which when invoked will apply to the entire contract are treated as other direct labor and will not be represented within template estimates. Planning Activities (Organic or Third Party) will add factors to the Work Item (WI) estimates in accordance with this

manual and the Government Planner's Handbook and Estimating Guide (GPHEG) to address the estimating of all other direct labor.

d. MSCMO will document the basis of estimate detailing the methods, sources of information and assumptions made when developing an MSC Template Preliminary Estimate. The goal of the basis of estimate is to provide a clear and complete understanding of how the preliminary estimate was derived. Standard assumptions will include that an average contractor under average conditions will perform the work. No assumptions concerning market conditions (i.e. port loading), executing activity scheduling (e.g. number of shifts worked or number of workers per shift) or prevailing weather will be made when preparing Template Preliminary Estimates. Any representation of duration will simply be the sum of the direct production labor hours to complete MSC Template requirements and invoked CAT II NSIs.

e. In general, MSCMO will utilize the bottom-up estimating method, also known as the detailed estimating method applying the appropriate GPHEG procedures when preparing Template Preliminary Estimates. In the bottom-up method, estimates for direct labor hours for individual requirement paragraphs to include invoked CAT II NSIs and CFM will be aggregated to form the overall preliminary estimate for the template. When information does not exist within the GPHEG, analogous estimating method will be used to prepare Template Preliminary Estimates. This method will rely upon historical Independent Government Estimates from Work Items that have achieved any of the following statuses within Navy Maintenance Database (NMD): Approved for Award, Packaged or Validated. Whatever estimating method is used for an individual template the details of that basis of estimate will be provided within NMD on the NAVSEA Form 4710/7 (Standard Cost Estimate) and as attached information contained in the Estimate Tab of a MSC Template.

f. Fully prepared thorough MSC Template Preliminary Estimates will assist Planning Activities to develop WI estimates for both deferred Work Notifications (WNs) from the Current Ship's Maintenance Project and WNs pushed from the Class Maintenance Plan as part of a Baseline Availability Work Package. Through the grouping of WNs some WIs will document requirements from both the Current Ship's Maintenance Project and the Class Maintenance Plan.

g. Parts of the basis of estimate detailed within MSC Templates used will carry forward to the WI estimate prepared by the organic Planning Activity. This will help to increase the speed and efficiency of depot level planning and estimating, assist development of Independent Government Estimates for WIs prior to turning over a Work Package to a contracting Officer for solicitation and award.

5.12.2 What MSC Template Preliminary Estimates "Do Represent" and "Do Not Represent".

a. MSC Template Preliminary Estimates do represent:

(1) The direct production labor-hours are estimated by trade for all main and sub paragraph requirements, to include invoked Utilization Category II NAVSEA Standard Items (CAT II NSIs), as well as direct Lead Maintenance Activity (LMA) Supervision, quality assurance, tests and reports identified within the Template.

(2) The expected LMA costs associated with hiring subcontractors (e.g. marine painting companies) and rental equipment (e.g. boom lifts or vertical staging) while executing WIs.

(3) LMA secured CFM costs. This would be either raw material or repair parts that are identified as requirements within a Template.

(4) Common Shelf Item Material (i.e. WI consumables) expended by the LMA during the execution of WIs as a factor of trade man-hours expended in a Template.

b. MSC Template Preliminary Estimates do not represent:

(1) Work Package invoked Utilization Category I NAVSEA Standard Items, general project LMA Supervision and general project LMA Quality Assurance, that is not documented within WI requirement paragraphs. Per this manual and GPHEG, these requirements will be addressed by adding a factor to a WI's estimate.

(2) Any representation concerning expected execution duration beyond simply the summation of the direct production labor hours to complete the requirements and invoked CAT II NSIs.

(3) Costs associated with labor brought to an LMA's facility in support of a Ship's Availability that are not paid for by the Ship Repair and Modernization Contract awarded to the LMA, for example: Government Inspectors, Government specialized repair teams, and Government Alteration Installation Teams.

(4) Government Furnished Material - Long Lead Time Material (GFM LLTM) costs will not be represented on the NAVSEA Form 4710/7 (Standard Cost Estimate). Items identified within Paragraph 5.1 (GFM LLTM) of a Template will have those costs represented within the basis of estimate information, attached to the estimate in NMD. This will allow downstream users to understand the likely GFM LLTM costs without affecting the Preliminary Estimate's presentation of expected maintenance activity direct production labor-hours and CFM costs.

(5) Costs associated with GFM Push or GFM Kitted material. These types of material are provided to a Ship Repair and Modernization Availability without the need of a funded procurement action on the part of an organic Planning Activity preparing WIs or the executing RMC.

(6) Requirements for hull specific interferences that would be found during a Work Item Ship Check.

(7) Requirement amounts that are hull specific. Class Standard Work Template preliminary estimates are prepared for a notional ship representative of the class.

(8) Specific class, hull or availability requirement amounts for SWTs. SWT preliminary estimates are based on a stated notional period of performance

with recommendations on how to scale estimates for different duration requirements. Work scope differences created by ship size, number of spaces affected, and depot availability duration differences are not represented (e.g. temporary services where the duration of the service impacts the estimate, or where the scope of the requirement such as installing temporary fire detectors is very situation dependent).

(9) Any likely integration or distribution of separate template requirements. Just as MSC templates are not interconnected, preliminary estimates standalone.

(h) STARS Users Manual (FMSO P-104)
(i) DoD Financial Management Policy Manual

6.1 PURPOSE. To provide information concerning the appropriation, allocation, management and accounting for funds that pay for services and materials used for ship maintenance, repair, modernization and during availabilities assigned to contractors through various types of contracts. This chapter provides discussion concerning the infrastructure and processes that must be considered and implemented to assure that the fiduciary responsibilities of the Procuring Contracting Officer and Administrative Contracting Officer and their appointed assistant financial managers are understood and consequences for noncompliance are articulated.

6.2 SCOPE. A Command's financial management program for the administration of funds is defined as an integral part of management. To accomplish the objective of financial management this chapter addresses the responsibilities associated with managing public funds that are appropriated for specific purposes as authorized by Congressional action, Department of War (DoW) allocations and Department of the Navy financial policies. The main purpose of financial management is to aid the higher-level management of ship repair planning and executing organizations. Appropriate accounting processes are engaged to account for funds and obligations committing funds of the Government's Treasury. This chapter specifically concerns financial management of funds authorized for the purpose of entering into contracts awarded to the private sector to accomplish repairs and modernization to ships, craft and other Government assets administered by Regional Maintenance Centers (RMC).

6.3 POLICY. Funds must be administered following current laws, regulations established by higher authority and policies established to provide for specific situations. The following are statutory requirements outlined in United States Code and other directives that establish funding controls requirements and policies:

a. Reference (a), Section 1301(a), states that appropriations will be applied only to the objects for which the appropriations were made, except as otherwise provided by law. There is no requirement to report a violation of this statute. The accounting, however, must be corrected to reflect the proper funding. This accounting correction can lead to

a reportable violation of the Anti-Deficiency Act if the proper funds were not available at the time of the obligation or expenditure.

b. Reference (a), Section 1341, states that an officer or employee of the United States may not make or authorize an expenditure or obligation exceeding an amount available in an appropriation or fund for the expenditure or obligation or involve the Government in any contract or other obligation for the payment of money before an appropriation is made, unless authorized by law.

c. Reference (a), Section 1342, states that no officer or employee of the United States will accept voluntary services not authorized by law, except in cases of emergency involving safety of human life or protection of property.

d. Reference (a), Section 1349, states an officer or employee of the United States Government or of the District of Columbia Government violating section 1341 and 1342 of this title must be subject to appropriate administrative discipline including, when circumstances warrant, suspension from duty without pay or removal from office.

e. Reference (a), Section 1517, states that an officer or employee of the United States may not make or authorize an expenditure or obligation exceeding an apportionment or the amount permitted by regulations prescribed.

f. Reference (a), Section 1518, states an officer or employee of the United States Government or of the District of Columbia Government violating section 1517 (a) of this title must be subject to appropriate administrative discipline including, when circumstances warrant, suspension from duty without pay or removal from office.

g. Reference (b), Volume 14, provides that the Commanding Officer (CO) of an activity is solely responsible under reference (a), section 1517, for the administration of all authorization of funds granted to the CO.

h. Reference (c) addresses the statutory responsibilities inherent in the administrative control of funds.

i. Reference (d), volume 2, Appendix A addresses administration of funding by funds administrators. These individuals must also be informed of principles concerning the administration of the appropriations as contained in reference (d), Volume 2, Chapter 2.

j. Reference (d), chapter 3, and reference (e) provide guidance to funds administrators concerning the administration of allotments and operating budgets.

k. Reference (d), paragraph 035400-035452, discusses the principles and procedures that are to be used concerning the use of various requests for work and services.

l. Reference (d), volume 3, chapter 5, section V states that all funded, reimbursable orders are subject to the recipient activity projecting that at least 51 percent of the funds will be used for “in-house” work.

m. Reference (f), section 23, states that a project order is provided as a specific, definite and certain order issued for the production of material for repair, maintenance, or

overhaul or for other specific work and services. It serves to obligate appropriations and funds in the same manner as contracts with a commercial enterprise.

n. Reference (a), section 1535, provides the authority as an economy act order is issued for work or services of a recurring nature where the scope of the work is not specific.

o. Reference (g) requires that funds current at the start of a major availability must finance the cost of the modernization or repair, including all scope-of-effort changes necessary to complete it.

6.4 GENERAL INFORMATION CONCERNING FUNDING AND FUNDS ADMINISTRATION.

6.4.1 Appropriations. An appropriation is the authority provided by an Act of Congress to incur obligations for specified purposes and to make payments for them out of the Treasury. The following is a brief description of the seven types of appropriations most often used by a Naval Supervisory Authority. Refer to the Department of the Navy Financial Policy Manual for a detailed explanation of appropriations.

6.4.1.1 Operation and Maintenance, Navy. Operation and Maintenance, Navy (O&MN) funds are for expenses, not otherwise provided for, that are necessary for the operation and maintenance of the Navy, as authorized by law. Equipment purchases under this appropriation are limited to a unit price of less than $250,000. This limitation may be changed in any future Congressional session. Operation and Maintenance funds are authorized on an annual basis.

6.4.1.2 Operation and Maintenance, Naval Reserve. This appropriation is for expenses, not otherwise provided for, necessary for the operation and maintenance of the Navy Reserve Fleet, as authorized by law. Equipment purchases under this appropriation are limited to a unit price of less than $250,000. Operation and maintenance funds are authorized on an annual basis.

6.4.1.3 Shipbuilding and Conversion, Navy. The funds finance the construction of new ships and conversion of existing ships, including all hull, mechanical and electrical equipment, electronics, guns, torpedo and missile launching systems and communications systems. This appropriation is a multiyear appropriation and normally remains available for obligation for five fiscal years.

6.4.1.4 Weapons Procurement, Navy. Weapons Procurement, Navy is used to finance the procurement of missiles, torpedoes, guns, munitions and the installation of modernization equipment. This appropriation is a multiyear appropriation and remains available for new obligations for three fiscal years.

6.4.1.5 Other Procurement, Navy. Other Procurement, Navy finances the procurement, production and modernization of equipment not otherwise provided for. Such equipment ranges from the latest electronic sensors to training equipment and spare parts. The unit price of this equipment must be in excess of $250,000. This appropriation is a multiyear appropriation and remains available for obligation for three fiscal years.

6.4.1.6 Research, Development, Test and Evaluation. Is used for expenses necessary for basic and applied research, development, test and evaluation, including maintenance, rehabilitation, lease and operation of facilities and equipment as authorized by law. This appropriation is a multiyear appropriation and remains available for obligation for two fiscal years.

6.4.1.7 Foreign Military Sales. Foreign Military Sales provides military assistance through the sale of defense articles and services to eligible foreign Governments and international organizations. The United States normally receives full reimbursement for costs associated with these sales.

6.4.2 General Classifications of Funds Transactions. All expenditures must be preceded by an authorization to expend from the available funds. In theory, every transaction progresses through the following four stages:

a. Initiations. An administrative action that identifies funds set aside (reserved) for planning purposes before establishment of commitments or obligations related to the purpose of the reservation. Initiations will not be maintained as a part of the official fiscal records.

b. Commitment. A firm administrative reservation of funds based on solid procurement directives, orders, requisitions, authorizations to issue travel orders or requests which authorize the recipient to create obligations without further recourse to the official responsible for certifying the availability of funds. A commitment is generally recorded when the comptroller signs the document to certify that the funds are available and properly cited for the effort. This is mandatory in the Standard Accounting and Reporting System (STARS) per reference (h).

c. Obligation. Incurred when an order is placed, contract is awarded, service is received, orders are issued directing travel and similar transactions are entered into during a given period requiring future payment of money in an agreed amount. By law, obligations must be supported by documentary evidence of a mutual agreement in writing. Each individual transaction must meet the test of the following principles:

(1) A determination that the specific goods, supplies or services required according to contracts entered into or orders placed obligating an annual appropriation are intended to meet a bona fide need of the fiscal year charged.

(2) Contracts entered into or orders placed for goods, supplies or services will be executed only with a bona fide intent that the performing activity will commence work and perform the contract without unnecessary delay.

d. Disbursement. Made when the bill is paid. This, plus accounts payable transactions processed by the RMC or disbursing office, as applicable, result in a reflection of expenditures.

6.4.3 Repair Funds.

a. The Fleet Commanders budget, (based mostly on the ship's Maintenance Team proposed annual Maintenance and Modernization Business Plan), and fund repairs from O&MN and Operation and Maintenance, Naval Reserve (O&MNR) appropriations, as applicable. The funds are normally provided to the RMC for specific use by the Type Commanders (TYCOM). These funds pay for contractual costs of authorized repairs and modernization of ships and for the incidental costs which include:

(1) Naval Supervisory Authority material.

(2) Travel and salary cost for overseas ship check.

(3) Ship Change and preparation of drawings or sketches to be contracted out.

(4) Sustainment Type One or Sustainment Type Two Fleet or Program Ship Changes on installed equipment.

b. Repair funds are received by the RMC from Fleet Commands (FLTCOM) on NAVCOMPT Form 2168/1, Expense Operation Budget, based on quarterly or monthly phasing plans approved by the TYCOMs. An Operating Budget (OB) is subject to the statutory limitations of reference (a), section1517. OBs pass funds for the execution of centrally managed procurement programs. Details on ship repair and modernization funds, including current year and prior year availabilities, may be found in reference (i).

6.4.4 Navy Modernization Process Funds. This program is covered in detail in Volume VI, Chapter 36 of this manual. Effective in Fiscal Year 90, the Navy Modernization Process was transferred from the O&MN and O&MNR appropriations to the Other Procurement, Navy appropriation. The transfer shifted the emphasis from ship alteration to equipment orientation. Installation of equipment is now funded with the same appropriation and fiscal year funds that procured the Government Furnished Equipment. Naval Sea Systems Command (NAVSEA) provides Project Directives for the accomplishment of Program and Fleet Alterations (Ship Changes). This funding covers expenses incidental to the accomplishment of alterations such as:

a. Preparation and reproduction of alteration drawings contracted out.

b. Travel costs, other than local, for overseas ship checks of alterations.

6.4.5 Berthing and Messing Funds. FLTCOMs provide berthing and messing funds using NAVCOMPT Form 2168/1, Expense Operation Budget, to the Project Manager. In addition, NAVSEA may provide funds for this purpose through project directives. Fleet Commander's directives concerning the berthing and messing of crews undergoing scheduled availabilities should be reviewed.

6.4.6 Commercial Industrial Services Contracts. The Commercial Industrial Services Program, when utilized and funded, provides work or services to ships by use of Indefinite Delivery Indefinite Quantity Contracts, likewise there are also standalone Indefinite Delivery Indefinite Quality Contracts for selected service or productive capabilities awarded by a Fleet Logistics Center or the RMC Contracts Department. Orders are placed for repair of individual items for a predetermined price and performance period. The TYCOM authorizes the repairs to be included in these contracts. O&MN and O&MNR funding is provided to RMCs on OBs.

6.4.7 Environmental Compliance Oversight. This function is funded by FLTCOMS and NAVSEA (travel and training) and includes hazardous waste and shore environmental protection. This section is addressed further in Chapter 10 of this volume.

6.5 LEGISLATED RESPONSIBILITIES FOR CONTROL OF PUBLIC FUNDS.

6.5.1 Commanding Officer Responsibility. Reference (b) provides that the CO of an activity is solely responsible, per reference (a), section 1517, for the administration of all authorizations of funds granted to the CO. The responsibility cannot be delegated in whole or in part within the Command. The CO will be held personally responsible for any act or an act of a subordinate

within the activity that causes an over-commitment, over-obligation or over-expenditure of an authorization of funds. COs must take all necessary action to establish accountability and enhance the administrative control of funds, including:

a. Establish and maintain adequate fiscal controls to prevent the over-authorization, over-commitment, over-obligation or over-expenditure of funds made available to the activity.

b. Issue an activity instruction providing for the authority, responsibility and procedures required in the administrative control of funds.

c. Delegate funds administration authority to individuals at the appropriate level to ensure that the individuals are personally aware of the necessary detail to establish total accountability. Funds administrators must be enabled to provide absolute technical input to funds control. Financial management remains the responsibility of the activity comptroller.

d. Ensure that subordinates delegated the authority to act as funds administrators are authorized in writing, by name, clearly specifying the extent of the authority and the responsibility delegated.

e. Ensure that designated funds administrators are familiar with the statutory responsibilities inherent in the administration of funds, including the provisions of the Administrative Control of Funds addressed in references (c) and (d). These individuals must also be knowledgeable of principles concerning the administration of the appropriations as contained in reference (d), Chapter 2, understand the administration of allotments and operating budgets as contained in reference (d), Chapter 3, reference (e) and the principles and procedures concerning the use of various requests for work and services contained in reference (d).

6.5.2 Comptroller. The activity's Comptroller has the responsibility for financial management and must report directly to the CO of the Activity. Depending on the activity, the senior person in the finance office is normally the Comptroller or the Budget Officer. The Comptroller must obtain guidance to resolve any questions on the interpretation of these laws.

a. The Comptroller has three basic functions:

(1) Budget Formulation including those actions performed in development, review, justification and presentation of the budget estimates.

(2) Execution encompassing budgetary actions required to effectively and efficiently accomplish the programs for which funds were requested, as authorized by appropriate authority.

(3) Managerial Accounting providing management with financial information necessary to support the preparation of budget estimates and facilitate the budget execution process. The process must ensure all funds are administered following the law, administrative policies and regulations of higher authority.

b. The Comptroller must be responsible for recording commitment and obligation transactions in the designated accounting system of record chargeable to OBs, Operating Budgets, performing periodic reviews of un-liquidated obligations and

unmatched disbursements, validating expenditures and advising the funds grantor of excess funds available for recapture.

6.5.3 Funds Administrators and Funds Managers.

a. Funds Administrators are delegated authority in writing by the CO to authorize, commit, obligate and expend specific funds related to a specified authority, as agents of the Comptroller Department. These individuals provide technical input to financial management and can be held accountable and personally liable for over-commitment, over-obligation or over-expenditure of the funds administered. Any individual who is duly authorized by the CO as a Funds Administrator will familiarize themselves with the policies directives that are outlined in paragraph 6.3 of this chapter. In particular:

(1) Clearly understand the statutory responsibilities inherent in the administration of funds, including the provisions of the Administrative Control of Funds addressed in reference (c) and (d), volume 2, Appendix A.

(2) Be informed of principles concerning the administration of the appropriations as contained in reference (d), volume 2.

(3) Understand the administration of allotments and operating budgets as contained in reference (d), volume 2, chapter 3, reference (e) and the principles and procedures concerning the use of various requests for work and services contained in reference (d).

b. Funds Administrators are designated in writing by the CO to manage the funds, in whole or in part, as specified by the Comptroller and that have been allocated to individual project. Authorized Funds Managers are required to request additional funds from the grantor of funds when needed. Likewise, Funds Managers will advise the grantor of funds when funds in excess of requirements are available for recapture.

6.6 RESPONSIBILITIES FOR SHIP MAINTENANCE FUNDING MANAGEMENT BUSINESS RULES. The goals of the Entitled Funding process are to reduce premiums paid for maintenance while at the same time improving the ability to respond to maintenance and operational requirements. The funding business rules for the Maintenance Team in managing the controls required to support all maintenance for a given ship are established in Volume VI, Chapter 31 of this manual.

6.6.1 Maintenance Team Funding Business Rules Responsibilities. The Maintenance Team identifies budget needs based on requirements in the Current Ship's Maintenance Project, Class Maintenance Plan, the Baseline Availability Work Package and historical data. The Maintenance Team identifies the total funding requirement to support the ship during the execution year, along with advance and availability planning and funding requirements for availabilities to be executed in future years. It also establishes the allocation of the "controls" or "phasing" plan that the team will utilize to support the ship.

a. The Maintenance Team, with TYCOM N43 concurrence, has the ability to shift controls between the Chief of Naval Operations (CNO) availability and Continuous Maintenance budget lines in order to most efficiently accomplish required maintenance and modernization.

b. The Maintenance Team, with TYCOM N43 concurrence, has the ability to adjust the Maintenance and Modernization Business Plan in response to changes in ship operations, planned maintenance periods and other business case reasons provided the intended distributions do not exceed the total remaining annual budget requirement allocated for that ship. This redistribution will be documented via a revised quarterly phasing plan, which will be submitted to the RMC, for approval and adjustment of the Maintenance Team controls. If funding controls permit, the Maintenance Team is permitted to accomplish maintenance that falls below the Maintenance Figure of Merit threshold provided the maintenance is accomplished during the most cost effective maintenance period available.

c. Depot level maintenance will normally be screened to the Private Sector Industrial Activity (PSIA) contractor. The Maintenance Team may go to other contracting vehicles when there is no PSIA contract in place or:

(1) The contractor and Government cannot agree on cost and scope.

(2) The contractor does not have the capability or capacity.

(3) Indefinite Delivery, Indefinite Quantity or Commercial Industrial Services (or Simplified Acquisition Purchases and a qualified vendors list) is available.

(4) Other organic RMC assets are available and have the capability for the work.

(5) Work is to be accomplished outside of homeport area.

(6) Work is to be accomplished by an Alteration Installation Team.

d. When work deferral reduces the total cost of the job or maintenance completes with a cost under-run and funds can be recaptured, the funding controls will normally remain under the control of the respective Maintenance Team. If the funds are needed for critical work on another ship or to cover a funding shortfall at the TYCOM or Fleet level, the RMC, with TYCOM concurrence, may redistribute or recapture controls from all or selected Maintenance Teams. The change will be documented in a revised quarterly phasing plan and the Maintenance Team(s) should provide to the RMC, and TYCOM, an impact statement and recommended plan to mitigate the effects of the plan change.

e. PSIA contractors normally submit cost reports to Maintenance Teams on a bi-weekly basis. The Maintenance Team will utilize these reports to assess the cost performance of the PSIA contractor and address items of concern to the RMC.

6.6.2 Regional Maintenance Center Funding Business Rules Responsibilities.

a. Based on input from the Maintenance Teams and the TYCOM regarding modernization requirements, the RMC Commander will develop a consolidated spending plan for the execution year.

b. The RMC will evaluate Maintenance and Modernization Business Plan (MMBP) adjustment requests based on the Summary of Events, recovery plan, and quarterly adjustment provided by the Maintenance Teams. If the RMC supports the request but lacks the spending controls required, the RMC will forward the issue to the TYCOM for consideration and resolution.

c. The RMC, with TYCOM N43 concurrence, has the ability to redistribute controls across the surface force ship Maintenance Teams for which the RMC is responsible. The RMC must inform the TYCOM whenever redistributions are required on any ship and must obtain prior approval from the TYCOM when controls require adjustment in excess of twenty (20) percent. The RMC may not redistribute funds between Active Fleet and Reserve Fleet funding lines or between different TYCOMs. The RMC must provide the TYCOM a record of all control changes for tracking purposes.

d. In the event of significant program wide control changes the RMCs must:

(1) Provide an impact statement to the TYCOM regarding the effect on the execution of maintenance.

(2) Provide a recommendation to minimize the impact on Force readiness.

e. The RMC must evaluate the financial status of each of the Maintenance Teams on a monthly basis.

f. The RMC must submit end of quarter financial summary reports to the respective surface TYCOM. This end of quarter report provides a comparison of actual versus planned funding execution. The last quarterly report for the execution year must include an annual summary showing how the funds were utilized, sorted by Naval Operations resource sponsor.

g. Normally, Emergency Maintenance funds will be used to fund C3 or C4 Casualty Report (CASREP) related maintenance. The RMC Commander has the authority and responsibility to determine when Emergency Maintenance funds should be used for the correction of C2 CASREPs or other non-CASREP related, but nonetheless urgent maintenance. The RMC Commander may, with the respective TYCOM's approval, use Emergency Maintenance funds to execute CNO availability or Continuous Maintenance.

6.6.3 Type Commander Responsibilities.

a. The TYCOM will provide a list of Fleet Alteration requirements for the execution year as input to the RMC business plan no later than 15 February in the year prior to execution. To assist with business plan development, the TYCOM will identify which alterations are scheduled for accomplishment and will provide the RMC with the cost estimates for accomplishment.

b. When the Fleet issues the spending controls to the TYCOM, the TYCOM will in turn issue spending controls to the RMC and update them on a quarterly basis.

c. The TYCOM has the authority to recapture spending controls previously issued to the RMCs in response to unforeseen Force budget requirements.

d. Funds will be provided to Maintenance Teams early enough to avoid premiums associated with late contract award or assignment of work.

e. If it is determined that the best course of action is not to fund a CNO availability, the TYCOM must approve the removal of funds before the RMC initiates this action. The TYCOM must ensure Program Executive Office, Ships are included in the decision

process to not fund any availability where Program Alterations are scheduled for accomplishment during that availability.

f. The TYCOM will evaluate MMBP adjustment requests forwarded by the RMC, based on the Summary of Events, recovery plan and quarterly adjustment provided by the Maintenance Team. If the TYCOM supports the request but lacks spending "controls" required, the TYCOM will forward the issue to the Fleet for approval and additional controls.

g. The TYCOM will evaluate the RMCs end of quarter financial status report to assess the degree of conformance to the approved RMC consolidated spending plan.

6.7 FUNDING VIOLATION REPORTING. When an over-commitment, over-obligation, over-authorization or over-expenditure of funds occurs, the violation must be reported per reference (b). Reports of violations are unique when compared to routine reports required by other laws or regulations. Each report must be submitted through the chain of command to the Assistant Secretary of the Navy (Financial Management and Comptroller), who will forward it through the DoW to Office of Management and Budget for transmission to the President. Copies of the report will also be forwarded to the President of the Senate and the Speaker of the House of Representatives.

6.8 FUNDING VIOLATION PENALTIES.

a. RMC personnel must avoid violation of the funding regulations addressed in reference (a). Penalties are contained in reference (a), section 1349. For non-criminal acts, appropriate administrative discipline is required. This could include removal. For criminal acts, which must be proven to be knowing and willful, a fine of not more than $5,000, imprisonment for no more than two years, or both, is required.

b. Penalties for violation of reference (a), section 1517, are contained in reference (f), section 1518. For non-criminal acts, appropriate administrative discipline that could include removal is required. For criminal acts that must be proven to be knowing and willful, a fine of not more than $5,000, imprisonment for no more than two years, or both, is required.

6.9 FUNDING METHODS AND ACCOUNTING.

6.9.1 Accounting and Reporting.

a. STARS is the official accounting system for Navy organizations with funding and accounting detailed in reference (h). This system, plus other command unique accounting systems, will eventually be integrated into the overarching Navy Enterprise Resource Planning System.

b. Financial managers may issue funds usage documents or provide funds to other financial managers through the Comptroller through various funding documents. FLTCOM funds are provided on OBs. Modernization funding from NAVSEA is provided on Project Directives.

c. RMCs are responsible for performing local accounting of all funds granted for maintenance and modernization in addition to other funding sources. Each RMC Comptroller is responsible for recording commitment and obligation transactions,

performing periodic reviews of un-liquidated obligations and unmatched disbursements, validating expenditures and advising the funds grantor of excess funds available for recapture.

6.9.2 Operating Budgets.

a. Ship repair and modernization funds are typically transmitted by means of OBs. The basic policy of funding mission operations is by use of OBs through command lines. However, in some instances a Technical Operating Budget (TOB) may still be the funding vehicle. TOBs are apart from a regular operating budget and may be issued, by a claimant or expense limitation holder, to a RMC within the chain of command or across command lines that are issued for implementation and execution of a headquarters-administered, centrally managed procurement program. The OBs and TOBs, carrying the same obligation and expense authority, and are governed by the same administrative and statutory controls, including reference (a).

b. The RMC is responsible for obligating transactions in the approved accounting system. The Authorized Accounting Agency (AAA) is responsible for posting expenditures. The Defense Finance and Accounting Service, Defense Accounting Office is the designated AAA for FLTCOM funds. The AAA will prepare and submit official accounting reports as required by references (d) and (e). The RMC should maintain only necessary records and should not duplicate records readily available through other accounting systems. RMCs receive many funds from NAVSEA and other users on various funding documents. The Fleet, via each individual Ships Maintenance Team annual MMBP approved by the TYCOM establishes planning estimates for anticipated requirements.

6.9.3 Reimbursable Orders. Reimbursable orders are written agreements between components of the Federal Government requiring the performance of work or services by one component and payment by the other component. Reimbursable orders are accepted per reference (d), Section V. All funded reimbursable orders are subject to the recipient activity projecting that at least 51 percent of the funds will be used for "in-house" work. If less than 51 percent of the work will be in-house effort, the funding for tasks to be contracted out should be provided on a Request for Contractual Procurement. Reimbursable order accounting requires extra effort in supporting documentation and accounting workload.

6.9.4 Project Orders. A project order is provided on NAVCOMPT Form 2275, Orders for Work and Services. It is a specific, definite and certain order issued under the authority contained in reference (f) for the production of material, repair, maintenance or overhaul or for other specific work and services. It serves to obligate appropriations and funds in the same manner as contracts with a commercial enterprise. Funds are not obligated until the performing activity signs acceptance of the project order. The accounting is the responsibility of the accepting activity. The funds provided on a project order cannot be exceeded without written amendment by the ordering activity. The funds provided by project order remain available for completion of the work or services requested regardless of the date the funds cited in the order expire. Research, Development, Test and Evaluation funds cannot be utilized on a Project Order.

6.9.5 Economy Act Order. An Economy Act Order, like the project order, is issued on NAVCOMPT Form 2275, Orders for Work and Services. The order is issued, however, under

the authority contained in reference (a), section 1535, and is intended for work or services of a recurring nature where the scope of the work is not specific. These orders are for services such as janitorial work, utilities and transportation. The funds are not obligated until acceptance is signed by the performing activity. The accounting is the responsibility of the accepting activity. The funds provided by an Economy Act Order cannot be exceeded without written amendment by the ordering activity. The funds provided can only be charged during the fiscal year of the availability of the funds cited on the document.

6.9.6 Direct Citations. Direct citations are requests from one Government activity to another for material, equipment or services that provide appropriate accounting data. The performing activity will cite the requesting activity's complete line of accounting data for any obligation or expenditure of funds. The accounting function will remain the responsibility of the requesting activity and its AAA. The funding cited on the document will not be exceeded without an amendment issued by the requesting activity. The funds retain all legal limitations that existed when the requesting activity accepted them.

6.9.7 Requests for Contractual Procurement. Requests for Contractual Procurement are issued on NAVCOMPT Form 2276. This document is issued when the receiving activity will contract out at least half of the work. The document becomes effective when the performing activity signs acceptance. The performing activity must comply with all restrictive statements contained in the document and ensure that confirmed copies of the contracts or orders that result are promptly provided to the requesting activity and its AAA for posting of obligations and expenditures. For funds received from other STARS or Human Capital Management users, a Project Directive is the preferred funding document in order to reduce memorandum accounting and reporting.

6.9.8 Letters of Authority. A Letter of Authority (LOA) can be used in funding work or services in instances when the activity requesting the work or services does not have the authority to issue a TOB and no other appropriate funding document can be identified for use. LOAs authorize the recipient to direct-cite the funds of the requesting activity on applicable financial documents. LOAs must contain complete line of accounting data, a statement of the maximum dollar amount authorized and the purpose for which the LOA is issued. If the LOA requires requisitioning material from stock, a universal fund code should be provided. The LOA should be assigned a standard document number. The LOA must provide for acceptance by the performing activity. The document becomes effective when the performing activity signs acceptance. RMCs will promptly provide a copy of all financial documents issued to the requesting activity. Due to this requirement for official accounting at the source activity, the use of LOAs is minimized.

6.9.9 Orders Placed With Government Agencies. Orders required by law to be placed with Government agencies will be recorded as obligations at the time the orders are issued. This category includes orders placed with the General Services Administration, Federal Prison Industries, Government Printing Offices, Defense Supply Agency, printing plants authorized to be established by the Joint Committee on printing and the Navy Publications and Printing Service Management Office. Military Interdepartmental Purchase Request, DD Form 448, is used for orders placed with non-Navy DoW activities.

