7. Integrity of launchers or signal ejectors must be established by admitting sea pressure through equalizing lines or flooding connection and the muzzle valve or door operated before conducting operational tests. Shoot water slugs from specified launchers or signal ejectors, at depths specified by reference (a). Shoot pyrotechnics on initial dive and at test depth on deep dive only if work was accomplished on the launchers or signal ejectors or if an escort vessel is required for the trial.

8. Run full power submerged for at least two hours. Operate at minimum non-cavitating depth but not to exceed 400 feet, per reference (a); water depth is not limited for this event.

9. a. The required sequence of events is initial dive, deep dive, full power run submerged, back emergency, then high speed maneuverability and steep angle tests.

   b. Completion of full power runs, deep dives and EMBT blow tests are prerequisites for high speed maneuverability and steep angle tests. Initial high speed ship control tests, steep angle tests and exercises at major casualties must be conducted in water that does not exceed one and one-half times design test depth.

10. The submerged full power run with an ahead flank bell is to be terminated with a back emergency bell, consistent with current Main Propulsion Operating Limits (shaft torque is not a limiting factor in this test). The duration of the back emergency bell will be limited to 45 seconds, to be followed immediately by an appropriate ahead bell. The 45 second limit will:

    a. Standardize the crashback requirements throughout the submarine force.

    b. Provide a backing transient similar to that experienced in response to a stern plane jam.

    c. Be short enough that no ship will gather sternway.

11. At maximum safe speed, operate the rudder and planes through full throw in both directions, in all remote modes of operation.

12. If required, perform resistance measurement checks of communication antennas per volume IV, chapter 22, of this manual.

13. Shoot water slugs at a speed and depth defined by the Commanding Officer unless otherwise specified in the Sea Trial Agenda.

APPENDIX L

MINIMUM SEA TRIALS REQUIREMENTS FOR CHIEF OF NAVAL OPERATIONS AVAILABILITIES GREATER THAN SIX MONTHS DURATION

REFERENCES:

(a) COMSUBLANT/COMSUBPAC OPORD 2000
(b) NAVSEAINST C9094.2 - Submarine Valve Operation Requirements for Builders and Post Overhaul Sea Trial Test Dives

1. Sea Trial Agenda. This Appendix provides the minimum requirements following a major Depot availability of greater than six months duration. Due to unique ship configuration, work performed or operational area requirements, these events may be re-sequenced as they are integrated with the testing required to certify shipyard and Ship's Force work, and the additional events required by the Commanding Officer of the submarine. TYCOM approval and NAVSEA concurrence with these changes is obtained when NAVSEA concurs and the cognizant TYCOM approves the agenda.

2. Sea Trial Policy. The following applies to the conduct of trials and tests associated with ships following major industrial activity availabilities, NAVSEA or Naval Surface Warfare Center, Carderock Division sponsored Trials and Tests or any other situation where the ship is requested to conduct trials or tests:

a. No test or trial event must be conducted that requires crew intervention to avoid exceeding normal operating limits. Trial agendas will be based on the expectation that the ship will remain within the normal operating limits of the SOE and at angles less than 30 degrees.

b. The trial director(s) must be prepared to project whether the next event might exceed normal operating limits based on the empirical results of the previous event. A run that is predicted to exceed normal operating limits will be deleted along with the more demanding runs of that sequence.

c. Any run which will result in exceeding normal operating limits of the SOE or 30-degree angles but which is essential to provide adequate test data must be specifically approved by the TYCOM. The test or trial sponsor will obtain this permission.

d. A violation of the SOE limit or exceeding a 30-degree angle, not previously approved, will be reported by unit SITREP. The TYCOM will resolve the situation.

e. Specific written approval by the TYCOM is not required to operate outside the upper limits of the SOE (i.e., shouldow and fast) while conducting the following operations during Sea Trials or tests following an agenda approved by the ISIC, NAVSEA or higher authority:

(1) Conducting full power runs or cavitation curves.

(2) Conducting NAVSEA sponsored acoustic trials following Naval Surface Warfare Center, Carderock Division acoustic trial agenda.

(3) The 200-foot EMBT blow conducted at the conclusion of the initial tightness dive.

f. In cases where troubleshooting is required, it must meet the following criteria or a formally approved change to the agenda is mandatory.

(1) The troubleshooting does not violate any policy listed in paragraphs 2.a. through 2.e. of this Appendix or any other requirement of the trials agenda.

(2) The troubleshooting will not result in the ship being in a certain condition before that condition is reached during the normal testing sequence. For example, troubleshooting requiring the ship to be deeper than 200 feet cannot be done until after the deep dive. Likewise, troubleshooting requiring large angles or turn rates cannot be done until after the completion of the steering and diving operational tests and the large angle tests.

(3) The depth authorization for sea trials is automatically suspended upon re-entry to the SUBSAFE certification boundary or casualty affecting recoverability, salvage, watertight integrity or operation of the ship's control surfaces. The ship must not operate at a depth greater than 200 feet until re-entry is certified to the TYCOM and the TYCOM grants approval to operate (resume sea trials) to test depth.

(4) In the instance of SUBSAFE REC conducted only to adjust Flood Control hydraulic valve or hull closure timing (discovered during individual valve or hull closure cycling or during Flood Control System Operation), the ship is authorized to continue with Sea Trials without specific message correspondence from TYCOM and the most recent depth message is considered valid, provided that:

(a) The ship initiates a REC to correct the identified valve or hull closure timing deficiency and the ship operates no deeper than 200 feet while valve or hull closure timing adjustments are in progress.

(b) Valve or hull closure timing, as well as applicable flood control system timing, is verified to be within specification prior to resumption of the deep dive or proceeding to depths greater than 200 feet.

(c) The REC is closed and a report is made to TYCOM on material deficiencies and corrective actions taken related to Flood Control valve or hull closure timing adjustments prior to resumption of the deep dive or proceeding to depths greater than 200 feet.

g. Each person involved in Sea Trials will be allowed to obtain a minimum of six hours of continuous, uninterrupted sleep during any 24-hour period.

3. Test Phasing. The Sea Trials will be scheduled and phased to support actions en route to the test dive area, in the test dive area, prior to the deep dive, etc., subject to these amplifying notes:

a. The following tests and evolutions may be carried out at any time during Sea Trials.

(1) Test operation of freshwater production (distilling plants or reverse osmosis systems) noting deficiencies.

(2) Test operation of high pressure and low-pressure air compressors.

(3) Run and observe air conditioning plants throughout trials noting deficiencies. Operate air conditioning plant to demonstrate ability to carry the maximum existing ship's air conditioning load, or 100 percent capacity.

(4) Run and observe refrigeration plant throughout trials, noting deficiencies.

(5) Operate IFF and ESM equipment. If possible, use aircraft.

(6) Test all radio transmitters, receivers, and electronic equipment. Test on all possible antenna combinations including emergency antennas and emergency radio equipment.

(7) Fire control system operation. Check target designation system, alignment of sensors to benchmarks and transmissions to receivers. Compute fire control solutions on available contacts. Conduct transmission checks to tubes.

(8) Check operation of magazine flooding if not tested in industrial activity.

(9) Additional requirements may be imposed at the discretion of the CO.

b. The following tests and evolutions, summarized in Appendix M, must be carried out on the surface en route to the test dive area and prior to the initial tightness dive:

(1) Underway. Rig for dive.

(2) Ship's Force instruct Sea Trial riders on the proper use of Emergency Air Breathing system.

(3) At slow speed, conduct operational tests of rudder in all modes (local and remote) per applicable class operating procedures.

(4) Navigation system check. Take fixes by all means available and compare.

(5) Test underwater log(s) using the base course or reciprocal course method (i.e., inertial reference method) or other approved functional procedures to determine accuracy.

(6) Test accuracy of all bearing transmitters and indicators. Compare sonar, visual and radar bearings.

(7) Check operation of all radars. Determine accuracy by conducting simultaneous radar and visual plot.

(8) Inspect stern tube packing gland and seals and circulating water flow for excessive heating, leakage and audible noise.

(9) Test Dead Reckoning Analyzer Indicator (if installed) or Dead Reckoning Analyzer (if installed), Dead Reckoning Tracers (if installed) and Revolution Per Minute (RPM) indication.

(10) Test fathometer(s) and compare with charted soundings.

(11) Run ahead at maximum allowable surface shaft RPM long enough for temperatures to reach a stable value. After readings have stabilized, at maximum allowable surface shaft RPM, operate the rudder through full throw

in each direction, in all remote modes of operation. Time evolution and compare with design values. (See Note 1).

(12) Ahead, at maximum allowed surface shaft RPM, to back emergency. For SSBN and SSGN 726 Class only - Answer ahead standard. Once ship speed has stabilized, perform back emergency for 5 minutes. This event may be conducted after the submerged full power run.

(13) Run astern up to a back full bell for 10 minutes or to meet the intent of a more restrictive industrial activity test. Full power run astern to be within the main engine limits of the applicable Steam and Electric Plant Manual.

For SSBN and SSGN 726 Class only - Run astern up to a back full bell for 5 minutes, followed by 60 SRPM for 5 minutes. (See Note 3.)

(14) Check operation and accuracy of ship's gyrocompass.

(15) Rendezvous with escort. Conduct radio and sonar communications checks (See Note 4).

(16) Test all bottom side sonars.

(17) Rig out bow planes, if applicable. Test bow, fairwater and stern planes in all modes.

(18) Flood variable tanks to computed compensation less a safety factor.

(19) Perform resistance measurement checks on all antennas, as appropriate.

(20) Operate trim and drain pumps (See Note 5).

(21) Test variable ballast system for proper operation.

(22) Perform both a low-pressure blow and an EMBT blow for as long as necessary to verify system operability. A static blow must not be used to test the EMBT blow system. For SSN 23 only: Additionally, perform an MBT 6 normal blow from the BCP for a minimum duration of 2 seconds to verify that air flows into MBT 6 as indicated by a reduction in air bank pressure. For SSBN and SSGN 726 Class submarines only: Additionally, perform a high-pressure blow for as long as necessary to verify system operability.

(23) Operate the Emergency Propulsion Motor for 10 minutes.

(24) Surface ventilate ship.

(25) Check that initial EMBT Blow system actuating air pressure and air bank pressure is within +0 PSIG, -200 PSIG of nominal operating air pressure.

(26) Ensure all MBT blow systems are in a normal line up.

(27) Start atmosphere control equipment.

(28) Additional requirements may be imposed at the discretion of the CO.

c. The following tests and evolutions, summarized in Appendix M, must be carried out immediately prior to or during the initial tightness dive:

(1) Obtain navigational fix and take soundings. Maximum depth of water is 400 feet as specified in reference (a).

(2) Rig ship for Deep Submergence. Line up propulsion plant for maximum reliability. All systems must be in the maximum secure condition with unnecessary sea systems isolated (See Note 6).

(3) Station additional personnel throughout the ship to inspect for leaks.

(4) Transmit commencing initial tightness dive message. Submerge the ship per the Ship Systems Manual Operating Procedures. If desired to conduct periscope depth tests, the ship may be submerged to periscope depth.

(5) Check operation of ship control systems, including depth indication (See Note 7).

(6) Equalize signal ejectors or launchers. Shoot pyrotechnics from each by hand and impulse methods (See Note 8).

(7) Communicate with escort on RAC or WQC at each depth increment or at 10-minute intervals, whichever is sooner. If communications are lost, return to depth at which communications can be established before continuing (See Note 4).

(8) All hands inspect for leaks and report them.

(9) Inspect the discharge of all automatic drains in each EMBT Blow quadrant for sea water leakage prior to the first dive when the ballast tanks are flooded (e.g., at periscope depth).

(10) Operate all periscopes checking optics and leakage. Operate all masts.

(11) Test full throw of rudder and planes at slow speeds.

(12) Test operation of trim and drain system discharging to sea.

(13) If not at 150 feet for SSN 688 Class submarines (155 feet for SSN 774 Class submarines), (160 feet for SSBN and SSGN 726 Class and SSN 21 Class submarines), proceed to 150 feet for SSN 688 Class submarines (155 feet for SSN 774 Class submarines), (160 feet for SSBN and SSGN 726 Class and SSN 21 Class submarines) and obtain SAT 1/3 trim per the Ship's Operating Manual. Take readings as required to make a check of ballasting.

(14) At 150 feet for SSN 688 Class submarines (155 feet for SSN 774 Class submarines, 160 feet for SSBN Class and SSGN 726 Class submarines and SSN 21 Class submarines), verify operation of each BQN-13 Transmitter using the ship's own SONAR.

(15) Test all sonar equipment on each hydrophone. In addition, for SSBN and SSGN 726 Class submarines, test the Emergency Underwater Telephone (BQC) on each hydrophone.

(16) At 200 feet:

(a) Adjust trim (See Note 10).

(b) Inspect for leaks.

(c) Communicate with escort at each depth increment or at 10-minute intervals, whichever is sooner. If communications are lost, return to depth at which communications can be re-established before continuing (See Note 4).

(17) At 200 feet as specified in reference (b):

(a) Check accuracy of depth gauges and repeater (See Note 7).

(b) Equalize signal ejectors or launchers and conduct operational tests (See Note 8).

(c) Check shaft bearings and stern tubes for excessive heating, leakage and noise. Test one seal for 20 minutes and shift to the other seal. Test the second seal for 20 minutes or until the boat is ready to go to the next depth, whichever comes first.

(d) Cycle rudder and planes through full throw, at slow speeds, to check for binding (See Note 11).

(e) Operate all hull and back-up valves (using remote closures, as applicable, from flooding control stations) of seawater systems required to maintain propulsion and other functions vital to the ship's operation.

NOTE: REQUIRED SYSTEMS ARE LISTED IN PARAGRAPH 4.B. OF REFERENCE (B). OBSERVE RESTRICTION ON OPERATION OF SYSTEMS LISTED IN PARAGRAPH 4.D. OF REFERENCE (B).

(f) Check operation of bulkhead ventilation valves and watertight doors for binding (excluding lower escape hatches).

(g) Operate trim and drain pumps, discharging to sea.

(h) Cycle components of each torpedo tube. Check for leakage. Establish integrity of torpedo tubes by admitting sea pressure through equalizing lines or flooding connection before cycling components (See Note 2).

(i) Cycle main ballast tank vents hydraulically to check for binding.

(j) Equalize TDU with sea pressure through trim line, then cycle the muzzle valve.

(k) Where installed, demonstrate ability of sanitary pump to discharge overboard. If shouldow dive area is within a "No Discharge Zone", this event may be delayed until a subsequent dive when the ship is in an area that allows discharge.

(18) Conduct an EMBT blow from 200 feet keel depth. Check bank pressure before and after surfacing. Additionally, for SSN 23 only, perform a MBT 6 normal blow from the BCP until MBT 6A and 6B are blown to residual water levels. Surfacing with EMBT blow may be delayed to accommodate additional testing or transit as explained in Appendix M.

(19) Additional requirements may be imposed at the discretion of the CO.

d. The following tests and evolutions, summarized in Appendix M, must be carried out following the initial tightness dive and prior to the deep dive:

(1) Transmit initial tightness dive completion message. (See Note 18.)

(2) A minimum of six hours of Individual Ship Exercises submerged for crew training.

(3) Charge air banks and battery as necessary. The ship may be submerged while charging air banks provided the depth of the ship does not exceed other guidelines in this instruction or those of the flooding bill or ship's operating procedures.

(4) Detach escort after initial tightness dive. Escort will then proceed to station for deep dive. Ensure that deep dive rendezvous time and location are clearly established before escort is released. The escort may be retained for additional testing during the transit as described in Appendix M. Transit depth must not exceed depth as described in Appendix M.

(5) Additional requirements may be imposed at the discretion of the CO.

e. The following tests and evolutions, may be carried out following the initial tightness dive but are not required to be completed prior to the deep dive:

(1) Snorkel on each engine designed for snorkeling. (See Notes 9 and 12).

(2) Test the SPM.

(3) Check hovering system (See Note 9).

(4) Additional requirements may be imposed at the discretion of the CO.

f. The following tests and evolutions, summarized in Appendix M, must be carried out immediately prior to or during the deep dive:

(1) Check that initial EMBT Blow system actuating air pressure and air bank pressure is within +0 PSIG, -200 PSIG of nominal operating air pressure.

(2) Verify MBT system lined up for normal operation.

(3) Take soundings. Maximum water depth is given in reference (a). Accurately fix the ship's position within the specified dive area, per reference (a). Transmit commencing deep dive message.

(4) Proceed to normal submergence depth and obtain slow speed trim. Use conservative angles and speed.

(5) Trim ship to maintain neutral buoyancy (See Note 10).

(6) Rig ship for deep submergence. Line up propulsion plant for maximum reliability. All systems will be in the maximum secure condition with unnecessary sea systems isolated (See Note 6).

(7) Station additional personnel throughout the ship to inspect for leaks.

(8) At 400 feet and then in increments of 100 feet descending to one-half the maximum operating depth and every 100 feet or other lesser specified increments thereafter down to the maximum authorized operating depth:

(a) Adjust trim (See Note 10).

(b) Inspect for leaks.

(c) Communicate with escort at each depth increment or at 10-minute intervals, whichever is sooner. If communications are lost, return to depth at which communications can be re-established before continuing (See Note 4).

(9) At depths listed for hull valve cycling in reference (b) (as applicable), except maximum authorized operating depth:

(a) Check accuracy of depth gauges and repeater. (See Note 7).

(b) Equalize signal ejectors or launchers and conduct operational tests (See Note 8).

(c) Check shaft bearings and stern tubes for excessive heating, leakage and noise. Main shaft seals must be tested at each depth specified in reference (b), testing one seal for 20 minutes and shifting to the other seal. Test the second seal for 20 minutes or until the boat is ready to go to the next depth, whichever comes first.

(d) Cycle rudder and planes through full throw, at slow speeds, to check for binding (See Note 11).

(e) Operate all hull and back-up valves (using remote closures, as applicable, from flooding control stations) of seawater systems required to maintain propulsion and other functions vital to the ship's operation at increments of depth specified in reference (b).

NOTE: REQUIRED SYSTEMS ARE LISTED IN PARAGRAPH 4.B. OF REFERENCE (B). OBSERVE RESTRICTION ON OPERATION OF SYSTEMS LISTED IN PARAGRAPH 4.D. OF REFERENCE (B).

(f) Check operation of bulkhead ventilation valves and watertight doors for binding (excluding lower escape hatches).

(g) Operate trim and drain pumps, discharging to sea.

(h) Cycle components of each torpedo tube. Check for leakage. Establish integrity of torpedo tubes by admitting sea pressure through equalizing lines or flooding connection before cycling components (See Notes 2 and 9).

(i) Cycle main ballast tank vents to check for binding. Main ballast tank vents will be cycled hydraulically except at test depth where they will be cycled manually.

(j) Equalize TDU with sea pressure through trim line.

(k) Where installed, demonstrate ability of sanitary pump to discharge overboard.

NOTE: DURING SEA TRIALS DO NOT OPERATE TDUs WITH BALL VALVES BELOW 200 FEET OR TDUs WITH FLAPPER VALVES BELOW 150 FEET.

(10) At maximum authorized operating depth:

(a) Repeat item (9) (a) - Depth gauges and repeaters. (See Note 7).

(b) Equalize signal ejectors or launchers. Shoot pyrotechnics from each by hand and impulse methods, as applicable (See Note 8).

(c) Repeat item (9) (c) - Shafting and bearings.

(d) Repeat item (9) (e) - Cycle hull and back-up valves as specified in reference (b).

(e) Repeat item (9) (f) - Bulkhead ventilation valves and watertight doors.

(f) Repeat item (9) (g) - Trim and drain pumps.