6.10 GENERAL INFORMATION CONCERNING AVAILABILITY AND OBLIGATION OF FUNDS.

6.10.1 General. In funding an availability, RMCs should treat any contingent liabilities such as the difference between the Government estimate and a lower bid price, as commitments, rather than as obligations, following NAVCOMPT and DoW policy. The use of commitments will allow RMCs to encumber balances needed to finance future valid obligations and help to prevent possible Anti-Deficiency Act violations. Increases of ship work funds, if required, should be requested from the grantor of funds. If the increases are not granted, the work items to be included in the solicitation must be reduced following the priority requirements of the funds' grantor so the RMC estimate is equal to the funds authorized. Funds must be obligated at contract award. Contract solicitations may be advertised before receiving funding authorization when there is reasonable expectation that the requirements are firm and valid. The award of a contract or job order can in no case be made in excess of the funds available.

a. Reference (g) requires that funds current at the start of a major availability must finance the cost of the modernization or repair, including all scope-of-effort changes necessary to complete it. Material requisitions entered into the supply system after normal expiration of the funds must cite the law. This provision does not apply to availability or modernization efforts not directly related to the completion of the modernization availability. This provision extends the fiscal year availability of induction-appropriated funds for overhaul scope-of-effort changes from one year to indefinite availability. Changes authorized within the scope of the job order for other than a major availability are chargeable to the funds supporting the job order.

b. Un-priced contract or job order modifications cannot be executed when the RMC estimate exceeds the funds available. It is extremely important that un-obligated funds be returned to the grantor of funds as soon as the excess can be identified so that the funds may be applied to other requirements before expiration. If funds are required for the authorization of changes after the end of the fiscal year, the funds will be requested from the fund's grantor when an upward obligation has been approved. Job order modifications that are outside the scope of the job order are chargeable to funds current at the time the modification is authorized.

6.10.2 Effects of the Grassley Amendment. The Grassley Amendment requires the validation of obligations in the accounting systems before making a payment to the contractor. This validation applies to all invoices contractors submit (New Construction and Repair), regardless of the value of an invoice. When the accounting system finds a matching obligation, it moves it into the accounts payable account and freezes the account. This action prevents the account from being reduced until payment is made. A delay of several weeks in payment to the contractor may result. If payment is late, no interest is paid on progress payments. Because progress payments are made for the contractor's financial convenience, no interest is paid. Payments are most often made late for the following reasons:

a. Improper or late distribution of contracts.

b. Direct Cite Funding - Most payment problems arise in this category. The funding activity inputs obligations for direct cite lines of accounting. If the obligation is not input or is input incorrectly, the RMC cannot correct the obligation. The reason is the RMC does not have access to the funding activity's Unit Identification Code in the accounting systems. Thus, the Defense Finance and Accounting Service office must obtain a guarantee from the activity that the obligation is awaiting payment.

c. Delete Modifications - Contractors tend to ignore “delete” modifications or bill them at a much later date. When validation is attempted, insufficient funds are available. The result is the contractor has to resubmit the invoice.

d. Misapplied Payments - Misapplied payments are the most time-consuming reason for late processing of invoices. The processing of previous payments to the wrong line of accounting results in insufficient funds. It often takes a great deal of time to identify and correct the problem.

E Progress Guidelines

7.1 PURPOSE. This chapter provides general guidance concerning the statutory and contractual requirements for management of availabilities and emergent work on Fleet units. In this chapter, the term Project Manager refers to the individual that has been assigned the administrative and statutory authority for the management of an availability or an assigned project that is to be or has been awarded as a contract. This chapter focuses on the management team and in particular addresses the fact that the Project Manager and the Contracting Officer (Procuring Contracting

Officer (PCO) and Administrative Contracting Officer (ACO)) for the assigned project or availability must have a strong communications network through various commands and individuals who assist them in exercising their responsibility.

7.2 GENERAL.

a. The awarded contract establishes the rights and obligations of the contractor and the Government. The Government's actions or inactions in performing responsibilities such as providing Government Furnished Information and Government Furnished Material (GFM) to support the contractors' schedules, approving or disapproving of contractors' requested contractual actions, responding to contractor reports and participating in conferences to discuss technical and contractual issues as well as performance, could have a significant impact on the contractors' ability to perform contract requirements. These responsibilities make the Government an active participant in the management of the contract.

b. The execution of any availability or contract with the private sector requires personnel with special training in their select area of responsibility when it applies to the administration of contracts.

7.2.1 Areas of Responsibility. Two of the more important general areas of responsibility are:

a. Personal conduct in working with the contractor to ensure that the terms and conditions of the contract are complied with.

b. The necessity to validate observations and maintain accurate records of these observations in "significant events" logs that include action that was taken to resolve the issues.

7.2.2 Standards of Conduct in Availability Management. All personnel engaged in matters related to contractual action must be familiar with and comply with the Standards of Conduct, avoiding not only situations involving an actual conflict of interest, but also any appearance of such a conflict. Personnel performing certain functions in the Regional Maintenance Centers (RMC) must submit the Status of Filing Report, RCS NAVSEA 5370-2, by 15 November of each year per reference (a).

7.2.3 Improper Actions. While participating in the management of a contract, personnel must avoid certain actions even if not specifically prohibited. Command instructions provide in-depth guidance on personal conduct including regulations concerning fraud, waste and abuse. Personnel involved in Contract Administration or Availability Management must avoid any actions that might create the appearance of:

a. Using a Government office for private gain.

b. Giving preferential treatment to any person or entity.

c. Impeding Government efficiency or economy.

d. Losing complete independence or impartiality.

e. Making a Government decision outside official channels that might affect public confidence in the integrity of the Government.

7.2.4 Documenting Significant Events. This is one of the most significant actions that every member of the availability management team must comply with. Significant events are personal observations of conditions or actions by or to any party to the contract which would affect the performance of the contract.

a. "Significant Events" will be recorded to assist in maintaining adequate documentation to be used to verify, qualify or refute matters relating to a contractor's claim or Request for Equitable Adjustment (REA). The documentation of "significant events" is required for all contracts in excess of $5 million or for which a claim is expected. A claim can be expected against any contract associated with ship modernization and repair. All Maintenance Team personnel who are responsible for observing a contractors' performance, production processes, observing Government "G" check points ("G" Points) and monitoring operational tests and evaluations must document their observations and maintain a continuous real time notebook of significant events. Significant Event logs must be turned over to the ACO, via the Project Manager, at the completion of the availability.

b. The contracting officer retains this documentation in the "Significant Events" file.

c. The significant events file and related documentation allows the Government to support or refute claims, terminations of contracts, settlements and determinations or to provide evidence for litigation to investigative bodies, as required. They also include written records of nonconformities in work progress and accomplishment. Contract related documentation such as correspondence, meeting minutes, labor records, material purchase orders, project schedules, schedule updates, productivity data and project monitoring information form the basis for the assertion or rebuttal of a claim. This information is beneficial in documenting the contractors' performance reported in the Contractors Performance Appraisal Reporting System (CPARS) submitted at the conclusion of the performance period.

d. Maintain a hard copy or electronic log. Each recorded event will indicate the date, time and a brief but complete description of the event. This log and related memoranda will become a part of the "Significant Events" file and will be marked "CONTROLLED UNCLASSIFIED INFORMATION."

7.3 PROJECT MANAGEMENT.

7.3.1 Project Management Team. The Project Management Team as defined in volume VI, chapter 41 of this manual is included in the advanced planning processes as well as the contract type to be awarded. The Project Team for availability must be designated well in advance to preserve the continuity of the planning and execution phases of the acquisition process. The Project Manager, Comptroller, Support Staff and the Contracting Officer and their assigned teams must coordinate their actions. The overall Project Management Team is accountable, and in some cases liable, for administering the contract and associated contractor and Government actions following award and throughout the contract execution phase as specified in the period of performance. The Government's Project Management Team must ensure that the contractors' performance complies with the specific terms and conditions of the contract and that the services are provided at a fair and reasonable price.

7.3.2 Project Manager. The Project Manager is the individual who is responsible for the management of the Project Team during an availability or emergent unscheduled work. The Project Manager is assigned by the Commanding Officer (CO) of the RMC and is the coordinator of the on-site shipbuilding specialist team. The authority of the Project Manager must be clearly defined, identified to all concerned, and in particular the Contractor in relation to contract administration. Duties of this position include but are not limited to the following:

a. Acts as business agent with other activities on availabilities and contracts assigned that includes ensuring that Type Commander (TYCOM) funds are utilized properly.

b. Maintains liaison with customers, the ships Maintenance Team, Ship's Force Representatives, RMC functional departments, Government Availability Planning Managers financial or accounting personnel, and contractor.

c. Acts as assistant funds administrator (when designated in writing from the RMC CO) for assigned availabilities and contracts.

d. Coordinates with Government Availability Planning Manager in the planning and cost estimating of Work Specification preparation and scheduling.

e. Reviews specifications to ensure completeness and conformance with authorized work.

f. Arranges and conducts the Arrival Conference, weekly progress conferences and attends or arranges for RMC representation at all conferences pertaining to assigned availabilities and contracts.

g. Evaluates all Technical Analysis Reports (TAR) and supports the Contracting Officer in contract negotiations.

h. Evaluates and acts on the reports received from other members of the availability management team.

i. Manages ship repair and modernization work items, job orders and contracts assigned by progressing and evaluating all work to anticipate, prevent and minimize delays, resolving all problems that affect the end cost, quality, schedule and performance of assigned availability or contract.

j. Prepares reports on current status of assigned project or contract.

k. Coordinates the on-site work effort in observing the contractor's in process production performance and operational testing events for projects assigned to the team.

l. Acts as the availability management team point of contact for outside agencies seeking information relating to the project, the contractor's performance or technical issues under review.

m. Attends on-site meetings to provide comprehensive information to all concerned and to remain current in all aspects of the project.

n. Reviews all work accomplished by assigned Shipbuilding Specialists to ensure compliance with regulations, directives, instructions and policies as well as to ensure that intended work is practical and necessary.

o. Identifies and initiates action to correct, prevent and minimize delays, resolving all problems that affect quality, schedule and contractor performance.

p. Reviews contractors work schedules, manning curves, material ordering or receipt schedules and special tasking or equipment requirements. Evaluates contractors' proposals prior to and during contract execution. Takes corrective actions to eliminate conflicts and prevent work stoppages.

q. Performs all administrative duties and actions normally assigned to a supervisor.

r. Maintains a Significant Event Log.

s. Participates in the Lessons Learned Conference following the completion of a major availability and in support of availability planning, execution and close out.

t. Provide written reports to the Contracting Officer for Award Fee Evaluations Private Sector Industrial Activity (PSIA) contracts.

u. Prepares CPARS for Chief of Naval Operations (CNO) Availabilities.

v. Project Manager records to be passed to the Contracting Officer should include but are not limited to the following:

(1) Correspondence files containing copies of all correspondence to the Contracts Office both internal and external.

(2) Work authorizations for growth and new work. Work authorizations may be in the form of naval messages, Speed Letters, letters, other transmittals or documents. In the case of growth work, the authorization may be verbal, a memo at a meeting or a telephone call. Verbal authorizations should be documented with a Memorandum for the Record.

(3) The Project Manager must maintain a ledger notebook to assist in funds administration. For each contract modification initiated in the work package, the Project Manager must show the title of the item, cite the proper funding authorization and account and show the Government estimate. The ledger must show funds committed and obligated for each contract modification and other financial transactions and provide an indication of funds available for future use. When changes occur during the negotiation process, the funds reserved or obligated must be changed to reflect the current funding status. Periodically, at least monthly, the Project Manager must reconcile ledger accounts with the Contracting Officer and Comptrollers' accounts to ensure that funds are not over obligated or expended.

(4) Material requisitions for GFM with prices.

(5) Project orders and economy act orders issued to other Government activities.

(6) Completion reports.

(7) Departure reports including summary costs of individual work items.

(8) All significant events logs from project team personnel.

7.3.3 Material Expediter. The RMC will normally assign a material expediter to monitor the GFM that has been ordered for an availability or project. The material expediter, working with the RMC Material Personnel, Fleet Logistics Center (FLC) Representatives and contractor should be able to provide the current status of GFM, but will challenge the system to improve delivery dates or identify alternative sources to satisfy production schedule requirements.

7.3.4 Ashore Ships Maintenance Manager. As defined in volume VI of this manual, the Ashore Ships Maintenance Manager for each ship is responsible for identifying the extent of modernization and repair to be addressed in the specification package to be awarded to a private contractor. The Ashore Ships Maintenance Manager works with the Project Manager in the day-to-day activity of work execution that is being performed on the ship by all activities. The Project Manager and the TYCOM must approve new work items that have the potential to impact the schedule, finances or other aspects of the progression of the availability and the completion date. Generally, the Project Team supports accomplishing additional work items or contract modifications through the contracting officer only when on-site inspection of actual material conditions supports a need for repairs to meet the established operational performance criteria following the availability. During contract performance, contractors are not to accomplish new work or growth work without authorization from the Contracting Officer. (Surface Force Only) the Naval Supervisory Authority Chief Engineer will review requested growth and new work items for technical compliance. The Systems Command or TYCOM will authorize or reject each new work candidate submitted. The Ashore Ships Maintenance Manager's primary input on all matters related to Combat System integration, modernization and Combat Systems Light-off and testing schedules will be from the AEGIS Combat Systems Project Engineer, as assigned.

7.3.5 Shipbuilding Specialists. Shipbuilding Specialists are individuals that possess a primary trade background but effectively perform across trade lines in two or more trade skill disciplines. Team assignments are made to balance trade expertise appropriately with the type of work in the project. A wide variety of comprehensive duties and responsibilities are assigned to these individuals who are expected to act as decision makers with comprehensive knowledge of each work item assigned. Typical assignments include the following duties and responsibilities (as with Project Managers, this may vary depending on the supporting organization):

a. Provides current information relating to assigned work items to the team leader who is usually a Project Manager.

b. Attends meetings, resolves production problems, develops scope of work requirements, assists in the development of Government TARs and negotiation positions, assesses contractor capabilities, work progress and performance, provides technical support to the ACO, participates in claims avoidance and provides other technical support as required.

c. Interfaces with members of the Ship's Force to provide current project information, notifies responsible personnel of scheduled evolutions and solicits required or desirable Ship's Force.

d. Receives and investigates contractor reports, assists with the development of the Government's technical response, requests engineering support, prepares necessary contract modifications, documents initial lessons learned within the Work

Specification's paragraph 4 (Notes) briefly summarizing why growth (positive or negative) change was required, develops the Government cost estimates, estimates the delay and disruption that may occur because of a contract modification, assists with negotiation preparation relative to TARs and contract modifications (as authorized by the ACO), provides the ACO support in negotiations and maintains records of actions taken.

e. Perform or witness "G" Points, identified in the work specifications, when the contractor calls them out. Accomplish random Product Verification Inspections (PVI) utilizing checklists or an attribute system to determine contractor compliance with the quality and technical requirements of the work specifications or contract. Write a Corrective Action Request when nonconformities are detected per Chapter 11 of this volume.

f. Participates in various Government evolutions such as boat inspections, hull inspections, combat systems inspections, drydocking and undocking, habitability inspections, pre-Light Off Assessments and other evolutions that may require or benefit from technical trade expertise.

g. Determines the physical progress, as a percentage of work completed, of each work item and each contract modification assigned. This information is updated weekly in a comprehensive progress report that is used in calculating the contractor's entitlement to progress payments as well as in evaluating the contractor's schedule performance.

h. Monitors the GFM and Contractor Furnished Material (CFM) report to anticipate actions that may be necessary to preclude schedule impact by unsatisfactory material delivery dates and initiates material orders to replace unsatisfactory GFM or to provide items with unique Government control and confirms the necessity for the contractor to make cash purchases from the Naval Supply system when it is in the best interest of the Government.

i. Monitors the contract guarantee period to help determine whether failure of equipment or systems covered by the guarantee clause is the responsibility of the Government or the contractor, ensures that the work determined by the ACO to be the responsibility of the contractor, whether it is covered by guarantee or was an exception to the completion of the contract, is repaired following the specification requirements and provides cost estimates for incomplete work so that the ACO can ensure that appropriate contract funds are retained in the event that the work must be deleted from the contract requirements or be procured from another contractor.

j. Provides positive lessons learned along with feedback related to deficient or inefficient work specifications or work authorizations to the appropriate planning group for use in improving future procurements.

k. Conducts oversight coordination and inspection of work-related environmental issues associated with Ship's Force and contractor's operations. This effort includes but is not limited to hazardous material (HAZMAT) and hazardous waste (HW) handling, removal, storage, transportation and disposal.

l. Conducts safety inspections jointly with the contractor, Ship's Force and Government Environmental Safety and Health (ESH) Representative(s).

m. Maintains a Significant Events Log.

n. Provides written reports to support Award Fee Evaluations and CPARS.

o. Must maintain the following records:

(1) Work item specifications, references and estimates for the work package, updated to reflect all modifications to include brief summary, within the Work Specification's paragraph 4 (Notes), documenting why a growth (positive or negative) change was required.

(2) Contractor condition reports including Government replies.

(3) New work identified and not authorized.

(4) GFM delivery status.

(5) Quality Assurance (QA) records.

(6) Records relating to the contractor's capabilities and capacity.

(7) Contractor performance evaluations.

7.3.6 Quality Assurance Manager. The RMC QA Manager will administer the Contract Administration Quality Assurance Program outlined in Chapter 11 of this Volume to evaluate the effectiveness of the Contractor's Quality Management System on work being performed both shipboard and in the contractor's or subcontractor's plant. Shipbuilding Specialists, Quality Assurance Specialists, or both, will conduct and document in-process inspections (PVIs) of the contractor's or subcontractor's work, attend "G" Point call outs and, if appropriate, document a Corrective Action Request when the contractor fails to satisfy contractual quality and technical requirements. In addition, Shipbuilding Specialists and Quality Assurance Specialists on site maintain a significant events log and provide written documentation that supports Award Fee Evaluations and CPARS.

7.3.6.1 Contractor Quality Management System. The contractor is required by the contract to have a government approved Quality Management System that meets the requirements of reference (b). The Quality Management System is an International Organization for Standardization, Quality Management Systems (ISO 9001) based quality system that includes a staff and an inspection system with procedures to ensure that all of the terms and conditions identified in the work specification or contract requirements are adequately met. The goal is to ensure the contractor inspects its own work, and inspects and accepts the work of subcontractors before presenting it to the Government for acceptance.

7.3.6.2 Alteration Installation Teams. Alteration Installation Teams (AIT) are activities tasked by a Naval Sea Systems Command (NAVSEA), Program Executive Office or TYCOM to accomplish an alteration under Government authorization and supervision. Reference (c) provides requirements for the planning, estimating, programming, budgeting, scheduling, funding, design and accomplishment of alterations as well as the Quality System to be used during accomplishment of such work. Whenever an alteration, to be accomplished by an AIT, is scheduled for an availability, AIT coordination with the RMC and Project Manager is required from planning through installation and testing.

7.4 CONTRACT ADMINISTRATION TEAM. The Contracts Administration Team assists the Project Manager and consists of the Administrative Contracting Officer, Contract Program Managers, Contracting Specialists, Cost Monitors and others as are necessary for a specific project. The main types of contracts administered are cost reimbursable contracts and fixed price contracts.

a. Cost reimbursable contracts require functional expertise and sufficient contract administration staffing to monitor the contractor's actions and validate that the terms and conditions of the contract have been complied with. The level of effort must include frequent and unscheduled observations to preclude incurring unnecessary costs by inefficient or excessive performance of contract requirements. This action is required since the contractor is reimbursed for cost of labor expenditures based on the accounting documented in the contractor's performance measurement system (time keeping documentation) and material costs incurred during the execution phase of the contract. The Defense Contract Audit Agency audit results must be utilized to assist with validating observations of manpower utilization. The accounting for labor and material charges is essential when a contractor is working both cost reimbursable and fixed priced contracts in their facility. Any proposed change by the contractor should have a TAR prepared with all details of the Contractors proposed change available for Project Managers and Contracting Officer to use in the negotiation process. Since the contractor will be reimbursed for all allowable costs incurred, most of the risk in a cost type contract is on the Government.

b. Firm Fixed Price contracts, particularly those with short durations, may require more technical personnel during the performance period because contract modifications that may be essential to the accomplishment of the intent of the contract must be quickly identified and resolved to minimize costly delay and disruption to the contractor's schedule. After award, changes are negotiated on a sole source basis. These contractor-developed reports require time-consuming investigation and a timely written response to the contractor and each could result in a contract modification. In this situation significant effort must be expended by Government technical personnel to develop a reasonable Government position and, when required, a TAR for negotiation of the cost of the change. Under these conditions, the contractor's negotiation position is significantly strengthened. It may be difficult to reach an equitable position on the cost of the change. Government's action or inaction has the potential to create increased costs to the Government. Additionally, because of the risk on the contractor, efforts to minimize costs associated with a fixed price contract could result in poor compliance with requirements of the contract that in turn will require more contract supervision and performance monitoring.

7.4.1 Administrative Contracting Officer. Chapters 1 and 2 of this volume provide extensive coverage on contracting and the contract administration responsibilities. After a contract has been awarded for ship repair or modernization, only the assigned warranted ACO, within the designated limit of the warrant, may change the terms or conditions of the contract or make a contractual commitment on behalf of the Government. In RMCs, the Contracts Department Head, Code 400, is the senior contracting officer within the Command with the inherent authority and responsibility for the day-to-day administrative contracting functions. The Contracts Department Head may appoint subordinates to perform some or all of the functions of

administering a specific contract whose authority is contingent upon the individual's warranted authority from NAVSEA. Typically, the ACO is assisted by a Contracts Specialist and Cost Monitor who reside in close proximity to the location where the availability is being performed. Administrative functions may be delegated to individuals with special technical or trade skill backgrounds who will obtain or have received additional training in the relevant contract administration areas including the Defense Acquisition Workforce Improvement Act (DAWIA) process so that they can function as a Contracting Officers Representative. The complex technical requirements of ship repair and modernization require the assignment of trade skill and technical personnel from a variety of functional disciplines who must work closely with the Project Manager and Contracting Officer to ensure that the specified terms and conditions of the contract are complied with and that upon final closure of the contract there are no non-conformant or exceptions to the work items except those that have been approved for deviation or waiver by the Contracting Officer.

7.4.2 Commercial Industrial Services Contract Program Managers. The Commercial Industrial Services (CIS) Program or Indefinite Delivery, Indefinite Quantity (IDIQ) Contract Managers administer the CIS program or IDIQ Contracts. The managers are part of the availability management organization due to technical determinations required and the need to recognize and coordinate interfaces to preclude contract delay and disruptions. Consolidation in one office provides the most efficient organization. Duties and responsibilities of a CIS or IDIQ Program Manager are:

a. Represents the command and acts as the command point of contact in all matters pertaining to the contract.

b. Chairs the IDIQ Contract Advance Planning Committee to review current contracts and to determine the need for and propriety of additional contracts.

c. Coordinates daily program operations.

d. Manages and coordinates requirements with Project Managers to resolve schedule conflicts and interface problems with other contracts and activities.

e. Performs the duties and responsibilities of the Assistant Funds Administrator for all IDIQ Contracts.

f. Accepts or rejects the request for work based on the scope of work required, the necessity of the work requested, the appropriateness of the contracts or program and the capacity of the contractor.

g. Determines the scope of the actual work requirements to develop the Government position.

h. Makes ordering decisions such as grouping the work with other requests, assessing the time available and time required to accommodate the contracted performance period, determining other work to be scheduled in the area, identifying interface requirements with other scheduled work, assessing how the work will impact the contractor's capacity to complete other work ordered and deciding whether to order against an existing IDIQ contract, propose the use of an appropriate Master Ship Repair Agreement (MSRA) or Agreement for Boat Repair (ABR) job order or initiate a one-time procurement with FLC or the RMC Contracts Department.

i. Coordinates preparation of the specification package to provide to the appropriate procurement office.

j. Authorizes and initiates contract changes with the ACO to accomplish growth within the scope of the work authorized.

k. Performs contract department duties in the acceptance of work.

l. Provides support to the ACO in negotiations and the resolution of contractor claims.

7.4.3 Contract Specialist. The ACO duties parallel the responsibilities of the Contracting Officer but their authority is limited as specified by the level of their DAWIA qualifications level of authority, specific limitations of their warranty and specific assignments made by the Contracting Officer. The ACO is assisted by warranted, DAWIA qualified personnel, who are assigned specific responsibilities for processing contractual issues and to assist with the management and administration of a contract.

7.4.4 Cost Monitors. Working directly for the Contracting Officer and administratively with the RMC Comptroller, these personnel primarily function in the capacity of "keeping the books" that track the financial status of each project. Following contract award, all contract changes must be reviewed by the assigned cost monitor who will work directly with the Contracting Officer who is designated as the Funds Administrator and who is accountable for financial management and obligating the Government funds that are provided to the contractor.

7.4.5 Navy Property Administrator for Contracts. The Navy Property Administrator, assigned by official appointment from the RMC Contracting Officer, is responsible for all Government property related to a specific contract including GFM, CFM for which the Navy claims title and material removed from the ship by contract requirements. The disposition of salvage and scrap material is determined by the Property Administrator per chapter 9 of this volume. The Property Administrator screens work specification clauses to determine the contractor's responsibility for Government property. Generally, the contractor is responsible for the proper care and protection of all Government property in the contractor's custody. The contract will not be closed until the contractor has accounted for all Government property or the Government has received acceptable consideration.

7.4.6 Allowance Specialist. The Allowance Specialist is responsible for allowance list corrections made necessary by modifications to existing equipment or the substitution of new for old equipment during an availability. The Allowance Specialist screens work specifications and identifies necessary changes.

7.4.7 Accounting Technician. The Comptroller assigns specific accounting responsibilities to an Accounting Technician knowledgeable of the type of funds and cost codes applicable to each availability or project who works closely with the contract Cost Monitor, Project Manager and Contracting Officer. The Accounting Technician is the only official source for obtaining a balance for a given account. Delegated Funds Administrators for each availability should establish a close working relationship with their assigned Accounting Technicians.

7.5 SUPPORT STAFF.

7.5.1 Functional Support Staff. Typically, the waterfront receives significant support from technical and functional specialists who support several availabilities and special projects.

7.5.2 Design Coordinator. When workload permits, an engineer or engineering technician, accountable to RMC Chief Engineer, will be assigned the responsibility of coordinating requests for all design assistance to resolve technical problems identified during performance of the contract that are not the responsibility of the Planning Yard (PY). The waterfront design coordinator assigned to the availability or project arranges for the appropriate engineering discipline to investigate the identified problems and provide engineering guidance. Maintains a significant events log and when appropriate provides reports to support Award Fee Evaluations and CPARS.

7.5.3 Planners and Estimators. Government trade skilled and technical personnel are assigned to prepare work specifications, per chapter 4 Appendix E of this volume (specification procedures), and planning estimates. They are also responsible to identify material requirements for a solicitation when responsibility for this task is not assigned to a contractor as in the case with the PSIA contract. They may also be tasked to assist with the preparation of TARs for work items to support the Contracting Officers negotiations. These personnel may be required to prepare work specifications for essential growth and new work authorized during the performance of an existing contract or may be required to perform work on-site in order to resolve production problems.

7.5.4 Combat Systems Managers or Representatives. Electronics Engineers or Electronics Technicians with experience in the various disciplines involved in combat systems are assigned to availabilities that include significant combat systems requirements. These specialists monitor the contractor's performance of work and testing in the combat systems work package. The combat systems representative provides expert advice in the anticipation, identification and resolution of problems that may occur during the maintenance, repair and alteration installation phases, as well as during the grooming and complex systems level testing phases. RMCs may assign Electronics Engineers or Technicians as Combat Systems Managers for the availability. The Combat Systems Managers take a more active role by accomplishing duties similar to those of Production Controllers, Ship Surveyors or Shipbuilding Specialists in addition to those of Electronics Engineers or Technicians for combat systems work items during an availability or project. Combat Systems Managers responsibilities include the following:

a. Provide current information relating to assigned work items to the Project Manager. This may also include reports to the ship's assigned Port Engineer for Combat Systems.

b. Attend meetings to resolve production problems, develops scope of work requirements, assists in the development of TARs to support the Government negotiation positions, assesses contractor capabilities, work progress and performance, provides technical support to the ACO, participates in claims avoidance and provides other technical support as required.

c. Interface with members of the Ship's Force to provide current project information, notifies cognizant personnel of scheduled evolutions, solicits required or desirable Ship's Force participation and provides technical advice.

d. Receive and investigate contractor reports, writes and receives answers to Liaison Action Reports, provide interim answers to Test Problem Reports, assist in developing the Government's technical response to contractor requests, assist the TAR writer by

providing engineering support and in developing the Government cost estimates, assist in preparing necessary contract modifications, estimate the delay and disruption that may occur because of a contract modification, provide the ACO support in negotiations and maintains records of actions taken.

e. Observes "G" Points for electronic systems and equipment identified in the work specifications when they are presented by the contractor, witnesses required equipment or system tests and accomplishes random in-process inspections (PVIs) at the work sites to determine contractor compliance with the requirements of the specification. Documents the contractor's failure to satisfy contractual responsibilities.

f. Determine the physical progress, as a percentage of work completed, of each work item and each contract modification assigned. This information is updated weekly in a comprehensive progress report that is used in calculating the contractor's entitlement to progress payments as well as in evaluating the contractor's schedule performance.

g. Monitor the GFM and CFM report to anticipate actions that may be necessary to preclude schedule impact by unsatisfactory material delivery dates. Assist the FLC or RMC Material Department in visually identifying and verifying receipt of GFM. Initiate material orders to replace unsatisfactory GFM or to provide items with unique Government control and authorizes the contractor to make cash purchases from the Naval Supply system when it is in the best interest of the Government.

h. Monitor the contract guarantee period to help determine whether failure of equipment or systems covered by the guarantee clause is the responsibility of the Government or the contractor. Ensure that the work determined by the ACO to be the responsibility of the contractor, whether it is covered by guarantee or was an exception to the completion of the contract, is repaired following the specification requirements. Provide cost estimates for incomplete work so that the ACO can ensure that appropriate contract funds are retained in the event that the work must be deleted from the contract requirements or be re-procured.

i. Provide lessons learned and feedback related to deficient or inefficient work specifications or work authorizations to the appropriate planning group for use in improving future procurements.

j. Maintains a Significant Events Log.

k. Coordinate the efforts of the MSRA or ABR and each combat systems related AIT.

l. The Combat Systems Manager is the primary point of contact for combat systems technical issues during the availability that arise with other technical organizations.

m. Participate in the Lessons Learned Conference following the completion of a major availability and in support of availability advanced and pre-planning, integration, execution and close out.

n. Provide written reports to support Award Fee Evaluations and CPARS.

7.5.5 Manager - Environment Compliance and Occupational Safety and Health Act. The Manager for ESH may have subordinate Safety Inspectors and Environmental Compliance

Representatives in addition to the Shipbuilding Specialist who also perform similar observations. The ESH Manager assists the availability management team in understanding and recognizing obligations of the contractor and the Government. The Safety Officer must be the first point of contact in matters relating to the safety of people and equipment; environmental issues, such as oil spills or other contamination of the water; asbestos and ceramic fiber insulation control and all HW control. Any personnel injuries occurring at the work site (whether Government or contractor, military or civilian) must be immediately reported to the Safety Officer. Unresolved issues noted in the daily safety and housekeeping walk-through or as required by contract must be referred to the Safety Officer for assistance or resolution as appropriate. All observed or suspected safety or environment violations or any related issue must be brought to the immediate attention of the Manager for ESH. The Manager for ESH reports directly to the CO of the RMC on safety-related matters and on environmental and other related matters. The Manager for ESH maintains a significant event's log and provides written reports to support Award Fee Evaluations and CPARS. Detailed information on this subject is contained in Chapter 10 of this Volume.

7.5.6 Technical Representatives from Other Activities. Throughout the availability, there are typically a large number of other Government activities that are participants in the execution phase of a contract. It is essential that these activities be identified prior to commencement of the performance period and they must comply with all of the contractor's security requirements prior to gaining access into the production facility. These activities should designate one individual as the Point Of Contact to facilitate coordination of their work or involvement with the contractor's production, to interface with the RMC Contracting Officer, Project Manager and Ship's Maintenance Team or Maintenance Manager, and for coordination and attendance at appropriate progress and production status meeting.

7.5.7 Planning Yard Technical Representative. The PY provides technical liaison services regarding PY drawings or technical documentation. The PY Technical Representative provides additional information or interpretation of PY drawings and technical documents, resolves requests for drawing changes, waivers or deviations and initiates drawing changes when the change is approved by the PY. PY liaison requirements are addressed in reference (d).

7.6 AVAILABILITY PERFORMANCE.

7.6.1 Preparation for a Contracted Availability. The Contracting Officer that is charged with the responsibility and accountability, per Federal Acquisition Regulation (FAR) and Defense Federal Acquisition Regulation Supplement (DFARS), to assure that the contractor is prepared to execute the availability or project following any previous agreements and the specific terms and conditions of the specifications for the availability. The level of effort that is required to administer a contract depends on numerous factors that include the completeness of the advanced planning effort, the type of contract, level of effort and complexity of the modernization package, performance period versus size of the total work package including forces afloat work and key events and seasonal consideration during the production phase. Once the work package is defined and the contract solicited when required, outside of the PSIA concept, there is sufficient cause to involve the other participants in preparations for the availability at the earliest opportunity. Contract administration personnel should be assigned as early as possible. If the availability is not with a PSIA contract, the Project Manager and as many other key personnel as possible must be assigned to the availability in time to participate in the contract award phase.