(g) Repeat item (9) (h) - Torpedo tubes. (See Notes 2 and 9)

(h) Repeat item (9) (i) - Cycle main ballast tank vents, manually only, and check for binding.

(i) Repeat item (9) (j) - Equalize TDU with sea pressure through trim line.

(j) Repeat item (9) (k) - Sanitary pump.

(11) Prior to blow, visually inspect discharge of automatic drains in each EMBT quadrant for seawater leakage. Surface fully with EMBT blow from maximum authorized operating depth (not to exceed maximum depth permitted by the SOE at the initial speed required for the test). Check air bank pressures before and after blow. For SSN 23 only: Perform an MBT 6 normal blow from the BCP until MBTs 6A and 6B are blown to residual water levels.

(12) Additional requirements may be imposed at the discretion of the CO.

g. The following tests and evolutions must be carried out on the surface following the deep dive:

(1) Transmit completion of deep dive message. (See Note 18).

(2) Note condition of periscope optics.

(3) Measure resistance to ground of all external electrical cables (may be accomplished upon return to dockside port).

(4) Take radio antenna resistance measurement readings (as appropriate) immediately after surfacing, if there are UNSAT readings again in one-half hour, and compare with readings obtained in item 3.b.(19) of this appendix.

(5) Measure resistance across and to ground from each side of all sonar hydrophones, projectors, and transducers or run applicable sonar hydrophone and transducer fault localization test (See Notes 13 and 19).

(6) Measure rodmeter coil and button resistance and coil insulation resistance to ground.

(7) Open all lower hatches. Check the upper hatch seals, Logistics Escape Trunks or Logistics Plug Trunks inter-seals and penetrations for leakage. Open the sonar sphere access door, where applicable, and check sonar sphere for leakage.

h. The following tests and evolutions must be carried out submerged following the deep dive:

(1) Full power run (See Notes 14, 15 and 16).

(2) Emergency stop (See Notes 14 and 15).

(3) Steering and diving operation at full speed (See Notes 15 and 17).

(4) Steep angles - operate ship through several depth changes using large up and down angles to check operation of ship machinery (See Note 15).

(5) Time raising each periscope and mast at maximum depth and speed for which they are designed. Check training feature where applicable.

(6) Shoot water slugs from all torpedo tubes. The CS and CCS test program does not always fulfill this requirement (See Note 2).

(7) Run ahead at maximum speed allowed by SOE. Operate torpedo tube shutters and ejection pump shutters. If shutters do not open, gradually reduce speed until shutters open. This establishes "stall speed" for each shutter.

(8) Additional requirements may be imposed at the discretion of the CO.

4. Sea Trial Conclusion. At the conclusion of Sea Trials, and based on a review of Sea Trial deficiencies and TYCOM concurrence, the submarine may transit to a port other than the overhauling activity. During this transit the submarine must not operate at depths greater than one-half test depth plus fifty feet, unless specifically authorized by NAVSEA, and must not be released for unrestricted operations until all RECs are closed and final URO certification is received, per the Submarine Safety (SUBSAFE) Requirements Manual.

NOTES:

1. Temporary condensate strainers that cannot be monitored for differential pressure **must** be inspected and cleaned during sea trials following at least one hour of operation at between 45 and 55 percent reactor power, and prior to operation at higher power levels per reference (ad).

2. Fire water slugs from torpedo tubes at the depths and speeds required by the CS and CCS test program (or Combat Systems Assessment or Non-Propulsion Electronic System Operability, Verification and Evaluation, as applicable). If the CS and CCS test program does not fire water slugs, shoot water slugs at a speed and depth defined by the Commanding Officer.

3. For SSBN and SSGN 726 Class only - This surface evolution, full power run astern, must be conducted only if maintenance was accomplished on the reduction gears, the astern throttle(s) or the main shaft thrust bearing.

4. In the execution of any Sea Trial, whether escorted or not, submarine COs are reminded of their responsibility to communicate with escorts, shore authorities, or both, within prescribed, previously agreed upon, time limits to avoid initiation of inadvertent lost contact or submarine disaster procedures.

5. Pumps will be tested in the industrial activity, prior to Sea Trials, to determine that they can pump against a test depth head.

6. Reference (b) prescribes procedures for system operation during deep dive.

7. Compare all depth and pressure gauges. Depth and pressure gauges will be checked as soon as the next specified depth is reached.

8. Integrity of launchers or signal ejectors must be established by admitting sea pressure through equalizing lines or flooding connection and the muzzle valve or door operated before conducting operational tests. Shoot water slugs from specified launchers or signal ejectors, at depths specified by reference (b). Shoot pyrotechnics on initial dive and at test depth on deep dive. Shooting of pyrotechnics during the initial dive must be accomplished in conjunction with the 200-foot EMBT Blow. Shooting of pyrotechnics at test depth during the deep dive must be accomplished in conjunction with the test depth EMBT Blow.

9. If major structural modifications were accomplished, those seawater systems which are not required for normal safe operation of the ship at test depth, but which have been designed for and may be subjected to test depth pressure, will not be subjected to submergence pressure during the initial dive to any specified depth (e.g., blown sanitary tanks). If major structural modifications were not accomplished, those sea water systems which are not required for normal safe operation of the ship at test depth, but which have been designed for and may be subjected to test depth pressure, may be equalized and operated on the initial dive to test depth (See reference (b)).

10. Deep dive will be conducted using moderate speed and constantly adjusting trim, at depths indicated in paragraph 3.c.(15)(a) and 3.f.(8)(a) of this Appendix, to maintain neutral buoyancy. Moderate speed must be defined as that range of speed that allows the ship to recover from a loss of stern plane control or flooding casualty or as otherwise directed by NAVSEA.

11. Cycling of rudder and planes through full throw must be limited to 90% of test depth. For SSN 21 Class follow the specific Sea Trial Agenda.

12. Check operation of electrodes, head valve and each snorkel safety circuit.

13. The spherical array need not be done if an array purge or power into the array measurements are scheduled at a later date.

14. The submerged full power run with an ahead flank bell is to be terminated with a back emergency bell, consistent with current Main Propulsion Operating Limits (shaft torque is not a limiting factor in this test). The duration of the back emergency bell will be

limited to 45 seconds, to be followed immediately by an appropriate ahead bell. The 45-second limit will:

a. Standardize the crashback requirements throughout the submarine force.

b. Provide a backing transient similar to that experienced during a stern plane jam.

c. Be short enough that no ship will gather sternway.

15. a. The required sequence of events is initial dive, deep dive, full power run submerged, back emergency, then high speed maneuverability and steep angle tests.

b. Completion of full power runs, deep dives and EMBT blow tests are prerequisites for high-speed maneuverability and steep angle tests. Initial high-speed ship control tests, steep angle tests and exercises at major casualties must be conducted in water that does not exceed one and one-half times design test depth.

16. Run full power submerged for at least two hours. CO may schedule full power run for four hours if deemed necessary. Submarine depth during the submerged full power run will be per reference (a), based on the EMBT blow from maximum authorized operating depth being previously accomplished.

17. At maximum safe speed, operate the rudder and planes through full throw in both directions in all remote modes of operation. Time evolutions and check against design values.

18. Perform resistance measurement checks on communication antennas per volume IV, chapter 22, of this manual.

19. Electrical or fault localization testing of sonar sensors located above the waterline will be tested while the sonar sensor is submerged.

APPENDIX M

SUMMARY OF SIGNIFICANT POST REPAIR SEA TRIAL REQUIREMENTS

SEA TRIALS	TRANSIT TO	INITIAL TIGHTNESS DIVE	TRANSIT BETWEEN DIVES	DEEP DIVE	TRANSIT BACK
Policy Reference	Appendix H Paragraph 3.b.	Appendix H Paragraph 3.c.	Appendix H Paragraph 3.d.	Appendix H Paragraph 3.f.	Appendix H Paragraph 3.g.
Start Depth	Surface	Surface	Surface to 400 Ft	Surface to 400 Ft	Surface
Conduct Depth	Surface	Periscope depth or about 150 ft for SSN 688 Class (155 ft for SSN 774 Class), (160 ft SSN 21 and SSBN and SSGN 726 Class) if sea state dictates for trim. Remaining events of Appendix L, Paragraph 3.c. no deeper than 200 ft.	Surface to 400 Ft but not to exceed deepest depth previously escorted or valve cycling accomplished. Additional trials and testing permitted within the ISE, crew rest and other requirements of this instruction.	200 Ft increments to ½ max Op depth, then 100 ft increments to max Op depth per Appendix L, Paragraph 3.f.	½ Test depth plus 50 ft.
Maximum Keel Depth	Surface	200 Ft	400 Ft	Maximum Authorized Operating Depth.	½ Test depth plus 50 ft.
Finish Event	Rendezvous with escort.	Surface from 200 Ft with EMBT blow.*	Rendezvous with escort	Deep dive will be terminated with an EMBT blow from max authorized Op depth.	TYCOM issue URO authorization message.
Escort Required	No	Yes**	No	Yes	No
SRDRS Required	No***	Yes	No***	Yes	No
Water Depth	Surface	400 Ft per COMSUBLANT/ COMSUBPAC OPORD 2000	Unlimited.	Per COMSUBLANT/COM SUBPAC OPORD 2000	

* May be delayed to permit additional testing, commencing pre-transit valve cycling or transit submerged. However, first surface after initial tightness dive must be by EMBT blow from 200 feet and must be conducted prior to deep dive.

** An escort is required on the initial tightness dive and on subsequent first dives to any deeper depths, i.e., the first dive to any depth requires an escort. EMBT blow escort requirements given in paragraph 2.6.8.2.7.

*** SRDRS required during tightness dives. For ease of scheduling SRDRS modified alert time, SRDRS will be placed on modified alert from start of Sea Trial until completion of deep dive, including final EMBT blow from maximum operating depth, per paragraph 2.6.8.1.c or 2.6.8.2.7.b.

RMKS/1. CO'S SUMMARY, EVENTS 1-9 COMPLETED WITH THE FOLLOWING DEFICIENCIES NOTED:
A. SUBSAFE/URO/FBW-SCS/DSS-SOC DEFICIENCIES.
1) NON-ISOLABLE SEAWATER LEAKS
(A) #1 SCOPE HULL GLAND LEAK 1 DPM AT 20% TD
(B) SSW-30 (BODY-BONNET LEAK)
(C) DE-7 (STEM SEAL LEAK)
(D) RUDDER RAM
(E) EHP P46-3P
(F) TD-89 (FWD ESCAPE TRUNK DRAIN)
(G) #2 SCOPE INBOARD HOIST CYLINDER FITTING
(H) #1 SCOPE INBOARD HOIST CYLINDER FITTING
(I) STERN PLANES RAM PACKING
(J) STBD RETRACTABLE BOW PLANE EXTEND RETRACT CYLINDER
(K) AHP-525 (PARKER CHECK VALVE SEAT LEAK)
(L) SSW-20 UPSTREAM FLANGE
(M) EHP P025-01S (WHIP ANTENNA)
(N) INNER STERN PLANES RAM PACKING
2) ISOLABLE SEAWATER LEAK
(A) TDU VENT, TD-104 LEAKS 3 DPM AT 65% TD
(B) ASW-5 BODY-BONNET LEAK
OTHER DEFICIENCIES

(A) STERN PLANES AUX ANGLE INDICATOR ON BCP DOES NOT ILLUMINATE, URO-16
(B) MSW-2 CYCLE TIME SHUT IS 10.1 SEC
(C) MBT 3A WILL NOT OPEN
B. NON-SUBSAFE/URO/FBW-SCS/DSS-SOC DEFICIENCIES.
1) SCULLERY DRAIN LEAKING AT FITTING F-18, 27 DPM
2) 3 FLOOR TILES IN CREWS MESS LIFTED AFFECTING SANITATION
3) CO HOT WATER SHOWER RECIRC PUMP FAILED

2. PREVIOUS DEFICIENCIES REPORTED AND STATUS.
(LIST ALL PREVIOUS DEFICIENCIES AND CURRENT STATUS-THE GOAL IS TO CAPTURE THE COMPLETE MATERIAL CONDITION IN EACH MESSAGE) STATUS = REPAIRED (REP), CORRECTIVE ACTION REQUIRED (CAR), NOT APPLICABLE (NA).

EXAMPLE -

1) SCULLERY DRAIN LEAKING AT FITTING F-18, 27 DPM -REP
2) 3 FLOOR TILES IN CREWS MESS LIFTED AFFECTING SANITATION - CAR
3) CO HOT WATER SHOWER RECIRC PUMP FAILED - CAR
4) #1 SCOPE HULL GLAND LEAK 1 DPM AT 20% TD - CAR
5) TDU VENT, TD-104 LEAKS 3 DPM AT 65% TD - CAR
6) STERN PLANES AUX ANGLE INDICATOR ON BCP DOES NOT ILLUMINATE, URO-16 - REP
3. ADDITIONAL INFO.
1) DESCRIBE ANY ADDITIONAL INFO DESIRED OR LIST “NONE”.
4. TYCOM, NAVSHIPYD, AND NAVSEA REPS CONCUR-DO NOT CONCUR (AS APPROPRIATE).//

REF/A/DOC/<SUPERVISING AUTHORITY>/<DATE>//
REF/B/RMG/ COMSUB<RON/GRU NO.>/<DTG>//{APPENDIX BS}
REF/C/RMG/ USS <SHIP NAME>/<DTG>//{APPENDIX BR}
NARR/ REF A IS <SUPERVISING AUTHORITY> SUBSAFE CERTIFICATION CONTINUITY REPORT FOR <SHIP NAME/HULL NO.>. REF B IS COMSUB<RON/GRU NO.> REPORT OF MATERIAL CONDITION OF SHIP NOT WORKED BY THE SHIPYARD. REF C IS SHIP REPORT OF SATISFACTORY COMPLETION OF FAST CRUISE.
RMKS/1. REF A CERTIFIED THE SUBSAFE MATERIAL CONDITION OF THOSE PARTS OF USS <SHIP NAME/HULL NO.> INSTALLED, REPAIRED AND/OR TESTED BY THE SHIPYARD IS SATISFACTORY FOR SEA TRIALS TO TEST DEPTH.
2. REF B CONFIRMS THAT THE CERTIFICATION OF THE REMAINDER OF ITEMS WITHIN THE SUBSAFE CERTIFICATION BOUNDARY OF USS <SHIP NAME/HULL NO.> HAS BEEN SUSTAINED. ACCORDINGLY, THE STATUS OF THE SUBSAFE CERTIFICATION BOUNDARY OF USS <SHIP NAME/HULL NO.> IS SATISFACTORY FOR SEA TRIALS TO TEST DEPTH.
3. REF B AND C REPORTED COMPLETION OF FAST CRUISE AND READINESS TO PROCEED ON SEA TRIALS.
4. USS <SHIP NAME/HULL NO.> IS AUTHORIZED TO DIVE UNDER DELIBERATE AND CONTROLLED CONDITIONS TO <SPECIFIED DEPTH>.
NOTE: IF AN UNSATISFACTORY CONDITION OR SEAWATER LEAKAGE IN EXCESS OF THE SPECIFICATION IS FOUND DURING THE CONDUCT OF THE CONTROLLED DIVE TO TEST DEPTH, AT THE DISCRETION OF THE COMMANDING OFFICER THE SHIP MAY CONTINUE TO TEST DEPTH UNLESS THE COMMANDING OFFICER DETERMINES IT APPROPRIATE TO ABORT THE DIVE.
5. EXCEPT AS LISTED IN 6. BELOW, THIS DEPTH AUTHORIZATION IS AUTOMATICALLY SUSPENDED UPON RE-ENTRY TO THE SUBSAFE CERTIFICATION BOUNDARY OR CASUALTY AFFECTING RECOVERABILITY,

SALVAGE, WATERTIGHT INTEGRITY, OR OPERATION OF SHIP'S CONTROL SURFACES. THE SHIP MUST NOT OPERATE AT A DEPTH GREATER THAN 200 FEET UNTIL RE-ENTRY IS CERTIFIED. TYCOM APPROVAL IS REQUIRED PRIOR TO COMMENCING A SUBSEQUENT DEEP DIVE TO CERTIFY WORK ACCOMPLISHED TO CORRECT SUBSAFE DEFICIENCIES DISCOVERED DURING THE SEA TRIAL.
6. RE-ENTRY CONTROL TO ADJUST FLOOD CONTROL HYDRAULIC VALVE TIMING WILL BE CERTIFIED BY THE COMMANDING OFFICER. TYCOM CERTIFICATION IS NOT REQUIRED, AND A SITREP WILL BE TRANSMITTED PRIOR TO RESUMPTION OF OPERATION BELOW 200 FEET.
7. FOLLOWING COMPLETION OF THE SEA TRIALS AGENDA, THE SHIP IS RESTRICTED TO ONE HALF OF TEST DEPTH PLUS FIFTY FEET UNTIL RECEIPT OF AN UNRESTRICTED OPERATIONS MESSAGE FROM <TYPE COMMANDER>. THE MESSAGE WILL BE SENT FROM <TYPE COMMANDER> FOLLOWING REVIEW AND ACCEPTANCE OF SEA TRIALS DATA BY <SUPERVISING AUTHORITY>. THE MESSAGE IS SENT WITHIN 24 HOURS FOLLOWING SHIPYARD RECEIPT OF SEA TRIAL DATA.
8. ALL SEA TRIALS SITREPS ARE TO BE SENT USING IMMEDIATE PRECEDENCE.
9. FOLLOWING COMPLETION OF SEA TRIALS NO SUBSAFE, SCOPE OF CERTIFICATION, FLY-BY-WIRE OR ANY OTHER CONTROLLED WORK MAY BE PERFORMED ON ANY SHIPS SYSTEMS OR COMPONENTS WITHOUT CONCURRENCE FROM TYCOM N43 UNTIL URO CERTIFICATION IS RECEIVED BY THE SHIP.//

4. EXCEPT AS LISTED IN 5. BELOW, THIS DEPTH AUTHORIZATION IS AUTOMATICALLY SUSPENDED UPON RE-ENTRY TO THE SUBSAFE CERTIFICATION BOUNDARY OR CASUALTY AFFECTING RECOVERABILITY, SALVAGE, WATERTIGHT INTEGRITY, OR OPERATION OF SHIP'S CONTROL SURFACES. THE SHIP MUST NOT OPERATE AT A DEPTH GREATER THAN 200 FEET UNTIL RE-ENTRY IS CERTIFIED. TYCOM APPROVAL IS REQUIRED PRIOR TO COMMENCING A SUBSEQUENT DEEP DIVE TO CERTIFY WORK ACCOMPLISHED TO CORRECT SUBSAFE DEFICIENCIES DISCOVERED DURING THE SEA TRIAL.
5. RE-ENTRY CONTROL TO ADJUST FLOOD CONTROL HYDRAULIC VALVE TIMING WILL BE CERTIFIED BY THE COMMANDING OFFICER, TYCOM CERTIFICATION IS NOT REQUIRED, AND A SITREP WILL BE TRANSMITTED PRIOR TO RESUMPTION OF OPERATION.
6. FOLLOWING COMPLETION OF THE SEA TRIALS AGENDA, THE SHIP IS RESTRICTED TO ONE HALF OF TEST DEPTH PLUS FIFTY FEET UNTIL RECEIPT OF AN UNRESTRICTED OPERATIONS MESSAGE FROM <TYPE COMMANDER>. THE MESSAGE WILL BE SENT FROM <TYPE COMMANDER> FOLLOWING REVIEW AND ACCEPTANCE OF SEA TRIALS DATA BY <SUPERVISING AUTHORITY>. THE MESSAGE IS SENT WITHIN 24 HOURS FOLLOWING SHIPYARD RECEIPT OF SEA TRIAL DATA.
7. ALL SEA TRIALS SITREPS ARE TO BE SENT USING IMMEDIATE PRECEDENCE.//

NOTE 1: UPCOMING TRIALS WHICH ARE SUBJECT OF THIS CERTIFICATION (E.G., SECOND SEA TRIALS, ETC.).