7.6.2 Pre-Award Survey. In some instances, the PCO may direct a full or modified pre-award survey to assess areas where past performance has been less than satisfactory as noted in previous CPARS or other documents. When the PCO directs a full or limited Pre-Award Survey of the apparent low bidder, RMC personnel may be assigned to participate in the survey, particularly for those contractor(s) selected for award of Master Agreement for Repair and Alteration of Vessels job orders. An in depth Pre-Award Survey is most often not required for contractors who hold a PSIA Contract or MSRA or ABR due in part to their compliance with the Agreement Process plus the familiarity of the PCO and ACO with the capabilities and past performance of the contractor. This familiarity with a specific contractor does not relieve the PCO of the accountability attendant to making the award. The Project Manager must participate as a minimum. In addition to being able to comment knowledgeably on the contractor's qualifications and readiness for performance of the work, the survey team members may gain additional insights about the contractor's approach to accomplishing the work which will facilitate the management of the contract.

7.6.3 Readiness to Start. A "Readiness to Start" report is required by reference (e) and must be prepared by the assigned Project Manager. In some projects or availabilities, it may be necessary to obtain written pre-availability agreement(s) initiated by the executing activity with the customer(s) or other Department of Defense activities and the status of any required agreement(s) should be addressed as well.

7.6.4 Work Specification Review. Where there is a PSIA contract, the Ship's Management Team or Ashore Ships Maintenance Manager and other personnel assigned for availability management must review the work specifications as well as all references to understand the full scope of the work package details and to identify discrepancies and areas of concern. For non-PSIA contracts, the Planning Activity and other personnel, as required, should conduct the specification review procedures that are outlined in Chapter 4 of this Volume. The planning objective should be to have the executing activity participate in the pre-award specification review. If such participation is not possible, at the earliest opportunity personnel charged with administering the specifications of the contract must review and familiarize themselves with the specification package. Every detail that could have a negative impact on the performance schedule, quality of work or cost must be identified early so that intelligent decisions can be made to remove work from the contract, modify work requirements in the contract or add essential work necessary to accomplish the intent of the work authorized. Personnel may be able to recognize potential contract deficiencies from familiarity with the contractor's practices or from experience with a class of ships or a particular ship. Early action on the part of the Government helps to minimize the impact of contract modifications on the contractor's schedule and the final contract price.

7.6.5 Ammunition Off-Load Prior to an Industrial Availability. In general, to obtain maximum safety during industrial work periods, all or most of the ammunition should be off-loaded prior to the commencement of work during a scheduled availability unless there is a specific waiver approved. The specific off-load requirements will be following the instructions of the TYCOM, the Senior Officer Present Afloat, the Commander of the Naval Base or Naval Station and local port regulations. Ships and crafts entering contractors' facilities for a period in excess of six weeks must offload all ammunition and other explosive materials except for those for Anti-Terrorism Force Protection. Navy units entering contractor's or Naval Station facilities for industrial work periods of less than six weeks will provide data required for necessary waivers

per reference (f). The message should identify appropriate work boundaries with respect to ammunition storage areas (e.g., ammunition and other HAZMAT must be separated from hot work by one compartment, tank or void (two bulkheads or two decks), a minimum of 20 feet and when such work does not result in heating the exterior boundary surface of the separated compartment, tank or void).

7.6.6 Fuel Off-Load Prior to an Industrial Availability. Surface force ships and aircraft carriers should enter any significant availability with a maximum fuel load of 15-20 percent, unless there is an approved waiver to enter with more fuel onboard. The extent of this requirement will be determined by the nature and magnitude of work to be accomplished. Tanks that will be directly involved or in known or anticipated hot work boundaries should be at low suction levels. It is difficult, very costly and disruptive to off-load and transport or even shift fluids during any availability, especially in a contractor's facility that has the potential to result in a REA or even a claim for delay or disruption. The RMC must advise the ship of specific off-load or transfer requirements sufficiently in advance of the availability start to allow the ship to schedule and accomplish the required effort.

7.6.7 Berthing of Ship and Crew.

a. Messing and berthing, transportation and other related issues that impact the quality of life of the crew must be anticipated during the availability planning period and provisions made to satisfy the requirements following current United States Fleet Forces Command instructions. The designated Planning Activity or Maintenance Team (MT) have the responsibility to determine if the authorized work package will render the ship or a part of the ship uninhabitable. If any off-ship berthing is authorized, the Project Manager must verify that there is adequate funding and consult with Ship's Force prior to making final arrangements for acceptable berthing and messing for the duration of the uninhabitable conditions.

b. Any requirement to be satisfied by the contractor must be included in the specification work package. If the availability is to be conducted in the contractor's facility, arrangements must be made for a safe and timely transfer of the ship into the contractor's facility and for the immediate connection of utilities and services. The MSRA and PSIA Contract requires the contractor to make provisions for the personnel assigned to the ship to have access to the ship at all times. Contract requirements must state that the contractor not interfere with the normal berthing and messing of personnel attached to the ship. If the crew will be berthed off of the ship, written agreements should be established clearly identifying what is being provided, the responsibilities of the provider of the facilities and the responsibilities of the crew. Normally, the crew will be responsible for all routine maintenance and housekeeping that would be accomplished on the ship. Conditions existing in the facilities prior to use by the crew must be carefully documented to resolve questions that may arise when the crew leaves the facility. It is the RMC's responsibility to ensure a smooth transition with a minimum loss of time for the crew during the move and to validate arrangements for transportation of the crew to and from the ship when the crew is berthed off of the ship or to and from meals when the ship is unable to prepare meals because of authorized contractor work in the messing facilities or support systems.

7.6.8 Contractor's Assumption of Responsibility. If availability is to be accomplished in a contractor's facility, the contractor's responsibility for the ship will commence when the contractor's tugs accept the ship's lines or the contractor's line handlers accept the ship's lines at the contractor's pier. Except as otherwise specified in the contract or job order, the contractor will furnish all necessary labor, material, services, equipment, supplies, power, accessories, facilities and other supplies and services as are necessary for accomplishing the work specified in the job order.

7.6.9 Security.

a. Force Protection and physical security within the contractor's facility is the contractor's responsibility following the requirements outlined in the contract or job order. The contractor must establish and maintain a personnel identification system, control visitor access to the facility and control the receipt and removal of property from the facility. Government personnel, when in the contractor's facility, must comply with the contractor's security regulations. If the Government wants physical security arrangements other than those the contractor is required to provide, then the requirement must be authorized by the funds grantor, funded and added to the contract requirements. Additional security requirements could include such items as security guards in Ship's Force parking areas, barriers to preclude access to the ship by unauthorized waterborne craft or the patrol of water approaches to the contractor's facility.

b. The RMC must build and maintain the access list to include citizenship and nationality and provide personnel access lists the ship, in accordance with reference (s). The prime contractor is responsible for all their subcontractors lists and actions on the contract. Defense Biometric Identification System (DBIDS) is the primary badge to be worn for identification and access. For any work in private shipyards, access control and badging will be in accordance with the shipyards access control procedures. Any questions should be directed to the supporting RMC. Foreign nationals are not permitted to work on naval vessels except in accordance with reference (s). Per volume III of this instruction, repairs and refurbishments for submarine operating as part of Australia, the United Kingdom, and the United Sates Submarine Transfer Authorization Act (AUKUS) agreement may be carried out by personnel and contractors of the United States, the United Kingdom or Australia as approved by the RMC. A workable procedure for granting contractors and other non-Ship's Force personnel access to the ship and work areas on the ship must be established by the ship's CO prior to the start of work. The RMC and Ship's Force, working together with the contractor, must ensure that the contractor's performance schedule is not delayed or disrupted because workers were not given access to the ship or the work site in a reasonable time.

c. The contractor, like Government personnel, must also comply with the requirements of the Industrial Security Manual. Prior to contract award, the Contracting Officer is required to validate that the contractor or the designated subcontractor possesses the appropriate up to date documentation that specifies the level of security clearance that the contractor has been authorized, and to verify that they are authorized to have access to classified material and spaces as specified in the contract and that the

contract does not require a clearance level that exceeds the level of classification which is documented. In this regard, the contractor is responsible for ensuring that personnel with appropriate security clearances are assigned for work in classified areas, on classified equipment or on work requiring the use of classified information. The Project Manager must ensure that appropriate clearance letters are provided to the ship, both for RMC and contractor personnel. Reference (g) provides the requirements for the contractor to obtain access to classified spaces or materials.

d. During an industrial availability, the ship's CO remains responsible for the security of the ship and the material and equipment onboard. Ship's Force should be reminded to provide for the safeguarding of pilferable items onboard. Likewise, the contract administration team must be alert for potential breaches in security and the inappropriate handling and unauthorized access to classified material.

7.6.10 Special Events During Availabilities. When special events such as changes of command, special training or drills are to be conducted by Ship's Force, readiness for light off, etc. are anticipated during an availability, certain contractual and administrative safeguards must be used to preclude the potential for the contractor to submit REAs or claims for delay and disruption to the contract that resulted from Government actions that were not covered by the specification package or prior arrangements to minimize impacts on production.

7.7 SCHEDULED CONFERENCES AND MEETINGS. Conferences and meetings should be requested any time there is a perceived need to resolve matters concerning the scope of work, a quality or safety issue, a schedule or progress issue, or to coordinate or harmonize the participants in the availability. Certain regularly scheduled meetings may require participation by managers with decision-making authority.

7.7.1 Arrival Conference. The Project Manager arranges and conducts an Arrival Conference on the ship's arrival for the availability or immediately preceding the availability if the ship is available. The arrival conference is a two-part meeting attended by RMC representatives, the Maintenance Team members, other ship representatives, other Government representatives with an interest in the availability and the contractor. Contractor representatives must not attend the part of the conference on Government issues and funding. The purpose of the Arrival Conference is to:

a. Introduce the key personnel involved and explain their roles and responsibilities.

b. Discuss specific work items and explain the impact of the Standard Items referenced.

c. Discuss local policies and procedures.

d. Explain constructive changes and discuss avoidance techniques.

e. Explain procedures for the acceptance of contractor work.

f. Review the schedule and the availability execution "game plan".

g. Define growth and new work and the impact of each.

h. Discuss the scheduling interface requirements between contractor and Ship's Force work, as well as Government events.

i. Discuss fire watches, housekeeping and other matters pertinent to the availability.

j. Explain the contractor's plan, procedures, schedules and key events.

k. Describe contractor-furnished facilities and services.

l. Describe contractor fire watch requirements.

m. Discuss safety, housekeeping, and environmental policies and procedures, as well as other pertinent issues requiring clarification.

n. Establish the ship's security requirements for personnel access to the ship. A typical agenda for an Arrival Conference is provided in Appendix A.

7.7.2 Weekly Commanding Officer's Conference.

a. A briefing report of the results of the weekly progress meeting and other issues of significance to the Government including AIT progress, safety issues, environmental compliance, physical security and funding status may be required for review by the RMC CO. The Project Manager will conduct the brief. The brief will address the results of the progress meeting and specific high visibility problems and actions planned or requested to resolve the problems. Based on this report and the comments and positions of the various Government representatives, the CO will approve the planned actions or direct other action as needed. After each briefing concerning the status of the overall availability has been presented, the RMC CO may conduct a Weekly Conference with all or selected COs of ships in current availabilities. The purpose of this conference is to give both the RMC CO and the ship COs an opportunity to discuss availability issues face-to-face and resolve the significant differences that may exist. The RMC CO will present a current status report to the ship's CO on the high visibility issues, and the CO will in turn address the customers' concerns to the RMC.

b. The CO of the ship is required by Navy regulations to be aware of the status of the ship at all times, and during a depot-level availability the ship's CO should pay particular attention to work being performed by Ship's Force, the Government's shore maintenance activity, CIS or IDIQ contractors, AITs and others as well as the ship repair contractor. Therefore, in advance of the Weekly Conferences, the ship's CO should conduct a shipboard meeting with the Project Team, MT, Ship's Force availability managers and department heads to obtain a current assessment of the status of the overall availability. Through such meetings, the ship's CO should be sufficiently well informed to contribute meaningfully to the substance of the Weekly Conferences.

c. The Weekly Conference is an integral part of the weekly routine established for availability management. The routine will not be the same at all RMCs, nor for that matter need it be the same for each availability. Typically, the routine will include the following:

(1) The week begins by assessing the weekend's activities and planning for activities to be accomplished during the week ahead. Typically, individual work items that must be progressed that week are assessed on Monday and Tuesday, and during this time, preparations are made for the progress meeting.

(2) The availability progress meeting is typically held during the middle part of the week as previously discussed. On Wednesday or Thursday, the RMC and senior staff are briefed and actions are taken to affect the plans approved or directed. In the latter part of the week, the Weekly Conference is held with the ship's CO. On Friday, required availability status reports are prepared and forwarded as required.

7.8 AVAILABILITY MANAGEMENT.

7.8.1 Quality Assurance.

a. The contractor is required by reference (b) to maintain a quality management system. The Contract Administration Quality Assurance Program is addressed in Chapter 11 of this volume. The contractor is responsible for offering to the Government for acceptance, only products that conform to required quality standards and for maintaining and furnishing substantial evidence of this conformance.

b. The work item specifications include "G" Points at selected points in the performance requirements. The purpose of the "G" Point is to require the contractor to give the designated RMC Representative advance notification of the event noted in the "G" Point. Having such advance notification gives the Government the option of concurrently witnessing the contractor's performance at the "G" Point. "G" Points are included in work items for all important tests or inspections, at critical points in the repair process or at points where the next step in the performance will conceal critical work accomplished.

7.8.2 Constructive Changes. A constructive change to a contract occurs whenever the Government, through its action or lack of required action, causes the contractor to depart from plan or perform other than as specified in the contract. During the performance period of the contract, the on-site team must exercise great care to minimize the impact of constructive changes. Constructive changes are discussed in detail in chapter 2 of this volume.

7.8.3 Work Stoppage. The contractor cannot be directed to stop work by anyone other than the ACO or another authorized contracting officer with one exception. The only exception to this requirement is to protect the safety of personnel or prevent the loss of or destruction of property and equipment. Because the Government is a self-insurer or may otherwise be liable for some portion of large insurance claims, the Government has a vested interest in any conditions or actions of the contractor or the contractor's employees which may lead to an insurance claim. The Government is liable for the loss or damage of Government property in excess of the specified limits in the contract. Further, the Government may be liable in situations where third party claims against the contractor exceed the contractor's commercial insurance coverage. Government employees involved in the availability must be vigilant and, when necessary, act to correct situations or conditions which could easily lead to personnel injury or damage to Government property. In situations where the loss of or damage to Government property is imminent and economically significant, the Government employee should act immediately to stop the work in progress or otherwise correct or rectify the cause of the problem. Likewise, if unsafe conditions or contractor work practices are observed which could lead to imminent injury to personnel or loss of life, the Government employee should act to stop the unsafe practice, correct the condition or otherwise remove the imminent threat. In situations where the danger or

potential for loss or damage is not imminent, the Government employee should refer the matter to the appropriate Supervisor Shipbuilding Specialist or Project Manager for action.

7.8.4 Award Fee Board Conferences. An Award Fee Board Conference is required for all Cost-Plus-Award-Fee contracts. An appointed Award Fee Board representing NAVSEA, the ACO, the RMC and customers, chaired by the Waterfront Operations Department Head, convenes to hear presentations from the on-site Project Management Team and the contractor. The Board then evaluates the contractor's performance against established award fee criteria and determines the amount of award fee to which the contractor is entitled for a set period of contract performance.

7.8.5 Fire Fighting and Fire Prevention Conference. When the ship enters the contractor's facility for availability, the contractor is required by reference (h) to conduct a Fire Fighting and Fire Prevention Conference. This conference should be attended by RMC representatives, Ship's Force representatives, contractor representatives and a representative from the municipal or other local firefighting organization, as applicable, if possible. This conference must be conducted within five days after arrival at the contractor's facility. The meeting familiarizes the Ship's Force with the contractor's procedures for fire prevention and firefighting, as well as the procedures used by the local firefighting organizations. The contractor and the local firefighting organization should be familiarized with the ship's firefighting systems and plans. Appendix B provides a list of subjects that must be addressed.

7.8.6 Fire Prevention, Safety and Housekeeping.

a. The contractor must comply with the Occupational Safety and Health Administration (OSHA) under the cognizance of the United States Department of Labor. The RMC Representative for Occupational Safety and Health, who is typically the Command Safety Officer, or the designated Safety Office Representative for the ship, monitors the contractor's compliance with OSHA requirements. This monitoring function is passed from Department of Labor to agencies that provide Contract Administration Services. Any Government employee that observes an accident, a fire, an unsafe act, or unsafe or hazardous conditions on or around the work site should immediately inform the RMC Safety Office and provide as many pertinent details as possible. The designated Safety Office will investigate all incidents and issue the required reports. When deemed necessary, an investigative team may be required to prepare findings for the Judge Advocate General. All Government personnel will cooperate fully with the Judge Advocate General investigators.

b. In addition to the federal, state and local laws and ordinances, contract clauses require the contractor to exercise reasonable care to protect the vessel and government property. These clauses also require the contractor to keep the site of the work on the vessel free from the accumulation of waste material or rubbish caused by its employees or the work, and at the completion of the work to remove all rubbish from and about the site of the work and leave the work in its immediate vicinity "broom clean" unless more exactly specified in the job order or contract specifications.

c. In addition to the contract clauses, reference (i) specifies procedures and equipment required for the prevention of fire. These requirements address the gas-free checking of tanks, the training and use of fire watches, the use of fire-retardant materials, the

conduct of daily fire prevention and housekeeping inspections and the establishment and maintenance of fire zone boundaries. When the ship is in a contractor's facility reference (h) requires the contractor to provide fire protection capabilities in addition to the OSHA requirements, including a requirement to conduct the Fire Fighting and Fire Prevention Conference.

7.8.7 Fire Watches. The contractor is required by OSHA and references (i) and (j), subpart 217-7015, to provide fire watches for contractor hot work. The ship's CO is always responsible for the safety of the ship and crew and may desire to supplement the contractor's system with additional fire watches or establish a fire watch monitoring system. In some cases, the TYCOM may direct the Ship's Force to provide fire watch personnel to save Government funds.

7.8.8 Docking Conference. When the ship is required to be drydocked during availability, a Docking Conference is scheduled by the dockmaster or the RMC docking officer. This conference is held onboard or near the ship, conducted by the dockmaster or docking officer and attended by the Project Manager, the ship's CO, Project Team, the MT and Ship's Force representatives, particularly the Engineer Officer and Damage Control Assistant, and the contractor's dockmaster and other cognizant personnel. The details of determining the docking position, establishing the stability conditions before docking and undocking, and defining safety and service requirements are discussed as well as responsibilities for a ship's movement in and out of dock. A typical agenda for a Docking Conference is provided in Appendix C.

7.8.9 Drydocking.

a. Reference (k) provides procedures for the safe drydocking and undocking of Navy Ships. Drydocking requirements are included as a work item in the contract and identify the required drydock position and other pertinent information for docking the ship. The details of drydocking the ship, the stability conditions that must be established and requirements for the protection of underwater projections are discussed at the Drydocking Conference. The RMC is represented at all drydock evolutions by an experienced dockmaster, a docking officer or both. In addition, experienced RMC docking observers should monitor docking evolutions.

b. When docking in a contractor's facility, the contractor assumes the duties and responsibilities that Navy Regulations prescribe for the docking officer. The ship is under operational control of the contractor's dockmaster while the ship is in the drydock and while the ship is entering or leaving the drydock. For safety, while the ship is under the operational control of the dockmaster, the Ship's Force must comply with dockmaster's requests. The only time that the Government will interfere with the dockmaster's operational control of the ship is in the case of dire circumstances involving the safety of the ship.

c. As soon as practical after the ship is safely positioned on the blocks and the water is removed from the drydock, the ship's underwater hull should receive a cursory inspection by the ship's MT or Maintenance Manager to include the ship's Chief Engineer, dockmaster, and other interested parties to identify additional work that may be mandatory. After the underwater hull has been cleaned, a more comprehensive underwater hull inspection is accomplished by the Project Manager, engineers, Shipbuilding Specialists, dockmaster, the ship's CO, Ashore Ships Maintenance

Manager, ship's engineer, other representatives and the contractor's cognizant personnel. This inspection is a detailed inspection to document the condition of the underwater hull, the underwater machinery, all projections and underwater devices, and the effectiveness of the cathodic protection system and to determine if the contract paint requirements for the underwater hull will be sufficient.

d. Before undocking, the Ship's Force must notify the RMC and dockmaster of significant changes in stability factors created by Ship's Force actions. This information is provided to the contractor and will be included by both the RMC and the contractor in stability calculations for the ship to determine if corrections are needed for a safe undocking. Ship's Force will be advised of necessary actions required, if any.

e. When all drydock work is completed, a joint walk through is conducted by the MT or Maintenance Manager, Project Manager, and the contractors to ensure that all work is complete and all openings have been properly closed. Ship's Force monitors all underwater valves and openings such as propulsion shafting seals to ensure watertight integrity while the drydock is being flooded.

7.8.10 Hazardous Material.

a. HW means any discarded material (liquid, solid or gaseous) that may, because of quantity, concentration, or physical or chemical characteristics, cause or significantly contribute to an increase in mortality or in serious irreversible or incapacitating reversible illness, or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed or otherwise managed (excluding infectious or radioactive waste provided that neither is mixed with Environmental Protection Agency or state-regulated HW), or any material designated as HW by the Environmental Protection Agency (EPA), the state or local regulations. Chapter 10 of this volume outlines the policy and RMC oversight functions for environmental matters.

b. The CO of RMC must appoint by letter the Manager for Environmental Protection. The Manager provides information on the identification of HAZMAT and HW to coordinate storage, control and handling procedures required by current applicable Federal, state and local regulations. They also will identify types and amounts of HW expected to be generated by Ships' Force, Navy Fleet Maintenance Activities or other Navy personnel during the availability. AITs are accountable for HW handling that is generated in the course of their work.

c. Reference (l), section 7311, and applicable state laws define the responsibilities of the generator in the disposal of HW. HW is listed in three types of waste: contractor-generated, Navy-generated and co-generated. All HW or HAZMAT identified for disposal will be transferred to an authorized disposal site through an HW manifest identified with an EPA generator number. When the ship is located in the contractor's facility, the contractor is tasked to handle all HW generated during the contract. The RMC furnishes an EPA generator number for use by the contractor in the disposal of Navy and co-generated HW. When the ship is located at a Government facility, Navy-generated HW is handled by the local Navy public works center. Contractor-

generated HW is handled by the contractor using the contractor's EPA generator number. Co-generated HW is handled by the contractor with the RMC furnishing a Government EPA generator number for use in the disposal in concert with the contractor's EPA generator number. HW training for Ship's Force is available through the Manager for Environmental Protection.

d. COs of naval vessels will be responsible for removing known HW, including expired shelf-life material, from the vessel before the contract start date or the vessel's arrival at a contractor's facility, whichever is earlier, to the extent such removal is feasible. Because the disposal of HW is difficult and costly, and to reduce the adverse impact of HAZMAT and HW, Ship's Force will maintain the absolute minimum inventory of HAZMAT and will offload HAZMAT and HW in excess of minimum requirements.

7.8.11 Government Furnished Material.

a. If material is available in a government supply system, GFM identified by the Planning Activity is ordered from the providing source. If GFM requirements are not available from a government source or exceed the purchase limitation authority of the RMC, the material requirement must be forwarded to a local Naval Supply Systems Command contracting office for procurement. The RMC material department may receive and store GFM and subsequently issues this material to the contractor.

b. The status of GFM and CFM is monitored by the on-site team and discussed at progress meetings. Material status reports are developed and maintained by material expediters who should also attend progress meetings and work closely with the RMC on-site team in locating required material. Every effort should be made to resolve material shortages before shortages affect the production schedule. Techniques such as changing GFM to CFM, when it has been determined that the contractor can find an alternate source for late GFM are appropriate if a government-responsible delay in the contractor's schedule can be avoided.

c. After the award of the contract, the contractor may discover that material that was commercially available during the pre-award period is no longer available. Although under most circumstances the contractor remains responsible for the potential impact of late or missing CFM, it is still in the best interest of the Government to work with the contractor to resolve CFM problems. If the contractor can show that for unforeseeable and unusual conditions the material that should have been available is no longer commercially available, then the contractor may be entitled to an equitable adjustment in contract price and delivery schedule for the adverse impact. In any event, if the Government can mitigate the adverse impact, it is best to do so. Assistance to the contractor can include the following:

(1) When required materials are delayed at a subcontractor's plant over which another Defense Contract Management Agency Contract Administration Office has cognizance, the RMC may request assistance from that office in expediting delivery of the materials. If the original subcontractor or supplier is unable to deliver the required materials and the prime contractor has been unable to locate an alternate supplier, the RMC may provide the names of other sources or may contact the local Defense Contract Management Agency

office for the names and addresses of firms which may be able to provide the desired material.

(2) Authorize, by means of a contract modification, the use of substitute material if the substitution will not degrade the work. The job order modification authorizing the substitution will reflect an appropriate change in the job order price for any increased or decreased cost to the contractor. The material may be obtained directly from Ship's Force stores or other afloat vessels, from Government Supply Systems or from the Navy Supply System under the Navy Cash Sales Program.

(3) Convert the CFM to GFM by means of a job order modification, if the Government has the material available and the modification results in a decrease in job order price, which is negotiated on the basis of what it would have cost the contractor to procure the material from commercial sources. This procedure will be used as a last resort and only after a determination is made by the ACO.

(4) In some extreme cases and with TYCOM approval, the material may be obtained by cannibalization from other ships.

(5) The RMC should determine if the needed material is available in the Navy Supply System. If the material can be located, then a decision must be made whether or not to authorize the contractor to make a cash sale procurement. When possible, a cash sale procurement by the contractor is the preferred alternative since the contractor will remain responsible for any potential schedule impact. The cash sale procedure requires the contractor to complete a form which identifies the item and the vendor's price and requests that the item be provided as a cash sale from the Navy Supply System. Items obtained through the cash sales program cannot exceed a cost of $5,000. A member of the Governments' on-site team certifies the requirement, and the RMC material department then verifies the information provided by the contractor and certifies that the material is required and not available commercially. The contractor may then procure the material from the Navy source at a cost of the higher of either the vendor's price or the Navy list price.

d. The material office may also procure services, within given limitations, in support of a specific ship availability, such as the services of a manufacturer's technical representative to provide technical assistance to RMC personnel.

7.8.12 Testing of Ship's Systems and Equipment. The Ship's Force will operate all systems and equipment installed in the ship for testing or any other purpose. The contractor is not permitted to operate installed ship's systems or equipment for any purpose. The RMC should impress upon Ship's Force personnel the importance of this contractual obligation. Failure in this matter may lead to delay, disruption and claims against the Government. Detailed guidance on testing is provided in volume IV of this manual.

7.8.13 Ship's Selected Records. The MT or Ashore Ships Maintenance Manager is required to assist Ship's Force to obtain the required documentation that includes:

a. Ship's Selected Records (SSR) contain significant technical information on the ship's operation, maintenance, supply and other logistic requirements and are maintained current throughout the life cycle of the ship. SSRs are comprised of:

(1) Selected Record Drawings: Consist of basic hull, mechanical and equipment drawings and are selected for their reference value for operational, maintenance, training and consulting purposes.

(2) Selected Record Data: Consist of basic technical information relative to certain shipboard arrangements, equipment and systems under the cognizance of NAVSEA that is selected because of its value for operational, maintenance, training and consulting purposes.

(3) Allowance Lists: Depict authorized onboard repair parts and equipage support of shipboard equipment and components and are published as a Consolidated Shipboard Allowance List. The Consolidated Shipboard Allowance List also includes authorization for non-component-related equipage and miscellaneous categories of material.

b. The delivery of this documentation is required before the TYCOM or RMC will accept redelivery of the ship to the Fleet. Detailed SSR update procedures are addressed in reference (m), section 4-11.

7.8.14 Documentation. The contracting officer is required to maintain contract files as prescribed in reference (n), subpart 802. Chapter 2 of this volume provides detailed information on the responsibilities of the Contracting Officer. The ACO is required to document each contract transaction sufficiently to provide a complete history of actions taken. The ACO's files provide background information supporting actions taken, provide information for reviews and investigations, and document the essential facts to support potential litigation. Some of the more significant data that should be found in the ACO's files include the following:

a. A copy of the contract and all modifications with copies of supporting documents.

b. Pre-award survey information.

c. Progressing, expediting and production surveillance records. All documents that are considered pertinent from the Project Manager, Shipbuilding Specialist and other project members.

d. QA records.

e. Property administration records.

f. Documentation regarding termination actions for which the contract administration office is responsible.

g. A cross-reference to other pertinent documents that are filed elsewhere.

h. Significant Events files from all sources.

i. Copy of the CPARS.

7.8.15 Fast Cruise, Dock Trials and Sea Trials. Information on these subjects is available in volume II of this manual.

7.9 AVAILABILITY PROCESSES.

7.9.1 Schedules. Availability scheduling is governed by the processes outlined in Volume II of this manual. The contract will have a start date and a completion date (Period of Performance) for the work specified in the contract. These dates will be determined with input from the TYCOM. Considerations will be based on the type and magnitude of the work to be accomplished, as well as other factors such as port workload and the ship's scheduled events. The dates may or may not coincide with the assigned availability. Fleet Commanders or TYCOMs are authorized to delay or advance scheduled starting dates up to five weeks and delay completion up to five weeks from the latest approved date. The TYCOM's authority to delay or advance starting dates and delay completion dates is limited to 15 days from the latest approved date. The RMC must concur and the modified starting dates must remain in the same fiscal year as the original dates. Early completion of availabilities may be authorized by the Fleet Commanders or TYCOMs if so designated. Changes in the start and completion dates of complex overhauls which will exceed established CNO duration must be approved by CNO.

a. The Navy's ship repair scheduling requirements included in reference (o) are network based and the methodology is commonly described as the Critical Path Method (CPM).

b. In developing a CPM schedule, the key steps include:

(1) Generation of a listing of project related activities.

(2) Arranging the activities in a network strictly on the basis of the logic of assembly showing the relationships of all the tasks or activities required to complete the project.

(3) Identifying each activity by narrative description and an event numbering system.

(4) Estimating and assigning time durations to each activity (except for dummy activities).

(5) Setting the time boundaries or limits for each activity by accomplishing basic CPM computations known as the forward pass and backward pass.

(6) Computing the amount of float or slack that the various activities in the network possess.

c. An activity is any portion of a project which consumes time or resources and has a definable beginning and end. The Critical Path is defined as that sequence of activities, which forms the longest duration and directly affects the completion date of an availability. It depicts the project's activity sequence and interdependency allowing determination of project duration, start and finish dates and project end date. Since a CPM schedule is network-based, and since the project's Critical Path is along a path of activities, the identification of critical activities' logic "relationships" or interdependencies within the network is vital to the legitimacy of the schedule. A logic "relationship" defines the relationship between two activities identifying when one can start in relation to another. For example, a Finish-to-Start logic relationship requires that the succeeding activity cannot start before the preceding activity has finished. The network provides a graphic display showing the planned sequence and

interdependent relationship of activities, milestones and key events within a Job Order. It identifies the work that is sequential and the work that can be done in parallel. The network must not have loops. The total number of days that a path of activities can be delayed without affecting the project finish date is known as Total Float. Total Float is the difference between Early Start (ES) and Late Start (LS) or between Early Finish (EF) and Late Finish (LF) dates (i.e., TF=LS-ES or LF-EF).

d. Distributing the number of persons on a project so as to optimize performance is known as manpower leveling. Generally, ship repair and new construction contractors forecast the required manpower and then level it. Prior to leveling the manpower on a project, it must first be determined what the manpower requirements are at the activity level. In this regard, it is useful to determine the total number by discipline or trade for each project day, week and month based on all the activities being performed at their early start-finish dates. Then it is possible to estimate total reasonable levels. To understand manpower leveling in conjunction with CPM scheduling, it is necessary to understand that an activity with float time is permitted to start somewhere between its ES and LS dates. Float is the scheduling tool or the wherewithal of resource leveling. For by judicious allocation of float, the peaks of manpower and equipment required to execute the project are reduced while still completing the project on schedule. An alternative method of manpower leveling is the sequencing of key resources through the addition of crew movement constraints to the network.

e. The contractor may have developed the best possible schedule with input from various specialists regarding activity content, sequencing, duration and manning estimates. But unless the project's performance is measured against the schedule, the activity will never know where the project is and, most important, where it is going. To this end, it becomes necessary to track actual progress against planned progress.

f. If it becomes apparent that the contractor is falling behind in some areas of the availability with regard to the established percentage of schedule completion, controlling work items or non-achievement of specified key dates or milestones, the RMC should apprise the contractor of this fact and request remedial action. The RMC should ensure that the contractor is informed of this fact sufficiently in advance of the scheduled completion date to permit the necessary action to be taken. Among the remedies which may be available to the contractor are multi-shift work, overtime and the employment of additional workers. When addressing this subject with the contractor, the Government must take great care to ensure that the contractor cannot interpret the discussion as an "order" from the Government to accelerate the work. Other alternatives to explore to determine whether time can be recovered include re-sequencing of activities, reduction in durations and deletion of work, if feasible. The Government cannot order acceleration without incurring the risk of a claim from the contractor. Therefore, the contractor should specifically be advised that the Government is not ordering acceleration, that the responsibility for acceleration, if it is undertaken, remains solely with the contractor and that any acceleration ordered by the Government will be in the form of a contract modification.

g. In addressing schedule adherence with the contractor, the Government must also assess the impact of Government actions or failures to act, when required, on the

contractor's performance. If the Government is responsible for even a small portion of the perceived delay or for disruption which has caused the delay in performance of scheduled work, then that issue should be addressed in a contract modification to properly compensate the contractor for the required acceleration to recover and maintain schedule adherence.

h. If the contractor alone is responsible for failure to produce as scheduled and such failure is viewed by the RMC as significant enough to place availability completion in jeopardy, then the Government concerns should be conveyed in writing to the contractor. Such a letter can be referred to as a "View with Concern" or "View with Alarm" letter, depending on the degree of severity of the contractor's situation. In the letter, the RMC should identify the areas of concern and how the Government "views" the situation and offer perceived reasons for the situation. The contractor should also be requested to provide a written response to the letter, identifying action the contractor proposes to take to prevent delay in completing the availability. Where the contractor insists that work can be completed on schedule without acceleration or other measures involving added cost, the Government cannot direct the contractor to perform otherwise. Any direction contrary to the contractor's plan will generally result in an REA or a subsequent claim.

i. While the contractor is trying to recover from poor schedule adherence, the Government should be as cooperative as possible, doing all that needs to be done to make it possible for the contractor to recover on its own. If it becomes clear that the contractor is not performing in a manner that will allow completion on schedule, a meeting should be convened with the contractor's top-level managers and the contracting officer. At this meeting, the contracting officer should again convey the Government's concern over the contractor's lack of progress and discuss the specific issues of concern. The contractor should be requested to address the specific issues causing problems, including the contractor's view of the cause of the problem. If the contractor identifies the Government as the primary cause of the schedule slippage, the issues raised must be addressed by the contracting officer. If the RMC agrees with the contractor that the Government is a party to the schedule delay following review of the contractor's contemporary schedule and cost documentation, then action must be taken to compensate the contractor for the impact. If the Government does not agree with the contractor about responsibility for the schedule slippage, then the contracting officer must make this view clear to the contractor. The meeting should result in an agreement about the actions to be taken to ensure availability completion on schedule. In the very worst of cases, termination should be considered. Otherwise, the results of the meeting should be documented in a letter from the contracting officer to the contractor. This letter should document the relative positions of the parties to the contract where there is disagreement and document the agreement made. This letter serves to place the matter on a business-like footing, documents the contract file for future reference and should be used in future pre-award surveys in assessing the contractor's past performance.

j. Personnel attached to the ship may not unduly interfere with the contractor's work or the contractor's employees. The contractor is obligated to accomplish the work specified by the contract within the dates specified by the contract. Therefore, when

progress is impeded by some action or lack of required action on the part of the Government that will cause delay or disruption in the contractor's scheduled work, the contractor will generally be entitled to an equitable adjustment in contract price and delivery schedule. This will be resolved by awarding the contractor compensation in the form of additional time or additional money or both as agreed by the parties.

k. A detailed schedule of the work to be accomplished by Ship's Force should be developed as well as the work that will be accomplished by other activities not under the control of the RMC. The complexity of this schedule will be determined by the resources that the ship can apply, the magnitude of work and interfaces and the perceived need. Automated scheduling systems may be made available to the ship. However, as a minimum, a simple bar chart schedule or GANTT chart should be developed and maintained by Ship's Force to assist in working around the contractor's schedule whenever possible. On occasion, Ship's Force will not be able to work around the schedule, and in such cases, the RMC must work with the contractor for resolution and coordination. Reference (o) requires the contractor to provide a representative whose only function is to coordinate Ship's Force work with contractor work. In addition to the representative being required to meet daily with the Ship's Force coordinator, the representative among other things, is required to submit weekly a report of conflicts where programmed Ship's Force work interferes with the contractor's schedule. When the RMC or the Ship's Force becomes aware of approaching disruptive events (e.g., work schedule conflict, planned power outages, drills, visits, Change of Commands) the contractor should be notified immediately to mitigate the impact on the contractor's schedule by allowing time for a shift of resources.