NOTE: ENSURE MESSAGES ARE PER CURRENT MESSAGE FORMAT AND CURRENT PLAD IS UTILIZED.

NARR/ REF A IS COMUSFLTFORCOMINST 4790.3, JOINT FLEET MAINTENANCE MANUAL, VOLUME II.
RMKS/1. CO'S SUMMARY, EVENTS 1-9 COMPLETED WITH THE FOLLOWING DEFICIENCIES NOTED:
A. SUBSAFE/URO/FBW-SCS/DSS-SOC DEFICIENCIES.
1) NON-ISOLABLE SEAWATER LEAKS
(A) #1 SCOPE HULL GLAND LEAK 1 DPM AT 20% TD
(B) SSW-30 (BODY-BONNET LEAK)
(C) DE-7 (STEM SEAL LEAK)
(D) RUDDER RAM
(E) EHP P46-3P
(F) TD-89 (FWD ESCAPE TRUNK DRAIN)
(G) #2 SCOPE INBOARD HOIST CYLINDER FITTING
(H) #1 SCOPE INBOARD HOIST CYLINDER FITTING
(I) STERN PLANES RAM PACKING
(J) STBD RETRACTABLE BOW PLANE EXTEND RETRACT CYLINDER
(K) AHP-525 (PARKER CHECK VALVE SEAT LEAK)
(L) SSW-20 UPSTREAM FLANGE
(M) EHP P025-01S (WHIP ANTENNA)
(N) INNER STERN PLANES RAM PACKING
2) ISOLABLE SEAWATER LEAK
(A) TDU VENT, TD-104 LEAKS 3 DPM AT 65% TD.
(B) ASW-5 BODY-BONNET LEAK
OTHER DEFICIENCIES

(A) STERN PLANES AUX ANGLE INDICATOR ON BCP DOES NOT ILLUMINATE, URO-16
(B) MSW-2 CYCLE TIME SHUT IS 10.1 SEC
(C) MBT 3A WILL NOT OPEN
B. NON-SUBSAFE/URO/FBW-SCS/DSS-SOC DEFICIENCIES.
1) SCULLERY DRAIN LEAKING AT FITTING F-18, 27 DPM
2) 3 FLOOR TILES IN CREWS MESS LIFTED AFFECTING SANITATION
3) CO HOT WATER SHOWER RECIRC PUMP FAILED
2. PREVIOUS DEFICIENCIES REPORTED AND STATUS.
(LIST ALL PREVIOUS DEFICIENCIES AND CURRENT STATUS-THE GOAL IS TO CAPTURE THE COMPLETE MATERIAL CONDITION IN EACH MESSAGE) STATUS = REPAIRED (REP), CORRECTIVE ACTION REQUIRED (CAR), NOT APPLICABLE (NA)

EXAMPLE –
1) SCULLERY DRAIN LEAKING AT FITTING F-18, 27 DPM -REP
2) 3 FLOOR TILES IN CREWS MESS LIFTED AFFECTING SANITATION - CAR
3) CO HOT WATER SHOWER RECIRC PUMP FAILED - CAR
4) #1 SCOPE HULL GLAND LEAK 1 DPM AT 20% TD - CAR
5) TDU VENT, TD-104 LEAKS 3 DPM AT 65% TD - CAR
6) STERN PLANES AUX ANGLE INDICATOR ON BCP DOES NOT ILLUMINATE, URO-16 - REP
3. ADDITIONAL INFO.
1) DESCRIBE ANY ADDITIONAL INFO DESIRED OR LIST "NONE".
4. TYCOM, NAVSHIPYD, AND NAVSEA REPS CONCUR-DO NOT CONCUR (AS APPROPRIATE).//

3.1 PURPOSE. Provide guidance for the implementation of policies set forth in references (a) through (t) for Fleet Maintenance Availability planning, scheduling, and execution. Policy, procedures and guidance regarding utilization of Fleet Technical Assistance program resources are contained in volume VI, chapter 2 of this manual.

3.2 DEFINITIONS.

3.2.1 Fleet Maintenance Activity. All government waterfront ship maintenance and modernization, activities, e.g., Regional Maintenance Centers, Naval Ship Repair Facilities, Naval Submarine Support Facilities, Naval Intermediate Maintenance Facilities, TRIDENT Refit Facilities, Weapons Repair Facilities, Naval Shipyards, tenders and other activities of that type responsible for the processing, screening and brokering, and execution of work candidates.

3.2.2 Lead Maintenance Activity. The single activity responsible for integrating all maintenance and modernization on US Naval ships during any type availability. The Lead Maintenance Activity (LMA) is the activity responsible for planning and coordinating the work of the Executing Activities in Continuous Maintenance (CM). The LMA may also be an Executing Activity.

3.2.3 Executing Activity. The public or private enterprise that is assigned or awarded the responsibility for accomplishing the actual production work to effect repairs or modernization to ships.

3.2.4 Business Case Analysis. A critical evaluation of late identified work, new work or growth work, based on the benefit of completing the work, the cost of the work to be performed including premiums, available work capacity and material resources, the risk to other work and schedule impact.

3.2.5 Planning Board for Maintenance. The regularly scheduled meeting of the ship's Maintenance Team, as required by part III, chapter 5, of this volume and defined in volume VI, chapter 41, of this manual, to discuss ship wide maintenance issues. Chaired by the ship's Commanding Officer using an agenda prepared by the Ashore Ship's Maintenance Manager, this forum provides a review of current planned off-ship and organizational maintenance, Current Ship's Maintenance Project (CSMP) quality and accuracy, future maintenance and modernization planning, and fiscal concerns. The objective is to ensure clarity of intent for both the ship's efforts and the shore infrastructure with respect to total ship maintenance, operational schedules, and other concerns affecting ship material readiness. The Planning Board for Maintenance (PB4M) should be conducted at the beginning of the SSN Fleet Response Training Plan immediately following deployment stand down and updated with a follow-on PB4M prior to each Continuous Maintenance Availability (CMAV) to ensure the maintenance plan is on track. The PB4M will cover all planned and known corrective maintenance and should take into consideration ship's operations and maintenance facility loading during each planned maintenance period in the SSN Fleet Response Training Plan.

3.3 FLEET MAINTENANCE AVAILABILITIES. Fleet maintenance availabilities consist of the following:

3.3.1 Ship's Force Upkeep. A Ship's Force Upkeep is a scheduled period in which the ship is principally engaged in self-maintenance.

3.3.2 Scheduled Continuous Maintenance Availability. A CMAV is a scheduled availability normally 2 to 6 weeks in duration and normally scheduled once per non-deployed quarter during a period when the ship will be in port.

NOTE: MAINTENANCE MODERNIZATION AVAILABILITIES MAY BE 2 TO 6 MONTHS LONG. THESE AVAILABILITIES CAN BE MANAGED SEPARATE FROM THE REQUIRED MAINTENANCE AVAILABILITIES OR INCORPORATED IN THE REQUIRED MAINTENANCE PERIODS AT THE DISCRETION OF THE PB4M AND ISIC. MODERNIZATION AVAILABILITIES WILL INCLUDE KEY EVENTS AND CERTIFICATION MILESTONES PRIOR TO AT-SEA OPERATIONS AND MAY REQUIRE SEA TRIALS AS APPROVED BY THE PB4M AND ISIC PER THIS CHAPTER.

a. The Scheduled Continuous Availability requirement is mandatory. It cannot be deferred, deleted or shortened without formal written Type Commander (TYCOM) (N43) concurrence. Appendix A contains a sample message to TYCOM from Immediate Superior in Command (ISIC) that will be used requesting concurrence to defer, delete or shorten a scheduled CMAV.

(1) For SSNs one regular CMAV every 3 to 4 months, of which a minimum of 21-days are dedicated to production work. SSN maintenance availabilities required to support the Fleet Response Plan will be scheduled per reference (a). SSN CMAV milestones are outlined in Appendix B_1.

(2) For SSGNs the maintenance schedule for a 20-24 month operations cycle will be scheduled per reference (a) to include three to five forward deployed 21-day CMAVs. SSGN CMAV milestones are outlined in Appendix B_1.

(3) For SSBNs, one 35-day CMAV will be conducted per patrol cycle. Docking CMAVs will be scheduled periodically by the TYCOM to meet Unrestricted Operation (URO) Maintenance Requirement Card (MRC) requirements. SSBN CMAV milestones are outlined in Appendix B_2.

b. Extra Large Unmanned Undersea Vehicles (XLUUVs). One regular CMAV every 5 to 6 months of which a minimum of 21 days are dedicated to production work. A modernization CMAV will occur every two years of which 51 days are dedicated to production work. XLUUV CMAV milestones are outlined in Appendix B_3.

3.3.3 Major Maintenance Period. A Major Maintenance Period (MMP) is a scheduled availability, unique to SSGNs, notionally 15 to 17 weeks in duration and normally scheduled every 15 to 18 months. The MMP's are mandatory availabilities and any changes to defer, delete or shorten must be routed through TYCOM N43 via Naval Message. Per reference (a), the OPCYCLE is defined as the start of one MMP to the start of the next. SSGN MMP milestones are outlined in Appendix B_4.

3.3.4 Unscheduled Continuous Maintenance Availability. The Unscheduled CM Availability is a single yearlong availability, for the period 01 October through 30 September, scheduled for each ship every fiscal year. The Year Long Unscheduled CM Availability is for the scheduling and completion of non-emergent work items that are not accomplished during any other schedule availability.

3.3.5 Emergent Availability. The Emergent (EM) Availability is designed for work of such an urgent nature that the heightened risk of disruption and paying of premiums is accepted and planning horizons are shortened.

3.4 COMMON ELEMENTS.

3.4.1 Responsibilities. Responsibilities regarding maintenance policies and procedures for Fleet maintenance availabilities are:

3.4.1.1 Immediate Superior In Command.

a. Coordinate scheduling of availabilities at Lead Maintenance Activities (LMA).

(1) Monitor corrective maintenance action taken by LMA or Executing Activities.

(2) Schedule and conduct inspections of Forces Afloat.

(3) Monitor progress of availabilities.

b. Initiate the required budgetary actions for funding availabilities.

c. Ensure all authorized alterations are identified by priority based on material availability.

d. Identify the routine package to be accomplished based on Master Specification Catalog or Master Job Catalog (MJC) review (as appropriate).

e. Review results of scheduled monitoring inspections and testing that could result in significant new work or could impact scheduled work.

f. Identify required special evolutions associated with availabilities in support of Pre-Overseas Movement preparations and pre-availability test and inspection requirements.

g. Issue availability planning message.

h. Ensure all Periodic Maintenance Requirement (PMR), Unrestricted Operations (URO) and Hull Integrity Procedure (HIP) (if applicable) Maintenance Requirement Card maintenance actions intended for accomplishment during availability are identified.

i. Send a Sea Trials Support Services message to specify Deep Submergence Rescue System “modified-alert” requirements per Appendix C.

j. Provide updated Sea Trials status by telephone to Commander, Submarine Squadron (COMSUBRON) ELEVEN if Deep Submergence Rescue System “modified-alert” support services are in use.

k. Identify key events for each CMAV during the pre-arrival conference. Determine if Fast Cruise, Sea Trails, or both, are required based on the scope of the availability work, alterations and modernization. The ISIC will task the Ship or Regional Maintenance Center (RMC) to submit the Fast Cruise, Sea Trials, or both, agendas for ISIC approval per paragraph 3.6.3.3.

l. Monitor Ship and Executing Activity preparations to transition to a CMAV period and make final report that the ship has transitioned to the CMAV period after the completion of the arrival conference to the Group and TYCOM.

m. Ensure reference (b) requirements are implemented in all CMAVs based on complexity, scope of work and duration of the CMAV. The ISIC will ensure all requirements of reference (b) are implemented to the maximum extent practical based these considerations. If portions are not implemented in a CMAV due to scope of work, complexity, or time restrictions the ISIC will inform TYCOM after the Work Package Execution Review (WPER).

3.4.1.2 Regional Maintenance Center or Lead Maintenance Activity. (As appropriate)

a. Develop recommended Key Event schedule and present to the ISIC and Ship’s Force.

b. Conduct ship checks, plan work candidates and order required material.

c. Recommend returned work candidates to the RMC ISIC, as applicable.

d. Develop strategy using the guidance found in volume VI, chapter 9 of this manual to accomplish calibration of systems, gages, instruments and tools in support of Ship's Force requested work and the availability milestones.

e. Identify and order Long Lead Time Material (LLTM).

f. Review the Availability Work Package, write Formal Work Package (FWP) or Technical Work Documents, identify critical jobs and develop an Integrated Work Schedule (IWS) to aid in tracking and coordination of all work.

g. Conduct the WPER.

h. Conduct arrival conference.

i. Conduct daily and weekly meetings.

j. Issue Departure and Assessment report per paragraph 3.6.3.2.e.

h. Review the requirements of reference (b) and make recommendations for implementation and exceptions to ISIC during the WPER. The LMA will ensure all requirements of reference (b) are implemented to the maximum extent practical based on scope of work, complexity and duration of the CMAV.

3.4.1.3 Submarine Maintenance, Engineering, Planning, and Procurement Activity.

a. (MMP only) Develop and publish work package identifying the following for accomplishment:

(1) PMRs scheduled for accomplishment during the availability.

(2) Naval Sea Systems Command (NAVSEA), TYCOM and Strategic Systems Programs authorized alterations for installation.

(3) DFSs scheduled to be cleared.

(4) Work identified in the CSMP for accomplishment.

(5) Planned Nuclear Work as received from Primary Shipyard

b. (MMP only) Maintain work package to ensure it reflects currently authorized work.

c. (MMP only) Schedule Initial Planning Meeting to incorporate input from stakeholders in the work package.

3.4.1.4 Ship's Maintenance Team. (Commanding Officer (CO))

a. Validate, broker, schedule, and track through execution all maintenance candidates.

b. Maintain a current and valid CSMP that serves as the single authoritative source for all maintenance requirements.

c. Develop, plan and coordinate Ship's Force Upkeeps, CMAVs, CMs, and EMs and repairs within the resources provided.

d. Prioritize all deferred maintenance actions intended for accomplishment during an availability.

e. Develop a strategy for calibration of gages, instruments and tools.

f. Publish a policy concerning number of duty sections, liberty, ship cleanliness, tagout procedures, tank closeout and installation of blank flanges of otherwise exposed fluid systems, waveguide and air systems before the availability starts.

g. Assign an Officer or Chief Petty Officer to serve as the Availability Coordinator, responsible for coordinating the completion of all pre-availability and availability milestones.

h. Make reference (b) implementation recommendations to ISIC.

i. Implement and execute requirements of reference (b) as directed by ISIC.

3.4.1.5 Assigning Lead Maintenance Activity and Ship's Force Maintenance Responsibility. The RMC or ISIC assigns work responsibility for each maintenance item in an availability work package. The assignment of work responsibility will be such that split responsibility between two organizations does not occur for the same unit task on a maintenance action. The following guidelines apply:

a. The Fleet Maintenance Activity (FMA) will remove all controlled system interference as defined in volume V, part I, chapter 2 of this manual and Ship's Force will remove all other interference.

b. The following are examples of maintenance actions requiring Intermediate Level shop work that will be assigned as "ship-to-shop":

(1) Calibration and repair of portable equipment, removable gages, and rack-out electronic equipment and meters.

(2) Manufacture of components which do not require fit-up in a larger assembly, or that are fabricated with a sample provided by Ship's Force.

(3) Small flanged or bolted valves and operators sized 2.5 IPS and below.

(4) Small components such as pumps, motors, controllers, deck plates, access covers and lockers.

3.4.1.6 FMA and Nuclear Regional Maintenance Department (NRMD) Radiological Controls Support. In order to fully use the FMA radiological controls resources, Ship's Force must request FMA or NRMD radiological support for their jobs that involve significant radiological controls. The following guidelines apply:

a. FMA or NRMD will provide full radiological control support including material, surveys, supervision and instructions for radiological aspects of the job.

b. FMA or NRMD will provide mock-up training, when necessary, for Ship's Force personnel performing the actual work.

c. Ship's Force jobs which fall into this category include, but are not limited to, retention tank (or equivalent) inspection, nuclear instrument detector replacement, and primary plant venting or draining evolutions.

d. As an example, during a retention tank inspection, an FMA or NRMD would:

(1) Construct and certify the containment tent.

(2) Conduct the necessary pre-job, in process and post-job surveys.

(3) Train Ship's Force personnel in the use of air fed hoods.

(4) Provide radiological monitoring.

(5) Review and comment on the Ship's Force work procedure.

e. The FMA or NRMD should develop standard radiological work procedures to be used in developing FWPs and TWDs in support of Ship's Force jobs. The service of the Fleet Maintenance Support Branch will be used by FMAs, when necessary, to formulate these work procedures.

3.4.2 Submission of Work Candidates.

3.4.2.1 Documenting Requests. Requests by Ship's Force for corrective maintenance assistance or support equipment from outside activities will be appropriately documented on an Ship Maintenance Action Form, OPNAV 4790/2K (2-Kilo) or Supplemental Form, OPNAV 4790/2L (2-Lima) of reference (c) or message work candidate and prioritized per reference (c). The work candidate will be promptly forwarded for processing. The description of the deficiency or support requested and the action desired must be complete and clear. This description must be in sufficient detail to allow LMA personnel to plan, obtain parts and assemble the correct tools.

3.4.2.2 Message Work Candidates. Messages may be used to notify the FMA as early as possible when data systems up-lines are not available. This is particularly applicable to ships in transit between FMAs, and ships scheduled to return to port shortly before starting an availability. Accordingly, ships will submit message work candidate requests to the parent RMC or ISIC, with an information copy to the tending LMA and tending Squadron or RMC (if different), for items of this type. Where the change of LMA occurs coincident with a change in Operational Control, the (new) tending Squadron or RMC will be action addressee for the message, with both the parent RMC or ISIC and (new) LMA as information addresses. Appendix D provides the format for a message work candidate.

3.4.3 Critical Jobs. Critical Jobs are those jobs or series of jobs that require special management attention and normally present the greatest risk to on-time completion of the key event or availability. The Executing Activity will be judicious in designating jobs as CJs to prevent diverting management attention from those jobs which are, in fact, critical to on time completion of the availability. Consideration must be given to, but not limited to, the following in determining the CJs:

a. Little or no room for delay exists.

b. Establishing plant conditions.

c. LLTM.

d. Complexity of job or special skills or resources required.

e. Significant test requirements.

f. Not previously accomplished by the Executing Activity (alterations, etc.).

3.4.4 Integrated Work Schedule. The IWS is an integrated timeline that includes plant conditions, major work steps, tests and recertification used to progress all jobs as determined by the Naval Supervisory Authority (NSA) or LMA. The IWS will include:

a. Establishing plant conditions.

b. Major production steps.

c. Testing and Recertification.

d. Closing out work procedures.

3.4.5 Technical Assistance and Assessment. Technical assistance and assessments are to be assigned as work candidates within any of the following Fleet maintenance availabilities:

a. CMAV.

b. CM.

c. EM Availabilities.

d. MMP.