7.9.2 Progressing. A project or availability that is not planned cannot be controlled. Once the project has commenced, project control is possible only when one knows the status of the project at a given point in time. The process of creating the project schedule baseline established the benchmark against which schedule progress is measured. The dynamic nature of a ship repair availability necessitates change. Some of the primary factors, which influence such change, include added and deleted work, delays, strikes, weather problems, changes in sequence and acceleration in the work, among others. "Updating" involves the periodic review of the project plan, schedule and progress to provide a complete and accurate report of actual versus planned progress. It can be utilized as a basis for the purpose of determining the amount of periodic progress payments to which the contractor is entitled. It may also serve as a basis for allowing the parties to schedule their remaining work in order to achieve the overall schedule objectives.

a. The pertinent information to be gathered and analyzed during each update period includes the following:

(1) Commencement and completion dates for all activities commenced or completed during the update report period.

(2) Current progress of activities which commenced in prior update periods, indicating actual completion dates or, if still in progress, the remaining time duration.

(3) The determination of what activities need to be re-sequenced, added, deleted or modified to clarify or reflect a change in plan or operation which to maintain requires schedule detail for proper monitoring and controlling.

(4) Fragments, which have been incorporated into the network diagram, to reflect delays or changes.

b. RMCs are required to develop an independent assessment of progress for use in comparison with the contractor's production progress report. A progress report is developed by determining the ratio of the planning estimate for labor and material separately for each work item compared to the planning estimate for labor and material for the total contract. This will establish a weight factor for the labor and a weight factor for the material for each work item. Every attempt should be made at the outset of the availability to reach agreement with the contractor on the relative value of each work item for progressing purposes. To ignore a contractor's justified concern about potential progress payments could be extremely harmful. In every case where there is a significant disparity between the Government's weight factor and that of the contractor, the RMC should investigate the cause and adjust the factors as needed. Contractors may attempt to front load the contract for progressing purposes to maximize early cash flow. In this regard, the weight factors for items scheduled for early accomplishment may be inflated. On the other hand, the contractor may have good justification for a weight factor significantly in excess of the RMC developed factor. Where the contractor has adequate justification for a weight factor, the RMC factor should be adjusted. In those cases where the RMC does not agree with the contractor, the Government weight factor must be used.

c. The total of all weight factors for labor added to the total of all weight factors for material should equal 100 percent. The actual percentage of completion of work is then determined independently for labor completion and material for each work item. Material progress assessments are made on the basis of the estimated dollar value of satisfactory material received by the contractor. The percentage of completion of the labor for each work item is multiplied by the labor weight factor established for that work item, and the percentage for material for each work item is multiplied by the material weight factor established for each work item. The sum of the products for labor and material for a work item is the total percentage of completion of the work item. For example, the weight factor for a work item is determined to be .01 percent and at a point in the contract the estimated actual labor and material completion is 50 percent; the contractor could be authorized a progress payment of .005 percent of the current contract value, less retentions. The sum of the products for the labor completed for all work items is the total percentage of labor completion, and the sum of the products for material for all work items is the total percentage of material completion. The total labor completion added to the total material completion is the total percentage of completion of the contract.

d. Contract modifications including change orders and other changes waiting to be adjudicated are included in the progress determinations when they are executed by the contracting officer. A contract modification may be considered along with the basic work item modified or for major modifications for growth or new work or may be

considered as a separate item for progressing purposes. When considered along with the work item modified, weight factors for each modification, including changes waiting to be adjudicated, are based on the Government estimate for the changes and not on the contractor's proposal. However, if settled, the settled price should be used. After the weight factors are initially established, the factors should not be changed except when the contract is modified. Each time the contract is modified, all weight factors in the program must be reconfirmed or changed as required.

e. The on-site Shipbuilding Specialist usually estimates the actual percentage of completion of assigned work items and modifications and routinely accomplishes in-process inspection. The Shipbuilding Specialist also reviews contractor condition reports on assigned work items and prepares responses and contract modifications, if necessary. Commands that do not have Shipbuilding Specialists may assign progressmen, production controllers, ship surveyors or others to accomplish the percent progress determinations. Typically, personnel who are Shipbuilding Specialists determine progress percentages only. The current contract value and value of the earned progress payment to the contractor is determined by the ACO, based on the technical progress assessment percentage. Labor progress determinations are made for each work item requiring a productive effort. For those work items currently not being worked by the contractor, the progress status from the previous week will simply be carried forward in the current week's progress assessment. Progress determinations on the remaining work items are made by physically assessing the status of work performed and comparing it to the total work required for the items. The progress assessment must be based on a valid progressing method appropriate for the nature of the work required. There are four basic approaches to progressing a work item: the uniform method, the 0 or 100 method, physical percent complete and the activity method.

(1) The uniform progressing method is applicable to work items that require a constant level of effort throughout the availability. The Level of Effort classification of work measurement includes general or supportive activities having no definitive or deliverable product. Budget is scheduled over the period of performance. The Budgeted Cost of Work Performed (BCWP) earned is based on the passage of time. Typical Level of Effort work activities include, but are not limited to, program management, production engineering, contract administration and field engineering. Hotel services to the ship can also be progressed as a uniform item, such that when the elapsed time of the availability is at 40 percent, the item is 40 percent complete.

(2) The 0 or 100 percent progressing method is applicable to small work items that will require a relatively short period of time to complete. The progress status of the items is carried at 0 percent until completed and at 100 percent after completion. Final acceptance remains the responsibility of the ACO.

(3) The physical percent complete classification of work measurement often depends upon individual evaluation of work accomplished. It is also commonly expressed as: BCWP cumulative divided by Budgeted Availability Cost (BAC)

$$Percent\ Complete = \frac{BCWP\ cum}{BAC}$$

Percent complete, when defined as an activity's percentage of completion based on duration is often misleading and should be avoided.

(4) The activity progressing method is applicable to large or complex work items that cannot be progressed by a simpler means. To apply this method of progressing, the work item is broken down into a number of discrete work activities consistent with the requirements specified in the work items. A weight factor is assigned to each activity that is approximately equal to the estimate for the work item paragraphs covered by the activity.

f. Two examples of activity progressing are provided in Appendix D and Appendix E. In the following examples, a work item requiring in shop overhaul of a fire pump is broken down into discrete activities.

(1) In the first example the Shipbuilding Specialist has broken the work item down into 11 significant activities that cover 100 percent of the work required, and a percentage of the total is assigned to each activity which is approximately equal to the percentage of the estimate of the activities covered to the total work item estimate. For example, the estimate for repairs to be accomplished in the shop is about 20 percent of the total work item estimate.

(2) In this second example there are 12 activities that contribute to achieving 100 percent complete. Progressing is accomplished by using each significant activity that is associated with the work item as a cumulative percentage of the total of all completed activities. In this example, the work item will be reported as 75 percent complete when the pump is delivered back to the ship and reinstalled. Examples are also provided for "on-ship repair" and Ship Change installations. For large activities, progress credit can be taken at a uniform rate for the time allocated to the activity, or the activity can be further divided into sub-activities to facilitate more detailed progressing.

g. Contractor's incurred costs and unsatisfactory work are not to be considered in the determination of the percentage of progress completion. The RMC must certainly monitor a contractor's incurred cost as a matter of principle. Incurring costs in excess of the expected cost for the percentage of work completed may indicate that the contractor will have trouble financing the completion of the work. For this and related reasons, the Government must be aware of the contractor's financial condition and the contractor's relative loss or gain position for the contract. That a contractor has expended a specific percentage of the contract value cannot be used in any way to influence the progress determination. Likewise, the contractor cannot be given credit for progress on a work item when deficient work has been reported. If a work item has a Corrective Action Report or Quality Deficiency Report issued against it, the progress for that work item should not be changed until the Corrective Action Report or Quality Deficiency Report is resolved. Progress percentages cannot be adjusted as a punitive measure in attempting to resolve a problem with the contractor; the ACO has other methods available to resolve such problems.

h. Material progress is based on the material cost incurred by the contractor. The material must be satisfactorily receipted and paid for by the contractor. This amount is divided by the overall material amount to determine the percentage of material completion. The contractor submits a progress report with completion percentages as required by the contract, normally each week. Independently, Shipbuilding Specialists will mark up the Government-generated work item labor and material completion percentages. The marked-up percentages will then be used to determine the contractor's current progress and to update the official progress reports. Differences in opinion with the contractor should be resolved in the weekly progress meeting.

7.9.3 Progress Payments. There are two types of payments provided by Government contracts: "Provisional Payments" associated with cost reimbursable type contracts, and "Progress Payments" associated with fixed price type contracts. Progress payments are further categorized as "customary" and "unusual". Customary payments are based on a payment rate, cost base and a frequency of payment. The unusual type of progress payment is based upon the actual amount of work completed and material acquired by the contractor for the work. Details of these types of payments may be found in reference (p), subpart 232-16. The process described in paragraph 7.9.2 of this chapter to determine the progress of repair and modernization is normally used to verify the payment of contractor's invoices.

7.9.4 Progress Conferences.

a. Progress Conferences should be scheduled with the contractor, Ship's Force or both, when there is a need to resolve schedule or progress issues. The RMC and ships MT may require these meetings with the contractor, Ship's Force and other activities as needed to address problems.

b. During the Progress Conference, the discussion of contractual issues must be avoided unless the ACO is present. A discussion of the status of funding must be avoided if the contractor is present. The purpose of the Progress Conference is to:

(1) Review the progress of each work item and modification.

(2) Identify and evaluate the controlling jobs.

(3) Resolve identified production problems or devise work around solutions.

(4) Review quality and safety problems.

(5) Review the status of GFM and CFM.

(6) Discuss key events or evolutions.

(7) Review and discuss the project's schedule including, but not limited to, the critical path's total float value.

c. Weekly progress meetings are conducted by the Project Manager and are usually held onboard or near the ship and are attended by key personnel from the RMC, the ship's CO and other MT members, key Ship's Force personnel and the contractor's key representatives. The Project Manager must ensure that an agenda of issues developed from input previously solicited from the participants in the weekly progress meetings is prepared at least one day prior to the meeting. Ship's Force should discuss problems with the contractor's performance, workmanship or the actions of the

contractor's personnel with the RMC before addressing the problems with the contractor. All issues between Ship's Force and the RMC should be resolved prior to meeting with the contractor. If such issues cannot be resolved before meeting with the contractor, the Government only issues should not be discussed in the presence of the contractor. The Government must speak with one voice to the contractor, as this is an opportunity for the contractor to perceive that the discussion was a constructive change to the contract.

d. The contractor is required by the scheduling work item to "provide cognizant management representation to participate." The specification further states, "The representative must be authorized to make management decisions relative to routine requirements of the job order which, in good faith, commit the contractor." The contractor is normally required by contract to submit among other things, the following information to the RMC and Project Manager one working day prior to the weekly progress meeting:

(1) The revised production schedule including additions, completions, modifications, progress and completions.

(2) Manpower utilization data.

(3) A report listing each work item's scheduled start date, scheduled completion date, actual start date and percentage complete.

(4) A report listing contractor and GFM not received, expected delivery date, required delivery date and action proposed to resolve problems resulting from late delivery.

(5) A report listing late or deficient Government Furnished Information and proposed corrective action.

(6) A report of overdue contractor condition reports and expected submission date. The report must also include those deficiency or condition reports for which Government response is outstanding.

(7) The revised weekly test schedule.

e. Two of the most critical aspects of ship repair and modernization project management is the management of resources and communication to accomplish the required work. Unlike other tasks, project management communications center largely around time sequenced and logic-sequenced events and the resources required to complete them. It includes the processing of project data to plan and control a project in terms of cost and time. When discussing and evaluating production problems during weekly progress meetings, or when evaluating or negotiating the cost and time impact of contract changes, communicate with the contractor, contract cost and schedule variances. To do so, knowledge of the contractor's production control and cost systems is necessary. In order to communicate and understand performance measurement for specific work, identify and discuss BCWP also known as 'Earned Value', Budgeted Cost of Work Scheduled (BCWS) also known as 'Planned Value', and Actual Cost of Work Performed (ACWP), also referred to as 'Actual Costs', up through the contractor's Work Breakdown Structure and Organizational Breakdown

Structure. Review the contractor's cost accounts and cost account descriptions (typically available through the local Defense Contract Audit Agency office, should the contractor be reluctant to provide such information). The "cost account" is a key and natural management control point as it represents the work assigned to a specific responsible organizational element on one work breakdown structure element. It is an element of work for which responsibility is assigned, and is further defined by work packages and work orders. In forecasting and evaluating problem areas on any given project, focus more on BCWP trends rather than ACWP trends. Cost Variance = Earned Value or BCWP - ACWP. By documenting and comparing actual hours expended to date (ACWP) to the earned value of the work performed (BCWP) and the amount of work remaining it is possible to project the cost at completion and, assuming stable labor resources and performance with no material challenges or change in work scope, an estimated completion date. Furthermore, the parties can then also compare the projects past work history to the amount of remaining work as a reality check on forecasts by the contractor's scheduling department. For more information on earned value management techniques and contemporary program management software capabilities, access the Defense Acquisition University Earned Value Management Home Page at https://www.dau.edu/knowledge-areas/earned-value-management.

f. Variance. The difference between the BCWS and BCWP is referred to as the schedule variance and is favorable if the Earned Value is EQUAL TO OR GREATER than the planned value. The difference between the ACWP and the Earned Value (BCWP) is referred to as the cost variance and is favorable if the earned value IS EQUAL TO OR EXCEEDS the actual costs.

g. Cost Performance Index (CPI) or Schedule Performance Index (SPI) (Surface Force Only) On a weekly basis, the CO, Project Team and RMC must report CPI and SPI.

(1) Cost Performance Index - This is an earned value analysis technique that is used to calculate cost performance efficiency with which contract work has been accomplished. CPI compares the actual costs of the work performed to the budgeted cost of the work performed over a specified period or the entire availability to date. The formula for CPI is: BCWP divided by ACWP equals CPI. A comparison of cumulative CPI to recent periodic CPI values supports assessment of the current trend as improving or deteriorating.

(2) Schedule Performance Index - This is an earned value analysis technique that calculates schedule performance efficiency with which contract work has been accomplished. SPI evaluates the "projected" schedule of work to be performed (as defined by the budget cost of work scheduled) against the actual work performed (as defined by the budget cost of work performed) over a specified period or the entire availability to date. The formula for SPI is: BCWP divided by BCWS equals SPI. A comparison of cumulative SPI to recent periodic SPI values supports assessment of the current trend as improving or deteriorating.

NOTE: REBASELINING PROJECTED FIGURES IN EITHER CASE MUST NOT BE ROUTINELY PRACTICED AS IT WILL RENDER REAL TIME DATA

USELESS IN ASSESSING THE PERFORMANCE OF THE AVAILABILITY.

(3) Based on SPI and CPI, an availability will be referred to as green, yellow or red as defined below.

(a) An availability will be referred to as GREEN, if both SPI and CPI are ≥ 0.96.

(b) An availability will be referred to as YELLOW if both SPI and CPI are ≥0.92 but <0.96, or one of SPI or CPI is ≥0.90 and the other is >0.96.

(c) An availability will be referred to as RED if either the SPI or CPI is <0.90 or if both are <0.92.

7.10 FUNDS ADMINISTRATION.

7.10.1 Over Obligation. Reference (q) establishes that Government funds may not be over obligated or over expended. Severe penalties may be imposed on the CO, RMC as well as any individual involved in such an infraction. Reference (r), section 1517, establishes that funds must be obligated or expended only for the purpose for which the funds were authorized. Funds administration has been addressed further in Chapter 6 of this Volume.

a. Personnel in Waterfront Operations must be involved in the funds administration process for the same reason that these personnel are involved in contract administration. The ACO is responsible for ensuring that the contract is properly funded and the Comptroller is responsible for proper financial management. Individuals in these positions will not normally be aware of the validity of the technical requirement for an obligation or expenditure. It is usually the waterfront staff that knows that the material ordered is actually required for the project that the funds grantor provided the funds to accomplish. It is usually the waterfront staff that is aware of the proper funds to apply to a project and must not proceed until the Funds Administrator obtains the proper authorization to use the funds from the funds grantor.

b. The Funds Administrator must be assigned in writing by the CO of the RMC and will be held responsible for the use of funds granted as well as for technical accountability. The funds administrator is then responsible for identifying funding requirements to the funds grantors, apprising the Comptroller on the advisability of acceptance and returning excess funds to the funds grantor.

c. Generally, the funds administrator is the only individual who can authorize the Comptroller to initiate, commit, obligate or expend the funds for an assigned availability or project. Requirements to increase work in an availability, no matter how critical, must be authorized by the funds administrator. Prior to the preparation of contract modifications, Shipbuilding Specialists must receive authorization from the funds administrator, who will cause the estimated funds to be committed. Funds must be available before negotiations can begin with the contractor or before the ACO can direct a change order, except in the case of impending disaster. In some cases, the funds administrator may be required to receive authorization from the funds grantor to authorize a modification, such as for growth work in excess of an established threshold. In the case of insufficient funds, the funds administrator must obtain additional funds before authorizing any obligation.

7.10.2 Growth and New Work.

a. Contract clauses and NAVSEA Standard Items require contractors to submit reports identifying additional work or material procurement necessary to produce a reliable or complete repair. The contractor is additionally required in various work items to submit condition reports that identify additional work necessary to accomplish the intent of the work authorized. The contractor may also submit unsolicited reports that may generate additional work, increase the value of the contract and affect the scheduled completion of the contract.

b. In the process of nearly continuous work identification, some new work may be identified that was not contemplated in the contract nor considered to be within the intent of the original work authorization. That work necessary to complete a satisfactory repair covered in the specifications will usually be authorized as growth within scope, or simply growth work by a contract modification if the funds can be made available. New work to be added to the contract should be the subject of a new work request. New work should not be added to the contract unless it is considered to be mission critical or a safety item and it is reviewed by the Naval Supervisory Authority Chief Engineer for technical compliance. Growth work should not be authorized except as necessary to complete the intent of the original work scope authorization. Growth work, above budget controls, requires the same level of review by the Naval Supervisory Authority Chief Engineer and adjudication by the TYCOM as new work. Any work, new work or growth work added to the contract after award will impact the contractor's scheduled requirements and will require additional resources, additional time or both.

c. The contractor condition reports will normally be received by the Shipbuilding Specialist that is assigned responsibility for the trade area of concern who will review the work item and references, as well as all related work items, to determine whether or not the work is already covered in the basic specifications. If the work identified in the condition report is not already a part of the contract, the Shipbuilding Specialist and the ship's Port Engineer for Surface Force ships and the Maintenance Manager for aircraft carriers will go to the ship, inspect the work site and, if possible, discuss the problem with the individual who generated the report for the contractor. If in the judgment of the Shipbuilding Specialist and the Port Engineer or Maintenance Manager, the work is already required by the contract, is not necessary to accomplish the intent of the work authorized, or can be deferred for later accomplishment, the Shipbuilding Specialist will annotate the report with the appropriate disposition and return it to the contractor after review by the Project Manager. The timing of the condition report review process is critical. Reports must be time stamped upon receipt from the contractor and returned within three days. When issues raised in a condition report require a longer processing time, the contractor should be advised as to the expected response time.

7.10.3 Contract Modifications.

a. When the Shipbuilding Specialist and MT or Ashore Ships Maintenance Manager concludes that a condition report identifies an additional work requirement necessary to complete a reliable repair and accomplish the intent of the work authorized, the

Project Manager will be notified that a contract modification is necessary and a TAR will be necessary for the additional work. The ACO must likewise be alerted that a contract action will be forthcoming. If the Project Manager, Ashore Ships Maintenance Manager and MT agree the contractors initial estimate is within the funds grantor's authorization and the necessary funds are available, the Project Manager should immediately request the ACO to commit the necessary funds and authorize the preparation of the work item specification and a TAR to support the negotiation process associated with a contract modification.

b. In some cases, the activity providing funds may place a dollar limit on individual growth work changes which can be authorized by the Project Manager and the ship's MT or Ashore Ships Maintenance Manager without the grantor's prior approval. Changes for growth work under this established threshold can be authorized by the Contracting Officer to process the change. For other changes, the Project Manager must obtain concurrence from the MT or Ashore Ships Maintenance Manager and advance approval from the funds grantor before the change can be authorized and in some cases, additional funds will be required. This requirement may cause delay in processing needed changes and increase the cost of the additional work. The Project Manager must do all that can be done to expedite the funding authorization to minimize the potential delay impact.

c. In some situations, problems may be identified which cannot be addressed adequately by the Project Team. When needed, the Shipbuilding Specialist will initiate a request for technical advice, assistance or direction from the RMC engineering department or the cognizant technical agent, as appropriate. For example, the local engineering department and Chief Engineer should be consulted first for any problem related to the repair work package. Additional consultation with other outside activities should be initiated only after local resources have been exhausted. Problems with the authorized alteration package should be referred to the on-site design liaison representative of the cognizant PY. Local engineering services and PY liaison services do not require funding from availability funds. However, requests for reimbursable services from other activities should be initiated only with the approval of the Project Manager, after consulting with the MT or Ashore Ships Maintenance Manager and Contracting Officer, who must be able to provide the required funding.

7.11 DELAYS IN PERFORMANCE.

7.11.1 Risk. Generally, the contractor bears the risk of both time and cost for delays which the contractor causes or which are within the contractor's control. This may be excused for delays caused by factors for which the contractor is not responsible.

7.11.2 Performance. Contractors are always responsible for providing plant, machinery, labor and finances required for the performance of contracts awarded. Failure to have the necessary machinery or other such means for performance, whether at the time of contracting or subsequently, generally is not a valid excuse for delay or failure to perform. For example, a breakdown of a contractor's machinery is not excusable unless the breakdown was caused by an excusable event.

7.11.3 Material. In a fixed price contract, the contractor assumes the risk of obtaining the materials necessary for performance and a subsequent market shortage is not an excusable cause for nonperformance. The fact that supplies cannot be obtained except at a cost in excess of the contract price is no excuse. Unwillingness to perform at a loss does not relieve the contractor from its contractual obligation. A contractor, even in a time of volatile prices, is deemed to have assumed the risks of increases in material cost. This does not apply in a cost type contract. The Government assumes the risk for providing GFM to meet the contract requirements and contractors' production schedule as mutually agreed upon.

7.11.4 Excusable Delays.

a. In most cases of excusable delay, the contractor must bear the cost impact of such delays. For excusable delay in a contractor's facility, the Government usually will compensate the contractor only for the cost of services provided for the benefit of the crew of the vessel and no other costs. The Government, however, will compensate the contractor for both the time and cost effect of delays caused by the Government.

b. Most excusable delays involve temporary work interruptions. When the impediment is removed, the contractor is expected to resume performance. Generally, the contractor is not liable for any excess costs if failure to perform the contract arises from causes beyond the control and without the fault or negligence of the contractor. "Fault or negligence" deals with acts or omissions of the contractor which cause delay. Examples of events beyond the contractor's control and without the contractor's fault or negligence may include:

(1) Acts of God or of a public enemy.

(2) Acts of Government in either its sovereign or contractual capacity.

(3) Fires.

(4) Floods.

(5) Epidemics.

(6) Quarantine restrictions.

(7) Strikes.

(8) Freight embargoes.

(9) Unusually severe weather.

(10) Terrorist Acts including bomb threats.

c. In each instance, the delay must be beyond the control and without the fault or negligence of the contractor. The element of "foresee-ability" must be considered regardless of any specifically enumerated excusable factors in order for a contractor to be entitled to excusable delay. If a delay is caused by a subcontractor at any tier, and if the delay is beyond the control of both the contractor and subcontractor and without the fault or negligence of either, the contractor is excused for the delay unless the subcontracted supplies or services were obtainable from other sources in sufficient time for the contractor to meet the required delivery schedule. Generally, delay is not excusable if the supplies or services were obtainable from other sources in sufficient

time to permit the contractor to meet the required delivery schedule. Delays caused by sole source subcontractors, even those designated by the Government, do not qualify for excusable delays if the subcontractor is at fault. When the Government directs the installation of a sole source item, it represents only that the requirements of the contract can be met by using that item. However, such representation is predicated upon the assumptions that the item has been properly manufactured and timely delivered by the vendor and that it will be installed properly and timely by the contractor. Excusable delay may result from:

(1) Acts of God: Delays caused by "Acts of God" (such as delay caused by earthquake) or other naturally occurring events are generally excusable. An "Act of God" has been defined as a "singular, unexpected and irregular visitation of a force of nature."

(2) Strikes: Delays caused by strikes are generally excusable. Strikes include job actions by a contractor's own employees and by a subcontractor's employees. Excusable delay may also be allowed for other job actions which have the effect of a strike against the contractor, such as organizational strikes, jurisdictional strikes, pickets protesting another contractor at a site, delays caused by impending strikes and wildcat strikes. In order to obtain an excusable delay for a strike, a contractor must prove that it acted reasonably by not wrongfully precipitating or prolonging the strike and took steps to avoid its effect. In the absence of a strike or other enumerated cause of delay, a contractor is generally not excused for labor difficulties. These difficulties usually involve either the loss of key personnel or an unexpected labor shortage. The boards have strictly adhered to the rule that the contractor assumes the risk of hiring and retaining a competent work force.

(3) Weather: Generally, delay caused by unusually severe weather is excusable. Unusually severe weather is that weather which is abnormal compared to the past weather at the same location for the same time of year. Normally, proof that weather is unusually severe is accomplished through the comparison of the United States weather statistics for past periods in the area with those recorded during the period of performance. When weather conditions are not totally abnormal from a statistical or average standpoint, but are abnormal and unusually severe in their effect on the particular type of contract work being performed, the contractor may be entitled to excusable delay. In cases where the nature of the work requires specific environmental conditions and when the work is delayed because of weather conditions, the delays are excusable to the extent that the weather conditions exceed the normal weather delays contemplated for the period of the performance.

(4) Government Acts: Acts of the Government in either its sovereign or contractual capacity may be cause for excusable delay.

(a) Contractual Acts: For a contractor to be excused by an act of the Government in its contractual capacity, the contractor must show that delay resulted from the Government's failure to perform its express or implied contractual duties.

(b) Sovereign Acts: Sovereign acts which delay the contractor's performance may be grounds for excusable delays. In general, however, when the Government's acts are for the general public good and are indirect in nature, the contractor is not excused for any resultant delay.

7.11.5 Non-Excusable Delays. Even though it may be argued that the following delays occurred through no fault of the shipyard and were unforeseeable, the shipyard is typically held responsible and the resulting delays are not excusable.

a. Subcontractor delay involves delay occasioned by a shipyard's own subcontractors. A shipyard assumes a non-delegable duty to perform a construction contract, and it is generally no excuse to allege that a shipyard has been delayed by its own subcontractors. The shipyard can, of course, look to the subcontractor for any damages incurred as a result of such delay.

b. Lack of sufficient working capital does not constitute an excusable cause of delay. A shipyard is expected to have the financial ability to perform the contract. The shipyard's delay or failure to perform resulting from its inability to obtain money is ordinarily inexcusable regardless of the reason; whether due to an economic downturn, general financial distress or failure of a third party on whom it relied on in furnishing support.

7.11.6 Compensable Delays. A contractor's ability to recover increased costs resulting from delays will depend upon the cause of the delay, the nature of its impact on the contractor and the contractual provisions dealing with compensation for delays. Generally, compensable delays result from either changes in the work, the existence of a differing site condition, or an unreasonable suspension of work or failure of the Government to perform its duties under the contract.

7.11.6.1 Government Delay of Work. The contractor cannot be directed to stop work by anyone other than a warranted ACO with one exception. The only exception to this requirement is to protect the safety of personnel, environmental compliance or prevent the loss of or destruction of property and equipment. If the contracting officer orders the contractor to suspend or stop work, the contractor will always be entitled to an equitable adjustment in both contract price and delivery schedule to compensate for the impact on performance. In other situations, the Government will be at fault if it breaches its implied duty not to hinder or interfere with the contractor's performance or its implied duty to cooperate with the contractor. Generally, the Government will be at fault when it is responsible for:

a. Delays in making the work site available.

b. Delays caused by interference with the contractor's work.

c. Delays in providing required Government reviews and approvals.

d. Delays in providing funding.

e. Delays in performing required inspection of work.

f. Delays in issuing changes.

g. Delays in furnishing Government Furnished Property.

h. Delays which are unreasonable in duration.

i. Delays caused by conflicting or defective Government specifications.

7.11.6.2 Excusable Delay Relief. A contractor is not entitled to relief upon the mere occurrence of an event that qualifies as an excusable delay. The contractor must show that the delay was caused by an excusable event and that the event caused delay to the overall completion of the contract, and the contractor must establish the number of days of relief to which the contractor is entitled. The event alone is insufficient to justify the granting of an excusable delay. Not every fire, quarantine, strike or freight embargo is an excuse for delay. Events may not be beyond the contractor's control if the contractor could have overcome the effects of the event, and further, when the event is considered foreseeable, the contractor may be held responsible for making alternative arrangements for performance. Even though a contractor can establish that an event or occurrence was unforeseeable, beyond its control and occurred without its fault or negligence, the contractor is not entitled to an excusable delay unless the contractor can prove that the time lost delayed the completion of the job. It is not sufficient to establish that some work was prevented. The work prevented must be work that will delay the overall completion of the job. When the CPM of schedule control is used, the delay must be on the critical path.

a. Generally, the duration of the time extension is governed by the extent to which the excusable cause of delay either increases the amount of time required for performance of the contract work as a whole, or defers the date by which the last of the required work will be reasonably capable of completion. The extension granted may be longer, shorter or of the same duration as the delay period.

b. Generally, the amount of equitable adjustment recoverable by a contractor is equal to the costs that were greater than those which would have been incurred but for Government caused delay. Generally, cost increases attributable to the delay, such as those associated with increased labor rates, time-related labor, equipment, insurance and overhead, if any, are accepted and negotiated. Acceleration costs are also recoverable against the Government if they are incurred in mitigation of the effects of a Government caused delay. When reviewing a contractor's request for delay or acceleration costs, particularly unabsorbed overhead, it is helpful to confer with responsible contracting personnel and legal counsel in order to ensure the appropriate criteria is applied to the specific alleged entitlement.