3.4.6 Late Work and Scope Control.

a. The complete LMA Availability work package is defined and agreed upon at the WPER. To provide for adequate time to plan the work and acquire the necessary materials in an efficient manner, the work submission cut-off date should not exceed the milestones listed in Appendix B_1, B_2, and B_4. A minimum of 30 days will be allotted for known work to be brokered to I-Level activities. This will allow a WPER to take place per the platform specific milestones. If these minimum thresholds cannot be complied with, the Maintenance Team will complete a Business Case Analysis per paragraph 3.4.6.b.

b. The Maintenance Team will perform a Business Case Analysis as a method of identifying risks associated with adding late work after the submission cut-off date identified in Appendix B_1 and B_2. The Business Case Analysis is described in Appendix E. Late work identified after the submission cut-off date will not extend the availability completion date. The RMC or ISIC will take appropriate actions to make job tradeoffs, defer jobs to a subsequent availability or seek outside assistance to conduct the work.

c. Non-mission essential late work may be accepted on a case-by-case basis. The ISIC will provide approval authority for all late work after establishing that the LMA can support the additional workload and the scope of work does not impact the ship's operational schedule or schedule of other operational units.

3.4.7 Memorandum of Agreement. The purpose of the MOA is to define areas of responsibility for all activities involved with the availability. For all submarine availabilities involving maintenance within the Submarine Safety (SUBSAFE) boundary, Scope of Certification (SOC) boundary and Fly-By-Wire (FBW) boundary, a MOA will be issued. A NSA representative must sign Memorandum of Agreements (MOA) as assurance that any civilian contractor requirements detailed in MOA(s) are contained within applicable contracts.

3.4.8 Radiological Controls. Nuclear powered vessels are responsible to implement and ensure adherence to radiological controls per reference (d). Industrial activities authorized to perform nuclear maintenance are responsible to engineer appropriate radiological controls into assigned work.

3.4.9 Ship to Shop Material Control. Positive identification and control of ship to shop transfer of equipment and components is maintained through the use of a Ship to Shop tag. The Ship to Shop tag may also be used in conjunction with other methods specified by the Executing Activity or the LMA. Each Executing Activity must make sure that positive control exists for those subcomponents of equipment and components received with a Ship to Shop tag attached. The procedure for using the Ship to Shop tag is provided in volume V, part I, chapter 11 of this manual.

3.4.10 Ship-checks. The LMA or Executing Activity must conduct ship checks, when the tended ship is available in order to support process milestones, to verify the scope of work, identify interference, obtain equipment technical data, identify shipping (rigging) paths, verify system and equipment configuration and obtain additional problem identification data from Ship's Force. Ship-checks must be conducted as early in the planning phase as possible.

3.4.11 Lead Maintenance Activity Daily Production Meeting. This meeting is for the coordination of ongoing work for all availabilities. The LMA Repair Officer or Production Officer, or their designated representatives, will conduct a Daily Production Meeting for all ships in availabilities.

a. Purpose. The primary purpose of the LMA Daily Production Meeting is to establish a joint Executing Activity and Ship's Force production plan and eliminate schedule conflicts that impact work for at least the next seven shifts (56 hours). It further tracks the current status of CJs. The results of this meeting are used to assess overall progress of the work, develop recovery plans when necessary and to ensure all the activities understand the production plan and support requirements during a minimum of the next seven shifts (56 hours).

b. Execution. The Daily Production Meeting will be held as early in the day as practicable.

c. Attendees. Representatives of the LMA Waterfront Operations, the Executing Activities, the tended ship, and LMA Supply or Fleet Logistics Center, as appropriate, will attend this daily production meeting and participate in its agenda. Others may attend as requested by the LMA.

d. Agenda. The following agenda will be used for the LMA Daily Production Meeting. Additional items may be added at the discretion of the Waterfront Operations Officer, Repair Officer or Production Officer.

(1) Discuss specific work scheduled to be accomplished and support required over the next seven shifts.

(2) Discuss projected site evolutions (ship moves, weapon moves, pier maintenance, or changes of command, etc.) which could impact production work.

(3) Discuss respective ship evolutions such as stores load or Fast Cruise that could impact production work.

(4) The Executing Activity brief on the current status of CJs on each ship.

(5) Review Safety of Ship Maintenance Item List, necessary safety precautions and their status.

(6) Discuss requirements and execution of reference (b) as agreed upon at the WPER. Any changes since WPER will be approved by ISIC prior to exceptions being implemented.

3.4.12 Lead Maintenance Activity Progress Review (Management Meeting). This review will be conducted weekly in CMAVs.

a. Purpose. The primary purpose of the LMA progress review is to ascertain that CJs and Key Events are progressing satisfactorily for on time completion of the availability and to ensure ISIC and Senior Repair Activity Management has a clear picture of the ongoing status of the availability and any obstacles to on time completion. The meeting must also identify and resolve any issues, conflicts or differences since availability start or last review. These meetings may be conducted in conjunction with a ship's PB4M.

b. Execution. This review must be conducted by the Waterfront Operations, Repair Officer, Production Officer, or their representatives and be scheduled so as not to conflict with daily production meetings.

c. Attendees. As a minimum, the following must attend this review.

(1) Waterfront Operations Officer, Repair Officer, or Production Officer.

(2) Ship Superintendent and designated Executing Activity representatives.

(3) Tended ship CO.

(4) Availability Coordinator and designated Ship representatives.

(5) ISIC designated representatives (Commodore, Senior Deputy or Maintenance Deputy).

(6) Maintenance Support Team (MST) Officer In Charge (OIC) (if applicable).

(7) LMA Commanding Officer, Deputy Shipyard Commander or designated representative (as applicable).

d. Agenda. As a minimum, the following agenda must be used for LMA progress review. Additional items may be added at the discretion of the Waterfront Operations Officer, Repair Officer, Production Officer, ship CO, or ISIC. Attendees must be prepared to discuss their respective portions of the agenda.

(1) Specific work scheduled for accomplishment during the availability.

(2) Projected Executing Activity and ship evolutions which could impact production work on ship(s).

(3) Discuss current status of CJs and Key Events listed in Appendix F.

(4) Heavily loaded Executing Activity work centers and impact on the availability.

(5) Status of funds, supplies and equipage funding.

(6) Status of outstanding DFS scheduled for correction during the availability.

(7) Outstanding high priority repair material status.

(8) Provide Automated Work Requests (AWR) or a list of completed work with applicable 3-M final action taken codes per reference (c).

(9) For ships with work in the Year Long CM or EM Availability no separate formal meeting is required. Rather, issues with these availabilities will be a part of the routine PB4M held by the ship's maintenance team or special meetings as needed to properly monitor and manage the ongoing maintenance.

(10) Ship's Force will brief the status of all scheduled K-MRCs and active On-Site Analysis Reports. The brief will include time critical K-MRC status, completion percentage and schedule to complete outstanding K-MRCs and schedule to correct active On-Site Analysis Reports in the availability.

(11) Discuss requirements and execution of reference (b) as agreed upon at the WPER. Any changes since WPER will be approved by ISIC and Repair Activity senior management prior to exceptions being implemented. Include issues occurred and resolution of the previous week.

3.4.13 100-Hour Transition Periods. The 100-hours at the beginning and at the end of a CMAV are critical times for availability execution. The ISIC, LMA and ship are responsible for coordinating the 100-hour plan. Any job or event that is viewed as hindering the start of the availability must be included in the 100-hour plan. Communication is vital to ensuring a full understanding of all work and associated requirements. The 100-hour transition plans will be outlined in the Availability Planning Message per Appendix G. Details for the first and final 100 hours must be as indicated in paragraphs 3.4.13.1 and 3.4.13.2.

3.4.13.1 First 100-Hour Plan. The First 100-Hour Plan will notionally start the first full workday of the availability. The items listed in this paragraph are the focus of the first 100 hours and will be discussed at the Arrival Conference.

a. Establishing plant conditions and work controls.

b. Working hours.

c. Jobs still requiring ship checks will be listed in the availability planning message.

d. Test forms required for Ship's Force retest of FMA work will be delivered to the ship within the first 100 hours for Ship's Force to review, plan and write procedures as necessary.

e. Time critical jobs that will start during the first 100 hours. Completion of all time critical K-MRCs as determined at the A-21 meeting with the maintenance team. Time critical K-MRCs are those that:

(1) Would result in long repair times if failed.

(2) Require unique plant conditions which conflict with required plant conditions for other scheduled work (e.g., seawater hull and backup valve cycling when seawater systems must be secured for maintenance or trim and drain pump performance test when trim and drain systems are to be secured).

(3) K-MRCs that have a poor historical performance based on review of the data contained in the Performance Monitoring Team (PMT) database.

3.4.13.2 Final 100-Hour Plan. The Final 100-Hour Plan will notionally begin four days prior to the last day of the ship's scheduled CMAV. Items listed in this paragraph must be completed prior to the 100-hour point. Appendix H will provide an outline of the final 100 hours.

a. Production work complete - it is vital all production work is completed by the 100-hour point to allow for the remaining event to occur without delay.

b. Weapons handling.

c. Testing associated with production work is completed.

d. Sail closeout.

3.5 SHIP'S FORCE UPKEEP. Ship's Force Upkeep availability is a scheduled period in which the ship is conducting self-maintenance per reference (c), training, supporting inspections by outside activities, and performing routine shipboard evolutions. Ship's Force Upkeep availability can be accomplished at sea when the ability of the ship to perform its assigned missions and tasks is not affected and the work is accomplished onboard the ship. Scheduled Ship's Force Upkeep periods must not be interrupted for other than emergency reasons.

3.5.1 Upkeep Work Planning.

3.5.1.1 Planning Sources. The upkeep work package must be developed using three sources:

a. PMS must be scheduled per reference (c).

b. Reactor Plant PMS must be scheduled per reference (e).

c. CSMP will be reviewed to ensure scheduling and accomplishment of all work which is within Ship's Force capability.

3.5.1.2 Ship's Force Planning Actions.

a. Preparation for Ship's Force Upkeep will be the normal activity of the maintenance team and be discussed at PB4M meetings.

b. Review all Ship's Force screened CSMP work candidates and identify those items to be accomplished within the scheduled Ship's Force Upkeep period.

c. Identify CJs.

d. Develop an IWS per paragraph 3.4.4 to aid in tracking and sequencing CJs.

e. Establish strategy for Ship's Force calibration of gages, instruments, and tools based on the onboard Calibration Recall List.

f. Develop FWPs, Controlled Work Packages, and TWDs, as required, per volume V, part I, chapter 2 of this manual.

g. Identify operational URO MRC and HIP (if applicable) to be accomplished during the availability. The ship must identify the plan to accomplish PMRs called down by the ISIC and identify any conflicts affecting the PMR execution.

3.5.2 Ship's Force Upkeep Work Execution. Duty section, division meetings, and shift briefings will be conducted as necessary to discuss the current status of work and projected work progress expected for the period covered. The status and projections will be based on CJs and the IWS and will be reviewed at the regular ship's PB4M Maintenance Team meetings.

3.5.3 Ship's Force Upkeep Work Completion.

3.5.3.1 Management Closeout Procedures. Upon completion of repairs, FWPs, Controlled Work Packages, and TWDs will be closed out per volume V, part I, chapter 2 of this manual. Update the CSMP. Ensure non-conformances (Waivers, Deviations or Departures from Specification) submitted during the availability by any activity are approved prior to trials at sea (if held) and not later than the completion of the availability.

3.5.3.2 Dock Trials, Fast Cruise and Sea Trials. Dock Trials, Fast Cruise and Sea Trials must be conducted as required. Sample agendas in part I, chapter 3 of this volume may be modified, as necessary, to ensure the equipment which was worked during the upkeep is exercised prior to at sea operation.

3.5.4 Ship Certification Prior to Underway. Ship and Executing Activity provide the ISIC a written report of ship's certification continuity prior to underway per volume V, part I, chapter 5 of this manual. If Upgrades, Alterations or Major Repair Work of the FBW SCS was performed by TYCOM managed activities, the ISIC will accomplish a 100% audit, as defined in volume V, part I, chapter 9 of this manual of the work. ISIC and TYCOM will use the FBW message reporting process for certification specified in part III, chapter 3 of this volume for availabilities of less than six months duration.

3.6 SCHEDULED CONTINUOUS MAINTENANCE AVAILABILITY.

3.6.1 Scheduled Continuous Maintenance Availability Planning. Thorough, detailed planning is an absolute prerequisite to effective CMAV execution. Effective CMAV management begins well before the ship arrives with material procurement and job planning. Appendices B_1 and B_2 are typical submarine CMAV Milestone Schedules to be used by all activities involved in planning and executing the submarine availability.

3.6.1.1 Scheduled Continuous Maintenance Availabilities Planning Sources. A significant portion of the CMAV Work Package can be identified in advance from five basic sources.

a. Ship's CSMP. This document contains work items deferred during previous maintenance availabilities as the result of inadequate material support, outstanding DFS, drydock requirements, etc. To ensure the CSMP accurately reflects the required ship's maintenance, the Maintenance Team and ISIC will review each ship's CSMP in detail with Ship's Force during routine PB4Ms and prior to every maintenance availability.

b. Ship's Force Planned Maintenance. Ship's Force must conduct a review of PMS and Reactor Plant PMS requirements (where applicable) and ensure all maintenance actions are identified. In particular, an in-depth review of scheduled K-MRCs is required so that they are properly integrated into the planning process.

c. PMR, URO and HIP electronic files. Submarine Maintenance Engineering, Planning and Procurement (SUBMEPP) Activity provides electronic files of PMR, URO and

HIP maintenance requirements for each ship, as applicable. The ISIC will load these requirements into each ship's CSMP for a specific CMAV.

d. Alterations (Fleet Alterations, Program Alterations, Ship Changes and Strategic Systems Program Alterations, etc.). The ISIC will enter alterations on the ship's CSMP that the TYCOM has authorized for accomplishment. The ISIC calls out alterations for a specific CMAV based on material availability and Executing Activity capacity as identified by the Executing Activity. Within funding constraints and TYCOM guidance, all alterations authorized on the TYCOM Alteration Management System or Navy Modernization Process (NMP) are candidates for accomplishment during each CMAV.

e. Work Routines. A set of standard routines from the MJC will be planned for every CMAV. The ISIC or RMC tailors each CMAV routine package to the needs of the ship by calling out additional routines to document periodic, interim dry docking, URO maintenance (as applicable), and calibration recall requirements, as appropriate.

f. Planning availability. (SSNs only) A scheduled one week planning availability will normally be scheduled approximately four weeks prior to a scheduled regular CMAV. The purpose of the planning availability is to allow the LMA and other activities scheduled to perform maintenance during the regular CMAV to conduct ship checks and job scoping and inspections (e.g., PMT time critical K-MRCs) early enough to write required FWPs and TWDs, order material and develop a cohesive plan for the regular availability. Only underway limiting repairs will be accomplished during a planning availability. Paragraphs of 3.6.1 and all A-30 items from Appendix B_1 must be addressed and focused on during the planning availability. The results of the planning availability directly feed into the WPER.

3.6.1.2 Scheduled Continuous Maintenance Availability Planning Functions. The Maintenance Team, RMC and ISIC will take the following actions in planning a CMAV.

a. Work Package Submission. Ensure that ships submit a CMAV work packages as scheduled per Appendix B_1 or B_2. Message work packages may be sent if the ship is not in port. This singular action has significant impact on the ability of both the RMC or ISIC and Executing Activity to properly plan for the CMAV, and determine potential impacts on other planned work.

b. PMR URO and HIP Review. Review PMR URO and HIP requirements and ensure all maintenance actions intended for accomplishment during the CMAV are identified and entered in the CSMP. Using the PMR scheduling system as described in volume VI, chapter 24 of this manual, the ISIC will request that all applicable PMR work be added to the ship's CSMP when the SUBMEPP CD-ROM is received. This work is applicable if it is prescribed for the ship and is due per the associated schedule. PMR, URO and HIP work is mandatory. PMR requirements are to be accomplished on or before the scheduled due date listed in the SUBMEPP provided report as contained in the TYCOM PMR scheduling system. PMR requirements which are not accomplished by their scheduled completion date will be rescheduled and identified to the TYCOM per volume VI, chapter 24, paragraph 24.8.3.g of this manual. UROs and

HIPs are to be accomplished by the scheduled due dates or appropriate waivers or DFS must be requested.

c. NMP Review. Review NMP and ensure all authorized alterations intended for accomplishment during the CMAV are identified by priority based on material availability as identified by the Executing Activity. Ensure they are properly entered into the CSMP.

d. MJC Review. Review the MJC and identify the routine package to be accomplished during the CMAV. Ensure it is properly entered into the CSMP.

e. Review work candidates for applicability of Master Specification Catalog task lists.

f. Draft Key Event Schedule.

g. Work Package Screening. Screen and forward the assigned prioritized work package to the Executing Activity. Maintenance Team, RMC and ISIC responsibilities for work package screening are established in reference (c). Additional specific requirements are:

(1) Ensure work candidates meet the criteria for the level of work and are correctly prioritized per reference (c).

(2) If the assistance requested is for use of the Executing Activity facilities or technical guidance in order for Ship's Force to accomplish planned or corrective maintenance, the submitting ship and TYCOM will be advised to use MJC Routine N0000EXCNA740, (Facilities for Ship's Force Work).

(3) If a work candidate is received in message format, the ISIC must input the message work candidate into the Maintenance Data System (MDS). For a ship in transit, the parent ISIC must advise the ISIC to which the ship is reporting of the desired disposition of the message work candidate.

(4) Designate controlled work as defined in volume V, part I, chapter 5 of this manual. Indicate the appropriate governing Key Event.

(5) If required repairs to equipment contained in the PMR program can possibly satisfy the PMR requirement, the ISIC will designate the work as Special Interest in Block 10, note the PMR MJC Job Control Number (JCN) in Block 49, and instruct to call out the MJC item. Enter remarks as necessary in Block 49 preceded by "SQ-", and sign in Block C.

h. From the Key Event schedule, develop an IWS per paragraph 3.4.4 to aid in tracking and sequencing CJs.

i. CMAV Funding. RMC or ISIC will establish CMAV funding targets in order to properly and responsibly administer funds, and gain optimum readiness return on each dollar invested.

j. Review scheduled Submarine Engineering Management, Monitoring and Fleet Support Program Office, Performance Monitoring Team, monitoring and testing that may result in significant new work for the Executing Activity or Ship's Force; or that may impact scheduled Ship's Force or Executing Activity work.

k. Outside Activity Support. Identify outside activities (e.g., Warfare Center, Alteration Installation Team, Naval Undersea Warfare Center, Supervising Authority, RMC, Industrial Activity Tiger Team, etc.) participating in the CMAV and their associated support requirements.

l. Special Evolutions. Identify required special evolutions associated with pre-availability tests and inspections.

m. WPER. The WPER is conducted with the Executing Activity, ISIC, TYCOM, (and Ship's Force if available) as scheduled per Appendix B_1, B_2 or B_4. The purpose is to finalize the CMAV work package and required evolutions. This is accomplished as noted in sub-paragraphs (1) through (13) of this paragraph. This meeting may be conducted in conjunction with the ship's PB4M.

(1) Attendees will include the Maintenance Team, ISIC Material Officer, Maintenance Planning Manager, RMC, Ashore Ships Maintenance Manager, Production Officer representative, Executing Activity, Ship's Engineer Officer, MST OIC, Availability Coordinator and the Ship Superintendent (as applicable).

(2) Assemble the proposed CMAV work package from the CSMP, PMRs, UROs, NMP and MJC, as applicable.

(3) Screen the proposed work package to designate the work to be accomplished during the CMAV.

(4) Validate the proposed work package will not require ammunition off-load.

(5) Prioritize the proposed work package.

(6) Identify Safety of Ship Maintenance Items List evolutions in volume IV, chapter 10 of this manual.