7.11.7 Concurrent Delay. Generally, in a case where the Government and the contractor are each responsible for delay in completing the work, the Government is barred from assessing liquidated damages against the contractor and the contractor is precluded from recovering delay damages. Concurrent delay does not bar extension of time, but it does bar monetary compensation for, among others, daily fixed overhead costs because such costs would have been on account of the concurrent delay even if the Government responsible delay had not occurred.

7.12 AVAILABILITY FINALIZATION.

7.12.1 Availability Completion Conference.

a. After Sea Trials and before the scheduled availability completion date, the Project Manager will arrange for the Availability Completion Conference. Generally, the scheduling of the conference will be deferred until most of the contractor's deficiencies have been corrected. The Availability Completion Conference is chaired

by the Project Manager and should be attended by the Project and Maintenance Teams, TYCOM Representative, ship's MT, NAVSEA (if significant NAVSEA alterations were accomplished), the ship's CO and the contractor's representatives including the ship superintendent. For major availabilities, the CO of the RMC must also attend the conference.

b. The purpose of the Availability Completion Conference is to establish the date and conditions under which the TYCOM and NAVSEA will accept redelivery of the vessel. To complete the availability and redeliver the vessel, the contractor's work must be completed or exceptions to completion must be documented and agreed upon by the parties concerned. For each exception permitted, a plan to complete the work must also be agreed upon and documented. Additionally, the RMC must ensure that Government responsible work is completed before redelivery or completed with exceptions.

c. Exception items that the contractor is allowed to complete after the redelivery date must be monitored by Ship's Force and RMC Representatives to ensure contractor compliance with contract requirements. Additionally, the ACO will retain sufficient retention funds to cover the estimated value of the incomplete work. Final payment and release of other retained funds is made when the ACO is satisfied that the contractor has substantially complied with all contract requirements and documented exception agreements.

7.12.2 Exceptions to Completion of the Contract. The exception list developed at the Availability Completion Conference will be reviewed by the Project Manager and the ACO to determine if the contract should be declared complete with the exceptions remaining to be completed. The Project Manager reviews the list with the MT or Ashore Ships Maintenance Manager and Project Management Team to identify items that should be deleted from the contract. Items that should be deleted are those items requiring Long Lead Time Material for completion or items that cannot be completed because of factors beyond the control of the contractor. Work item specifications and TARs are then prepared to support negotiation of contract modifications to delete the work from the contract and reduce the contract value. The on-site team also provides estimates for the outstanding items on the exception list so that the ACO can ensure that adequate funding is retained to complete the outstanding items. The redelivery date of the ship is established by the ACO when agreement is reached by all parties on the disposition plan for all exception items.

7.12.3 Availability Completion. When the RMC considers the ship ready for redelivery to the Fleet, the TYCOM is notified. The TYCOM generally concurs if, in the TYCOM's judgment, the exception list does not include outstanding work which would prevent the ship from being fully capable of accomplishing its mission or an accumulation of smaller items which would seriously affect the ship's safety or operations. When agreements of the Availability Completion Conference have been met (if applicable for the class of ship), the TYCOM will accept redelivery of the ship to the Fleet, the contract is declared complete with exceptions and the availability is officially ended.

7.12.4 Contract Guarantee Period.

a. When the ship is redelivered to the Fleet, the contract guarantee period begins. The PSIA contract guarantee period is typically 60 days. For fixed price contracts, the contractor must correct deficiencies in the work performed or in the materials supplied for a period of 90 days. The guarantee period on the items that were exceptions to the completion of the contract will start when the RMC accepts the completed work. Defective contractor work or material deficiencies identified after completion by Ship's Force or others must be reported to the RMC promptly. RMC Representatives investigate the deficiency, and, if it is determined to be a contractor-responsible deficiency, the ACO notifies the contractor in writing. If it is reasonable to do so, the Government must allow the contractor access to the ship to correct the noted deficiencies. If the ship is in port and accessible, the contractor has the option to accomplish the repairs or arrange for another contractor to accomplish the repairs. If the contractor corrects the defect directly or by the use of a subcontractor, then a new guarantee period begins when the repairs are accepted by the RMC. The total guarantee period for any item under a fixed price contract cannot exceed a maximum of 180 days.

b. If the contractor fails to arrange for the correction of the deficiencies, then the ACO will arrange for the defects to be corrected by other means and execute a contract modification with the contractor for an equitable reduction in the contract value. The defects can be corrected by various Government resources, including Ship's Force or by another prime ship repair contractor. If the ACO contracts with another contractor to correct the defect, then the new contractor is responsible for a new contractor 90-day guarantee period when the repair is accepted by the RMC.

c. In the case of split availabilities, the contract guarantee period may begin prior to redelivery of the ship to the Fleet if the Navy uses the equipment provided or the repaired item prior to redelivery.

d. Throughout the guarantee period, the Project Manager must maintain contact with the ship and monitor the contractor's completion of exception items and the correction of guarantee defects. Disputes about guarantee work items must be resolved by the ACO.

7.12.5 Completion Reports. The RMC reviews the records and compiles a number of reports at the conclusion of the availability, the completion of the guarantee period and the closing of the contract.

7.12.6 Availability Completion Reports. (Surface Force Only) An "Availability Completion Report" is required by reference (q) and must be prepared by the assigned Project Manager. This report clarifies the reporting requirements contained in reference (e) for Surface Ship availabilities under the cognizance of the RMC.

7.13 INSURANCE.

7.13.1 Introduction. NAVSEA's insurance policy differs from most Government agencies since NAVSEA is basically a self-insurer beyond contractually specified deductibles for which the contractor is responsible. In general, there are two types of insurance coverage. The first covers loss, damage or destruction to the vessel, its equipment or materials; the second covers third

party and collision, protection and indemnity liabilities. It is essential to remember that insurance claims are different from contract claims. Specifically:

a. Require direct physical damage to vessel from external cause.

b. Excludes delay, disruption, faulty work and materials, cost of sea trials and consequential damages.

c. Excludes fixed overhead.

d. Excludes overtime, unless authorized.

e. Excludes cost of money.

f. Can pay negotiated profit influenced by degree of contractor fault and based upon profit of all yard work.

g. Reimbursement not to be based on estimates, but on return costs for labor performed and bills paid for material.

h. Can settle outside contract price (targets).

i. Deductible is not a contract cost.

7.13.2 Master Ship Repair Agreements or Private Sector Industrial Activity Contracts - Loss or Damage to Government Property. Reference (r), section 1301(a), does not refer to any Navy Syndicate Forms (i.e., the coverage is self-contained). The contractor is directed to exercise reasonable care and use best efforts to prevent accidents, injury or damage to all employees, persons and property in and about the work and to the vessel or part on which work is being done. The term "reasonable" is normally defined in terms of criteria established by the National Fire Protection Association. Of course, any specific contract requirements will govern. Issues regarding Insurance should be directed by the Contracting Officer and the Counsel for the RMC. For example, the requirements are very complex and the Department of Defense is self-insured as noted in the following:

a. The contractor will not, unless otherwise directed or approved in writing, carry or incur the expense of any insurance against any form of loss or damage to the vessels or to the materials or equipment to which the Government has title, or which have been furnished by the Government for installation by the contractor. The Government assumes the risks of loss or damage to the vessels and such materials and equipment. The Government does not assume any risk with respect to loss or damage compensated for by insurance or otherwise, or resulting from risks with respect to which the contractor has failed to procure or maintain insurance, if available, as required or approved.

b. Further, the Government does not assume risk with respect to and will not pay for any costs of the contractor for the inspection, repair, replacement or renewal of any defects themselves in the vessel(s) or such materials and equipment due to the following:

(1) Defective workmanship or defective materials or equipment performed by or furnished by the contractor or subcontractors.

(2) Workmanship or materials or equipment performed by or furnished by the contractor or subcontractors which does not conform to the requirements of the

contract, whether or not any such defect is latent or whether or not any such nonconformance is the result of negligence.

c. In addition, the Government does not assume the risk of and will not pay for the costs of any loss, damage, liability or expense caused by, resulting from or incurred as a consequence of delay or disruption of any type; or willful misconduct or lack of good faith on the part of any of the contractor's directors, officers, and any of its managers, superintendents or other equivalent representatives who have supervision or direction of all or substantially all of the contractor's business or all or substantially all of the contractor's operations at any one plant. However, for such risk assumed and borne by the Government, the Government will be subrogated to any claim, demand or cause of action against third persons which exists in favor of the contractor, and the contractor will, if required, execute a formal assignment or transfer of claims, demands or causes of action. Moreover, none of this will create or give rise to any right, privilege or power in any person except the contractor, nor will any person (except the contractor) be or become entitled to proceed directly against the Government or join the Government as a codefendant in any action against the contractor brought to determine the contractor's liability, or for any other purpose. In addition, the contractor will bear the first $50,000 of loss or damage from each occurrence or incident, the risk of which the Government otherwise would have assumed under the provisions specified.

d. The Insurance Clause typically requires that the contractor will, at the contractor's expense, procure and maintain such casualty, accident and liability insurance in such forms and amounts as approved by the Government, insuring the performance of its obligations under paragraph (c) of the clause. Further, the contractor will procure and maintain Workers' Compensation Insurance (or its equivalent) covering employees engaged on the work and will ensure the procurement and maintenance of such insurance by all subcontractors engaged on the work. The contractor will provide evidence of such insurance as required by the Government.

7.13.3 Administration of Insurance Requirements.

7.13.3.1 Responsibilities of the Assistant Secretary of the Navy Research, Development and Acquisition - Acquisition and Business Management. The Assistant Secretary of the Navy (ASN) Research, Development and Acquisition (RD&A) - Acquisition and Business Management (ABM) is available to contracting activities to provide guidance on insurance matters. The ASN (RD&A) - ABM is authorized by direction of the Secretary of the Navy, or the duly authorized representative of the head of a contracting activity, the contracting officer or any other naval official designated in such a contract, to do the following:

a. Require or approve insurance when a contract provides that a contractor will procure such insurance.

b. Execute, sign or endorse in the name of and by direction of the Secretary of the Navy any and all lost policy releases, proofs of loss, subrogation agreements, endorsements of policies for claims or return premiums, payment orders and insurance drafts made payable to the Secretary of the Navy and not affecting the obligating of appropriations.

c. For risk pooling arrangements, confirm to the cognizant activity the amount of premium due and, if the funds allocated to the contract are not sufficient, the amount due must be paid as an item of cost under the contract out of other appropriated funds.

d. Advise and recommend to the Secretary of the Navy or other authorized interested officials of the Navy Department regarding insurance drafts that affect the obligating of appropriations and assignment, in order to assure payment of premiums found to be due after the completion of a contract.

e. ASN (RD&A) - ABM should be consulted if any assistance is required in determining Government responsibility. All matters concerning self-insurance covering any kind of risk will be submitted to the ASN (RD&A) - ABM.

7.13.3.2 Procuring Contracting Officer or Regional Maintenance Center Administrative Contracting Officer Responsibilities and Actions. Responsibilities outlined in the NAVSEA Contracts Handbook, Subpart 28.301, include:

a. Establishing and maintaining adequate records on required contractor insurance.

b. Expediting acquisition of the required insurance by the contractor.

c. Reviewing insurance policies. The previous requirement to forward insurance policies to the ASN (RD&A) - ABM for review has been canceled. If problems exist with specific contractor insurance policies that the ACO cannot resolve, then NAVSEA 02 assistance should be requested.

d. Ensuring the contractor maintains qualifying insurance under the annual Public Law 85-804, Secretary of the Navy Determination or individual authorization (see FAR Part 50.3).

e. Establishing and maintaining adequate contract records of contractor claims when the Government assumes the risk or indemnifies the contractor under the contract, analyzing such claims to ascertain patterns of neglect or misconduct, and calling such matters to the attention of the contractor.

f. Taking action on insurance as directed by NAVSEA.

g. Ensuring that contract modifications for repairs to GFM are not issued when the need for corrective action results from damages of an insurance nature.

h. Ensuring that any loss or damage that may be the subject of an insurance claim is promptly reported by the contractor in writing to the ACO.

i. Take the following actions and record the specified information for loss or damage that may be the subject of an insurance claim:

(1) Contractor’s name and contract number.

(2) Navy classification symbol and hull number, if appropriate (not the contractor’s hull number).

(3) Claim number or job order number.

(4) Date of occurrence.

(5) Full description of damage and of accident or event causing damage in simple, non-technical language.

(6) Estimated or actual cost of repair in full detail.

(7) Comment on any circumstances that make the contractor responsible for the loss, such as willful misconduct, with the Navy not having title to the material because the material was in the possession of a subcontractor, or where the damages were not accidental. The ACO's investigation concerning responsibility must be thorough (the contractor's investigation will not be the only investigation made). When the ACO considers that there are mitigating circumstances concerning the responsibility of either party, the ACO's comments should provide a full report of the circumstances.

(8) Comment on any need to place the contractor on notice that, due to a repetitive pattern of claims, the Government would not be liable for any future claims.

(9) Comment to the extent of the contractor's entitlement.

(10) Legal review by activity counsel.

7.13.3.3 Notification of Legal Actions Against the Contractor. As required by the insurance clause(s) of job orders or contracts, a contractor will immediately, or as soon as practical, notify the ACO of any legal action filed against the contractor if the legal action arises out of the performance of the contract and if the cost may be reimbursable, the risk is uninsured or the amount claimed is in excess of the amount of insurance coverage. The ACO will then direct the contractor to immediately furnish copies of all pertinent papers received in connection with the claim, if not provided with the contractor's notification. The ACO will also promptly notify the NAVSEA contracting officer, or NAVSEA 02, and NAVSEA counsel of any such legal actions filed against the contractor and forward copies of all papers and statements of available facts concerning any action resulting from bodily injury, death or property damage and involving a member of the public or any employee of the contractor or subcontractor.

APPENDIX A

ARRIVAL CONFERENCE AGENDA

Introduce key players and their roles	Discuss paper flow of contractor reports
Brief RMC role	Define growth and new work and impact
Brief contractor organization and history	Discuss delay and disruption
Brief local policies and procedures	Explain the contractor's fire watch responsibilities
Explain weekly management review cycle	Discuss housekeeping and safety
RMC explain the contract terms	Have contractors explain their approach
Brief each work item	Discuss procedures of communication
Brief each Standard Item referenced	Have contractors discuss the schedule
Outline key event and milestone dates	Identify the contractor-furnished facilities and services
Discuss contractor's and Ship's Force schedules	Discuss security of the ship and the contractor's facilities
Explain constructive changes and acceptance of work	

APPENDIX B

FIRE FIGHTING AND FIRE PREVENTION CONFERENCE AGENDA

Fire alarm and response procedures	Shipboard arrangement including access routes, availability of firefighting systems (installed and temporary) and communication systems
Contractor firefighting capability and procedures	Shipboard firefighting organization, systems, drills and equipment
Municipal firefighting capability and procedures	Ship, space and equipment security consideration
Firefighting jurisdictional cognizance	Compatibility of ship, contractor and municipal firefighting equipment
Communication system for fire reporting and control of firefighting efforts	Industrial work scope, including location of ship, and effect on firefighting systems, access and communications
Safety Data Sheets	Review the Safety Data Sheets (SDS) and list of Hazardous Materials for each activity (e.g., Ships Force, RMC, AIT, LMA) to assist in coordination of any firefighting efforts. During the firefighting and fire prevention conference, each activity should have available a copy of the SDS for each hazardous substance they plan to use or store on board ship or at the industrial facility.

APPENDIX C

DRYDOCKING CONFERENCE AGENDA

Date of drydocking and time across the sill	RMC dockmaster responsibilities
Docking position	Contractor dockmaster responsibilities
Tugs and pilots	Line handling
Stability for moving into and out of drydock	Sounding tanks after ship has landed on the blocks
Liquid load	Monitoring weight changes while in drydock
Electrical power	Drydock services
Fire pumps	Drydock safety precautions

APPENDIX D

"ACTIVITY" PROGRESSING METHOD EXAMPLE

LISTING OF APPENDICES.

A Work Item Completion Report

8.1 PURPOSE. To provide an overview of the processes and requirements that are to be used in the final phases of the performance period in validating satisfactory completion of all work items through post production testing and trials in preparation for the Naval Supervisory Authority (NSA) to certify completion and redelivery of the ship to the Fleet following a maintenance or modernization availability.

8.2 SCOPE. This chapter provides general guidance and identifies processes, testing and trials plans and specific events and meetings that are the responsibility of the NSA as contract administrator to use in validating that the terms and conditions of the contract have been complied with and certifying completion of the contract. The discussion centers on actions to ensure that the contractors work performance is demonstrated during production acceptance testing and trials. Guarantees are required following preliminary acceptance of the work to offset the cost of any premature failures resulting from poor performance that could not be determined before the ship was redelivered to the Fleet.

8.3 APPLICATION OF TOTAL SHIP TEST PROGRAM TO MODERNIZATION AND REPAIR WORK.

8.3.1 Introduction. Production acceptance testing is required by references (a) and (b). Volume I, Chapter 4 and Volume V, Part I, Chapter 7 of this manual contain additional guidance on Tests and Inspections that may apply to significant modernization availabilities or overhauls.

a. Depending upon the complexity and duration of the Chief of Naval Operations (CNO) availability, the NSA will ensure that test program management and testing is accomplished per reference (c). The objectives of the Total Ship Test Program

principles are to provide a test program that will effectively and efficiently assure that the work performed by all organizations was properly completed and to assess the ship's readiness to perform its mission at the completion of the industrial period.

b. The technical and inspection requirements to be met by the contractor are detailed in the work item specifications. Normally, both the work specification and the NAVSEA Standard Items (NSI) (or other requirements) referenced in the work item must be used to determine the complete technical requirements, check points and other testing to be satisfied by the contractor.

c. The extent of system testing required will be determined by an engineering analysis performed by the NAVSEA designated Ship Systems Test Development Director or Combat Systems Test Development Director and will be specified in the Integrated Test Package. The Total Ship Integrated Test Package will be provided according to milestones established by the Regional Maintenance Center (RMC) Project Manager or Supervisor of Shipbuilding Advanced Planning Manager or by the Type Commander (TYCOM) or the ship's Maintenance Team.

d. Reference (c) contains a detailed description of test methodology, development, organizations, processing, witnessing and test problem reporting.

8.3.2 Ship System Testing (Hull, Mechanical and Electrical). The primary assessment agent for Light-Off Assessments will be determined by the Immediate Superior In Command. For major availabilities, a Fleet Engineering Mobile Assessment Team may visit as necessary to conduct inspections onboard the ship prior to the Light-Off Assessment so corrective action can be identified and written into the work package, as required.

8.3.3 Combat System Testing. Combat System requirements are invoked in the specifications by appropriate work items based on the NSI 009-67. NSI 009-67 tasks the contractor to prepare and manage a comprehensive test plan following general specifications for overhaul. The Lead Maintenance Activity will develop a test plan, generate test sequence networks, arrange for temporary services to support testing and manage the testing to ensure an orderly and timely completion. Combat system testing normally occurs during the last weeks of the availability. Current NAVSEA guidance has established the following criteria:

a. For short availabilities, normally less than 120 days, Stage 3 (equipment tests) and Stage 4 (intra-system tests) of the Total Ship Test Program will be scheduled only for equipment and systems modified, overhauled or repaired. Selected additional Stage 4 and Stage 5 through Stage 7 testing will be specified in the Integrated Test Package to check interfaces disconnected or changed during the availability. Except for testing associated with Ship Changes, testing requirements for shorter availabilities is a TYCOM or RMC decision.

b. Testing requirements will increase proportionally with the length and complexity of the combat system work. Longer availabilities require Stage 3 testing of all equipment, Stage 4 intra-system and Stage 5 through Stage 7 testing of all systems to demonstrate overall combat system operability readiness. Lower level testing of equipment modified, overhauled or repaired will be accomplished by the activity screened to perform the work item.

c. The industrial activity should accomplish the higher level intersystem testing (Stage 5 and above).

d. If assigned, the Combat Systems Project Engineer will assist with integration of the work package and develop the Combat Systems Test Sequence Network as an input to the Integrated Total Ship Test Plan. Working with Ship's Force, the In-Service Engineering Activity and Alteration Installation Teams, the Combat Systems Project Engineer is responsible for all applicable stage testing requirements and will confirm that at availability completion, the Combat Systems are ready to commence training.

8.4 TRIALS FOR OVERHAUL AND REPAIR AVAILABILITIES.

8.4.1 General. The Master Ship Repair Agreement (MSRA) discussed in Chapter 3 of this volume requires that if dock trials or sea trials are required by the NSA, the trials will be specified in the job order. Accordingly, the specifications will include requirements for such trials if the trials are considered necessary. For a commissioned ship, the ship is operated by Ship's Force and the contractor normally provides a specified number of personnel by trades to ride the ship. The NSA will provide the ship with the list of personnel who will be onboard for the trial. The Naval Ships Technical Manual contains further information on dock and sea trials. The requirement for these trials will specify a scheduled number of days before the completion of work, usually from four to seven days to allow for adequate adjustment and correction of defects found during the trial. The dock trial should be scheduled from two to four days prior to the sea trial for similar reasons.

8.4.2 Post Repair Trials. When required by the specifications, dock trials and post-repair sea trials are conducted before the completion of modernization and extensive repair availabilities primarily to determine satisfactory work performance by the contractor. The ship's Commanding Officer, in coordination with NSA and Repair Yard, is responsible for the scheduling and conduct of trials, preparation of the trial agenda and arrangement of necessary services.

8.4.2.1 Dock Trials. The primary purpose of this trial is to conduct preliminary checks and tests necessary to ensure the ship is ready for operations at sea. Operation of all equipment during dock trials will be attended by NSA and contractor personnel. In addition to tests of the propulsion and damage control systems, special attention should be given to the electrical, electronic and mechanical equipment required for safe navigation at sea.

8.4.2.2 Fast Cruise. The purpose of this evaluation is for Ship's Force to operate the ship while still secured to the pier, as if the ship were at sea. NSA Representatives may be present to witness the operation of certain equipment whose condition was suspect during dock trials. Special attention is given to operation of the combat systems and casualty control drills during this period.

8.4.2.3 Sea Trials. When a post-repair sea trial is required by the specification, RMC Supervisor of Shipbuilding will provide a list of RMC or NSA and contractor personnel required for the sea trials.

8.5 FINALIZATION PROCEDURES FOR REPAIR AND MODERNIZATION AVAILABILITIES.

8.5.1 General. After completion of the required dock and sea trials, the contractor must remedy all contractor-responsible defects (non-conformities) uncovered during the trials and other work which may be authorized. The contractor must make every effort to complete all unfinished

work items by the scheduled job order or contract completion date. Where delays are due to the fault or negligence of the contractor, the contractor should be reminded that failure to meet the scheduled delivery date will make the contractor liable to assessment of liquidated damages, following the terms of the contract. When the contractor's failure to complete the work within the specified time arises from causes beyond the control of and without the fault or negligence of the contractor, as defined in Clause 15(b) of the MSRA or Agreement for Boat Repair, any additional time required for adjustment of job order price for hotel costs for the ship's crew to complete the work may be granted as a job order modification. Reference (d), section 222.101, contains guidance on labor disputes. Disagreements on whether delays are or are not excusable under the terms of this clause are resolved per procedures established by Clause 17, Disputes, of the MSRA. Disagreements on whether delays are or are not excusable under the terms of this clause are resolved following procedures established in the job order contract. In either case, the NSA must obtain an extension of the availability period from the parent TYCOM. If an extension cannot be obtained, the percentage of uncompleted work must be determined.

8.5.2 Availability Completion and Readiness for Sea.

a. The successful completion of an availability or modernization period depends on reaching a mutual agreement between the NSA and the customer (ship's Commanding Officer, TYCOM, NAVSEA Ship's Program Manager) that all work authorized in the approved work package specifications and supplemental work authorizations have been either satisfactorily completed, or an agreement has been reached concerning a completion plan and schedule for any items partially completed. The job order completion date is determined by the contracting officer and formalized by an Availability Completion Certificate. Format for such certificates varies by NSA offices.

b. (Surface Force Ships only) The Readiness for Sea (RFS) period is a period immediately following the maintenance or modernization availability period that is scheduled for active Fleet ships to provide time to complete additional preparations before commencing active sea duty. The RFS period allotted to a ship will not normally exceed seven days and will frequently be less. The RFS period may even be omitted entirely when there is an immediate operational need for the ship. If a ship has been assigned an RFS period immediately following a major availability, the contractor is not normally permitted to use this period for the accomplishment of work items which the contractor has been unable to complete by the scheduled delivery date without obtaining authority from the TYCOM or RMC. If such authority cannot be obtained, the RMC should obtain the assignment of a new availability or an extension of the present availability.

8.5.3 Contracted Work Completion Report.

a. Based on evaluations of work completion made during the final progressing conference, the senior NSA representative must prepare a Work Item Completion Report, Appendix A, reflecting the final status of all authorized work for the Administrative Contracting Officer (ACO) and other NSA personnel as required by reference (g), section 4.804. This report must list and describe each work item and indicate for each item:

b. The Work Item Completion Report must include a statement on the value and disposition of any scrap material generated.

c. The ACO may subsequently use the Work Item Completion Report as the basis for releasing funds retained from progress payments and for final adjudication with the contractor on any revisions in the contract price resulting from uncompleted work, sale of scrap and similar factors. Any disagreements between the contractor and NSA representative on the percentage of completion of unfinished work items or dollar value of uncompleted work may be resolved with the ACO at this time. Once agreement has been reached, a decrease cost supplemental agreement will be prepared reflecting this agreement.

8.5.4 Terminal Inventory Report. After completion of the availability, the contractor must make a terminal inventory of all excess Government property, including material, equipment, scrap and salvage per reference (h). This report should be forwarded to the NSA property administrator for appropriate disposal action. The quantity or value of any scrap sold by the contractor following NSA directions should also be included in this report, as well as in the Work Item Completion Report.

8.5.5 Release of Retained Funds and Final Payment to the Contractor. The ACO is required under the progress payments provision of the Payments clause of the MSRA and Agreement for Boat Repair to retain funds sufficient to protect the Government's interests at all times. Conversely, as the contractor meets or, by mutual agreement with the ACO, settles contractual obligations, funds previously retained for these purposes should be released for making payments to the contractor.

8.5.6 Release of Retained Funds. On receiving the Completion Report, the ACO will schedule the release of retained funds following the sequence of events listed in this paragraph and advise the contractor of the amount that the contractor may be paid on submitting each invoice. Except as indicated, the ACO has no authority to retain a percentage of the value of progress payments as a guarantee reserve until expiration of the 90-day guarantee period in anticipation of guarantee defects for which the contractor would be responsible.

a. First Event - Completion and Acceptance of All Work: Release all retained funds, except those estimated by the ACO to be required to cover the net value of the amount due the Government, if any, resulting from the algebraic addition of all estimated cost changes (unsatisfactory work and incomplete work including missing software), liquidated damages and outstanding increased cost changes.

b. Second Event - Final Payment to Contractor: On receiving the invoice marked Final Payment, release the balance of the funds retained if the adjusted job order price shown on the invoice includes all equitable adjustments for:

(1) Decreased cost changes.

(2) Contractor-responsible guarantee defects not corrected by the contractor.

(3) Increased cost changes adjudicated before the date of final payment invoice.

8.5.7 Final Payment to Contractor.

a. Based on the Completion Report and after allowing for any payment from the retained funds, the contractor may make the final billing to the NSA for approval and referral to the local payment office. This billing will normally be made for the final sum specified in the Completion Report (or the sum reached as the result of subsequent negotiations between the contractor and the ACO, less the sum of all previous progress payments and the sum of any payment of retained funds).

b. The balance of retained funds may not be released for payment until all of the conditions prescribed in section 8.6 of this chapter are fulfilled, including delivery of all of the software required by the job order. If spares have been borrowed by the contractor from the ship, funds should be retained to cover the cost until the NSA is notified of the ship receiving the spares. Although the final billing may be made before the disposition of Government property listed on the terminal inventory report, the final billing should not be certified by the NSA for final payment until receipt of the inventory report, even though the report may be negative.

c. The NSA certification of the contractor's final invoice is similar to certification of invoices for progress payments. In brief, the cognizant NSA representative and the Inspection Officer should first certify that the work for which the contractor claims payment has been satisfactorily accomplished. Appropriate personnel in the Contracts Department should then make a further check to ensure the accuracy of the computations. The ACO should provide an appropriate certifying statement and affix the ACO signature. The ACO or other appropriate NSA personnel must indicate on the invoice the amount of the total sum to be paid from each cost category or allotment. The invoice is then forwarded to the paying office for final payment.

d. When liquidated damages are to be assessed against the contractor, the ACO should include a statement with the contractor's final invoice, notifying the paying office to the applicability of the Liquidated Damages clause of the job order. The paying office will then assess liquidated damages based on the NSA calculation of the amount of liquidated damage that is based on scheduled completion date, the actual date and hour of completion as stated in the final invoice and the daily rate established in the job order for the computation of liquidated damages. If the ACO determines that delays in the completion of the vessel are excusable, a job order modification extending the date should be prepared. In the absence of this modification, the paying office will assess liquidated damages based on the stated completion date.

8.5.8 Departure Reports.

a. Per reference (e), the NSA is required to submit a Departure Report consisting of the following:

(1) Ship Departure Report, reference (e).

(2) Alteration Completion Report, reference (e).

b. The reports required by reference (e) apply to the NSA administering contracts for the performance of repairs and alterations to U.S. Navy ships and crafts for all CNO scheduled availabilities and any other availabilities of 3000 man-days or greater. These availabilities include complex overhauls, regular overhauls, selected restricted availabilities, conversions, inactivations, activations and phased maintenance

availabilities. Reference (e) is not applicable to new construction and normally will not be applicable to conversions. These reports would be applicable to conversions only when the authorization procedures used parallel those for regular overhauls of the same type of ship.

c. Departure Reports and Alteration Completion Reports are to be submitted within 60 calendar days after completion of the availability, unless separately negotiated with individual customers.

d. (Surface Ships Only) An Availability Completion Report (ACR) report is required by reference (i) and must be prepared by the assigned Project Manager. This report clarifies the reporting requirements contained in reference (e) for Surface Ship availabilities under the cognizance of the RMC.

8.5.9 End of Availability Certification. The NSA will certify to the NAVSEA Ships Program Manager the status of each logistic element with respect to its completed delivery and receipt onboard the ship. Copies of this certification must be provided to the TYCOM, Planning Yard and the ship. This form is due 30 days after the end of the availability.

8.5.10 Guarantee Engineer and Industrial Availability Quality Assessment Reports. Reference (f) defines the Guarantee Engineer as the manager for the correction of guarantee items on CNO-scheduled modernization or repair availabilities accomplished by naval and private shipyards. NAVSEA policy requires that a guarantee engineer be assigned to each ship completing a major modernization availability. This guarantee engineer will have the authority to establish the contractor's position on all discrepancies and to initiate immediate corrective action on those considered contractor-responsible. In addition, this instruction requires an Industrial Availability Quality Assessment Report for all CNO-scheduled availabilities. Following the completion of the guarantee period, the Guarantee Engineer Report will be submitted to NAVSEA following the flowchart provided with this instruction. The NSA will flag any discrepancies on the Guarantee Engineer Report with which the NSA disagrees. The Industrial Quality Assessment Report, a comprehensive appraisal of the availability and a narrative assessment of the Guarantee Engineer's Report will be provided, noting any disagreements or questionable data found. Both reports must be submitted within 30 days after completion of the guarantee period.

8.5.11 Integrated Logistic Support Requirements. Reference (j) states that all logistics required for the support of maintenance during the life of new ships or classes will be identified, and necessary resources will be programmed and budgeted, sufficiently in advance of ship deliveries to ensure that all required maintenance logistic support is in place on ship delivery and will be fully supported during the life cycle of the ship. Specific Integrated Logistic Support reporting is located throughout volume VI of this manual.

8.6 FINAL ACCEPTANCE.

8.6.1 Guarantee Period. The contractor is responsible for the correction or repair of defects in work performed by the contractor on the ship, if such defects are discovered within a period of 90 days after completion of the job order. The responsibilities of the NSA are specified by Clause 11, Guarantees, of the MSRA and Agreement for Boat Repair. This clause also provides that the starting date of the guarantee period for items which were incomplete at the time of completion of the job order is the date that work on that item is completed. For example, if a pump repair is only

75 percent complete at the time the availability is completed but this repair is finished 10 days afterwards, then the initial guarantee period for this pump repair is end of overhaul plus 10 days to end of overhaul plus 100 days. The NSA will maintain a record of the completion dates of such items to establish the guarantee period.

8.6.2 Correction of Defects. If defects in the work performed or material furnished by the contractor are found during the guarantee period, the NSA will, if practical, afford the contractor an opportunity to affect such corrections and repairs. When the condition, location or operating commitments of the vessel require immediate use of the defective equipment, or for any other reason returning the vessel to the contractor is impractical or undesirable, or when the contractor fails to proceed promptly with the repairs when directed by the contracting officer, such correction and repairs will be effected at the contractor's expense at another location which the Government will determine.

8.6.3 Availability Extensions. If additional time is required for correction of defects, the NSA must request from the TYCOM or RMC a Continuous Maintenance Availability. The ACO must obtain certification of completion from the Commanding Officer of the ship once the defect has been adequately corrected. In addition, if the corrective work is of sufficient scope and importance, the ACO may request the NSA nearest to the current location of the ship to act as the inspection officer and provide further certification after satisfactory completion of the work. When qualified private contractors are unavailable in a given area, the contractor may prefer to have a Naval Shipyard perform the work. In such cases, the NSA should contact the Naval Shipyard to determine whether it can accept the work and, if so, to make appropriate administrative arrangements with the shipyard and the TYCOM for performing the work. The contractor will then be required to deposit funds adequate to cover the performance of the work in advance. Excess funds will be returned to the contractor after completion of the work.