(7) Designate the CJs.

(8) Integrate Executing Activity recommended CMAV Key Event schedule with other ISIC and Ship planned events for the ship, such as weapons moves, fueling, and training events.

(9) Review scheduled PMT testing that may result in significant new work after the CMAV starts.

(10) Establish the CMAV berth for pre-staging material and support equipment.

(11) Review adequacy of available testing and support equipment needed for the CMAV.

(12) Identify other outside activities participating in the CMAV and associated support requirements.

(13) Identify required special evolutions associated with pre-availability tests and inspections. The result of the CMAV WPER will be an executable work package within the CMAV time frame, budget, and Executing Activity capacity.

(14) Review the plan developed by the ship for the K-MRC completion and ensure it is part of the integrated schedule per paragraph 3.4.13.1.e. Prior to this meeting, Ship's Force engineer and 3M Coordinator will meet with the PMT, TYCOM 3M representative and ISIC together (typically at A-40) to review current K-MRC status, ensure the ship's records match that of PMT and develop a K-MRC execution plan. Any discrepancies will be adjudicated prior to A-21 and provided to the RMC for inclusion in the integrated work schedule. ISIC will concur with Ship's Force plan for K-MRC completion. All time critical K-MRCs (see paragraph 3.4.1.13.e.) will be completed as soon as possible, preferably on the in-port transit with PMT aboard (when possible) but no later than the end of the first 100 hours.

(15) Ensure reference (b) requirements are implemented in all Continuous Maintenance Availabilities (CMAVs) based on complexity, scope of work and duration of the CMAV. The ISIC will ensure all requirements of reference (b) are implemented to the maximum extent practical based on these considerations. If portions are not implemented in a CMAV due to scope of work, complexity, or time restrictions, the ISIC will inform TYCOM after the WPER.

n. Re-screen Work Candidates. Re-screen and assign returned work candidates (per part III, chapter 1 of this volume). Notify ship of final disposition of each item.

o. Issue the Ammunition Off-Load Requirement Message. Subsequent to package lock, but no later than two weeks prior to the start of the availability, Ship's Force will send the Ammunition Off-Load Requirement Message prepared in accordance with Appendix I and reviewed during the availability WPER to TYCOM. It will certify that the Availability Work Package has been reviewed by the Maintenance Team for exclusion of work that requires ammunition off-load, as required by reference (f).

p. Issue Availability Planning Message. No later than two weeks prior to start of the CMAV, send the Availability Planning Message prepared per Appendix G and reviewed during the CMAV WPER, to the ship. It should describe the major work scheduled, controlling Executing Activity and Ship's Force Key Events, PMT and MCA testing, PMR jobs scheduled, alterations to be accomplished by the Executing Activity and Ship's Force, any other scheduled evolutions and 100-hour transition plans. This message will identify the current numbers of components due or overdue from the Calibration and Weight Test Recall Program.

3.6.1.3 Issue Availability Planning Response Message. No later than one week prior to the start of the CMAV, the ship must certify readiness to transition to a CMAV period, and address any concerns with the Availability Planning Message to TYCOM or ISIC per Appendix J. The following items must be addressed in the ship's report:

a. Schedule requirements such as action items from Availability Planning Message, schedule of key events, ability to conduct 100-hour transition plans.

b. Ship material preparation such as a report status of parts for Ship's Force work and desires for ISIC or TYCOM assistance in procurement and ensuring all outstanding

Casualty Reports (CASREP), SUBS, Z0ZZ and TDENT messages are identified in availability planning message.

c. Ship's Force integrated schedule such as miscellaneous programs (calibration, small valve maintenance, etc.), drills and trainers that will affect Ship's Force ability to support production work, preservation zones and planned maintenance (to include PMS, Reactor Plant PMS, and K-MRCs).

d. CO's report of readiness or concerns: CO review items of paragraph 3.6.1.3.a through 3.6.1.3.c and availability planning message and report readiness and exceptions to transition to CMAV period.

3.6.1.4 Arrival Conference. This conference is conducted by the LMA. The Arrival Conference purpose is to provide an executive level brief to the RMC or ISIC, Executing Activity, MST OIC (if applicable) and ship's CO on the total scope of the CMAV effort and must be conducted as discussed in sub-paragraphs "a" through "d". Note that the Arrival Conference may be conducted in conjunction with the PB4M.

a. Attendees. The Arrival Conference is hosted by the responsible FMA and attended by the following personnel:

(1) ISIC Senior Management (Commodore or Senior Deputy) and Material representative(s).

(2) Executing Activity representative(s).

(3) Tended ship, (recommended, as applicable, are the CO, Department Heads, and Availability Coordinator).

(4) Site PMT OIC.

(5) MST OIC (if applicable).

(6) LMA Commanding Officer, Deputy Shipyard Commander or designated representative (as applicable).

b. Agenda. The following items comprise the agenda to be covered during the Arrival Conference:

(1) Introduction of key FMA, Executing Activity and ship personnel.

(2) CMAV material and funding status.

(3) Review the CMAV Key Event schedule for potential conflicts.

(4) Special evolutions scheduled during the availability.

(5) Validate that critical jobs to be accomplished by the Executing Activities and Ship's Force are properly sequenced in the IWS.

(6) Introduce the LMA representative as the single point of contact for all elements of the CMAV, including responsibility for coordination of all Executing Activities and Ship's Force. This point of contact may be the Project Manager or Ship Superintendent, as applicable.

(7) Alterations to be accomplished.

(8) Significant material issues.

(9) Review status of outstanding Departure From Specification (DFS), as applicable.

(10) Results of arrival inspections and Performance Monitoring Team (PMT) testing.

(11) Issue meeting schedule for the CMAV.

(12) Discuss requirements and execution of reference (f) as agreed upon at the WPER. Any changes since WPER will be approved by the ISIC prior to exceptions being implemented.

c. Tended Ship Actions. The ship takes the following actions at this conference:

(1) Submit a list of key Ship's Force personnel, including officers, Leading Petty Officers or Work Center Supervisors, Quality Assurance Inspectors, Calibration Coordinator and Availability Coordinator.

(2) Verify that all known work candidates requiring outside assistance have been identified and work candidates submitted to the LMA or TYCOM (or submit known late work candidates for immediate screening).

(3) Discuss potential Executing Activity and Ship's Force work interface concerns.

(4) Identify Ship's Force and MST (if assigned) planned evolutions that could impact scheduled work and verify that they are properly sequenced in the IWS.

(5) Ship's Force brief the plan developed by the ship, with help from PMT, for the K-MRC completion and ensure it is part of the integrated schedule per paragraph 3.4.13.1.e.

d. ISIC Actions. During this conference, the ISIC staff will take the following actions (if not already done):

(1) Review any late work candidates submitted by the ship per paragraph 3.4.6. If the late work presented require that other work be deferred, that work to be deferred must be clearly understood. A Business Case Analysis described in Appendix E will be conducted.

(2) Brief the Key Events schedule for the availability. The ship's Key Events will normally be scheduled in the Pre-CMAV or Availability Planning Message, concurred with by the ship's CO on arrival and input to the MDS by the RMC or ISIC prior to the Arrival Conference. CJs controlling the CMAV completion must be identified for special management attention by the ISIC, LMA, Executing Activity and Ship's Force.

3.6.2 Continuous Maintenance Availability Execution. CMAVs are complex evolutions characterized by detailed management, closely coordinated LMA, ISIC, Executing Activity and Ship's Force work, systems testing, and other sequenced evolutions such as weapons movements, diver operations and training. Successful CMAV execution requires the closest

possible communication and coordinated efforts by the LMA, ISIC, Executing Activity and Ship's Force.

3.6.3 Continuous Maintenance Availability Completion Procedures. The following procedures will be utilized for completing a CMAV. Exceptions are provided for those CMAVs of less than three weeks, or are of a minor scope where the Departure and Assessment Conference may be an appropriate forum.

3.6.3.1 Management Reports Closeout Procedures. Upon completion of a scheduled availability, the MDS files must be updated to reflect the current status of work. To accomplish this goal and to ensure that all activities understand the status of all work, the following procedures will be followed:

a. Upon completion of the assigned work, the LMA or Executing Activity will present a copy of the work candidate or a list of completed JCNs with the applicable final action codes to the ship to obtain concurrence that the described work was completed. Ship's Force will complete all AWRs per reference (c). Within 2 weeks of completion, the Executing Activities who have performed any configuration change must submit a Ship's Configuration Change Form, OPNAV 4790/CK of reference (c) to Ship's Force for submission to Configuration Data Managers Database - Open Architecture.

b. Within two working days after the completion of an availability, all work centers will ensure that final man-hours have been entered. The ship's superintendent may sign off all Executing Activity routines for the ship. Completed work candidates and AWRs will be a product of the CMAV Departure and Assessment Conference of paragraph 3.6.3.2.

c. On the third working day after the completion of an availability, the Maintenance Team will ensure that the CSMP ship and shore files reflects the current status of the ship's JCNs and request a Departure and Assessment Report by priority for the ship.

d. On the fourth working day after the completion of an availability, the ship's superintendent will annotate each incomplete JCN on the final Departure and Assessment Report by JCN as to its present status and actions required in order to complete the item. Lead work centers must update this status into the MDS.

e. Within seven working days after the completion of an availability, the Executing Activity will forward copies of the annotated Departure and Assessment Report to the ship and ISIC.

f. Review status of outstanding DFSs.

3.6.3.2 End of Scheduled Continuous Maintenance Availability Departure and Assessment Conference. This comprehensive review and critique of the availability is another cornerstone of the continuous improvement policy regarding Fleet maintenance.

a. Purpose. The CMAV Departure and Assessment Conference is held to:

(1) Review the conduct of the availability and identify those improvements necessary to increase the effectiveness of Fleet maintenance.

(2) Identify the work that was completed during this CMAV and complete the appropriate documents (e.g., work candidates, AWRs, etc.) or produce the list necessary to update the ship's CSMP to reflect the completed work.

(3) Identify and reschedule to a future CMAV, the work deferred during this CMAV.

(4) Identify any incomplete work candidates and plan of action to complete items.

(5) Establish the basic requirements (i.e., initial work package, sequence number and tentative dates) for the next CMAV.

(6) Review status of outstanding DFSs.

b. Execution. The Departure and Assessment Conference will be held during the last week of the CMAV at a time agreed upon by the LMA Repair Officer or Production Officer, ISIC and the ship. This meeting may be held in conjunction with the final weekly Management Conference or Progress Review.

c. Attendees. The Departure and Assessment Conference is arranged, coordinated and chaired by the LMA Repair or Production Officer. Where the LMA is a contractor, the LMA Project Manager may co-chair these meetings with the NSA Project Manager. However, lack of participation by the contractor does not alleviate the NSA Project Manager of this responsibility. The following personnel must attend this meeting and participate in its agenda:

(1) ISIC Supply Materials, Weapons, Combat Systems, Electronics Material Officer, and Submarine Engineering Management, Monitoring and Fleet Maintenance Support Program Office or PMT Staff personnel (as applicable).

(2) LMA Repair Officer, Production Officer, and Ship Superintendent, or their designated representatives.

(3) Tended ship CO, MST OIC (if applicable), Engineer and Availability Coordinator.

(4) Others as directed by the TYCOM, ISIC or Executing Activity CO.

(5) Executing Activity representatives.

d. Agenda. The following agenda must be used for reviewing and assessing the CMAV. Additional items may be added at the discretion of the TYCOM, ISIC, Executing Activity or ship. Attendees will be prepared to address their respective portions of the agenda.

(1) Review of the CMAV work package to establish status of each item and, for items completed satisfactorily, complete the work candidate or AWR.

(2) Review incomplete work candidates that will remain open from this CMAV and identify plan of action to complete these items.

(3) Identify and reschedule to a future CMAV the work deferred during this CMAV.

(4) Assess the scheduling, execution and quality of work accomplished by each activity during the CMAV.

(5) Assess the quality of general services provided by the Executing Activity site.

(6) Review recommendations for process improvements and possible LEAN initiatives.

(7) Assess lost time that prevented or delayed execution of scheduled work. (Lost time internal to the Executing Activity, e.g., waiting for transportation, assist work center, etc. and lost time caused by the ship such as waiting access, tagout, other Ship's Force support.)

(8) At the end of the first normally scheduled CMAV after a CNO availability, the LMA, via letter, informs the appropriate Naval Shipyard, with copies to the ISIC, TYCOM, PMS392, PMS394 or PMS396, as applicable, SEA04X, of any identified lessons learned, rework and quality concerns related to Naval Shipyard work.

(9) Reference (t) lessons learned and corrective actions for future CMAVs.

e. Results. The LMA must consolidate the minutes of this meeting into the Departure and Assessment Report to the ISIC and provide a copy to the TYCOM and appropriate planning activity (and NAVSEA 04X07 for NAVSEA Managed Submarine Repair Activities only). The report must include:

(1) List of completed work or completed work candidates or AWRs for direct input into MDS to update the ship's CSMP and Configuration Data Managers Database - Open Architecture.

(2) Preliminary establishment of the next CMAV.

(3) List of policies and processes identified as requiring review for improvement. Proposed process improvements and corrective actions suggested to improve the effectiveness of future CMAVs.

(4) Lessons learned from the availability.

3.6.3.3 Fast Cruise or Sea Trials. The ISIC may schedule a one-to-two-day Fast Cruise as part of the CMAV Key Event schedule. This is normally the last major Key Event prior to CMAV completion. As a minimum, the Fast Cruise agenda will include specified drills and evolutions necessary to re-establish proficiency in basic ship operations. It will also include sufficient formal testing to certify that the equipment and systems are fully ready to operate at sea in an operational environment. For CMAVs less than four weeks, the requirement for a Fast Cruise must be at the ISIC discretion. The necessity of Sea Trials is a function of work performed during a CMAV and may not be required. If the duration or complexity of the CMAV is determined to be sufficient to warrant Sea Trials, the Ship, ISIC or TYCOM (as required by specific Force policy) must determine if a formal Sea Trial Agenda is necessary, and if required, task the RMC or ship to prepare a formal Sea Trial Agenda for ISIC or TYCOM approval.

3.6.4 Lessons Learned. For long duration or complex CMAVs, or in cases where there are significant lessons to be learned, Lessons Learned will be conducted. The Lessons Learned Conference will be within 30 days of completion of the availability. The Lessons Learned

process is described in volume VI, chapter 39, of this manual. All key NSA, RMC, LMA, TYCOM or their representative, Executing Activity and Maintenance Team personnel must attend it. The agenda and details of the meeting must be determined by the RMC and Maintenance Team and must be of appropriate length to evaluate the overall scope of the work accomplished. The Lessons Learned process provides the maintenance and modernization community with a process to identify, resolve, and provide feedback communication on barriers causing inefficiencies or waste within business processes. While there are several milestone meetings within the availability planning and execution process, the feedback process exists to continually collect information to improve processes.

3.6.5 Maintenance Management Performance Goals. Except for section 3.6.5.1, which is also applicable for RMC I-Level Production Shops, the following maintenance management performance goals are established for Submarine Tender Repair and Weapons Repair Departments. COs and Repair Officers are responsible for making every effort to attain these goals.

3.6.5.1 Activity Performance Summary. The Activity Performance Summary is a compilation of manpower statistics and production indices that are cumulative on a monthly basis. The following information summarizes the content and use of this report:

a. This report is produced weekly on a cumulative basis for the current month and analyzed by the Production Officer and Repair Officer. This analysis will help determine the relative accuracy and adequacy of the man-hour accounting for each work center. The data reflects how each work center is loaded with production work.

b. On the last day of the month, a complete monthly cumulative report is produced. A thorough review and analysis is conducted by the Repair Officer and Production Officer, similar to the weekly review.

c. Following review and analysis, the Repair Officer approves the data and the required reports are submitted to the TYCOM (for Submarine Tenders) or Commander, Navy Regional Maintenance Center (for RMC I-Level Production Shops). The TYCOM or Commander, Navy Regional Maintenance Center in turn forwards the data to higher authority.

d. The Performance Summary provides management with data to determine the capacity of the activity for CMAV maintenance, and subsequent monitoring of the activity maintenance effort conducted on ships. The determination of activity capacity for ship maintenance is the gauge by which managers can evaluate activity productivity while reviewing the report of man-hour expenditures.

e. Activity capacity is a function of both total manpower and the distribution of personnel within the activity. A comparison of Repair Department manning to the manpower authorization will be conducted periodically to ensure activity work centers are not undermanned with respect to rate, Navy Enlisted Classification, or number of personnel. This review may determine that local action is required to schedule formal schools leading to the Navy Enlisted Classification acquisition where shortages exist, or may dictate a temporary or permanent reassignment of resources from one work center to another.

NOTE: FOR RMC I-LEVEL PRODUCTION PERFORMANCE SUMMARY, RMCs ARE NOT REQUIRED TO COUNT TRANSIENT PERSONNEL AND OTHERS THAT ARE NOT ABLE TO TRULY ACCOMPLISH OR SUPPORT PRODUCTION WORK, YET ARE ASSIGNED TO I-LEVEL PRODUCTION SHOPS FOR SUPERVISION.

f. Part One of the activity Performance Summary shows the manpower distribution within the Activity. The Analyst Records and Report Section is responsible for collecting manning information from the activity departments and divisions as a basic input to the Performance Summary. The manning level of the Repair Department is monitored to ensure that this department is properly manned across its work centers.

g. Part Two of the activity Performance Summary provides departmental manpower usage indicators and statistics. The Productivity Index is a key indicator of activity employment. Each Productivity Index is a ratio of production man-hours expended to the production man-hours available. Available man-hours are computed from the number of production personnel assigned each day, assuming an eight-hour workday and no more than five working days per week.

h. Part Three of the activity Performance Summary is a breakdown of activity man-hours expended aboard each tended ship.

i. Part Four of the activity Performance Summary shows the status of work screened for activity accomplishment.

j. Part Five of the activity Performance Summary provides the same man-hour usage information as Part Two, but broken down by work center.

3.6.5.2 Available Production Hours. The standard workday consists of eight hours of available production work each workday, five days a week. Weekends and national holidays are not considered to have available production work hours. It further requires that TYCOMs will establish policies that maximize available production hours within the context of the total activity mission profile. The activity CO must implement the eight-hour production workday for activity personnel. Reduction in this available effort will be for requisite industrial training, skill qualification, facilities maintenance, and capability certification efforts needed to meet the activity's Mission Profile requirements.

3.6.5.3 Performance Indices.

a. All factors relative to the following indices must be accurately reflected in the baseline of the FMA computer management system. These factors are:

(1) Assigned Man-hours. The number of personnel assigned to the activity as production and production support, over the normal eight-hour workday and the number of days tending (exclusive of weekends, holidays and days underway), comprise the "Assigned (Gross Available) Man-hours".

(2) Production Man-hours. The man-hours actually expended in the progress and completion of work requests authorized for activity accomplishment are those expended by personnel assigned to the activity work centers. The expended man-hours by personnel from other departments are not included in the

activity's indices, but are credited to other special work centers on the Performance Summaries.

(3) Productive Support Ratio for the Department is defined as:

$$\frac{\text{Total Assigned Support Personnel}}{\text{Total Assigned Production Personnel}}$$

b. A Productive Support Ratio of between 0.65 and 0.85 must be maintained. A ratio of greater than 0.85 is indicative of an excessive number of FMA personnel assigned to non-FMA tasks. A ratio of less than 0.65 is indicative of a shortage of personnel in Quality Assurance, Planning and other critical production support work centers. For AS-39, local specification is 65% ± 10%.

c. Supervisory Ratio. The Supervisory Ratio, production personnel to permanent support personnel, must be a minimum ratio of 7:1.

d. Supply Production Support. Production work centers must not have supply function production support personnel assigned such as Repair Parts Petty Officers. The supply support function is assigned to the Planning and Estimating and Repair Other Vehicle work centers. When the production work centers must provide technical details for Repair Other Vehicle supply requests, such research time must be reported as production time against the applicable work request. Production managers must ensure the Automated Material Requisitioning system is fully utilized to preclude wasted labor by activity personnel in copying supply data already available from the computer.

e. Department Productivity Index.

(1) The Productivity Index for the Department is defined as:

$$\frac{\text{Total Production Man-Hours Expended by Department Personnel for the Reported Period}}{\text{Total Production Personnel x 8 hours per day x Total Number of Days Tending for the Reported Period}}$$

(2) A Productivity Index for the department should average between 0.55 and 0.75. An index of greater than 0.75 indicates (AS-39 local specification is 55% to 90%):

(a) Insufficient assignment of production personnel resulting in significant overtime work or deferral of requisite technical skill training and qualification, and proficiency or general military training.

(b) An excessive amount of overtime work caused by improper work-loading of an activity by the ISIC.

(c) Inaccurate reporting of man-hours.

(d) Inaccurate accounting of assigned personnel (e.g., 340 assigned personnel working and reporting production hours but only 310 shown in the computer as assigned).

f. Work Center Productivity Index. A Productivity Index for individual production work centers for the month could range from 0.25 to 1.35 with a norm of 0.85. However, if the quarterly average for a production work center is less than 0.40, the number of personnel will be reduced.

g. Repair Utilization Index. Repair Utilization Index for the Department is:

$$\frac{\text{Total Support Man-hours + Expended Production Man-hours}}{\text{Total Production and Support Man-hours Assigned}}$$

The Department Repair Utilization Index requires 45% to 90% for the month.

h. Long-Term Non-FMA Duty Index. There are two special work center codes established to monitor the total Repair Department (10J) and Weapons Repair Department (10K), if assigned, personnel detailed to non-activity duties for greater than 30 continuous days. These numbers should not exceed ten percent of the total assigned activity personnel averaged for the calendar quarter.

3.7 MAJOR MAINTENANCE PERIOD.

3.7.1 Major Maintenance Period Planning. The designation of "CNO for Scheduling Purposes Only" make MMPs unique in the submarine community. This designation makes planning support through standard meetings, formal work packages, and additional oversight available to the TYCOM or ISIC, if required. Maintaining MMPs as fleet availabilities allows executing activities to resource accomplishment of work at a level commensurate with other work being done on an operational asset. Effective MMP management begins well before the ship arrives with material procurement and job planning. Appendix B_4 is a typical submarine MMP Milestone Schedule to be used by all activities involved in planning and executing the submarine availability.

3.7.1.1 Major Maintenance Period Planning Sources. A large majority of the MMP Work Package can be identified in advance from four basic sources.

a. Ship's CSMP. To ensure the CSMP accurately reflects the required ship's maintenance, the Maintenance Team and ISIC will review each ship's CSMP in detail with Ship's Force during routine PB4Ms and prior to every maintenance availability.

b. PMR and URO electronic files. SUBMEPP provides electronic files of PMR and URO maintenance requirements for each ship, as applicable. The ISIC may load these requirements into each ship's CSMP for a specific MMP or they may be provided by SUBMEPP as part of a formal work package.

c. Alterations (Fleet Alterations, Program Alterations, Ship Changes and Strategic Systems Program Alterations, etc.). Depending on the direction provided by TYCOM or ISIC alterations may be identified for installation in the formal work package or they may be entered in the ship's CSMP for accomplishment during the availability. TYCOM calls out alterations for a specific MMP based on material availability and Executing Activity capacity as identified by the Executing Activity. Within funding constraints and TYCOM guidance, all alterations authorized on the TYCOM Alteration Management System or NMP are candidates for accomplishment during each MMP.

d. Work Routines. A set of standard routines from the MJC will be planned for every MMP. The ISIC or RMC tailors each MMP routine package to the needs of the ship by calling out additional routines to document periodic, interim dry docking, URO maintenance (as applicable), and calibration recall requirements, as appropriate. The routine package is authorized in either the local job planning system or in a formal work package, if provided.

3.7.1.2 Major Maintenance Period Planning Functions. The Maintenance Team, RMC, ISIC, SUBMEPP and LMA will take the following actions in planning a MMP.

a. Establish and Confirm Availability Dates. TYCOM will establish or confirm availability dates for the MMP with input from the ISIC, Maintenance Team or LMA. These dates will be provided to SUBMEPP for development of the ship's platform schedule. The accuracy of these dates is important to determine which PMR and URO requirements will be scheduled in the availability and schedule changes can result in significant modification to the work package.

b. Platform Schedule. SUBMEPP will update the ship's platform schedule for the MMP, ensuring that all PMR and URO requirements that are due during the MMP, or that will become due prior to the next availability are included. PMR and URO work is mandatory. PMR requirements are to be accomplished on or before the scheduled due date listed in the SUBMEPP provided report as contained in the TYCOM PMR scheduling system. PMR requirements which are not accomplished by their scheduled completion date will be rescheduled and identified to the TYCOM per volume VI, chapter 24, and paragraph 24.7.3.g of this manual. UROs are to be accomplished by the scheduled due dates or appropriate waivers or DFS must be requested.

c. Current Ship's Maintenance Project Update. The Maintenance Team will ensure that the CSMP is updated as scheduled per Appendix B_4. Work intended to be accomplished during the availability, to include PMS and testing for Ships Force assignment, must be prioritized and submitted to the ISIC. This action has significant impact on the ability of both the LMA or ISIC and Executing Activity to properly plan for the MMP, and determines potential impacts on other planned work.

d. Reactor Plant Work Requirements. The Maintenance Team will review Reactor Plant PMS and update the CSMP with the actions that need to be accomplished during the MMP. Additionally, the ISIC must identify any major nuclear actions that are to be scheduled during the availability.

e. PMR and URO Review. The Maintenance Team will review PMR and URO requirements in order to ensure all maintenance actions intended for accomplishment during the MMP are identified.

f. Alteration Management System or NMP Review. ISIC will review and ensure all authorized alterations identified for accomplishment during the MMP are prioritized based on material availability. If applicable, the ISIC will provide list of alterations identified for installation to SUBMEPP for inclusion in the work package.

g. Dry Deck Shelter off-loads and on-loads. NAVSEA is responsible to identify Dry Deck Shelter off-loads and on-loads planned for the availability.

h. Director, Strategic Systems Programs (DIRSSP) alterations and work. DIRSSP is responsible to identify any unique work requirements or alterations scheduled to be accomplished in the availability for inclusion in the work package.

i. Missile Tube reconfiguration. ISIC will identify any actions required for the availability to support necessary Missile Tube reconfiguration.

j. Preliminary Work Package. If requested by the funding customer, SUBMEPP will publish the Preliminary Work Package in order to assist availability planning. The Preliminary Work Package is used by NAVSEA, TYCOM, ISIC, LMA, and the Maintenance Team to develop an initial scope of the availability and identify work requirements which may impact successful execution.

k. Preplanning Meeting. If requested by the funding customer, the Preplanning Meeting serves as the initial review of the Preliminary Work Package. The Preplanning meeting may be attended by TYCOM, ISIC, LMA, Ship, NRMD and Primary Shipyard and SUBMEPP. The intent of this meeting is to provide an initial review of the MMP Work Package. The following will be reviewed for incorporation into the Initial Issue Availability Work Package; PMR and URO requirements, alterations, DFSs, and CSMP items that are in the Preliminary Work Package or need to be added.

(1) PMR and URO requirements from the class maintenance plan.

(3) Authorized NAVSEA, TYCOM and DIRSSP alterations.

(4) DFS that have been deferred to the MMP.

(5) Work currently identified in the ship's CSMP.

(6) Shipyard Nuclear Work.

l. JCN Call Down. SUBMEPP will call down JCNs for PMR and URO requirements intended for accomplishment during the availability. JCN Call Down is executed after the Preplanning Meeting in order to minimize the number of JCNs generated which will not be worked in the MMP.

m. Long Lead Time Material. The LMA will review CSMP T/A 2 items and order any Long Lead Time Material required.

n. Initial Issue Work Package. Initial Issue Work Package is the first formal work package issued for MMP and incorporates changes from the Preliminary Planning Meeting. The Initial Issue Work Package includes PMR and URO requirements, alterations, CSMP items, and DFSs that are identified for accomplishment during the availability.

o. Work Package Fully Brokered. With the publication of the Initial Issue Work Package, identifying all work authorized by the TYCOM and JCN Call Down completed by SUBMEPP the ISIC will broker all known work.

p. Initial Planning Meeting. The LMA will schedule and chair the Initial Planning Meeting (IPM). The IPM is conducted with the assistance of SUBMEPP and is usually attended by NAVSEA, TYCOM or ISIC and Ship's Force. The IPM serves as system-by-system review of the Initial Work Package in order to ensure that all

necessary work is identified and potential problems with conflicting requirements are identified.

(1) Attendees will include the Maintenance Team, ISIC Material Officer or TYCOM Ship's Coordinator, Maintenance Planning Manager, RMC, Ashore Ships Maintenance Manager, Production Officer Representative, LMA, Ship's Engineer Officer, Ship Superintendent, SUBMEPP, and NAVSEA.

(2) Review the initial MMP work package in order to ensure all required work is identified.

(3) Authorize the Initial Issue Work Package.

(4) Integrate Executing Activity recommended MMP Key Event schedule with other ISIC or Ship planned events for the ship, such as weapons moves, fueling, and training events.

(5) Review scheduled PMT and Total Ship Readiness Assessment (TSRA) testing that may result in significant new work after the MMP starts.

(6) Review adequacy of available testing and support equipment needed for the MMP.

(7) Identify other outside activities participating in the MMP and associated support requirements.

q. Work Integration. Activities supporting work during the availability are expected to provide the LMA with scope of work, testing requirements, and timelines. This information is critical to successful execution of the MMP, ensuring that the LMA can plan and resource work.

r. Post Initial Planning Meeting Work Package. If requested by the TYCOM, SUBMEPP will issue a formal, Post Initial Planning Meeting Work Package containing all of the changes identified at the IPM. This serves as the authorizing document for work requirements accomplished during the MMP.

s. Deficiency Screening. The RMC, LMA, PMT, and the Maintenance Team must submit the results of all pre-availability testing (POTs, PATs or K-MRCs) to the TYCOM or ISIC with recommended changes to the availability work package. The TYCOM or ISIC will provide authorized changes to SUBMEPP for inclusion in the work package, if applicable.

t. AIT Memorandums of Agreement. AIT Managers are responsible for submitting Memorandums of Agreement to the LMA.

u. Nuclear Work Risk Assessment. NRMD will provide a risk assessment for the MMP to the LMA. This is required for LMA development of overall MMP risk assessment letter for TYCOM or ISIC.

v. Execution Planning Products. The LMA will develop the following products in support of MMPs.

(1) FWPs, TWDs and TGIs to support identified work requirements.

(2) Integrated Work Scheduling, identifying critical jobs.

(3) Weapons and Sail arrival inspection plan.

(4) Recommended Key Event Schedule for presentation to ISIC or Maintenance Team.

w. WPER or Final Planning Meeting (FPM). The WPER or FPM is conducted by the LMA. The WPERP or FPM is scheduled per Appendix B4. The purpose is to finalize the MMP work package and required evolutions, any new work submitted after the WPER or FPM is considered "Late Work". This meeting may be conducted in conjunction with the ship's PB4M.

(1) Attendees will include the Maintenance Team, ISIC Material Officer or TYCOM Ship's Coordinator, Maintenance Planning Manager, LMA, NRMD and Primary Shipyard representative, Ashore Ships Maintenance Manager, Production Officer Representative, Ship's Engineer Officer, Availability Coordinator, Ship Superintendent, and SUBMEPP.

(2) Review the proposed MMP work package to ensure all required work is identified.

(3) Prioritize the proposed work package.

(4) Identify Safety of Ship Maintenance Items List evolutions in volume IV, chapter 10 of this manual.

(5) Designate the CJs.

(6) Integrate Executing Activity recommended MMP Key Event schedule with other ISIC and Ship planned events for the ship, such as weapons moves, fueling, and training events.

(7) Review scheduled PMT or TSRA testing that may result in significant new work after the MMP starts.

(8) Establish the MMP berth for pre-staging material and support equipment.

(9) Review adequacy of available testing and support equipment needed for the MMP.

(10) Identify other outside activities participating in the MMP and associated support requirements.

(11) Identify required special evolutions associated with pre-availability tests and inspections. The result of the MMP WPER or FPM will be an executable work package within the MMP time frame, budget, and Executing Activity capacity.

(12) Review the ship's K-MRC plan and ensure it is part of the integrated schedule per paragraph 3.4.13.1.e. Prior to this meeting, Ship's Force engineer and 3M Coordinator will meet with the PMT, TYCOM 3M representative and ISIC together (typically at A-365 and A-90) to review current K-MRC status, ensure the ship's records match that of PMT and develop a K-MRC execution plan. Any discrepancies will be adjudicated prior to WPER or FPM and provided to the LMA for inclusion in the integrated work schedule. Additionally, PMT

will provide RMC curves to Ship's Force in order to help Ship's Force develop a plan to conduct all required K-MRCs during the availability. ISIC will concur with Ship's Force K-MRC plan. ISIC will work with TYCOM to execute all K-MRCs that will inform the Final Work Package in the last deployed CMAV before RTHP. All time critical K-MRCs (see paragraph 3.4.1.13.e.) will be completed as soon as possible, preferably on the in-port transit with PMT aboard (when possible) but no later than the end of the first 100-hours.

x. Issue Availability Planning Message. No later than four weeks prior to start of the MMP, send the Availability Planning Message prepared per Appendix G and reviewed during the MMP WPER, to the ship. It should describe the major work scheduled, controlling Executing Activity and Ship's Force Key Events, PMT or TSRA testing, PMR jobs scheduled, alterations to be accomplished by the Executing Activity and Ship's Force, any other scheduled evolutions and 100-hour transition plans. This message should identify the current numbers of components due or overdue from the Calibration or Weight Test Recall Program.

3.7.1.3 Issue Availability Planning Response Message. No later than two weeks prior to the start of the MMP, the ship must certify readiness to transition to a MMP period, and address any concerns with the Availability Planning Message to TYCOM or ISIC per Appendix J. The following items must be addressed in the ship's report:

a. Schedule requirements such as action items from Availability Planning Message, schedule of key events, ability to conduct 100-hour transition plans.

b. Ship material preparation such as a report status of parts for Ship's Force work and desires for ISIC or TYCOM assistance in procurement and ensuring all outstanding CASREPs, SUBS, ZOZZS and TDENTS are identified in availability planning message.

c. Ship's Force integrated schedule such as miscellaneous programs (calibration, small valve maintenance, etc.), drills and trainers that will affect Ship's Force ability to support production work, preservation zones and planned maintenance (to include PMS, Reactor Plant PMS, and PMT K-MRCs).

d. CO's report of readiness or concerns: CO review items in sub-paragraphs "a" through "c" of this paragraph and availability planning message and report readiness and exceptions to transition to the MMP period.

3.7.1.4 Arrival Conference. This conference is conducted by the LMA. The purpose is to provide an executive level brief to the TYCOM or ISIC, Executing Activity, and ship's CO on the total scope of the CMAV effort and must be conducted as discussed in sub-paragraph "a" through "d" of this paragraph. Note that the Arrival Conference may be conducted in conjunction with the PB4M.

a. Attendees. The Arrival Conference is hosted by the responsible FMA and attended by the following personnel:

(1) LMA or ISIC Material representative(s).

(2) Executing Activity representative(s).

(3) Tended ship, (CO, Executive Officer, Chief Of the Boat, Department Heads, EDMC and Availability Coordinator).

(4) Site PMT or OIC.

b. Agenda. The following items comprise the agenda to be covered during the Arrival Conference:

(1) Introduction of key LMA, Executing Activity and ship personnel.

(2) MMP material and funding status.

(3) Review the MMP Key Event schedule for potential conflicts.

(4) Special evolutions scheduled during the availability.

(5) Validate that critical jobs to be accomplished by the Executing Activities and Ship's Force are properly sequenced in the IWS.

(6) Introduce the LMA representative as the single point of contact for all elements of the MMP, including responsibility for coordination of all Executing Activities and Ship's Force. This point of contact may be the Port Engineer, Project Manager, or Ship Superintendent, as applicable.

(7) Alterations to be accomplished.

(8) Significant material issues.

(9) Review status of outstanding DFS, as applicable.

(10) Results of arrival inspections and PMT or TSRA testing.

(11) Issue meeting schedule for the MMP.

c. Tended Ship Actions. The ship takes the following actions at this conference:

(1) Submit a list of key Ship's Force personnel, including officers, Leading Petty Officers, Work Center Supervisors, Quality Assurance Inspectors, Calibration Coordinator and Availability Coordinator.

(2) Verify that all known work candidates requiring outside assistance have been identified and work candidates submitted to the LMA or TYCOM (or submit known late work candidates for immediate screening).

(3) Discuss potential Executing Activity and Ship's Force work interface concerns.

(4) Identify Ship's Force or planned evolutions that could impact scheduled work and verify that they are properly sequenced in the IWS.

(5) Brief the Ship's Force plan for the K-MRC completion and ensure it is part of the integrated schedule per paragraph 3.4.13.1.e.

d. LMA or ISIC Actions. During this conference, the LMA or ISIC staff will take the following actions (if not already done):

(1) Review any late work candidates submitted by the ship per paragraph 3.4.6. If the late work presented require that other work be deferred, that work to be

deferred must be clearly understood. A Business Case Analysis described in Appendix E will be conducted.

(2) Brief the Key Events schedule for the availability. The ship's Key Events should normally be scheduled in the Pre-MMP or Availability Planning Message, concurred with by the ship's CO on arrival and input to the MDS by the LMA or ISIC prior to the Arrival Conference. CJs controlling the MMP completion must be identified for special management attention by the ISIC, LMA, Executing Activity and Ship's Force.

3.7.2 Major Maintenance Period Execution. MMPs are complex evolutions characterized by detailed management, closely coordinated LMA or ISIC, Executing Activity and Ship's Force work, systems testing, and other sequenced evolutions such as weapons movements, diver operations and training. Successful MMP execution requires the closest possible communication and coordinated efforts by the LMA or ISIC, Executing Activity and Ship's Force.

3.7.3 Major Maintenance Period Completion Procedures. The following procedures will be utilized for completing a MMP.

3.7.3.1 Management Reports Closeout Procedures. Upon completion of a scheduled availability, the MDS files must be updated to reflect the current status of work. To accomplish this goal and to ensure that all activities understand the status of all work, the following procedures will be followed:

a. Upon completion of the assigned work, the LMA or Executing Activity will present a copy of the work candidate or a list of completed JCNs with the applicable final action codes to the ship to obtain concurrence that the described work was completed. Ship's Force will complete all AWRs per reference (c). Within 2 weeks of completion, the Executing Activities who have performed any configuration change must submit the form 4790CK of reference (c) to Ship's Force for submission to Configuration Data Managers Database - Open Architecture.

b. Within four working days after the completion of MMPs, all work centers will ensure that final man-hours have been entered. The ship's superintendent may sign off all Executing Activity routines for the ship. Completed work candidates and AWRs will be a product of the MMP Departure and Assessment Conference of paragraph 3.7.3.2.

c. On the fifth working day after the completion of MMPs, the Maintenance Team will ensure that the CSMP ship and shore files reflects the current status of the ship's JCNs and request a Selected Job Management Report by priority for the ship.

d. On the sixth working day after the completion of MMPs, the ship's superintendent will annotate each incomplete JCN on the final Selected Job Management Report by JCN as to its present status and actions required in order to complete the item. Lead work centers must update this status into the MDS.

e. Within eighth working days after the completion of MMPs, the Executing Activity will forward copies of the annotated Selected Job Management Report to the ship and ISIC.

f. Within 25 calendar days after the completion of an availability, and prior to issuing the Departure and Assessment Report, the Executing Activity will have all JCNs for the availability closed.

g. Review status of outstanding DFSs.