8.6.4 Notices to Contractor.

a. If returning the ship to the contractor is considered practical and feasible, the notice to the contractor will advise the contractor of:

   (1) The nature of the defects and deficiencies deemed to be the contractor's responsibility.

   (2) The reason why the contractor is responsible, including references to the applicable job order, specification work item and work item requirements.

   (3) The place and date the ship will be available for the contractor to inspect the defects and deficiencies involved and the arrangements made for the contractor's inspection.

b. If returning the ship to the contractor is considered impractical or undesirable, the notice to the contractor will advise the contractor of:

   (1) Nature of the defects and deficiencies deemed to be the contractor's responsibility.

   (2) Reason why the contractor is responsible, including references to the applicable job order, specification work item and work item requirements.

(3) Explanation why returning the ship to the contractor for repairs is impractical or undesirable.

(4) Place and date the ship will be available for the contractor's inspection of the defects and deficiencies involved and the arrangements made for the contractor's inspection.

8.6.5 Work Correction Under Another Naval Supervisory Authority. When permitting the contractor to repair the defect is not practical, the TYCOM or RMC should arrange for an additional availability of the ship under another NSA or at a Naval installation. The original NSA should provide the Authorization Letter and applicable Work Specifications to the other NSA or Naval Installation. The original NSA should be furnished a copy of the Departure Report after completion of the work describing the work performed and the costs incurred. The original NSA should ensure that no other repairs of a non-guarantee nature are included or, if such work were performed, that the repairs are charged to the TYCOM and not to the original contract. Once the costs for the corrective work have been determined, the NSA should advise the contractor of the costs and should obtain a check in the billed amount made out to the U.S. Treasurer. This check should be deposited at the proper Authorized Accounting Agency with the request that the amount be credited to the funds used originally to pay for the work.

APPENDIX A

WORK ITEM COMPLETION REPORT

From:	Senior NSA Representative		
To:	Contracting Officer,		
Subject:	DD-175 USS *Ready*, Completion Report		
Contractor:	Jones Corporation	Type Availability:	
Availability:		Work Started:	
Arrived:		Undocked:	
Dry-docked:		Departed:	

Item	Description	Percent Completed
099-00	GENERAL CRITERIA (NEW 3/73)	
099-02	CALIBRATION AND CERTIFICATION REQUIREMENTS (2/73)	
099-04	CHECK POINTS (2/73)	
099-06	ABRASIVE BLASTING	
099-09	PROCESS CONTROL PROCEDURE REQUIREMENTS (2/73)	
099-14	DOCUMENTATION (2/73)	
099-23	INTERFERENCE (2/73)	
099-50	GOVERNMENT PROPERTY (NEW 3/73)	
099-51	GANGWAYS/BROWS (NEW 3/73)	
099-52	KEY EVENT/REPORT SCHEDULE FOR SHIPS (NEW 3/73)	
099-62	PROCUREMENT OF PARTS (REV 10/73)	
099-63	INSTALLATION OF ELECTRICAL AND ELECTRONIC CABLES (NEW 3/73)	
099-64	PAINT WORK (NEW 6/73)	
099-65	POST REPAIR TRIALS	
099-66	TEMPORARY SERVICES	
099-67	TOWBOAT SERVICES	
099-68	GAS FREEING LOT I (APPLICABLE TO LOT I ONLY)	
099-68	GAS FREEING LOT III (APPLICABLE TO LOT III ONLY)	
099-70	PURCHASE ORDERS AND PURCHASE ORDER INDEX (NEW 8/73)	
099-72	INSPECTION SYSTEM REQUIREMENTS (NEW 8/73)	
999-01	DRYDOCKING AND UNDOCKING	

999-02 STATIC GROUNDING

999-03 UNDERWATER HULL INSPECTION

999-04 BOTTOM CLEANING AND PAINTING

999-05 WATER SLEEVES REPAIR

999-06 FATHOMETER TRANSDUCER REPLACEMENT

999-07 RUDDER REPAIRS

999-08 UNDERWATER LOG VALVE REPAIRS

999-09 DRAFT MARKS VERIFICATION (S/A 150K IN PART)

999-10 SEA VALVES REPAIR

999-11 PROPELLER REPAIRS

999-12 SHAFTING AND BEARINGS

999-8 CATHODIC PROTECTION, ANODES REPLACEMENT

8,000 lbs of Scrap sold by the contractor

I certify that the above percentage of completion is correct as of date shown, all Navy-owned Scrap has been accounted for, and all reports and test results as required have been received.

(k) NAVFAC Technical Publication DM-29 - Drydocking Facilities

9.1 SCOPE. Government property administration will be accomplished following specific contract requirements and references (a) through (e). This chapter provides additional guidance to be used in application of Government property administration. When terms of the contract conflict with other directives, the terms of the contract will generally govern.

9.2 REAL AND PERSONAL PROPERTY. Government Property includes all property, both real and personal, and generally falls into one of the following types of property:

a. Land.

b. Other Real Property.

c. Industrial Plant Equipment.

d. Other Plant Equipment.

e. Special Tooling.

f. Special Test Equipment.

g. Agency Peculiar or Military Property.

h. Material - Government Furnished Material (GFM) and Contractor Furnished or Provided Material (CFM).

9.2.1 Government Property Types. Definitions of types of Government Property are found in reference (a) and (b). The following paragraphs provide key additional information.

a. Government property consists of both Government Furnished Property (GFP) and contractor-acquired property. GFP is property that the Government has possession of

and provides to a contractor or directly acquires to provide to the contractor, including related data and information requested or furnished to the contractor that is reasonably required for the intended use of the property. The definition of GFP is especially important in the material area because of the requirement to report, as a separate line, the value of GFM on DD Form 1662 of references (b), subpart 505, and (c), subpart 505.

b. Contractor acquired property is property acquired or otherwise provided by the contractor for performing a contract and to which the Government has or takes title. When a contract is a cost type, all property purchased as a direct charge to the contract becomes Government-owned contractor-acquired property. Under fixed price and fixed price incentive contracts, all property purchased by the contractor which is spelled out as a line item in the contract or is a change order line item becomes Government-owned contractor-acquired property. A requirement exists to report the value of Contractor Acquired Material as a separate line on the DD Form 1662 of reference (b), subpart 505.

c. CFM is a term in common use in the property administration field that is not used in the Federal Acquisition Regulation or Defense Federal Acquisition Regulation Supplement. CFM is considered to be material provided by the contractor to which the Government has acquired a lien or title solely because of partial, advance or progress payments (usually a fixed price contract). The requirements of reference (a) do not apply. This definition allows the discussion of all types of material in the contractor's possession related to a fixed price contract, that is: GFM and Contractor Acquired Material, which are covered by reference (a) requirements and CFM, which is not covered under reference (a) requirements. Any other property to which the Government acquired title or lien solely because of partial, advance or progress payments can be considered contractor-furnished property to which the requirements of reference (a) do not apply.

9.2.2 Duties and Responsibilities for Contract Administration of Government Property.

9.2.2.1 Head of Regional Maintenance Center Contracts Department.

a. Select, appoint and terminate Property Administrators in writing to comply with references (e) and (b), subpart 7001.

b. Appoint the Plant Clearance Officer in writing with responsibilities as outlined in reference (b), subpart 70002. The Property Administrator may serve in this capacity.

c. Validate that Property Administrators and Plant Clearance Officers have completed and continue to satisfy the mandatory training course requirements for their certification level as required by reference (f), section 1724.

9.2.2.2 Regional Maintenance Center Property Administrator Duties and Responsibilities.

a. Administer Government Property per the guidance in references (a), (b), (c) and (e) and as outlined in the Government Property Clauses or specific contractual provisions (e.g., Insurance clauses and the Liens and Title Clause) of each contract ensuring that all types of government property are considered in property administration oversight.

b. Conduct annual property control surveys and validate that the contractor's approved Property Control Procedures comply with government requirements and contract clauses for the upcoming fiscal year.

c. Review each contract to determine the requirements and clauses in effect concerning GFM, Government Furnished Information, CFM, Special Tooling and Test Equipment, Rental of Property and Agency - Peculiar Property.

d. Verify that contract clauses exist which allows contractor access to the supply system for purchase of material for particular purposes such as "cash sales".

e. Oversee disposition of excess government property as prescribed in the contract or direct disposition when required. This includes submitting a quarterly report on DD Form 1638, Report of Disposition of Contractor Inventory.

f. Ensure the transfer of Government property between contracts when required.

g. Certify that contractors annually, as required by contract, enter data in the appropriate contract property information system or submit information to Assistant Secretary of the Navy (Research, Development and Acquisition).

h. With the Contracting Officer authorization, coordinate the repair or modification of Government Furnished Property when it has been received in a condition that is not suited for its intended use.

i. Administer all facility contracts and leases for which Regional Maintenance Center (RMC) has been designated contract administrator, either by specific letter, contract document or by Naval Sea Systems Command (NAVSEA) instruction.

j. When required, supervise the contractor's preparation and maintenance of property record cards for Class III property, maintaining individual equipment identification logos, ensuring that equipment is properly marked and identified and taking periodic inventories.

k. Ensure that contactors use facilities following lease agreements and in the event that the involved contractor is using the facilities for commercial work when such work is not authorized, immediately direct the contractor, in writing, to cease the unauthorized use.

l. Review and approve the contractor's program for the inspection, maintenance, repair, adjustment, protection and preservation of equipment under facilities contracts. Such reviews are conducted at the inception of a contract and at least annually thereafter, as long as the facilities remain in the contractor's possession.

m. Monitor rental payments for facility contracts, floating drydock leases and production equipment leases to ensure payment following the agreements and report pertinent information to NAVSEA as required.

n. For government-owned facilities, when required, verify that the contractor or lessee maintains the proper type of insurance in amounts acceptable to the Insurance Examiner of the Navy.

o. Provide the annual inspection of civil works.

p. Arrange for periodic inspections of fire protection measures at reserve plants under RMC's cognizance.

q. Maintain Shore Facilities Planning System documents for facilities under RMC's cognizance.

r. Administer the removal or transfer and disposal of facilities under RMC's cognizance.

9.2.2.3 Contractors.

a. Annually, as required by contract, enter data in the appropriate contract property information system or submit information to Assistant Secretary of the Navy (Research, Development and Acquisition).

b. Identify Government property when it is no longer needed to perform the contract, per reference (a), subpart 6, the terms and conditions of the contract, and report excess property to the Plant Clearance Officer.

c. Coordinate the disposal of all government property with the Plant Clearance Officer as directed by contract or in compliance with Contractor Inventory Redistribution System (CIRS) or other Navy plant clearance programs designated for the reutilization and disposal of excess material.

d. Coordinate the disposal of hazardous material and hazardous waste following the terms and conditions of the contract and in coordination with the Plant Clearance Officer and Environmental Coordinator.

9.3 PROVIDING GOVERNMENT PROPERTY TO CONTRACTORS.

9.3.1 Property. Under reference (a), subpart 102, contractors are ordinarily required to furnish all property necessary to perform Government contracts. If contractors are provided Government property, the Navy is required to ensure that the requirements of reference (a), subpart 102, concerning minimization of competitive advantage, use of Government property only as authorized, rental when appropriate, contractor responsibility and accountability, contractor justification for retention and reutilization of contractor inventory within the Government, are met.

9.3.2 Material.

a. Contractors ordinarily furnish all material for performing Government contracts. The Navy provides material to a contractor when necessary to achieve significant economy, standardization, expedited production or when otherwise in the Government's best interest per references (a) and (b). These directives also provide guidance for economic utilization of available Government-owned material as GFM (in lieu of CFM).

b. In repair and overhaul contracts, GFM is usually identified by the Planning Activity in the schedule of the contract or the specifications. In new construction contracts, GFM is usually identified in Schedule A of the contract, with Government Furnished Information identified in Schedule C. Outfitting material provided as GFM is usually identified (by the Naval Supply Weapon Systems Support (NAVSUP WSS) Mechanicsburg, PA) in the Consolidated Shipboard Allowance List, which is considered to be part of the contract.

c. During the performance of the contract, if the contractor has difficulty in obtaining CFM for contract use, the Government has three options:

(1) Issuing a supplemental agreement authorizing substitute material (with no degradation or increase in contract price and appropriate reduction in price if substitution results in lower overall cost to contractor).

(2) Authorizing the contractor to obtain the required CFM through the "cash sales" procedure following Naval Supply Systems Command guidance.

(3) Issuing a supplemental agreement converting the CFM to GFM with a decrease in contract price and release of any government responsibility for delay or disruption if subsequent material is not received in a timely manner. This method should only be used as a last resort.

(4) The Property Administrator should ensure that contractor's approved Property Control Procedures address special considerations when any of the three options are used.

d. "Cash Sales" Procedures.

(1) Naval Supply Systems Command Manuals contain procedures to permit contractor purchase from Navy sources, as well as providing direction to the Administrative Contracting Officer for developing local instructions on use of the cash sales method. The Property Administrator must ensure that the contractor has specific procedures to address requests for cash sales purchases, as well as procedures for receiving and tracking of cash sales material to ensure that all Navy policies and requirements for control, use and return (if required) of cash sales material are met. The Property Administrator will include a review of the contractor procedures during the annual or biennial contractor property control surveys. The Navy Supply System considers all purchases from the supply system that are not Government requisitions to be cash sales because of the method of payment used. NAVSEA refers to cash sales only for unique circumstances where the Government is providing assistance to the contractor to meet contract requirements without the administrative burden of contract modification. Other contract clauses exist which allow contractor access to the supply system for purchase of material for particular purposes. The Property Administrator must review the individual contract upon award to determine if such a clause has been included.

(2) RMC monitoring of contractor access to the supply system for purchase of material, excluding the Navy cash sales procedure, should be kept to a minimum. Involvement will vary depending on the type of contract. In all cases other than cash sales, the supply system is another vendor for the contractor. The material purchased by the contract will be covered by reference (a), subpart 5, requirements if purchased under a cost type contract or as a line item under a fixed price contract. If the material is purchased under a fixed price contract (and not defined as a line item purchase), reference (a), subpart 5, requirements do not apply. RMCs should still monitor contractor actions under fixed price contracts in order to ensure that no fraud, waste or

abuse is occurring. The property is CFM (if not a line item purchase) and Government oversight of that material is limited.

9.3.3 Special Tooling. Reference (a), subpart 306, gives direction for providing special tooling to contractors both existing special tooling and special tooling purchased by the contractor under cost-reimbursement contracts (Government acquires title) and fixed price contracts (Government may or may not acquire title). Special tooling requirements and clauses may vary between contracts. Therefore, the Property Administrator must review each contract carefully to determine the requirements and clauses in effect.

9.3.4 Special Test Equipment. Reference (a), subpart 307, addresses requirements for providing existing Government-owned special test equipment as well as requirements for acquiring special test equipment. It also references applicable Federal Acquisition Regulation clauses.

9.3.5 Agency-Peculiar Property. Reference (a), subpart 310, notes requirements for providing the contractor with agency-peculiar property (i.e., military property).

9.3.6 Facilities. Contractors are required to furnish all facilities required for performing Government contracts except as provided under reference (a), subpart 302. Reference (a), subpart 301, addresses the requirements for facilities contracts when the Government does provide facilities. Additional facilities determinations and approval guidance is provided in reference (b), subpart 302. Reference (c), subpart 302, gives specific Navy guidance on determinations and approval for providing facilities.

9.3.7 Industrial Plant Equipment. Reference (b), subpart 301, relates requirements for providing industrial plant equipment with an acquisition cost of $15,000 or more.

9.3.8 Automated Data Processing Equipment. Reference (b), subpart 302, provides guidance to Administrative Contracting Officers on processing acquisition of automatic data processing equipment to the Defense Information Systems Agency per reference (g).

9.4 CONTRACTOR USE AND RENTAL OF GOVERNMENT PROPERTY. Reference (a), subpart 4, prescribes policies and procedures for use and rental of Government production and research property. Generally, Government use is on a rent-free basis. Non-Government use is on a rental basis. RMCs administer very few contracts that allow rental of Government property for non-Government use. The value of those administered is very small. The Government Property Administrator must be aware of any rental clauses, since utilization rates for the property must consider Government and non-Government utilization.

9.5 ADMINISTRATION OF GOVERNMENT PROPERTY.

9.5.1 Regulation and Contractual Requirements. The primary contractual clauses affecting the administration of Government property are the Government Property clauses of reference (h), section 245.4. They may be used in solicitations and contracts when a fixed price, time-and-material or labor-hour contract is contemplated where the acquisition cost of all GFP is $100,000 or less.

9.5.1.1 Oversight of Contractor Operations. Reference (a), subpart 4, and its supplemental documents contain extensive and detailed administrative requirements regarding Government property. The most detailed guidance is provided in reference (e), chapter 5, which addresses special topics related to the property administration process that may be applicable to property administrators. The Property Administrator must ensure that all types of government property

are considered in property administration oversight. Property to which the Government has acquired a lien or title solely as a result of advance, progress or partial payments is not subject to the requirements of reference (a), subpart 5. There are special provisions related to the disposition of excess Government property related to fixed price incentive contracts that are not applicable for other types of fixed price contracts as explained in paragraph 9.5.3.5 of this chapter. The property administrator may be involved in review of contractor furnished material for fixed price contracts under other contracts requirements related to areas such as Material Management and Accounting Systems, but not under reference (a), subpart 5, requirements.

9.5.1.2 Liens and Title Clause. Specific contractual provisions that affect the administration of Government property (e.g., the Insurance clauses and the Liens and Title clause) are usually included in contracts. The Liens and Title clause in fixed price contracts does not affect the reference (a) guidance that property to which the Government acquires a lien or title solely as the result of advance, progress or partial payments is not subject to the requirements.

9.5.1.3 Transfer of Government Property Between Contracts. The Property Administrator must ensure that transfer of Government property between contracts is accomplished per reference (c). Excess Government property from one contract should be transferred for use on another contract where a need is identified, but must not be transferred to another contract where a need for the property is not identified.

9.5.1.4 Annual Property Administration Plan and Report. At the beginning of each fiscal year, each RMC must schedule analyses of the contractor's system for property administration to be conducted for all active contractors during the upcoming fiscal year.

9.5.1.5 Annual Reports. For contracts that require annual property reports, property administrators and contractors should enter data in the appropriate contract property information system no later than 15 November at http://web1.dcmde.dcma.mil/cpms/ or mail paper copies of the certified DD 1662s of reference (b), subpart 505 to:

Assistant Secretary of the Navy (Research, Development and Acquisition)
OASN (RDA)ACQ,
1000 Navy Pentagon BF992
Washington, DC 20350-1000

9.5.1.6 Additional Reports. Per reference (b), each RMC will submit a DD Form 1638 report to NAVSEA on a quarterly basis. Reports are required at NAVSEA by 15 October, 15 January, 15 April and 15 July. The Remarks Block of the form should be used to explain major increases or decreases in value of excess property reported, dispositioned, or both. Excess property reutilized on other Government jobs or contracts at the contractor facility should not be reported on the DD Form 1638.

9.5.2 Responsibilities and Duties. Whatever the organizational alignment, personnel designated as Government Property Administrators are primarily responsible for the administration of contractual provisions related to Government property.

9.5.2.1 Appointment and Duties of Property Administrators. The selection, appointment and termination of appointment of property administrators must be made in writing by the Head of the Contract Administration Office or designee. Reference (b), subpart 7001 addresses selection and appointment or termination requirements. Reference (e) addresses the duties and responsibilities of the Property Administrator.

9.5.2.2 Appointment and Duties of Plant Clearance Officers. The Plant Clearance Officer must be appointed in writing by the Head of the Contract Administration Office or designee. The Property Administrator may serve as the Plant Clearance Officer. Reference (g) delineates Plant Clearance Officer duties.

9.5.2.3 Training Requirements for Property Administrators and Plant Clearance Officers. Property Administrators and Plant Clearance Officers will satisfy the mandatory training course requirements for their certification level as required by reference (f), section 1724.

9.5.3 Plant Clearance.

9.5.3.1 Procedures. Per reference (a), subpart 6, contractors are to identify Government property when it is no longer needed to perform the contract. The Plant Clearance Officer should work with contractors to ensure excess Government property is disposed of in a timely manner by established time frames for reporting excess Government property with contractors.

9.5.3.2 Disposal Methods. References (a), subpart 6, and (b), subpart 6, address the plant clearance process and reference (b), subpart 608-70, stipulates the use of the CIRS. The Navy has established other plant clearance programs to expedite and increase reutilization and disposal of excess material that should be utilized prior to CIRS actions. New, ready-for-issue, standard stock-numbered material may be returned to the Navy supply system through the Material Turn In To Stores program. Non-standard, ready-for-issue material may be returned through the Material Returns Program for identification and reutilization screening. Other Navy programs that are appropriate for the particular type of excess material to be disposed may be utilized. Disposition of Automated Data Processing equipment, Industrial Plant Equipment and special test equipment should follow procedures in reference (b), subpart 6. CIRS may be utilized for disposal of excess material that cannot be handled by the Navy disposal program.

9.5.3.3 Disposing of Hazardous Material or Hazardous Waste. The distinction of hazardous material and hazardous waste is important, particularly regarding the disposal actions. Reference (i) provides the following definitions:

a. Hazardous Material (or hazardous substance): Any material, which because of its quantity, concentration or physical, chemical or infectious characteristics may pose a substantial hazard to human health or the environment when released or spilled.

b. Hazardous Waste: Any waste material, liquid, solid or gaseous, that because of quantity, concentration or physical or chemical characteristics may:

   (1) Cause or significantly contribute to an increase in mortality or to a serious and irreversible or reversible but incapacitating illness.

   (2) Pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed or otherwise managed. This excludes infectious and radioactive waste. If infectious or radioactive wastes are mixed with an EPA or state-regulated hazardous waste, then the hazardous constituents remain regulated as a hazardous waste. Hazardous waste does not include hazardous material with an expired shelf life unless designated as such by a Defense Reutilization Marketing Service.

Coordination between Plant Clearance Officer and the Environmental Coordinator is necessary to ensure that excess hazardous material and hazardous waste are properly identified for disposition actions following contract requirements and federal, state and local environmental regulations.

9.5.3.4 Disposal Actions Resulting From Engineering Changes. Under fixed price contracts, engineering changes may result in CFM being converted to Government property. If the contractor has already purchased material to perform a part of the contract covered by the fixed price, and that part is changed so that the contractor can no longer use the material, the engineering change will normally identify the material for purchase by the Government. The contractor should have a system to ensure that the material is identified to the Plant Clearance Officer as excess Government material. The Plant Clearance Officer then follows normal procedures to dispose to the material.

9.5.3.5 Disposal Provisions Under Different Types of Contracts.

a. The need of the Government for the excess material should be considered in determining title to excess material since there is a cost to the Government associated with disposal actions. Contractor needs for the excess material may also be considered in determining title, as well as "value" to be credited to the contract if the contractor retains the material. The value credited to the contract will vary depending on the needs of the Government and the needs of the contractor. The value of the material can be zero, depending on the material and circumstances associated with disposal actions.

b. Identifying excess Government property under firm-fixed-price and cost-reimbursable type contracts is straightforward.

    (1) Under firm-fixed-price contracts, all excess GFP and property paid for as a line of the contract (outside the firm-fixed-price) is considered to be Government property for the Government plant clearance actions (though the form of the Liens and Title clause must be followed in the plant clearance process).

    (2) In cost-reimbursable contracts, all excess GFP and excess contractor-acquired property accountable to the contract is considered Government property for plant clearance operations. Fixed price incentive contracts (with the fixed price Government property clause) require a more involved process to distinguish excess Government property (to be disposed through the plant clearance process) from excess contractor-owned property for contractor actions. The incentive portion of the contract creates a share line between the Government and the contractor. Other clauses in the contract may affect ownership of excess. Identification of ownership of residual contractor furnished material under the fixed price incentive contracts requires the coordination of the Property Administrator, Plant Clearance Officer and contracting officer, as well as NAVSEA 02, 00L and 04.

c. The contractor is required to provide a list of all residual material on the fixed price incentive contract to the Government.

    (1) If the Government takes title to the material, no further contract actions are required.

(2) If the Government does not take title to the material and the material is retained by the contractor, the contract must be credited for the value of the material (the value may be negotiated). The Government may take title to only part of the residual, with the remainder going to the contractor and the contract being credited for only the value of the material going to the contractor.

9.6 RESPONSIBILITIES OF THE CONTRACTOR. Specific contract requirements determine responsibilities of the contractor. However, reference (a), subpart 5, was developed to allow the Government to review an entire system of Contractor-Government property control. The Property Administrator must be aware of unique or additional contract provisions to ensure that the contractor adjusts their Government property control system to meet special requirements.

9.7 REPAIR OR MODIFICATION OF GOVERNMENT FURNISHED PROPERTY. When Government property is furnished to a contractor and is received in a condition not suited for its intended use, the contracting officer may, under the terms of the Government Property clause or other contract provision, direct the contractor to affect the necessary repair or modifications. Equitable adjustment in the contract price and other provisions may be necessary following procedures in the "Changes" clause or other provisions of the contract. Reference (h), section 245.2, provides procedures to allow effective and economic ordering and pricing of repair or modification of GFP.

9.8 FACILITIES AND LEASES.

9.8.1 General. The RMC is responsible for the field administration of all facility contracts and leases for which it has been designated contract administrator, either by specific letter, contract document or by NAVSEA instruction. The RMC may also be assigned responsibility for administering the National Security clause in instruments of sale of industrial facilities.

9.8.2 Property Accountability. The cognizant RMC has property accounting responsibility for facilities which exist regardless of whether the facilities are under NAVSEA contracts, leases or permits for which representatives of other offices are the contract administrators. The responsibility includes supervising the contractor's preparation and maintenance of property record cards for Class III property, maintaining individual equipment identification logos, ensuring that equipment is properly marked and identified and taking periodic inventories. These functions are performed following the requirements of the Navy Comptroller Manual.

9.8.3 Use of Facilities. Facilities contracts may limit the contractor's use of the facilities to specified NAVSEA contracts or to other specified work. In the event that the involved contractor is using the facilities for commercial work when such work is not authorized, RMC will immediately direct the contractor, in writing, to cease the unauthorized use. When the unauthorized use is in performance of another Government contract, the RMC will inform the contractor that it must seek proper contractual authorization for use. All instances of unauthorized use of facilities will be reported in detail to the cognizant facility's contracting officer.

9.8.4 Rental Payment. NAVSEA facilities contracts, floating drydock leases and production equipment leases provide for rental payments to the Government on various bases. Rental payments are made monthly, quarterly or annually. To ensure prompt payment, the cognizant RMC should obtain from the contractor either a copy of the letter transmitting the rental payment to the Agency as designated in the lease or rental agreement or other assurances of payment, as

necessary. When rental payments become 30 days overdue, the RMC should notify NAVSEA describing the circumstances. The RMC should also furnish NAVSEA with any other pertinent information it may have about the contractor's financial condition, so that NAVSEA may take appropriate action with regard to the delinquency. Any questions involving interpretation of the method of computing the amount of rental payments also should be referred to NAVSEA for clarification.

9.8.5 Insurance. When insurance of Government-owned facilities is required by the terms of the contract or lease, it is the RMCs' responsibility to see that the contractor or lessee carries the proper type of insurance in amounts acceptable to the Insurance Examiner of the Navy.

9.8.6 Need for Funds. The cost of normal maintenance and security for each facility must be borne by the contractor, lessee or occupant to the extent of its responsibility under the agreement. The cost of long term or Capital Maintenance may be funded by NAVSEA or through Contracting Officer approved use of lease revenue for Capital Maintenance projects with Not to Exceed ceilings. The RMC will monitor the contractor or lessee maintenance efforts and inform NAVSEA of problems, if any, and when approved maintenance has been completed. In addition, the RMC should continually study and make recommendations as to the means by which preservation of essential reserve production capacity at reserve plants can be maintained on a self-supporting basis whenever possible.

9.8.7 Maintenance Responsibility Under Facilities Use Agreements.

a. NAVSEA facilities contracts and leases generally require the contractor to protect, maintain, preserve and repair the facilities involved following sound industrial practices. Capital expenditures are not the contractor's responsibility and capital repairs at Government expense can generally be made only on the basis of specific authority and funding from the NAVSEA contracting officer.

b. The beginning of the non-use period should be considered as that point at which productive use for the Government has terminated. Termination for productive use for the Government generally comes with the delivery of the last ship or boat to the Government. Incidental use of transportation or other equipment in connection with the storage and disposal of surplus Government-owned material and equipment alone should not delay the beginning of the non-use period.

c. Prior to the time when maintenance expenses will become reimbursable by the Government under the contract, the contractor, in conjunction with the RMC, should prepare a maintenance and protection plan and budget, according to NAVSEA maintenance and protection standards. This plan and budget should then be forwarded to NAVSEA for approval. If the plan and budget are approved by NAVSEA, expenses incurred in performing the work are reimbursable under the facilities contract. The contractor should prepare and submit separate invoices for work performed following the approved plan and budget.

9.8.8 Inspection and Report of Machinery and Equipment Maintenance. The property administrator must review and approve the contractor's program for the inspection, maintenance, repair, adjustment, protection and preservation of equipment under facilities contracts. Such reviews are conducted at the inception of a contract and at least annually thereafter, as long as the facilities remain in the contractor's possession.

a. The property administrator's inspection and intervening spot checks should be sufficiently detailed to determine that the machinery and equipment are receiving the care that the contract and good industrial practice require. Maintenance practices must include lubrication of bearings and other moving parts, adjustments for wear of moving parts before deterioration of associated parts takes place and regular and proper cleaning. Any evidence of inadequate care, unsatisfactory performance or possible damage to machinery or equipment that is discovered by the property administrator should be fully investigated.

b. Maintenance inspection by the field office must include Navy machinery and equipment that is in storage or that is idle pending transfer. The removal of the machinery or equipment to storage or its contemplated transfer does not relieve the contractor of its maintenance responsibilities. The contractor is responsible for seeing that the property is properly handled and safeguarded against damage when it is moved into storage or prepared for transfer to a new location. Some time may elapse between the date on which machinery or equipment is reported idle and the date of its shipment to a new location. Prior to the removal of the machinery or equipment in such cases, the RMC should determine whether any damage, loss or deterioration that might alter the decision to transfer the property has occurred. If such a change has occurred, NAVSEA should be notified and confirmation or revision of the shipping order requested.

c. Immediately following each maintenance inspection or spot check, the RMC must notify the contractor by letter of any deficiencies that have been noted and direct it to take appropriate corrective action. Follow-up letters should be sent to the contractor as necessary to ensure that the deficiencies are corrected. Copies of all such letters must be sent to NAVSEA. Any damage, excessive wear or deterioration of machinery or equipment should be recorded on all copies of the property record card, with a statement of the corrective action taken to repair the damage. If a periodic inspection of a plant (other than an occasional or spot check) discloses no deficiencies in the care, maintenance or use of the Navy-owned machinery or equipment and if the RMC is fully satisfied that the contractor is fulfilling its contractual obligations in this respect, NAVSEA should be so informed by letter. Whenever a recommendation is made that maintenance should be accomplished, as a financial responsibility of NAVSEA, an estimate of the cost of making such repair should be included, along with an explanation of why the cost is considered NAVSEA's responsibility.

9.8.9 Inspection and Report of Maintenance of Civil Works.

a. The Naval Facilities Engineering Command Engineering Field Division provides technical services to the RMC in connection with the inspection and maintenance of civil works. Civil works include lands, structures and utilities owned by the Government that are operated by contractors, are in the possession of contractors or are held under the National Security clause. Transportation and weight handling equipment are also considered civil works for purposes of this inspection. It is the RMC's responsibility to see that civil works are inspected at least annually (unless this requirement has been specifically waived by NAVSEA).

b. Civil works inspections, conducted per reference (j), are made by a team composed of representatives of the RMC, the Facilities Engineering Office (FEO) and the contractor. If the plant is under the administrative control of the General Services Administration, a representative of that agency will also participate in the inspection. Any deficiencies noted in the civil works should be called to the attention of the contractor's representative during the inspection.

c. Following the inspection, the FEO submits a report of the deficiencies noted, with its recommendations for corrective action. This report is submitted to the RMC, with copies sent directly to NAVSEA by the FEO. The RMC, in turn, furnishes NAVSEA with its comment on the report and any special recommendations it may wish to make. The RMC also provides a copy of the report to the contractor and requests the contractor to submit a schedule of dates by which the recommended maintenance will be completed. With the assistance of the FEO the RMC then takes appropriate follow-up action to ensure that the work is, in fact, completed. If the RMC feels that the work is the responsibility of the Government rather than the contractor, NAVSEA should be so informed, with supporting reasons, contractor's estimate of cost and the FEO's comment as to the reasonableness of the estimate.

9.8.10 Inspection of Dry Docks. Periodic inspections of dry docks under facilities contracts or leases administered by the RMC must be made per reference (k).

9.8.11 Fire Protection Measures. The RMC is responsible for arranging for periodic inspections of the fire protection measures at the reserve plants under its cognizance. Inspections must be made annually unless NAVSEA specifically waives this requirement. A waiver should be requested only in exceptional circumstances.

9.8.12 Inspection and Report of Mobilization Readiness. NAVSEA is required to submit to the Secretary of Defense annual inspection reports with regard to each plant in the National and Departmental Reserve for which NAVSEA is responsible. These reports are prepared by RMC and must be submitted to NAVSEA no later than 15 August each year. The preparation of the report should be correlated with the report of the annual inspection of civil works.

9.8.13 Shore Facilities Planning System. Except where the requirement has been specifically waived, the RMC is responsible for maintaining the Shore Facilities Planning System documents for facilities under its cognizance.

9.8.14 Redistribution and Disposal. The RMC is responsible for administering the removal, transfer and disposal of facilities under its cognizance. In addition, idle production equipment in industrial reserve plants should be reported to NAVSEA for further reporting by NAVSEA to the Defense Industrial Plant Equipment Center. No facilities may be removed or transferred from a facilities project until authority to do so has been received from NAVSEA.

10.1 PURPOSE. This chapter outlines Navy policies and Regional Maintenance Center (RMC) responsibilities associated with the protection of the environment, the safety and health of government personnel and the safety of government property in private shipyards.

10.2 ENVIRONMENTAL PROTECTION.

10.2.1 Background.

a. Reference (a) describes the Navy's Environmental Protection (EP) Program and establishes Navy policy for conducting operations in an environmentally sound manner. The goals of this program are to comply with existing federal, state and local environmental laws and regulations, conserve natural resources, prevent pollution, clean up existing waste sites and facilitate the development and introduction of new technologies that will support these goals.

b. Federal facilities and personnel are responsible and liable for compliance within their areas of control. In addition, the Navy may be determined to be responsible for activities that occur in private shipyards associated with the construction, repair and modernization of Navy vessels.

10.2.2 General Policy. This section delineates policy guidance established by reference (a) for RMC implementation of the EP program. It contains a brief overview of inspections, liabilities, specific elements and limitations of the EP mission. Per the policy stated in reference (a), RMC personnel are to perform their duties in compliance with federal, state and local laws, as well as Navy regulations and directives. Navy EP regulations, unless contractually invoked for shipboard applications, do not apply to contractors. Additionally, RMCs performing their contract administration responsibilities will not directly assume an enforcement role with respect

to contractor EP program management, either by contract language or administrative or personnel actions, unless directed by higher authority.

10.2.3 Regional Maintenance Center Responsibilities.

10.2.3.1 Regional Maintenance Center Commanding Officers. RMC Commanding Officers are responsible for ensuring that the command mission is accomplished following applicable federal, state, local and Navy environmental protection laws and regulations. Specific EP program areas that should be addressed include, but are not limited to:

a. Establishment of an appropriate environmental management system and organization.

b. Reductions in internal hazardous materials usage.

c. Oversight of contractor and Ship's Force hazardous materials and hazardous waste management efforts.

d. Acquisition pollution prevention.

e. Environmental self-evaluations.

f. Management of government-furnished materials (including shelf-life management) for ship repair and modernization.

g. Collection and reporting of data for determination of contractor performance award fees (when applicable).

h. Collection and reporting of data for contractor past performance databases.

i. Interface with Ship's Force during availabilities to ensure compliance with applicable requirements.

j. Environmental issues related to management of inactive Fleet assets.

k. Performing generator duties with regard to Navy-generated hazardous wastes (where applicable).

l. Ensuring appropriate environmental controls are in place for new construction warranty work on homeported vessels.

10.2.3.2 Manager for Environmental Protection. The Manager for Environmental Protection (which may be combined with the Manager for Occupational Safety and Health) reports to the RMC Commanding Officer. Primary functions include:

a. Developing, implementing, managing and evaluating local policy and directives to address the requirements defined in this chapter.

b. Advising the RMC Commanding Officer on EP matters.

c. Serving as the single point of contact on EP issues.

d. Interfacing with contractor, regulator and other Navy personnel on EP issues.

e. Developing and providing training for personnel.

f. Submitting reports required by reference (a).

10.2.3.3 Environmental Self Evaluations. RMCs are required to conduct Environmental Self-Evaluations using the Naval Sea Systems Command (NAVSEA) 09S Safety and Environmental

Department. The RMC should add all applicable state and local regulatory requirements as specific attributes to ensure compliance with issues applicable to the individual RMC. RMCs must conduct Environmental Self-Evaluations annually unless they are exempted from this requirement by the responsible Naval Facilities Engineering Command Engineering Field Division and NAVSEA. The result of the Environmental Self-Evaluation is a report to the Commanding Officer (CO) that allows the command to evaluate its own environmental compliance posture and its overall environmental management.

10.2.4 Regional Maintenance Center Oversight Functions.

a. The RMC performs oversight, but not enforcement, of contractor EP programs. This oversight is limited to ensuring compliance with contractual requirements. The contractors are responsible for compliance with applicable federal, state and local environmental regulations in their facilities. Contractual deficiencies are to be brought to the contractor's attention for correction. Non-contractual deficiencies identified by RMC personnel will be informally reported to the contractor. The RMC will conduct more in-depth oversight in the event that significant or recurring deficiencies are identified, or in the event the contractor fails to take appropriate corrective action within a reasonable time frame. The RMC will report violations of federal, state or local laws and regulations identified in the contractor's facility to the appropriate regulators and the contractor should be notified whenever this action is taken.

b. Correction of EP deficiencies in contractor workplaces, whether at the contractor's facility or a Navy facility, is the contractor's responsibility. The RMC must employ the Corrective Action Request (CAR) per Chapter 11 of this volume to bring deficiencies to the attention of the contractor. These CARs must be titled "Environmental Deficiency Report" to differentiate them from other types of deficiencies reported in a CAR. CARs must also be considered as supporting documentation for evaluation of contractor performance for award fee determination, where applicable, and also as past performance data for consideration in award of future contracts.

c. RMCs must coordinate with other Navy commands, whether shore facilities or ship COs, when contracts administered require work on Navy property to ensure contractor compliance with applicable Navy facility requirements.

10.2.5 Hazardous Waste. RMCs must ensure that handling, storage, transportation and disposal of hazardous wastes from ships undergoing repair is per reference (b), and all Federal, State, and local regulations. Reference (c), section 223-3, and the Alternate I clause of that same paragraph, provide additional guidance on the management and disposal of hazardous waste. Different states have established specific procedures for issuing Environmental Protection Agency generator numbers and disposal procedures for hazardous waste generated at private and government facilities. Ship COs and hazardous waste coordinators must check with their local Manager for Environmental Protection to ensure that proper hazardous waste disposal procedures are used. The RMC must establish a Memorandum of Agreement with Ship's Force to define responsibilities for disposal of hazardous and infectious wastes generated by the ship. Ship's Force-generated wastes are not subject to regulation as hazardous wastes while the wastes are on board the ship.

10.3 OCCUPATIONAL SAFETY AND HEALTH.

10.3.1 Background. It is Navy policy to enhance operational readiness and mission accomplishment by establishing an aggressive and effective Occupational Safety and Health (OSH) Program. The goals are to reduce job-related injuries, material damages, and to maintain healthful working conditions. Occupational safety addresses control of hazards that can result in immediate injury or death. Occupational health is primarily concerned with the identification and minimization of exposure to hazardous chemical, biological and physical agents.

a. Section 19 of reference (d) and subsequent Presidential Executive Orders direct Federal Agencies to establish and maintain OSH programs. Reference (e), section 1910, contains the requirements for these programs.

b. The Navy Occupational Safety and Health (NAVOSH) Program is a major component of the Navy's overall mission. A comprehensive overview of NAVOSH is contained in reference (f), the Navy Occupational Safety and Health Manual.

10.3.2 Policy Guidance. Reference (f) establishes policy guidance for implementation of the NAVOSH program. It contains a brief overview of liabilities, specific elements and limitations of the OSH program.

10.3.3 Regional Maintenance Center Responsibilities.

a. RMC Commanding Officers are responsible for ensuring safe and healthful workplaces. Specific OSH program functions and responsibilities include, but are not limited to:

(1) Establishing an appropriate OSH management system and organization.

(2) Providing mishap prevention programs.

(3) Establishing hazard abatement programs.

(4) Providing OSH training.

(5) Conducting workplace inspections.

(6) Coordinating occupational health and industrial hygiene field support.

(7) Establishing OSH councils or committees.

(8) Establishing clear lines of authority to ensure all personnel are fully aware of their rights and responsibilities.

(9) Fostering hazard awareness in all personnel.

(10) Conducting contractor oversight.

(11) Collecting and reporting data for determination of contractor performance award fees.

(12) Collecting and reporting data for contractor past performance databases.

b. Manager for Occupational Safety and Health. The primary functions and responsibilities of the Manager for Occupational Safety and Health include:

(1) Developing, implementing, managing and evaluating local policy and directives to address the requirements cited in this chapter.

(2) Advising the Commanding Officer on OSH matters.

(3) Serving as the single point of contact on OSH issues.

(4) Interfacing with contractor, regulator and other Navy personnel on OSH issues.

(5) Developing and providing training for personnel.

(6) Providing timely and accurate submittal of reports required by reference (f).

10.3.4 Occupational Safety and Health Oversight Functions.

a. Navy Workplaces. Navy workplaces are defined as Navy-owned or Navy-leased facilities or those furnished by a contractor for Navy exclusive use. Navy workplaces should be inspected at least annually. Hazardous workplaces should be inspected more frequently as determined appropriate by the Manager for Occupational Safety and Health.

b. Contractor Workplaces. RMCs will not conduct inspections of facilities owned and occupied solely by contractors. The contractor is responsible for providing safe working conditions for their personnel, following regulations, in contractor production shops, shipways, dry-docks, etc., that are not occupied by Navy personnel. When a contractor is performing work on board a Navy ship, the ship space involved is a contractor workplace in which the RMC and the ship's CO have a NAVOSH responsibility for protection of government personnel and property. The RMC does not enforce Occupational Safety and Health Act requirements in contractor workplaces, but does conduct monitoring to ensure safe working conditions for government employees. The RMC monitors the contractor's efforts, especially aboard Navy ships under construction, overhaul and repair, to ensure safe working conditions in areas where government personnel are present. It also brings OSH deficiencies to the contractor's attention for correction.

c. Shared Workplaces. Certain workplaces, such as receiving areas for Government Furnished Equipment, are shared by both government and contractor personnel. As with contractor workplaces, the RMC monitors shared workplaces to ensure safe working conditions for government personnel and inform contractors of OSH deficiencies. RMCs may remove Government employees when a space is not compliant with Occupational Safety and Health Act, even if no imminent danger is present.

d. Deficiency Abatement. NAVOSH deficiencies identified in Navy-owned workplaces are to be abated by the RMC or another cognizant Naval command. Abatement of OSH deficiencies at contractor facilities is the contractor's responsibility. Safety and environmental deficiencies are brought to the contractor's attention through the use of a CAR per Chapter 11 of this volume. These CARs should be titled "Safety Deficiency Report" to differentiate them from other types of deficiencies reported in CARs. These CARs should also be considered as supporting documentation for evaluation of contractor performance for award fee determination, where applicable, and also as past performance data for consideration in award of future contracts.

e. Imminent Danger. In the event of imminent danger to personnel or property, work will be stopped immediately by the observing party (RMC, Ship's Force or contractor), and the RMC will immediately remove all government personnel from the site, notify responsible management and insist on immediate correction or termination of the operation.

f. Ship CO Coordination. RMCs should collaborate with the ship's CO in NAVOSH inspections relating to contractor work sites and operations. Unless otherwise specified by agreement, NAVOSH responsibilities do not extend to Ship's Force. Nevertheless, NAVOSH requirements are essentially the same for each party. The RMC should keep the CO and prospective CO informed of significant deficiencies that could adversely affect the ship or Ship's Force.

g. Gas-Free Engineering. Requirements for gas-free engineering by Navy personnel are addressed in reference (g). Gas-free operations accomplished by contractors are addressed in reference (h), Section 306.

10.3.5 Inspections.

a. The Navy Inspector General coordinates the inspection program of NAVOSH and conducts oversight inspections of Navy shore activities. Additionally, United States Fleet Forces Command, Pacific Fleet and NAVSEA will conduct periodic onsite Environmental, Safety and Health reviews of ship repair contracts and the controls exercised by the RMC to ensure compliance with contractor oversight responsibilities and reference (i), section 7311, requirements.

b. RMC and other government personnel should comply with contractor safety precautions as well as Occupational Safety and Health Act regulations while in the contractor's facility. Navy fire protection and NAVOSH requirements, unless contractually invoked for shipboard applications, do not apply to the contractor. RMCs should not directly assume an occupational health and safety enforcement role with respect to the contractor's safety program, either by contract language or by administrative or personnel actions. Both the RMC and contractor are responsible for providing safe and healthful working conditions for their respective employees.

LISTING OF APPENDICES.

A Corrective Action Request
B Letter of Delegation (Example Only)

11.1 PURPOSE. This chapter establishes the basic provisions for the Regional Maintenance Center (RMC) repair Contract Administration Quality Assurance Program (CAQAP) for hardware and technical data. This chapter includes provisions for tailoring the implementation of these programs to the particular need, based on contractual requirements. There are seven elements of the CAQAP that are designed to provide a systematic program for ensuring contractor compliance with contract requirements. These elements, which are based on the deliverable product and contractual requirements, are Planning, Document Review, Procedures Evaluation (PE), Product Verification Inspection (PVI), Quality Audits, Corrective Action and Quality Data Evaluation (QDE). The RMC will develop, apply and maintain an effective program for

performing Government Quality Assurance (QA) actions consistent with the CAQAP. The elements of the CAQAP will be described by operating procedures that provide RMC personnel with specific direction in applying these to the local contracting environment. This chapter also includes the QA oversight requirements set forth by reference (a). Data related to PE, PVI, Quality Audits, and Corrective Action elements should relate to each individual availability to support Contractor Performance Appraisal Reporting System.

11.1.1 Scope. This chapter establishes the CAQAP requirements for repair and overhaul contracts and applies to all nuclear and non-nuclear areas, except as otherwise indicated.

11.1.2 Applicability. This chapter is applicable to repair and overhaul contracts administered by RMC activities.

11.1.3 Quality Assurance Directives. Fleet instructions, directives and policy letters not included in this chapter containing mandatory QA requirements will be incorporated into each CAQAP. Naval Sea Systems Command (NAVSEA) instructions, directives and policy letters not included in this chapter containing mandatory QA requirements will be incorporated into each CAQAP as directed in writing by the Fleet.

11.1.4 NAVSEA Evaluations. NAVSEA will conduct product-oriented evaluations of contractors and associated RMC contract administration activities as considered necessary. The purpose of these evaluations is to determine contractor conformance to specification requirements and RMC contract administration conformance to QA functions and responsibilities.

11.2 PROGRAM DIRECTION AND CONTROL.

11.2.1 Contractor Responsibilities. The contractor carries out the obligations as set forth in the terms and conditions of the contract and in the applicable specifications. The contractor is responsible for controlling product quality, offering to the Government for acceptance only those supplies and services that conform to contract requirements and, when required, for maintaining and furnishing objective evidence of this conformance.

11.2.2 Government Responsibilities. Government will determine the type and extent of CAQAP actions required based upon the particular procurement. These actions will include as a minimum:

a. Inspection of the product or process.

b. Adequacy Reviews and Audits of the contractor's Quality Management System (QMS) or of any other means employed by the contractor to control quality and to comply with contract requirements.

c. Teaming with the contractor to establish and improve the QMS and associated processes.

d. Maintenance of Government records to include:

   (1) The number of observations or inspections made and the number and type of nonconformities detected.

   (2) Corrective Action Requests (CAR).

   (3) Records described in paragraph 11.2.4 of this chapter.

e. Final acceptance of product, when required.

11.2.2.1 Compliance. The Government determines if the contractor's performance of work complies with the requirements of the contract. The contractual documents must provide the authority to require the contractor to maintain a QMS adequate for the work. The contractor must provide and maintain a QMS acceptable to the Government "as specified in the contractual documents." To implement this, cognizant Government personnel will determine the effectiveness of the contractor's quality effort, as well as perform the product inspections necessary to ensure contractor's conformance to the specification.

11.2.2.2 Quality. Government personnel are responsible to ensure that the contractor resolves quality issues and improves quality processes. Government personnel will not serve as a replacement for the contractor's own QMS, nor will Government personnel be used by the contractor as a progressive inspection device to determine end product acceptability.

11.2.2.3 Verification. If the product is repetitively not ready for inspection after Government services have been requested or items accepted by the contractor are found to be nonconforming during Government inspection, the Government representative will notify the contractor that contractual requirements have not been met. In addition, the Government representative must discontinue verification actions and initiate corrective action identifying the specific nonconformities.

11.2.2.4 Evaluation. While evaluating the contractor's performance of work on a specific product, the Government representative must require the contractor only meet those requirements set forth in the contractual documents. The Government representative will not require higher quality work than that set forth in the specifications. Doing so provides the contractor with grounds for requesting an increase in price to cover the higher costs of performance. The Government representative must not accept lower quality work or work of a lesser scope than specified in the contractual documents. Work performed will only be accepted when the work conforms to the contractual documents and changes.

11.2.2.5 Preservation Oversight of Critical Coated Areas. The RMC is considered to be the third party inspector and must be responsible for providing a qualified coating inspector per reference (b). The RMC third party qualified inspector is responsible for ensuring compliance with the requirements of references (b) and (c) before signing acceptance or witness for all Hold points, including (G) points in NAVSEA Standard Items (NSI) during execution of the preservation process. The third party inspector may either perform the inspection or witness, by personal observation, a qualified contractor individual performing the required measurements. Hold points, including (G) points in NSIs (or key checkpoints) which the third party inspector must sign, are at a minimum, those items identified in reference (b), table 631-11-1 indicated by note 2. The RMC must also provide for the retention of required preservation records. Any out-of-specification condition found is to be mitigated per volume V, part I, chapter 8 of this manual.

11.2.3 Specification Review. Planning Activities, Executing Activities and contractors prepare and issue work specifications. Executing Activities will review these work specifications for adequate quality requirements and inclusion of all technical requirements. Modifications or sequences that are written to the original work specifications will also be reviewed for adequate quality and technical requirements. Specification review will include, as a minimum:

a. The location of (I), (V) and (G) points are consistent with the procedure referenced in chapter 4, Appendix E of this volume.

b. There is adequate, written description of the technical requirements.

c. Accept or reject criteria for inspections and tests is clearly stated and includes appropriate tolerances.

d. The use of references in work specifications should be avoided unless the material is too extensive to quote or paraphrase.

e. An (I), (V) and (G) point is not invoked in the work specification before a paragraph which references an NSI which invokes the same (I), (V) and (G) points.

Government will establish and maintain a feedback and corrective action process that formally reports specification problems and nonconformities to the preparing Government or contractor activity.

11.2.4 Retention and Disposal of Inspection Records. Quality inspection records (i.e., inspections, qualifications, training, assessments, evaluations, audits, CARs, PVI and critical coat paint preservation) and other quality assurance documents are part of the contract administration office contract file per reference (d) subpart 4, section 4.803. As such, these records must be retained for six years and three months after final contract payment for contracts exceeding the simplified acquisition threshold per reference (c) and reference (d), subpart 4, section 4.805 and . Per Defense Federal Acquisition Regulation Supplement, subpart 204.805, the records should be kept for 12 months following contract completion by the office responsible for maintaining them at which time the records may be sent to the local records holding area or to a Federal Records Center until they are eligible for disposal. These records may be destroyed at the completion of the retention period unless legal action is pending with contractors for which these records pertain. Specialty inspection records, such as SUBSAFE, nuclear, Level I, etc., should be retained as specified in volume V, part I, chapter 10, paragraph 10.2.2 of this manual.

11.3 PERSONNEL CAPABILITY REQUIREMENTS.

11.3.1 Quality Assurance Manager or Department Head.

a. Is responsible for determining needed personnel requirements, initiating action necessary to obtain the required personnel and providing training necessary to ensure the skills are available for the performance of QA functions.

b. Will ensure that the required skills are available to determine acceptability of products produced and services rendered by the contractor. Training must be provided to ensure personnel have the skills, techniques and knowledge necessary to comply with the requirements of this chapter. QA training opportunities must be extended to all appropriate personnel engaged in performing quality-related functions. A training plan or matrix will be established and maintained current.

11.3.2 Training.

a. Personnel providing in-process oversight of the contractors must complete introduction or overview training of CAQAP elements internally prepared by the QA Manager. Personnel performing contractor QMS Audits must receive both introduction or overview training of CAQAP elements internally prepared by the QA Manager and also introduction or overview of International Organization for

Standardization (ISO) 9001 training as a minimum and may be internally prepared by an experienced auditor.

b. Personnel performing quality audits of the contractor must satisfactorily complete ISO 9001 Internal Auditor training or equivalent (trained by a Lead Auditor) as a minimum. This training is optional if Lead Auditor training has been received.

c. Personnel assigned as Lead Auditor or Audit Team Leader must satisfactorily complete ISO 9001 Lead Auditor training as a minimum.

11.3.2.1 Coating Inspection. Specialized training and certification in Coating Inspection is required for each individual performing verification of contractor coating processes on critical surfaces. Training, certification and recertification must be accomplished through a NAVSEA approved course (e.g., National Association of Corrosion Engineers International Coating Inspector Program Level 1 or higher, NAVSEA Basic Paint Inspector or Society for Protective Coatings Protective Coating Inspector Program). Requirements for critical surfaces are defined in reference (b).

11.3.2.2 Oxygen Cleanliness. Specialized training and certification in Oxygen Cleanliness is required for each individual performing verification of contractor cleaning, assembly or packaging of certified oxygen clean systems and components. Training and certification must be administered by a NAVSEA approved Certified Oxygen Clean Instructor per reference (e). Recertification of personnel is required every three years.

11.3.2.3 Electrical Cableway. Personnel performing inspection or acceptance of electrical cableway work on Navy ships must be trained and qualified to reference (f).

11.3.3 Welding and Brazing Workmanship Training Requirements. Personnel performing oversight of contractor-performed welding or brazing workmanship must satisfactorily complete locally developed training in welding and brazing workmanship and associated in-process work practices per reference (g).

11.3.4 Nondestructive Test Personnel Requirements. Specialized training, experience and certification in the applicable Nondestructive Testing (NDT) method is required for each individual performing Procedure Review (PR), PE, PVI, Process Quality Audits (PQA) and actual accomplishment of the NDT method. Unless otherwise specified herein, NDT personnel must be qualified and certified per references (h) and (i), as applicable.

11.3.4.1 Training and Qualification. Training programs may be developed by the RMC or attained from Portsmouth Naval Shipyard, other Naval Activities, Navy technical schools, chapters of the American Society for Nondestructive Testing or from private industry. Work-time-experience required as a qualification prerequisite for NDT inspector candidates must be obtained by actual hands-on experience and performance of PR, PE, PVI and PQAs of a contractor's inspection functions in the applicable NDT method under the guidance of a certified Level II (Inspector) or Level III (Examiner). Formal classroom training and qualification testing must be per reference (h) or (i), as applicable. Work-time-experience may be considered sufficient when the inspector candidate's experience is such that the qualification requirements as defined in paragraph 11.3.4.1.a of this chapter are met. NDT qualifications are:

a. NDT Inspector: An individual qualified to set up and calibrate equipment and to interpret and evaluate results with respect to applicable codes, standards and

specifications. The Inspector must be thoroughly familiar with the scope and limitations of the methods for which the individual is qualified, exercise assigned responsibility for on-the-job training (i.e., WTE) and guidance of trainees and prepare written instructions, and document or report NDT results.

b. NDT Examiner: An NDT examiner will be capable of establishing techniques and procedures; interpreting codes, standards, specifications and procedures; and designing the particular test methods, techniques and procedures to be used. The NDT examiner will be responsible for the NDT operations for which qualified and to which assigned and will be capable of interpreting and evaluating results in terms of existing codes, standards and specifications. The NDT examiner will have sufficient practical background in applicable materials, fabrication and product technology to establish techniques and to assist in establishing acceptance criteria where none are otherwise available. The Examiner will have general familiarity with other appropriate NDT methods and will be qualified to train and examine Inspector personnel for certification.

NOTE: RMC ACTIVITIES REQUESTING EXAMINER CERTIFICATION MUST PROVIDE EVIDENCE TO THE CERTIFYING ACTIVITY AS TO THE NEED TO FUNCTION AT THIS LEVEL AND THAT FACILITIES AND EQUIPMENT ARE AVAILABLE.

11.3.4.2 Certification. RMC CAQAP Inspector must be certified or recertified at their activity under a program administered by NDT examiner certified per reference (j) which provides the NDT examiner qualification and certification requirements for all government-employed civilian and military personnel who are attached to Naval activities. NDT Inspector certification is restricted to the oversight of contractor performed NDT and not for product acceptance inspections. NDT Inspector personnel must recertify at the intervals specified in reference (h). Portsmouth Naval Shipyard is authorized to administer NDT Inspector (Level II) qualification examinations to CAQAP personnel in any of the following methods:

a. Visual Test.

b. Magnetic Particle Test.

c. Liquid Penetrant Test.

d. Radiographic Test (Structural, Castings and Piping).

e. Ultrasonic Test.

f. Eddy Current Test Inspection (Welds and Base Material).

11.3.4.3 Certification Maintenance. NDT Inspector personnel must maintain certification per reference (h) or (i) requirements, as applicable.

11.3.4.4 Inspector Oversight. The oversight and oversight periodicity of inspection personnel must be clearly described in the activity's Written Practice. If so employed, oversight must be conducted through a NAVSEA NDT Examiner. Otherwise, oversight of inspection personnel must be conducted through normal supervisory managed controls (e.g., supervisor performs deck oversight or by way of a supervisory managed peer review program) to ensure inspection personnel remain proficient and active in the performance of contractor oversight duties.

Inspectors failing to maintain proficiency must be disqualified. Requalification must be conducted as described herein. Records of inspector oversight must be maintained.

11.3.4.5 Nuclear Nondestructive Testing Qualifications. RMC personnel performing Nuclear NDT Examiner duties are to be certified or recertified as specified in reference (j). Nuclear NDT Inspectors are to be certified or recertified by the RMC activity's Nuclear Examiner per references (k) and (l).

11.3.5 Ship's Force Quality Assurance Interface. Although the RMC is the Contract Administration Activity and the authority for acceptance of accomplished work following the contractual agreement, the ships Commanding Officer should be satisfied that the work performed on the ship is satisfactory. The Commanding Officer should normally assign members of the Ship's Force to inspect work performed on the ship. If a ship's inspector is dissatisfied with the quality of the contractor's work on an individual item, the ship's inspector will not attempt to require contractor personnel to redo or otherwise amend the work performed. Rather, the ship's inspector will relay the findings to the cognizant RMC representative who will then take appropriate action. Ship's Force inspectors should also participate in conferences held to determine progress of work and to discuss any problems with quality of the work or services provided to the ship. In addition, Ship's Force personnel may be provided training or assigned QA functions under the responsibility of the RMC Contract Administration Activity following a Memorandum of Understanding negotiated between the Commanding Officer of the ship and the Commanding Officer of the RMC Contract Administration Activity. (Aircraft Carriers only) For any space which is tracked by Corrosion Control Information Management System, accomplish a joint inspection with the Supervisor and the Commanding Officer's designated representative (i.e., Ship's Force personnel or a Type Commander National Association of Corrosion Engineers Inspector) upon completion, inspection and acceptance, by the contractor, of the work within each compartment. This joint inspection is essential for the integrity of the Corrosion Control Information Management System database and future availability preservation planning.

11.4 SURVEYS AND CONFERENCES.

11.4.1 Bidders' Conference. A bidders' conference provides an opportunity for discussion of the contract quality requirements to ensure all bidders understand the extent and level of QA required.

11.4.2 Pre-Award Surveys. Prior to the award of a contract, the prospective contractor must be evaluated for quality organization, practices, procedures or quality history to determine capability for the type of work for which the contractor is being considered. The Contracting Officer and the Quality Manager will determine the method of evaluation. In addition, the scope of the pre-award survey will include a discussion of the contractual QA requirements to confirm the contractor's understanding of these requirements and how the contractor intends to implement the requirements. The QA participant in the pre-award survey is a member of the overall survey team headed by the team coordinator. When possible, the survey will be a joint team effort. When this is not possible, QA actions will be coordinated with the team coordinator. The QA report and recommendations are considered by the Pre-Award Survey Review Board in making the ultimate recommendation to the Procuring Contracting Officer who considers the recommendation in award of the contract.

11.4.3 Post-Award Conference. When it is determined after contract award that the contractor does not or may not have a clear understanding of the scope of the contract, the technical requirements or the rights and obligations of the parties, the Administrative Contracting Officer must initiate post-award orientation action to clarify contract requirements and resolve misunderstandings. A conference of all RMC participants should be held before conferring with the contractor to ensure that the RMC position on all matters is established.

11.4.4 Arrival Conference. An Arrival Conference must be held to discuss the conduct of the repair availability and the interface between Ship's Force, contractor, other Government activities and RMC personnel and the responsibilities and interface of each in performing quality related functions.

11.5 ELEMENTS OF THE CONTRACT ADMINISTRATION QUALITY ASSURANCE PROGRAM.

11.5.1 Planning. Planning the actions required to determine the contractor's compliance with the contract requirements will be systematic and consider the contractual requirements and relative importance of the product. This planning is to take into account all the factors involved in deciding how RMC personnel can most effectively and economically perform the CAQAP function. As a minimum, the planning for all products will include:

a. Appropriate distribution of Government effort between inspection of products and evaluation of the contractor's QMS.

b. Provisions for review of the contract package including specifications and related documents to determine completeness, continuity and responsibilities for ensuring contractor's performance of technical and quality requirements.

c. For each availability, the activities must have a specific quality oversight plan based on QDE evaluation to identify high-risk areas and provide direction for targeted PVI, PE or PQA.

d. For non-Chief of Naval Operations (CNO) maintenance, activities must have a general quality oversight plan based on QDE evaluation to identify high-risk areas and provide direction for targeted PVI, PE or PQA.

e. Provisions for PR or approval of contractor's written procedures and technical data to ensure adequacy and timely release of the procedures.

f. Provisions for PE of the contractor's written procedures to ensure the contractor accomplishes the intended purpose of controlling product or process quality.

g Provisions for the development of detailed PVI checklists and for the actual inspection or verification of products to determine conformance to the requirements of the contract.

h. Provisions for applying corrective action when a breakdown or other inadequacy is noted in the contractor's quality.

i. Provisions for the collection, evaluation and use of quality data.

j. Provisions for accomplishing quality audits.

k. Provisions for review of the contractor's quality history.

11.5.2 Document Review. Document Review is the CAQAP element for verifying that the contractor's documented procedures and technical data comply with contractual requirements.

11.5.2.1 Procedure Review Criteria. When a contractual requirement exists for a contractor to develop written procedures, the RMC will identify those procedures necessary for review based on the degree of risk. Each identified procedure will be reviewed for conformance to the administrative and technical requirements contained in the contract. The RMC representative must review the contractor's procedures in a timely manner and not delay the contractor's contract performance. This review may be accomplished in increments, is not limited to newly developed procedures and includes subsequent revisions and changes. When the contractor does not develop required written procedures or fails to correct inadequate procedures previously reported to the contractor, the RMC must initiate corrective action.

11.5.2.2 Technical Data Review Criteria. Data review and evaluation will be performed on all deliverable technical data. Review of technical data means the detailed examination or review with the application of engineering judgment by engineers or technicians to determine if the data content and format conform to contract requirements. The RMC may use any local means of selecting characteristics or attributes of this technical data.

11.5.2.3 Acceptance of the Contractor's Documented Quality Management System. The collection of documents describing the contractor's policy and methods of implementing the specific requirements of reference (m) constitutes the contractor's documented QMS. The RMC will conduct an adequacy review and furnish the contractor written notice of the acceptability of the documented QMS.

11.5.2.4 Approval of Procedures. Approval of the written quality procedures will be based on full compliance with the contract provisions. When these written procedures are contractually required, the contractor will be notified promptly on approval or disapproval.

11.5.2.5 Documentation. Documentation will include the identification number and title of the document(s), revision date, date reviewed, acceptability or unacceptability, the printed name and signature of the individual who accomplished the review.

11.5.3 Procedure Evaluation. PE is the CAQAP element that verifies that the contractor is compliant with contractually required quality procedures and that procedures are accomplishing the intended purpose of controlling product or process quality.

11.5.3.1 Conduct of Procedure Evaluation. PEs should be conducted utilizing the QA plan and NAVSEA standard attributes. Flexibility for adjustments in the frequency of inspections will depend on nonconformity rates and problem areas that develop based on contractor quality history.

11.5.3.2 Documentation. Documentation for PE will include:

a. Developed checklists or attribute system for PE.

b. PE or PQA results will include observations and nonconformities.

11.5.4 Product Verification Inspection. PVI (surveillance) is the CAQAP element that verifies that the product being produced by the contractor conforms to contract requirements. PVI is accomplished by the cognizant RMC representative by in-process inspections in the form of

physical examination, verification, testing, concurrent witnessing or monitoring of critical aspects of the repair or overhaul process. Provide results to the QA manager.

NOTE WHEN GOVERNMENT (G) NOTIFICATION POINTS ARE NOT PERFORMED OR WITNESSED, THE REASON WHY (E.G. CONFIDENCE IN THE CONTRACTOR'S INSPECTION, OVERTIME NOT AUTHORIZED, INADEQUATE MANPOWER, ETC.) MUST BE DOCUMENTED IN THE COMMENTS SECTION OF THE (G) POINT LOG.

11.5.4.1 Conduct of Product Verification Inspection. PVIs should be conducted utilizing the QA plan and NAVSEA standard attributes. These checklists or attribute lists must include Government (G) notification points, critical inspection points and those areas that may be concealed from further inspection. Flexibility for adjustments in the frequency of inspections will depend on nonconformity rates and problem areas that develop based on contractor quality history.