3.7.3.2 End of Availability Departure and Assessment Conference. This comprehensive review and critique of the availability is another cornerstone of the continuous improvement policy regarding Fleet maintenance.

a. Purpose. The MMP Departure and Assessment Conference is held to:

(1) Review the conduct of the availability and identify those improvements necessary to increase the effectiveness of Fleet maintenance.

(2) Identify the work that was completed during this MMP and complete the appropriate documents (e.g., work candidates, AWRs, etc.) or produce the list necessary to update the ship's CSMP to reflect the completed work.

(3) Identify and reschedule to a future availability, the work deferred during this MMP.

(4) Identify any incomplete work candidates and plan of action to complete items.

(5) Establish the basic requirements (i.e., initial work package, sequence number and tentative dates) for the next MMP.

(6) Review status of outstanding DFSs.

b. Execution. The Departure and Assessment Conference will be held during the last week of the MMP at a time agreed upon by the Executing Activity Repair Officer or Production Officer and the ship. This meeting may be held in conjunction with the final weekly Management Conference or Progress Review.

c. Attendees. The Departure and Assessment Conference is arranged, coordinated and chaired by the LMA Repair or Production Officer. The following personnel must attend this meeting and participate in its agenda:

(1) ISIC Supply Materials, Weapons, Combat Systems, Electronics Material Officer, and Submarine Engineering Management, Monitoring and Fleet Maintenance Support Program Office or PMT Staff personnel (as applicable).

(2) LMA Repair Officer, Production Officer, and Ship Superintendent, or their designated representatives.

(3) Tended ship CO, Engineer and Availability Coordinator.

(4) Others as directed by the TYCOM, ISIC or Executing Activity CO.

(5) Executing Activity representatives.

(6) SWFLANT Representative.

d. Agenda. The following agenda must be used for reviewing and assessing the MMP. Additional items may be added at the discretion of the TYCOM, ISIC, Executing

Activity or ship. Attendees will be prepared to address their respective portions of the agenda.

(1) Review of the MMP work package to establish status of each item and, for items completed satisfactorily, complete the work candidate or AWR.

(2) Review incomplete work candidates that will remain open from this MMP and identify plan of action to complete these items.

(3) Identify and reschedule to a future availability the work deferred during this MMP.

(4) Assess the scheduling, execution and quality of work accomplished by each activity during the MMP.

(5) Assess the quality of general services provided by the Executing Activity site.

(6) Review recommendations for process improvements and possible LEAN initiatives.

(7) Assess lost time that prevented or delayed execution of scheduled work. (Lost time internal to the Executing Activity, e.g., waiting for transportation, assist work center, etc. and lost time caused by the ship such as waiting access, tagout, other Ship's Force support.)

e. Results. The LMA must consolidate the minutes of this meeting into the Departure and Assessment Report to the ISIC and provide a copy to the TYCOM and appropriate planning activity). The report must include:

(1) List of completed work, completed work candidates and AWRs for direct input into MDS to update the ship's CSMP and Configuration Data Managers Database - Open Architecture.

(2) Preliminary establishment of the next MMP.

(3) List of policies and processes identified as requiring review for improvement. Proposed process improvements and corrective actions suggested to improve the effectiveness of future MMPs.

(4) Lessons learned from the availability.

3.7.3.3 Fast Cruise or Sea Trials. The ISIC may schedule a one to two day Fast Cruise as part of the MMP Key Event schedule. This is normally the last major Key Event prior to MMP completion. As a minimum, the Fast Cruise agenda will include specified drills and evolutions necessary to re-establish proficiency in basic ship operations. It will also include sufficient formal testing to certify that the equipment and systems are fully ready to operate at sea in an operational environment. If the duration or complexity of the MMP is determined to be sufficient to warrant Sea Trials, the Ship, ISIC or TYCOM (as required by specific Force policy) must determine if a formal Sea Trial Agenda is necessary, and if required, task the RMC or ship to prepare a formal Sea Trial Agenda for ISIC or TYCOM approval.

3.7.4 Lessons Learned. Lessons Learned Conferences will be conducted. The Lessons Learned Conference will be within 30 days of completion of the availability. The Lessons Learned process is described in volume VI, chapter 39 of this manual. All key NSA, LMA, TYCOM or

his representative, Executing Activity, Maintenance Team, and SUBMEPP personnel must attend it. The agenda and details of the meeting must be determined by LMA and Maintenance Team and must be of appropriate length to evaluate the overall scope of the work accomplished. The Lessons Learned process provides the maintenance and modernization community with a process to identify, resolve, and provide feedback communication on barriers causing inefficiencies or waste within business processes. While there are several milestone meetings within the availability planning and execution process, the feedback process exists to continually collect information to improve processes.

NOTE: FOR RMC I-LEVEL PRODUCTION PERFORMANCE SUMMARY, RMCs ARE NOT REQUIRED TO COUNT TRANSIENT PERSONNEL AND OTHERS THAT ARE NOT ABLE TO TRULY ACCOMPLISH OR SUPPORT PRODUCTION WORK, YET ARE ASSIGNED TO I-LEVEL PRODUCTION SHOPS FOR SUPERVISION.

3.7.5. Activity Performance Summary. The Activity Performance Summary is a compilation of manpower statistics and production indices that are cumulative on a monthly basis. The following information summarizes the content and use of this report:

a. This report is produced weekly on a cumulative basis for the current month and analyzed by the Production Officer and Repair Officer. This analysis will help determine the relative accuracy and adequacy of the man-hour accounting for each work center. The data reflects how each work center is loaded with production work.

b. The Performance Summary provides management with data to determine the capacity of the activity for maintenance, and subsequent monitoring of the activity maintenance effort conducted on ships. The determination of activity capacity for ship maintenance is the gauge by which managers can evaluate activity productivity while reviewing the report of man-hour expenditures.

3.8 YEAR LONG CONTINUOUS MAINTENANCE. The CM is a single yearlong availability, for the period 01 October through 30 September, scheduled for each ship every fiscal year. The Year Long Continuous Maintenance (YLCM) availability is for the scheduling and completion of non-emergent work items that are not accomplished during any other scheduled availability.

3.8.1 Year Long Continuous Maintenance Planning. Planning sources and actions are similar to those for the CMAV. Since the continuous availability is a year long, it has no specific arrival date as a reference for the planning milestones. As a result, the milestone dates for the yearlong availability are consistent with those for the scheduled availability but are referenced to the planned execution date(s) of the work item(s). This approach for non-emergent work is intended to reduce premiums and waste for most work candidates by allowing the work to be planned, resourced with manpower and materials in a routine way. The submarine planning Milestones are included in Appendix B_1 or B_2. The definition of Executing Activity scope that takes place in the WPER of a CMAV does not occur in the YLCM availability as a discrete signal point. Rather LMAs should continuously define scope and schedule across the LMA and assigned Executing Activities at the times described in Appendix B_1 or B_2.

3.8.2 Year Long Continuous Maintenance Work Execution. During the execution period of work items in the YLCM availability, measures will be taken to ensure that Ship's Force, LMA and Executing Activities remain appraised of:

a. Status of work to be accomplished.

b. Identities of designated contact personnel.

c. Status of material and other resources.

d. Current schedule status.

e. Special Evolutions that may impact completion of the work items.

3.8.3 Continuous Maintenance Completion. At the end of the fiscal year, the availability will be entered as complete and a new availability established for the new fiscal year.

3.9 EMERGENT AVAILABILITY. The EM Availability is designed for work of such an urgent nature that the heightened risk of paying premiums is accepted and planning horizons are shortened. This type of availability is for C3 or C4 CASREPs, or a C2 CASREP with reasonable potential to become a C3 or C4 CASREP. These CASREPs are identified as emergent maintenance and ordinarily funded from emergent funds. The RMC Commander may, with the respective TYCOM's approval, convert Emergent Maintenance funds to execute CNO availability or CM in this regard. Emergent work will be scheduled to minimize premiums in as much as the operational schedule will permit. Generally, C2 CASREPs will be corrected using the CM Process where work is scheduled in the unscheduled Continuous Maintenance availability, a Window of Opportunity or a CMAV, which supports the ship schedule, need and policy objectives minimizing premiums paid and operational schedule impacts.

3.9.1 Emergent Availability Planning. Planning sources and actions are similar to those for the CMAV. In the case of the EM Availability, the milestone dates for the availability are not consistent with those for the scheduled availability and produce added risk of disruptions and payment of premiums. This risk is acceptable only because of the effect of the work on the mission capability of the tended ship. The definition of scope and schedule for emergent work occurs after the definition for both scheduled CMAV and unscheduled CM availabilities when Executing Activities may already be fully loaded and material may need extra effort to be expedited. Additionally, it may result in already scheduled work being deferred.

3.9.2 Work Execution. During the execution period of work items in the EM Availability measures will be taken to ensure that Ship's Force, LMA and Executing Activities remain appraised of:

a. Status of work to be accomplished.

b. Identities of designated contact personnel.

c. Status of material and other resources.

d. Current schedule status.

e. Special evolutions that may impact completion of the work items.

3.9.3 Availability Completion. Once the Ships Commanding Officer and ISIC determine that the Ship's mission capability has been restored, the LMA can certify the work and the ISIC can close the availability.

3.10 INTERIM DRYDOCKING OR PRE-INACTIVATION RESTRICTED AVAILABILITIES. A scheduled availability for repair activity accomplishment of specific maintenance items, such as URO MRCs. The availability, together with a Material Condition

Assessment per reference (g), can request that the CNO extend the ship's operating interval, operating cycle, or both. A Pre-Inactivation Restricted Availability (PIRA) is specifically used to extend the operating interval, operating cycle, or both, to the inactivation availability for the submarine. An Interim Drydocking (IDD) is specifically used to extend the submarine's operating interval, operating cycle, or both, to the next CNO scheduled availability other than an inactivation availability. Appendix K contains a list of Major Trial and Inspection Milestones for IDD and PIRA availabilities.

3.10.1 TYCOM or ISIC (Group or Squadron) Responsibilities.

a. Authorize new items and growth industrial work items.

b. Monitor and approve all changes in established milestones, not internal to industrial activity completion dates.

c. Issue direction when the quality or completeness of industrial activity work is in question.

d. Notify the TYCOM when essential Ship's Force work cannot be completed on the scheduled contract or Key Event completion date. Make recommendations for assistance where appropriate.

e. Periodically assess and monitor shipboard conditions during the availability.

f. Prior to Fast Cruise, the ISIC Quality Assurance Officer must conduct a formal audit of Ship's Force Re-Entry Control (REC) and DFS Records. Using the SUBMEPP PMR and URO MRC scheduling reports and current industrial activity and Ship's Force updates to the latest report, ensure all required "D"-Level PMR and URO MRC accomplishment is current. The ISIC must forward the audit results to the TYCOM via the cognizant Commander, Submarine Group. The ISIC will then report to the TYCOM by message per message sample format of Appendix L the status of the crew and material certification. An update of this certification is needed prior to Sea Trial and following the rescinding of certification noted in paragraph 3.9.9.

g. Conduct a material inspection of the ship prior to Fast Cruise.

3.10.2 Certification Availabilities (Less Than Six Months).

a. Duties and Responsibilities for Sea Trials and Inspections. Reference (f), as applicable, delineates the TYCOM's responsibility for operational control of assigned submarines during trials and for assuring that the crew and ship have attained satisfactory state of training, administrative, operational and material readiness for at-sea operations during the trials. Appendix M provides a sample ship message to ISIC and TYCOM concerning material certification upon completion of sea trials.

b. General Instructions for Industrial Activity Availability Trials and Inspections.

(1) Fast Cruise may not commence until Dock Trials have been satisfactorily completed and a satisfactory state of crew training (if required) and material readiness (if required), as delineated by this manual, has been certified. The required inspections and tests and their associated time periods may be modified by the TYCOM upon request from the cognizant ISIC.

(2) Sea Trials involving escorts will not normally be scheduled to commence on a weekend. When circumstances are such that Sea Trials must be rescheduled or planned to commence on a weekend to avoid costly delays, TYCOM approval will be obtained by the ISIC.

(3) Critical operation of reactors while nuclear powered ships are in a naval or commercial industrial activity will be governed by reference (h). The CO may authorize critical operation of the reactor in support of tasks assigned the ship. However, as long as the ship remains in an industrial activity, the CO will notify the Supervising Authority well in advance of any critical operation of the ship's reactor. This notification must include the nature and duration of such operations.

(4) In conducting the inspections required herein, inspectors will be guided by the concept that at the start of Fast Cruise, the ship will be, in all respects, ready for Sea Trials with the exception of the additional training the crew will receive during the Fast Cruise.

(5) The requirement for TYCOM SUBSAFE certification of SUBSAFE, SOC and FBW certification of work not performed by the industrial activity and the material readiness upon completion of an industrial activity availability imposes additional responsibilities on the ISIC inspectors. Included in the material inspection will be a review of all outstanding Forces Afloat DFS as defined in volume V, part I, chapter 8 of this manual. A review of the Ship's Force REC or CWP Records is necessary for SUBSAFE, SOC and FBW work accomplished by Forces Afloat per volume V, part I, chapter 5 of this manual, along with a review of the applicable URO MRC status.

(6) The ISIC certification message, per Appendix L, will also provide a status report of any outstanding Re-Entries, Forces Afloat DFS and delinquent URO MRCs. The scope and nature of this inspection will vary dependent upon the extent and length of the availability. In this regard:

(a) Material certification may be made subject to the correction of specific deficiencies. (Deficiencies are such that they can be readily identified and listed).

(b) Material certification will be postponed to a later date when deficiencies are so significant or so numerous as to preclude correction in the time remaining before the scheduled start of Fast Cruise.

(c) Deficiencies that could affect the safe operation of the ship during Sea Trials must be corrected, reinspected and reported to the TYCOM as having been corrected prior to the start of Fast Cruise.

(7) Inspectors must determine that all work and testing necessary to support Sea Trials has in fact been completed or identified for completion prior to the start of Fast Cruise including the following:

(a) All ship's systems which affect safe operation during Sea Trials must be operable.

(b) All work necessary for safe operation of the ship during Sea Trials which was undertaken by the industrial activity, Ship's Force, FMA, or other outside activities must have been satisfactorily completed and tested. Included must be a check for any special configuration or installations ensuring that they have been authorized by the proper authority, that their impact has been fully assessed and that the Sea Trial Agenda includes these impacts or limitations.

(8) Following the completion of the required training and material readiness certification, COs must keep the cognizant ISIC fully informed of any changes in personnel, training or material status which could affect the validity of certification. Prompt TYCOM notification is required to permit revision or Operational Orders and services required.

(9) Underway trials following IDDs or PIRAs, particularly initial submerged and test depth trials, must be undertaken with the knowledge that the crew lacks recent experience operating as a unit and that the ship's structure and fittings have not been tested in an at-sea environment. All tests and procedures must be conducted carefully and methodically. Systems and components designed to operate at test depth will not be demonstrated at that depth for the sole purpose of proving the design, but instead will be operated at the deepest depth at which they might be used. For example, the hovering system will not be demonstrated at test depth. Trials and tests which are inherently hazardous will not be conducted.

(10) A schedule is required for each underway, dockside or simulated trial. Prerequisites of the first underway period are satisfactory ship's material condition as shown by the successful completion of alongside tests, Distressed Submarine and Salvage Inspection, Ship's Force Dock Trial, and a satisfactory state of training as shown by the successful completion of crew certification inspection and Fast Cruise. Fast Cruise deficiencies affecting safe operations revealed in either material conditions or state of training must be corrected prior to getting underway for Sea Trials.

(11) The trial schedule must include a minimum of six hours of Individual Ship Exercises (ISE) for Ship's Force training. This ISE will be sequenced as soon as practical after the initial tightness dive and will include the necessary evolutions to allow each watch section ship control party to familiarize themselves with their assigned stations and duties. The ship will be operated at moderate speed to develop proficiency prior to the deep dive and full power run Testing may be scheduled during the ISE period on a not-to-interfere basis with training. The time spent in the initial tightness dive, if at moderate speed, may be included as one section's training. The requirement to provide each watch section ship control party with about two hours experience submerged at moderate speed prior to the deep dive and full power run is mandatory for ship's safety.

(12) All trial periods must be organized such that each member of the command has an opportunity to get six uninterrupted hours of rest during each 24-hour

period encompassed by the trials. Sea Trial events which can be accomplished by normal watch sections may be conducted concurrently with crew rest periods.

(13) Prior to getting underway for Sea Trials, Shipyard, Ship's Force and Type Commander must jointly agree that the required seven-day supply of Oxygen (O2) and seven day supply of Carbon Dioxide removal capacity will be available in each compartment, based upon the number of expected occupants of that compartment, independent of the supply and removal capacity in the other compartment(s).

(14) After the conclusion of Sea Trials, the submarine must not be operated at depths greater than ½ Test Depth plus 50 feet, unless specifically authorized by the TYCOM, and must not be released for unrestricted operations until all RECs are closed and the TYCOM issues the unrestricted operations authorization message.

(15) After the conclusion of Sea Trials, and based upon a review of Sea Trial deficiencies and TYCOM authorization, the submarine may transit to a port other than the industrial activity.

3.10.3 Operating Depth Policy. The TYCOM's policy with respect to maximum allowable operating depths during trials, evolutions to be performed at the various depths, and the prescribed maximum water depth applicable in each case is stated in volume VI, chapter 26 of this manual. In every instance where the maximum authorized operating depth is exceeded, a report must be made per reference (i), section 3.3.5.c.

3.10.4 Propulsion Plant Tests (If Required). For full power trials provisions of reference (j), Section 6 applies. Submarine depth during the submerged full power trial will be consistent with the applicable Submerged Operating Envelope (SOE), based on the Emergency Main Ballast Tank (EMBT) blow from maximum authorized operating depth being previously accomplished. The full power submerged ahead test for commissioned nuclear powered submarines must be terminated by a back emergency bell. The duration of the back emergency must be limited to 45 seconds, to be followed immediately by an appropriate ahead bell. Caution must be exercised to avoid developing stern way.

3.10.5 Phase II Crew or Material Condition Inspection. A Phase II Crew Certification Inspection is normally not required, but will be determined on a case basis by the parent ISIC. If there will be less than 15% personnel turnover, crew certification may be waived. If the CO determines that alterations accomplished or the transfer of experienced personnel warrant a crew certification, a formal request must be submitted to the ISIC. When required, crew certification will be performed per references (k) through (o). The material certification consisting of an ISIC audit of all Ship's Force SUBSAFE work per volume V, part I, chapter 9 of this manual will need to be conducted for all industrial activity availabilities since the extent of the availability is such that an independent evaluation by an organization other than Ship's Force is required.

3.10.6 Pre-Critical Inspections. For availabilities where the reactor will be shut down for 16 weeks or more, it is considered prudent to use an inspection plan similar to that employed by NAVSEA. Normally, the crew's readiness can be assessed within two days using such a plan, which should encompass the following:

a. An administrative review.

b. Observation of basic drills and evolutions not requiring reactor operation.

c. Personnel interviews.

d. Material inspection.