11.5.4.2 Documentation. Documentation for PVI will include:

a. The reason why Government (G) notification points were not performed or witnessed.

b. PVI results including observations or inspections and nonconformities.

11.5.5 Quality Audits. Quality audit is the CAQAP element that examines and evaluates products, procedures or processes, services, systems and elements thereof.

11.5.5.1 External Audit. External audits such as QMS audits (functional audit), and horizontal or vertical product quality audits are conducted to determine the effectiveness of the contractors QMS, analysis of the process and assessment of product conformance. The QMS audit may be conducted as a single audit or may be a combination of several audits. Targeted Process and Product Quality Audits must be scheduled at least once every 12 to 18 months for each contractor, provided a complete QMS audit is performed every five years. An audit of welding and NDT must be performed at least once every 12 to 18 months for each contractor. Attributes for the accomplishment of the QMS audit must be derived based on contractor performance and do not necessarily encompass the entire ISO checklist but will target specific areas. Process and product quality audits are encouraged for detailed root cause analysis. Process and product quality audits may be prompted by significant changes in the contractor's QMS, processes or product quality.

11.5.5.2 Internal Audit. Internal audits must be conducted to determine RMC contract oversight compliance by internal departments with quality related directives and operating procedures or processes. The RMC will schedule and conduct the following audits at least once every 12 to 18 months at a minimum:

a. Contract Administrative Quality Assurance Program (CAQAP).

(1) Planning.

(2) Documents Review or PR.

(3) PE.

(4) PVI.

(5) Quality Audits.

(6) Corrective Actions.

(7) QDE.

(8) Work Specification Review:

(a) Location of (I), (V) and (G) points is consistent with the procedure referenced in chapter 4, Appendix E of this volume.

(b) There is adequate, written description of the technical requirements.

(c) Accept or reject criteria for inspections and tests are clearly stated and include the appropriate tolerances.

(d) The use of references in work specifications should be avoided unless the material is too extensive to quote or paraphrase.

(e) An (I), (V) and (G) point is not invoked in the work specification before a paragraph which references an NSI which invokes the same (I), (V) and (G) points.

(9) Training:

(a) Personnel providing in-process oversight of the contractors must complete introduction or overview training of CAQAP elements.

(b) Personnel performing contractor Quality Management System Audits must receive both introduction or overview training of CAQAP elements and also introduction or overview of ISO 9001 training.

(c) Personnel performing quality audits of the contractor must satisfactorily complete ISO 9001 Internal Auditor or Lead Auditor training or equivalent.

(d) Personnel assigned as Lead Auditor or Audit Team Leader must satisfactorily complete ISO 9001 Lead Auditor training as a minimum.

b. Availability Quality Management Plans for CNO Availabilities and Continuous Maintenance Availabilities (CMAV) requiring certification, reference (n).

(1) Navy Maintenance Database (G)-Point Tracking - G-Point completion recording is current with work progression and consistent with the contractor's Test and Inspection Plan (TIP).

(2) Population of Contractor's TIP - Is consistent with the corresponding (I), (V) and (G)-Points required by the individual work items and the associated NSIs.

(3) Maintenance of Contractor's TIP - Work progression is up to date and completed tests and inspections are per NSI 009-04 and 009-67.

(4) Objective Quality Evidence documents are captured and complete.

c. Additional items for internal audit consideration. Reports for CNO or CMAV availability certification.

(1) Required Reports:

(a) Submission.

(b) Compliance to content dictated by the Work Specification.

(c) Appropriate RMC routing and technical parameter review via Engineering Support Request (ESR).

(d) Appropriate response with technical direction via ESR.

(e) Contractual incorporation into the work package of resultant technical direction.

(2) Condition Reports (growth):

(a) Appropriate RMC routing and technical parameter review via ESR.

(b) Appropriate response with technical direction via ESR.

(c) Contractual incorporation into the work package of resultant technical direction.

d. Additional items for internal audit consideration. Certification Process or Execution for CNO or CMAV availabilities.

(1) Undocking (if applicable).

(2) Production Completion Date.

(3) Combat Systems Production Completion Date (AEGIS Light-off for AEGIS Ships).

(4) Dock Trials.

(5) Fast Cruise.

(6) Sea Trials.

11.5.5.3 Process Quality Audit. PQA is the CAQAP element used for verifying the contractor's product or process complies with contractual requirements. The term PQA may be used for either a vertical or horizontal quality audit.

a. Vertical Quality Audit. Audit conducted on a particular product (e.g., a top to bottom audit of a fire pump overhaul). This audit is normally conducted by QA Specialist and may be assigned on the Quality Maintenance Plan or conducted on an as needed basis as a result of contractor performance issues.

b. Quality Audit. A horizontal audit conducted on a process (e.g., an audit conducted on blanking and tagging across the entire availability or contract). This audit is normally conducted by QA Specialist and may be assigned on the Quality Maintenance Plan or conducted on an as needed basis as a result of contractor performance issues.

11.5.5.4 Documentation. Documentation will include:

a. Audit schedule.

b. Identification of the Lead Auditor or Team Leader.

c. Audit reports including results or resolutions and follow-up actions.

11.5.6 Corrective Action. Corrective action is the CAQAP element that defines the methods for requesting the contractor to act to correct nonconformities. To the maximum practical extent, contractors should be encouraged to correct minor nonconformance's "on-the-spot" (during the current shift). For Surface Ship availabilities, government CAR issuance is not typically necessary for Method A non-conformances corrected "on-the spot" unless a history of repetitive issues of substantially identical nature exists. At a minimum, the unsatisfactory observation will be documented as a PVI surveillance per paragraph 11.5.5. To achieve assurance of compliance throughout all phases of the contractor's operation, for major, systemic, or critical non-conformances, the basic causes of nonconformities must be identified and the contractor must initiate prompt corrective action to correct assignable conditions that have resulted in generating nonconformities. The correction of the nonconformity alone does not satisfy this goal. Corrective action as described in this section employs the "closed loop" concept (i.e., appropriate measures must be taken to identify the cause and prevent the recurrence of nonconformities and the corrective and preventive measures must be accepted by the government). The contractor will be required not only to correct specific nonconformities but also to initiate preventive action to eliminate cause of nonconformities. RMC must determine the effectiveness of the contractor's action and will also determine the necessity for tighter control until ensured that the contractor's corrective action is satisfactory. In addition to the CAR, Appendix A, a Trouble Report must also be prepared and distributed per reference (o) for all significant problems encountered in the construction, repair and maintenance of Naval ships. Significant problems are those that affect ship safety, cause significant damage to the ship or its equipment, delay ship deployment or incur substantial cost increase or involve severe personnel injury. Trouble Reports should also identify systemic problems and issues that constitute significant lessons learned for other activities.

11.5.6.1 Corrective Action Request. When corrective action by the contractor is required, one of the following methods will be requested:

a. Minor Nonconformities (Method A)

(1) A minor nonconformity is a defect or flaw that will probably not impair the performance or life of a product or result in unsafe conditions for the user. Generally, a minor nonconformity is administrative in nature or can be corrected on the spot; the contractor can be reasonably expected to correct it within one-three days. Examples of minor nonconformities are non-docking related late reports, repeated housekeeping violations, potential safety discrepancies such as a hot work chit not posted on-site, minor repetitive administrative discrepancies with submittals of work specifications, Process Control Procedures, reports, etc., minor Objective Quality Evidence discrepancies and G-Points called out during normal working hours that are not ready for inspection at the designated time.

(2) Minor nonconformities must be presented to responsible contractor's personnel in writing for correction. Each minor nonconformity will be described in sufficient detail to allow the contractor to understand what contractual requirement is violated and to take appropriate corrective action. The RMC representative should not require contractor written response, however, the

internal RMC process must ensure that minor nonconformities are documented, corrected and date verified or cleared.

b. Major Nonconformities (Method B)

(1) A major nonconformity is a nonconformance that judgment and experience indicate could impair the performance or life of a product or result in hazardous or unsafe conditions for the user. Examples of major nonconformities are late dry-dock related reports, repeated Method A nonconformities in the same area, safety discrepancies that pose an immediate threat or danger, serious injuries to personnel, damage to government property or ship's systems that impact the product or performance, contractor's actions that result in the issuance of a trouble report and technical authority violations such as unauthorized substitution of materials or unauthorized changes to ship's systems.

(2) When major nonconformities are detected or a trend of recurring minor nonconformities are noted, a CAR will be initiated citing the specific contract, specification or contractor's procedural requirement and a description of the nonconformity, clearly indicating how the contract, specification or contractor's procedural requirement was violated. Additionally, the CAR must include contract number or job order, ship, appropriate references, originator's signature, unique serial number, contractor's corrective action response and preventive action(s) taken to eliminate the causes of potential nonconformities in order to prevent their occurrence and the RMC representative's indication of acceptability and signature. Appendix A provides an example of a CAR form that may be used. The CAR should be forwarded to the appropriate level of the contractor's management for action. The actual time frame for completion of contractor corrective action may vary. However, prompt response to CARs is required. An interim reply may be acceptable, pending contractor's completion of corrective actions.

c. Systemic or Critical Nonconformities (Method C or Method D)

When the previous methods fail to obtain satisfactory results or when the severity of the situation warrants, a Method C letter must be issued from the Quality Assurance Officer, Director, Manager or the appropriate department head notifying the contractor's appropriate level of management that a systemic or critical problem exists and immediate management action must be taken to comply with the provisions of the contract.

In addition, when a Method C letter fails to obtain satisfactory results or when the severity of the situation warrants, a Method D letter must be issued by the Commanding Officer or the Contracting Officer notifying the contractor's top level of management that a systemic or critical problem exists and immediate management action must be taken to comply with the provisions of the contract. An electronic or hard copy of each Method C or D letter must be furnished to the Contracting Officer.

11.5.6.2 Requesting Corrective Action. CARs will be used for requesting correction of quality-related nonconformities, elimination of the causes of the nonconformities and identification of

preventive actions to eliminate the causes of potential nonconformities in order to prevent their occurrence. The CAR may also be used to request correction of non-quality related nonconformities (e.g., safety, environmental or management), elimination of the causes of the nonconformities and identification of preventive actions to eliminate the causes of potential nonconformities in order to prevent their occurrence provided the CARs can be readily segregated.

11.5.6.3 Documentation. Documentation of the corrective action element will include:

a. Records of all Trouble Reports.

b. Records of all CARs.

c. Status of all CARs.

11.5.7 Quality Data Evaluation. QDE is the CAQAP element that provides for the collection, evaluation and use of contractor, RMC, NAVSEA Logistics Center and customer quality data. Operating procedures will be established to describe the system to be used for collecting, evaluating, maintaining and using the data. Quality data should include:

a. Trouble Reports.

b. Critiques.

c. PR, PE and PVI results.

d. Audit results.

e. CARs.

11.5.7.1 Data Evaluation. Evaluate the quality data individually or collectively at established periodic intervals for the purpose of:

a. Adjusting the intensity of application of basic elements of the CAQAP.

b. Providing a basis for acceptance or rejection of products or services.

c. Determining effectiveness of contractor's QMS.

d. Providing a basis for recommending process improvement initiatives to the contractor.

e. Providing a basis for decisions related to the reallocation of personnel.

f. Producing a metric for contractor quality history.

11.5.7.2 Documentation. Documentation will include a Quarterly Report indicating contractor QDE results and forwarded to codes 100, 200, 300 and 400.

11.6 GOVERNMENT CONTRACT QUALITY ASSURANCE ACTIONS AT SOURCE.

11.6.1 General. The prime contractor is responsible for controlling the quality of materials, items and services provided by its subcontractors. Government Contract Quality Assurance (GCQA) on subcontracted supplies or services must be performed only when required in the Government's interest. The primary purpose is to assist the RMC in determining if the prime contractor is ensuring the conformance of subcontracted supplies or services with contract requirements. GCQA at source, previously referred to as Government Source Inspection, does not relieve the prime contractor of any responsibilities of the contract and GCQA does not establish a contractual

relationship between the Government and the subcontractor. Requests for GCQA must be held to a minimum based on quality performance history.

11.6.2 Exception. This part does not apply to procurements under the technical responsibility of the Deputy Commander, Nuclear Power Directorate, NAVSEA 08. Reference (p) provides guidance for procurement of products under NAVSEA 08 cognizance.

11.6.3 Requesting Government Contract Quality Assurance at Source. RMCs will establish a process for invoking GCQA on subcontracted supplies and for preparation and issue of GCQA instructions to the Defense Contract Management Agency (DCMA) Contract Management Office. RMCs may elect to use prime contractor source inspection in lieu of those aspects normally requiring Government oversight provided the prime contractor performs each aspect of the inspection to be verified by the Government. When source inspection is used in lieu of GCQA the RMC must have alternative evaluation methods (e.g., process evaluation, audits, QDE, etc.) to ensure conformance of subcontracted products or services with contractual requirements.

11.6.3.1 Government Contract Quality Assurance Criteria. Government inspection during contract performance is essential. Complex items have quality characteristics, not wholly visible in the end item, for which contractual conformance must be established progressively through precise measurements, tests and controls applied during purchasing, manufacturing, performance, assembly and functional operation either as an individual item or in conjunction with other items. GCQA is to be invoked based on the following criteria in reference (a):

a. Mandatory GCQA actions imposed on the RMC that can be accomplished only at the subcontractor's location.

b. Performance at any other place would require uneconomical disassembly, destructive testing or special required instruments, gauges or facilities available only at the subcontractor location.

c. Performance at any other place would destroy or require the replacement of costly special packing and packaging.

d. Considerable loss would result from the manufacture and shipment of unacceptable supplies or from the delay in making necessary corrections.

e. Government inspection during contract performance is essential.

f. The contract specifies that certain quality assurance functions, which can be performed only at the subcontractor's plant, are to be performed by the Government.

g. A (G) POINT (see reference (m)) is invoked in purchase orders for inspections and tests to be performed which are outside a 50-mile radius of the contractor's plant nearest to place of performance of the contract.

h. It is determined for other reasons to be in the Government's interest. Supplies or services for which a certificate, records, reports or similar evidence of quality must be at the subcontractor location.

i. The item is to be shipped from the subcontractor's plant to the using activity and inspection at source is required.

11.6.3.2 Purchase Order Clause. When subcontract GCQA actions are determined to be necessary, the prime contractor will be requested to add the following Government notification and access clause to the purchase order:

> "Government inspection is required prior to shipment from your plant. Upon receipt of this order, promptly notify and furnish a copy to the Government representative who normally services your plant so that appropriate planning for Government inspection can be accomplished. In the event the Government representative or office cannot be located, our purchasing agent must be notified immediately."

11.6.3.3 Amending Subcontract After Release. When the decision to request GCQA actions at subcontract level is made after the subcontract is released, the contractor will be requested to amend the subcontract to include the appropriate requirement for GCQA action at source.

11.6.3.4 Delegation of GCQA to the Defense Contract Management Agency (DCMA). When a condition stated in paragraph 11.6.3.1 of this chapter exists, RMC's will request assistance via the DCMA website: www.pdrep.csd.disa.mil using "Quality Assurance Letters of Instruction & Letters of Delegation (QALI/LOD)" to "Create a New QALI/LOD." The use of PDREP eliminates the need to handle completed LOD documentation. All written statements, contract terms and conditions relating to GCQA actions at the subcontractor level must be worded so as not to:

a. Affect the contractual relationship between the prime contractor and the Government, or between the prime contractor and the subcontractor.

b. Establish a contractual relationship between the Government and the subcontractor.

c. Constitute a waiver of the Government's right to accept or reject the supplies or services.

11.6.3.5 RMC to RMC GCQA Request. When criteria of paragraph 11.6.3.1 of this chapter exist within a 50-mile radius of another RMC, a Letter of Delegation (Appendix B of this chapter) will be prepared.

11.6.3.6 Letter of Delegation Follow-up System. Maintain a follow-up system to track GCQA actions. When Delegation 1.0 is utilized, documented actions are maintained within the system and an automated email is generated upon submission, acceptance and completion of each delegation request. Additionally, a user may access the DCMA website for the status at any time. All OQE associated with the completion of the delegation request is maintained by the Prime Contractor and the DCMA representative. The DCMA representative will provide a copy of all OQE upon request. When processing Appendix B Letters of Delegation (LOD) between RMCs, SUPSHIPs, or Naval Shipyards, maintain a follow-up system to ensure the LOD was received, the receiving activity will perform the inspection as stated and documenting all GCQA actions have been completed.

CHAPTER 12

CONTRACTED SUBMARINE PRESERVATION SYSTEM REPAIRS

REFERENCES.

(a) NAVSEA Standard Item 009-32 - Cleaning and Painting Requirements Accomplishment
(b) NAVSEA T9081-AD-MMO-010 & 020 - URO MRC SSN 21 Class
(c) NAVSEA 0924-LP-064-8010 - URO MRC SSN 688 Class
(d) NAVSEA T0700-AA-PRO-010 - URO MRC SSBN/SSGN 726 Class
(e) NAVSEA T9081-AE-MMO-010 - URO MRC SSN 774 Class
(f) SMS 7650-081-091 - Submarine Hull Inspection and Repairs
(g) SMS 6310-081-015 - Submarine Preservation General Painting

12.1 PURPOSE. To ensure compliance with the Unrestricted Operations (URO) Maintenance Requirement Cards (MRC) Program when accomplishing contract preservation work on submarines. Reference (a) provides standard preservation requirements whereas references (b) through (g) provide submarine specific preservation requirements. This Chapter provides information for the Supervisor of Shipbuilding (SUPSHIP) contracting work on Submarine Preservation Systems to ensure that specific submarine URO MRC requirements are met.

12.2 SCOPE. This chapter provides requirements for Intermediate Maintenance Activities and Navy Contractors to be used in maintaining, repairing, and replacing preservation systems on non-nuclear components and spaces of U.S. Navy submarines. Technical questions regarding the structural URO MRCs or Submarine Preservation must be directed to Naval Sea Systems Command (NAVSEA) 05U7S.

12.3 APPLICABILITY. This chapter is applicable when contracting maintenance on preservation systems of all submarines in service.

NOTE: SUPERVISOR IS RESPONSIBLE TO ENSURE COMPLIANCE WITH ALL URO MRC PROGRAM REQUIREMENTS AND TO ENSURE THAT A URO MRC MEASURED PARAMETER IS NOT VIOLATED.

12.4 SUBMARINE PRESERVATION REQUIREMENTS FOR CONTRACTING. Submarine preservation work has additional requirements to ensure continued safe unrestricted operations until the next inspection. The URO MRC Program contains these requirements. URO MRC inspections and repairs must be accomplished per references (b) through (g). The URO MRC Program is invoked by the Submarine Class Maintenance Plans. Preservation system repairs are a URO MRC attribute and are to be accomplished per reference (g). It is the responsibility of the SUPSHIP to ensure that all URO MRC requirements are met when invoking reference (a) for contracts. Reference (a) has been updated to contain submarine specific painting requirements. However, SUPSHIP must review references (b) through (g) to ensure all submarine safety requirements are accomplished. This may involve requiring structural inspections, repair and reporting.

12.4.1 Structural Integrity. Maintaining the protective capability of the coating system applied to areas that are listed on the Equipment Guide List of the URO MRC inspection and monitoring program is critical to maintaining structural integrity during the periods between inspections. For this reason, complying with requirements for coating system application for all aspects of the preservation process is essential. Other systems that impact the URO MRC 003 program are Special Hull Treatment application process, including Mold-In-Place, maintenance of Impressed Current Cathodic Protection systems and anodes, and installation of various types of tiles (acoustic, damping, etc.).

12.4.2 Tanks. Preservation work in submarine tanks and enclosed spaces is usually scheduled to occur when the tanks are opened and entered to perform URO MRC 003 structural inspections. Any time a tank is entered, if the scheduled URO MRC 003 structural inspection is not being performed, a structural visual examination per reference (f) must be performed. There are specific qualifications for performing these inspections; requirements are contained in references (b) through (f).

12.4.3 Blasting. Any URO MRC 003 and URO MRC 002 item being blasted and painted must have the URO MRC 003 hull survey inspection and URO MRC 002 inspection performed prior to blasting and prior to repainting. When blasting and repainting an item, ensure that URO MRC structural repair sites are not contaminated with paint overspray until repairs have been completed. Upon completion of structural repairs, the affected areas will be abrasive blasted to SSPC-SP-10 prior to paint application unless otherwise specified.

12.5 REPORTING.

12.5.1 Existing Conditions. Report existing paint conditions and all preservation work performed as required by reference (g). This report and all preservation in-process Quality Assurance and Quality Control documentation are considered URO MRC Objective Quality Evidence. Submarine as-arrived coating inspection requirements are per reference (g) Attachment 7.

12.5.2 As Arrived Conditions. Report as-arrived coating inspections on Submarine Tanks, Voids, Free floods, Sail, Superstructure, and Interior Miscellaneous Inspection Worksheet, reference (g) Form 1, or Submarine Underwater Hull Inspection Worksheet (3.0 Form 2) electronically using the Preservation Feedback Tool (coordinated by SUBMEPP Code 1873) or a legible hard copy to SUPSHIP. Sample copies of preservation data forms and information on reporting requirements are provided in reference (g), Section 8. Preservation feedback must be submitted for validation using the Preservation Feedback Tool at the time the URO MRC report is due. This feedback is considered URO MRC 003 Objective Quality Evidence.

12.5.3 SSN 21 and SSN 774 Class Submarines. For SSN 21 and SSN 774 Class submarines, excessive use of mechanical tools (grinders, sanders, chippers, abrasive blasting, etc.) must be minimized to avoid metal loss due to lack of corrosion allowance. Overly aggressive blasting which causes metal thickness loss over the amount required for surface profile should be avoided. Any areas of potential metal loss by corrosion or mechanical means must be investigated per URO MRC 003. Mold-In-Place or Special Hull Treatment removal must be accomplished only by water jetting. Removal by mechanical means is not allowed.

12.6 SUBMARINE PRESERVATION WAIVERS AND DEVIATIONS.

12.6.1 Requirements. Submarine Preservation Waivers and Deviations must be per reference (g) section 9. URO MRC Program Waivers and Deviations requirements are:

a. Nonconformance requests that result in a change of the URO MRC inspection periodicity (not authorized by the URO MRC), a change in a URO MRC technical requirement, or deferral of required work during accomplishment of the URO MRC require NAVSEA approval. Local (Chief Engineer or Type Commander) approval is not authorized for these non-conformances.

b. To support operational commitments, Commander, Submarine Force Atlantic (COMSUBLANT) and Commander, Submarine Force Pacific (COMSUBPAC) may authorize temporary periodicity extensions (not already authorized by the URO MRC) after consultation with SEA 05U7S. The periodicity extensions should be limited to the next availability or in port period, where a Submarine Fleet Maintenance Activity is available, and must be documented by a Major Departure from Specification per volume V, part I, chapter 8 of this manual. The Departure from Specification must then be submitted to NAVSEA for approval.

12.6.2 Notification. The cognizant NAVSEA (SEA 05U7S) and Type Commander codes must be notified in writing within two days of any URO MRC related decision made by an inspection activity that will result in a change of periodicity, a change of technical requirements, or deferral of required work.

a. A copy of the notification must also be forwarded to SUBMEPP (Code 1832). Any subsequent waiver or deviation requests must be sent to NAVSEA for review and approval or disapproval.

b. An official signed copy of all NAVSEA approved waivers or deviations must be included with the Data Report Form when forwarding URO MRC inspection results to SUBMEPP and other addressees.

VOLUME VII

CHAPTER 13

SHIPBOARD CONTRACTING STRATEGY AND UTILIZATION

13.1 PURPOSE. This chapter provides guidance on contracting for shipboard maintenance and modernization work.

13.2 SCOPE. This chapter applies to all activities conducting shipboard maintenance or modernization work in Continental United States (CONUS) and Hawaii. Shipboard maintenance and modernization work includes repairs, modernization, installations, alterations or engineering technical services if there is a potential for system or boundary entry, testing or impact on other ship operations; or if there is a requirement for coordination and integration of multiple contractors and government activities.

13.3 APPLICABILITY. This chapter does not apply to:

a. The reactor or primary plant systems under the cognizance of Naval Sea Systems Command (NAVSEA) 08.

b. Fleet Ballistic Missile systems under the cognizance of Submarine Strategic Program.

c. Space Systems under the National Security Space Acquisition Policy.

d. Naval aircraft and avionics equipment.

13.4 OBJECTIVE. The objectives of the Comprehensive Contracting Strategy for shipboard maintenance and modernization are:

a. Alignment of contracting actions amongst Navy requirements officials and contracting and technical warrants.

b. Solicit contracts for shipboard work only via warranted Navy contracting officers, and ensure they include appropriate technical content.

c. Improve maintenance contracting “situational awareness”, thereby reducing unnecessary contract proliferation, redundant or niche contracts by identifying existing contracts that could service the need or identify national contracting strategies for similar services.

d. Coordinate and vector proposed contracting to the proper authorities for procurement, administration, task order management and oversight.

e. Ensure proper utilization and balance of Alteration Installation Team, Indefinite Delivery, Indefinite Quantity (IDIQ), and Private Sector Industrial Activity (PSIA) contracts to ensure the Navy has procurement options and leverage in the maintenance and modernization market place.

f. Proper execution oversight.

13.5 BACKGROUND. The Fleets, Deputy Assistant Secretary of the Navy (Ships), and Naval Sea Systems Command have embarked on a joint initiative to develop a Comprehensive Contracting Strategy for shipboard maintenance and modernization that compliments the Navy’s use of PSIA contract vehicles as the primary means for accomplishing shipboard work in the

private sector. This strategy is an effort to reduce the amount of coordination required during work execution on the waterfront and to reduce the inefficient use of available contracting resources in procurement and administration. This strategy emphasizes the four principles outlined in the following paragraphs.

13.5.1 Optimal Use of Surface Force Ship or Aircraft Carrier Private Sector Industrial Activity Contracts. The first strategy is the optimal use of Surface Force Ship or Aircraft Carrier PSIA contracts to accomplish as much maintenance and modernization work within their organic capability in order to gain learning curve efficiencies, facilitate predictable contractor loading, reduce premium prices paid and spread contractor overhead across a larger business volume.

13.5.2 Indefinite Delivery, Indefinite Quantity Contracts. The second strategy is the determination of the right types and numbers of IDIQ contracts required to supplement PSIA contracts so that viable options are available if PSIA contractors are unable to provide suitable coverage, encounter capacity constraints, cannot meet required schedule or exhibit unreasonably high costs.

13.5.3 Industrial Capabilities. The third strategy is the identification of industrial capabilities where the Navy will exclusively use IDIQ contracts to accomplish maintenance and modernization work beyond PSIA capability and develop procurement strategies that most efficiently meet such needs.

13.5.4 Contracts Portfolio. The final strategy is the cataloguing of these contracts in a "Portfolio of Shipboard Production Contracts" managed at the local Regional Maintenance Center (RMC). The local RMC must be the point of entry for servicing all shipboard maintenance and modernization production requirements, and must match (whenever possible) requirements to an existing Portfolio Contract.

13.6 OVERVIEW. The elements of the Comprehensive Contracting Strategy for shipboard maintenance and modernization include:

a. Breadth: any contracted shipboard work (maintenance, repair, modernization, or alteration) that requires system or boundary entry, testing or impact to routine shipboard system operations. Exceptions:

   (1) Non-permanent change installations (Temporary Alteration, Engineering Development Model and prototype installation).

   (2) Non-intrusive shipboard technical reviews (ship checks, design reviews, logistic reviews or audits, etc.).

b. Contract types: PSIA, Original Equipment Manufacturer, IDIQ or Commercial Industrial Services, Alteration Installation Team contracts, Performance Based Logistics repair contracts.

c. Contract access: The "Portfolio of Shipboard Production Contracts" maintained at RMCs to serve all organizations performing shipboard work.

d. Shipboard production work execution only with Portfolio Contracts.

e. Portfolio content managed through the Contracts Governance Council Process.

f. The Contracts Governance Council (CGC) is the standing body that manages the Contracts Portfolio and provides maintenance and modernization procurement oversight for the Fleet Maintenance Board of Directors (FMBoD). The CGC works to continuously improve this process and the Contracts Portfolio.

13.7 RESPONSIBILITIES.

13.7.1 Fleet Maintenance Board of Directors. The FMBoD must:

a. Charter the CGC and provide oversight to all processes associated with the Comprehensive Contracting Strategy for shipboard maintenance and modernization.

b. Render final approval or disapproval for any contractual actions unresolved by the CGC.

13.7.2 Contracts Governance Council. The CGC must implement the Comprehensive Contracting Strategy for shipboard maintenance and modernization by managing the approved Contracts Portfolio available for customers with shipboard work requirements.

13.7.3 Systems Commands and Program Executive Offices. The Systems Commands and Program Executive Offices must use contracts in the Contracts Portfolio (including PSIA) for any maintenance or modernization work that is performed on board ships or crafts, or if the work will require substantial integration with other executing activities.

13.7.4 Fleet Maintenance Activities. All CONUS and Hawaii maintenance activities must ensure all contracted shipboard maintenance and modernization work is done using a contract in the Contracts Portfolio (including PSIA).

13.8 CONTRACTS GOVERNANCE COUNCIL.

13.8.1 Structure. The CGC is a standing body co-chaired by Commander, Naval Regional Maintenance Center (CNRMC), NAVSEA 21 and NAVSEA 02. It is responsible for the continuous improvement of the Contracts Governance process and for providing strategic guidance for the Navy's overall ship maintenance and modernization contracting strategy.

13.8.2 Contracts Governance Council Process. The governance process encompasses shipboard maintenance and modernization contracts used on Fleet assets in CONUS and Hawaii (all customers and all locations). The focus of the CGC is non-nuclear work. Maintenance and modernization of nuclear propulsion systems and supporting sub-systems, as well as SUBSAFE systems and sub-systems, are not applicable under the CGC's cognizance.

13.8.3 Contracts Governance Council Membership. The CGC will consist of senior members representing the following government maintenance and modernization organizations:

a. CNRMC (Co-Chair)

b. NAVSEA 21 (Co-Chair)

c. NAVSEA 02 (Co-Chair)

d. NAVSEA 00L (Legal Counsel)

e. NAVSEA 02A, 02B, 21A, 024, PMS 400F, PMS 470, PMS 505

f. Naval Regional Maintenance Center (NRMC) Code 300 and Code 400

g. RMC Code 300 and Code 400

h. Additional members may include:

(1) Fleet Forces Command N43

(2) Commanders Pacific Fleet N43

(3) Other RMC personnel

(4) Submarine Force, Surface Force and Aircraft Carrier Type Commanders (N43)

(5) Warfare Centers

(6) Program Executive Offices

(7) Naval Information Warfare Command (NAVWAR) 04

(8) Naval Supply Fleet Logistics Center

13.8.4 Contracts Governance Council Policy. The CGC seeks to implement and support policy from the Assistant Secretary of the Navy Research, Development and Acquisition and this manual for Comprehensive Contracting and Depot Work Integration for ship maintenance and modernization contracting as:

a. Operate the CGC to oversee contracts that support, plan and execute shipboard maintenance, modernization and sustainment production work.

b. Manage the portfolio of approved shipboard contracts maintained by CNRMC.

c. Focus on RMCs to implement standard policy throughout the non-nuclear maintenance and modernization enterprise. This includes any repairs, modernization, installations or alterations where potential exists for systems or boundary entry, work control or tag-out procedures.

d. Discuss acquisition strategy and how future spirals of PSIA Contracts will be developed.

13.8.5 Contracts Governance Council Products. The CGC will provide:

a. Management of authorized contracts portfolio to optimize the number of contracts needed to complement PSIA contracts.

b. A quarterly summary report to CGC Membership. The RMCs must provide metrics to support the quarterly reports per the Basis for Measurement provided by the CGC.

c. Business rules for implementing CGC governance at the RMCs.

13.8.6 Contracts Governance Council Expectations. The CGC expects to impact cost and benefits in the following manner:

a. Increase standardization in the execution of contracts across all RMCs.

b. Optimize the number of contract vehicles required for shipboard work.

c. Improve waterfront work integration.

d. Increase discipline in the contracting process.

13.8.6.1 Contracts Governance Council Monthly Meetings. USFF N431 (Fleet Maintenance Acquisition Manager) will chair the monthly meetings of the CGC. The CGC will render one of three possible actions:

a. Option year renewal(s) of existing contracts.

b. Solicitation and award of new contracts.

c. Incorporation of existing contracts not yet in the Contracts Portfolio.

13.8.6.2 Contracts Governance Council Consideration. The CGC must approve or disapprove the request(s), or return the request to the requiring agent for clarification or alternate sourcing consideration.

13.8.6.3 Contracts Governance Council Decision. CGC approvals and disapprovals must be by unanimous decision. Any request for which a unanimous decision cannot be achieved will be referred to the "expanded" FMBoD for resolution. The Expanded FMBoD includes the permanent FMBoD members as well as a flag officer or senior executive of the requiring agent's organization. The Expanded FMBoD will resolve the request.

13.8.6.4 Meeting Administration. CNRMC Business Office will prepare the agenda for the CGC, coordinate all CGC actions, replies, and record the minutes of the meeting. USFF N431 will send a status report to the CNRMC's Business Officer informing him or her of the disposition of each request for CGC action within five days of the monthly CGC meeting.

13.8.6.5 Quarterly Briefing. USFF N431 will brief the FMBoD quarterly of actions taken by the CGC, and present any unresolved contract action requests for disposition by the FMBoD. The quarterly summary report to the FMBoD will include:

a. Any changes to the Contracts Portfolio.

b. Summary statistics on CGC actions.

c. Any changes made to the review process.

d. Any problems encountered.

e. Any recommendations for process improvement.