3.10.6.1 Scheduling of Pre-Critical Inspections. The ISIC Pre-Critical Inspection will be scheduled by the responsible ISIC about four weeks prior to criticality. The TYCOM will be advised as soon as possible in advance of the tentative date for the ISIC Pre-Critical Inspection and confirmed dates will be established about one month in advance of the inspection.

3.10.6.2 Composition of the Inspection Team. The Pre-Critical Inspection Team should consist of:

a. A nuclear-trained member of the cognizant ISIC Staff, usually the Squadron Training Officer.

b. A qualified nuclear-trained officer with experience as an Engineer Officer.

3.10.6.3 Reports of Inspection.

a. The Senior Inspector will provide the inspected unit with an informal report of findings by the inspection team, copy to the cognizant ISIC and TYCOM.

b. The ship's CO must review the findings of the inspection team and make necessary adjustments to his training program to ensure his crew's readiness for criticality. The CO must keep the cognizant ISIC advised of his training plan and his assessment of his crew's progress.

c. The cognizant ISIC must review the inspection findings, the CO's training plan and progress evaluations and direct follow-up reviews and inspections necessary to verify the ship's readiness for criticality.

3.10.7 Dock Trials. Dock Trials must, as a minimum, test those systems and equipment repaired or altered during the availability. The CO will use Appendix N as a guide in preparing the Dock Trial Agenda.

3.10.8 Fast Cruise. Fast Cruise may commence immediately upon completion of Dock Trials and must consist of the minimum requirements as set forth in Appendix O. The requirement for a Fast Cruise may be less than or greater than 24 hours in length depending upon the length of the availability and the time since the crew last operated the ship at sea. The CO, with ISIC concurrence, will determine length of the Fast Cruise. Prior to the ship commencing Fast Cruise, the Supervising Authority must report to the ship, by message, that all mandatory work approved for accomplishment during the availability is completed. When the ship is ready for sea, with the exception of conducting Fast Cruise and after receipt of the SUBSAFE material certification report from the performing activity as required by reference (l) and volume V of this manual, the ship will request permission from the ISIC by priority message to commence Fast Cruise. The ISIC will then, if satisfied with the state of crew training and material readiness, authorize the ship to commence Fast Cruise by message, information copy to CNO, Fleet Commander, NAVSEA, and the TYCOM.

a. A 24-hour rest and repair period will normally be scheduled following Fast Cruise and prior to the start of Sea Trials. This rest and repair period may be extended or reduced at the discretion of the ISIC.

b. COs should consider the work and alterations accomplished during the availability when determining the extent of the Fast Cruise. The minimum requirements are listed and identified with an asterisk in Appendix O.

3.10.9 Sea Trials. Following completion of Fast Cruise, the ISIC will notify the TYCOM of satisfactory completion of Fast Cruise and readiness for Sea Trials using the message format of Appendix P. The submarine TYCOM will authorize the ISIC to allow the ship to get underway for Sea Trials using the message format of Appendix Q. Sea Trials are required only as necessary to test work completed during the availability but must include those mandatory requirements identified in Appendix R. The industrial activity must include at least two days in the availability for conduct of Sea Trials. The industrial activity must prepare a Sea Trial Agenda for Sea Trials conducted after an availability at the industrial activity. For an availability at a FMA, the submarine must prepare the Sea Trial Agenda, assisted by the industrial activity. The submarine involved must submit the Sea Trial Agenda to the ISIC for approval, with an information copy to the TYCOM. During the Sea Trial, the submarine CO will keep the TYCOM aware of the progress of the Sea Trial through periodic Situational Reports using the message format of Appendix S. The frequency of these Situational Reports will be identified by the TYCOM or the Sea Trial Agenda. Extensions or reductions of the Sea Trial period may be granted where warranted by the scope of the work accomplished. Where extension of the Sea Trial period and a change in the availability schedule is required, requests for such extensions must be submitted by the industrial activity to the TYCOM as early as practical. All deficiencies resulting from Sea Trials will be satisfactorily resolved prior to the completion of the availability. If no Sea Trial deficiencies are found, the availability may be completed with TYCOM occurrence at the completion of Sea Trials.

NOTE: SUBSEQUENT TO THE MESSAGES, APPENDICES O AND S, ANY DEFICIENCY DISCOVERED AND THE CORRECTIVE ACTION TAKEN WHICH AFFECTS THE WATERTIGHT INTEGRITY, THE RECOVERABILITY OF THE SHIP, THE OPERATIONS OF THE SHIP'S CONTROL SURFACES OR THE SHIP'S SALVAGE CAPABILITY MUST BE REPORTED TO THE TYCOM BY THE SUPERVISING AUTHORITY, ISIC OR TYCOM REPRESENTATIVE BY MESSAGE. PREVIOUS CERTIFICATION MESSAGES MUST BE SUSPENDED. WHEN A REVIEW OF THE DEFICIENCY IS COMPLETED BY THE TYCOM, THE TYCOM WILL CERTIFY THAT THE SHIP'S SUBSAFE CERTIFICATION BOUNDARY IS SATISFACTORY FOR SEA TRIALS TO A SPECIFIED DEPTH.

a. Assignment of Escort Ship.

(1) Per reference (m), an escort must be provided during deep dive submergence trials for ships completing an availability for repair of collision or grounding damage where deformation is observed to be in the hull integrity envelope or supporting structure.

(2) Per reference (m), the requirement for providing an escort during deep dive submergence trials upon completion of all other availabilities will be evaluated by Commander, NAVSEA on a case basis. Commander, NAVSEA will advise the applicable Submarine Force Commander in writing whether or not an escort will be required based on the scope of work in the availability. In general, an industrial activity availability of less than six months duration should not require an escort, since the work typically performed in these availabilities is limited in scope, is carefully controlled and, therefore, does not result in substantial risk of unidentified or incomplete work adversely affecting the SUBSAFE boundary.

(3) Escort requirements will be determined early so that an escort satisfying the requirements of part I, chapter 3, of this volume can be scheduled if required. The TYCOM will in turn request services from the Fleet Commander as applicable. As a general rule, pressure hull work which could not affect hull circularity will not require an escort.

(4) Waiver of escort requirements may be requested by message when necessary. The ISIC will request the waiver as soon as possible. The TYCOM will pass the request to Commander, NAVSEA for approval. An escort waiver request message is to include all of the following specific statements, as applicable:

(a) A ( ) inch by ( ) inch hull cut between frames ( ) and ( ) including a ( ) inch section of frame ( ) was the only major hull integrity work accomplished during the availability. If no hull frame cut was made, a positive statement to that effect is required.

(b) The hull cut weld satisfactorily passed Radiographic Testing and 7-day Magnetic Particle Testing nondestructive tests.

(c) Post repair frame circularity check readings are within specifications.

b. Assignment of Deep Submergence Rescue System during Submarine Sea Trials.

(1) A Submarine Rescue Diving Recompression System will be placed in a modified alert status at the beginning of Sea Trials requiring an escort following an industrial availability or major maintenance availability for:

(a) Ships initial tightness and deep dive events.

(b) Subsequent Sea Trials until the completion of the initial dive to design test depth.

(c) If, in the TYCOM's judgment, a Sea Trial requires an escort due to major hull cuts.

(2) The ship conducting Sea Trials will notify COMSUBRON ELEVEN when Submarine Rescue Diving Recompression System services are no longer required due to completion of the events in paragraph 3.9.9 or due to delay in completing Sea Trials.

c. The ship's normal load out of Lithium Hydroxide canisters for Disabled Submarine (granular or ExtendAir®, no mix), Lithium Hydroxide curtains (or ExtendAir®

Deployment kits, if equipped), Emergency Air Breathing masks, Submarine Escape Immersion Ensemble suits and oxygen candles is not sufficient to support this increase in personnel. Therefore, an additional four Lithium Hydroxide canisters (or three ExtendAir®, if equipped), four Lithium Hydroxide curtains (or one ExtendAir® Deployment kit for every multiple of 60 ExtendAir® canisters in the compartment, if equipped), one Emergency Air Breathing mask, one Submarine Escape Immersion Ensemble suit and two Oxygen candles must be carried for each rider exceeding normal crew manning. Stowage of this additional equipment for Disabled Submarine must be in the same escape compartment as the rider's designated General Emergency muster site assigned by the Commanding Officer. Lithium Hydroxide canisters, Emergency Air Breathing masks, Submarine Escape Immersion Ensemble suits and Lithium Hydroxide curtains are to be obtained from the industrial activity.

3.10.10 Interrupted Sea Trials. In the event a Sea Trial is interrupted, or an additional Sea Trial becomes necessary, the following requirements are to be met. These requirements must be invoked if the ship returns to port for industrial activity repairs which affect SUBSAFE certification or which will require at-sea testing.

a. The submarine will draft a revised Sea Trials Agenda to support resumption of the trials. This agenda must be provided to the ISIC for concurrence and TYCOM for information.

b. Ship's Force will report by message (format of Appendix T) that Ship's Force is ready for follow-on sea trials.

c. The ISIC must report by message (format of Appendix U) to the TYCOM that the material condition of those SUBSAFE Certification boundaries that were installed, repaired or tested by Ship's Force is satisfactory for resuming Sea Trials.

d. Upon completion of all of the requirements in paragraphs 3.9.10.a. and b., the TYCOM will provide a message (Appendix V) to the ISIC granting permission to proceed with the conduct of Sea Trials and authorize the ship to dive to the Sea Trial operating depth.

APPENDIX B_1

AVAILABILITY MILESTONE SCHEDULE - CMAV

(SSNs and SSGNs ONLY)

NOTE STANDARD MILESTONES SHOWN IN THIS TABLE WILL BE MODIFIED BY THE MAINTENANCE TEAM (USING AN MOA OR OTHER SIMILAR CORRESPONDENCE) FOR CMAVS WITH A PLANNED DURATION OF GREATER THAN 120 DAYS, IN ORDER TO ENSURE SUFFICIENT PLANNING TIME IS AVAILABLE FOR EXTENDED CMAVS. PROPOSING AND FINALIZING THIS MAINTENANCE TEAM AGREEMENT NLT A-270 IS AN ISIC RESPONSIBILITY.

* Times are in days

NO.	MILESTONE	Responsible Activity	Scheduled CMAV *	Year-Long CM *	Remarks
1	Identify drawing development assignments, including Class Drawings.	PARMs, TYCOM, NAVSEA	A-390	NA	Send to RMC and Planning Yard.
2	Assign drawing development responsibility.	PEO Ships	A-390	NA	
3	Issue Hull Modernization Plan (HMP) and Letter Of Authorization AITs.	SPM, NAVSEA, TYCOM	A-360	NA	HMPs to be issued in March each year to maintenance Teams. Letter of Authorizations will be posted at A-360.
4	Request Availability Funding for planning repair work.	NSA	A-345	NA	This provides funds for early executor planning.
5	Task and Fund SID Development.	SPM, NSA, AIT, TYCOM, RMC Manager	A-330	NA	
6	Screen CMP and TYCOM routines.	TYCOM	A-270	NA	Push CMP work items to CSMP NOT LATER THAN A-270.
7	Issue and Deliver SIDs to NSA for contractor(s) and AITs.	Planning Yard	A-180	NA	This is a change from A-4. Including all SIDs for AITs. For FFP contracts, this milestone should occur at A-8 when possible and NOT LATER THAN A-180.
8	Request Availability	NSA or RMC	A-180	NA	

NO.	MILESTONE	Responsible Activity	Scheduled CMAV *	Year-Long CM *	Remarks
	Funding for both repair & modernization work.				
9	All Modernization Risk Assessments (including waivers) submitted.	PARM SPM TYCOM	A-175	NA	
10	All Modernization Risk Assessments (including waivers) approved.	TYCOM	A-150	NA	
11	Identification of AIT support and schedule impact requirements.	AIT Manager	A-135	NA	A-168 for FFP or IDIQ.
12	Ship checks completed for alterations.	Planning Yard	A-90	NA	No FFP considerations relate to this date.
13	Provide Incremental Funds for ordering Long Lead Time Material for both repair and Alt or mod work to meet required dates.	SYSCOM or TYCOM	A-90	NA	
14	Award AIT contracts for work not being done by prime contractor.	AIT Sponsor	A-90	NA	
15	Solicit Bids.	RMC	NA	NA	A-50 for FFP or IDIQ. If CMAV is to be performed under an IDIQ contract and is over $500k RMC may need to add 30 days for solicitation per Fair Value purchasing policy. This would reset the CMAV solicit bid milestone to A-70.
16	Review PMR and URO requirements and ensure all maintenance actions intended for accomplishment during the availability are identified.	ISIC	A-60	NA	
17	Review CSMP and ensure all deferred maintenance actions intended for accomplishment during the	Maintenance Team	A-50	NA

	availability identified by priority and submit to the TYCOM or ISIC.				
18	Conduct Pre-CMAV Planning Board for Maintenance	Maintenance Team	A-50	NA	And at the start of each Fleet Response Training Plan
19	Provide Availability Funding for Modernization to the RMC or LMA.	SYSCOMS, PEO, TYCOM	A-45	NA	Includes funding for AITs support services.
20	Review PMS, Reactor Plant PMS, CSMP, and testing requirements and ensure all Ship's Force maintenance actions scheduled for accomplishment during the availability are identified. Ship's Force review K-MRC data with PMT, TYCOM 3M representative and ISIC to develop K-MRC Completion Plan for submission to integrated work schedule.	Maintenance Team	A-40	NA	See Paragraphs 3.4.13.1 and 3.6.1.2.m.(13) of this chapter.
21	Review TYCOM Alteration Management System or NMP and ensure all authorized alterations intended for accomplishment during the availability are identified by priority based on material availability as identified by the LMA.	TYCOM	A-40	NA	
23	Review CSMP T/A 2 items. Identify and order LLTM.	FMA	A-40	NA	
24	I-Level work package fully brokered.	Maintenance Team and Ship's Force	A-40	E-14	Intent is to fully broker all known work to I-Level by this date. This allows for routine procurement of materials and brokering

NO.	MILESTONE	Responsible Activity	Scheduled CMAV *	Year-Long CM *	Remarks
					of work candidates to other Executing Activities if necessary.
25	Establish funding targets for budgeting purposes for the availability.	Funding Activity	A-40	NA	
26	Review the availability work package, begin writing FWPs and TWDs, identify critical jobs and develop the integrated work schedule to aid in tracking and coordination of all work.	LMA	A-40	E-14	
27	100% of D-Level maintenance work package 2Ks planned, estimated.	Planning Activity	A-35	E-14	A-60 for FFP or IDIQ.
28	Supporting activities submit work scope, testing requirements, and timelines to LMA for integration in to overall schedule	Maintenance Team	A-35	NA	Include NRMD, AITs, KTR
29	I-Level work package fully accepted.	Planning Activity	A-33	E-14	Intent is for I-Level to accept or reject all work brokered to it up to this point in time, work entering later in the process will be subject to normal Business Case Analysis. At this point the I-Level activity work has been locked. Any remaining work will be re-brokered to another Executing Activity, rescheduled or returned.
30	100% of maintenance work D-Level package 2Ks locked.	Maintenance Team	A-30	E-7	A-60 for FFP or IDIQ.
31	Develop recommended Key Events schedule and present to ISIC, Ship's	LMA	A-30	NA

APPENDIX B4

AVAILABILITY MILESTONE SCHEDULE - MMP

(SSGNs ONLY)

* Times are in days

NO.	MILESTONE	Responsible Activity	MMP	Remarks
1	Establish and Confirm Availability Dates.	TYCOM and Project Team	A-395	
2	Review CSMP and ensure all deferred maintenance action intended for accomplishment during the availability are identified by priority and submit to the TYCOM or ISIC.	Maintenance Team	A-395	
3	Review PMS, Reactor Plant PMS, CSMP, and testing requirements and ensure all Ship's Force maintenance actions scheduled for accomplishment during the availability are identified.	Maintenance Team	A-395	Include all required K-MRC.
4	Identify major nuclear maintenance actions scheduled for accomplishment during the availability.	NAVSEA and TYCOM	A-395	Preliminary list. Finalize during planning process.
5	Review TYCOM Alteration Management System or NMP and ensure all authorized alterations intended for accomplishment during the availability are identified by priority based on material availability as identified by the LMA.	TYCOM	A-395	
6	Issue Modernization Planning Letter.	NAVSEA	A-.395	
7	Identify DIRSSP alterations and work.	DIRSSP	A-365	
8	Identify Missile Tube reconfiguration actions for the availability.	ISIC	A-365	
9	Provide Preliminary Issue Availability Work Package to NAVSEA, TYCOM, NSSC, ISIC, Project Team.	SUBMEPP	A-365	
10	Conduct Preliminary Planning Meeting (TYCOM, NSSC, ISIC, Project Team).	SUBMEPP and Project Team	A-330	TYCOM may elect to conduct meeting with just Project Team and NSSC.
11	Review PMR and URO requirements and ensure all maintenance actions intended for accomplishment during the availability are identified.	Maintenance Team	A-330	
12	Perform JCN call down for the availability.	SUBMEPP	A-310	To be done based on results of Preliminary Planning Meeting.

NO.	MILESTONE	Responsible Activity	MMP	Remarks
13	Review CSMP T/A 2 items. Identify and order LLTM.	LMA	A-300	
14	Work package fully brokered.	Maintenance Team	A-300	All jobs currently planned for execution during the availability.
15	Begin writing FWPs, TWDs and TGIs, identifying critical jobs and developing the integrated work schedule.	LMA	A-300	
16	Provide Initial Issue Availability Work Package.	SUBMEPP	A-300	
17	Work package fully accepted.	LMA	A-210	All known work, expect Ship's Force to submit 2-Kilos until WSCO.
18	Conduct Initial Planning Meeting (IPM) to review the availability Work Package.	SUBMEPP	A-180	IPM conducted based on TYCOM guidance.
19	Supporting activities submit work scope, testing requirements and timelines to LMA for integration into overall schedule.	Maintenance Team	A-180	Includes NRMD, AITs, KTR.
20	Issue Post Initial Planning Meeting Availability Work Package.	SUBMEPP	A-150	
21	MOAs submitted to LMA.	AIT Managers	A-120	
22	Review scheduled PMT inspections and testing that may result in significant new work or that may impact scheduled work.	ISIC	A-120	
23	Develop weapons and sail arrival Inspection plan.	LMA	A-120	
24	Develop recommended Key Event schedule and present to ISIC and Ship's Force.	LMA	A-120	
25	Perform risk assessments and verify deliverables O-Level and I-Level work items and AIT schedule requirements to LMA	LMA	A-120	
26	Provide risk assessment to LMA.	NRMD	A-120	
27	Issue Risk Assessment letter to TYCOM.	LMA	A-75	
28	Conduct Work Package Execution Review (WPER) or Final Planning Meeting (FPM)	LMA	A-60	Agenda for meeting will be negotiated between LMA and TYCOM.
29	Issue availability planning message	LMA	A-30	
31	Work Submission Cutoff established	LMA	A-30	Begin processing all new work as "late work". May move milestone to correspond to first day after the ship can communicate following alert.
32	Develop strategy for LMA and Ship's Force calibration of gages, instruments, and tools	Maintenance Team	A-10	

NO.	MILESTONE	Responsible Activity	MMP	Remarks
33	Identify to RMC, ISIC, TYCOM and SUBMEPP (as applicable) rejected work candidates.	LMA	A-7	Rejected work candidates will be identified by the WPER or IPM if possible.
34	Issue availability planning response message	Ship's Force	A-7	Per Appendix J
35	Conduct Readiness to Start Conference	Maintenance Team	A-7	Includes TYCOM, NSSC, ISIC, NRMD, Shipyard.
36	Commence first 100-hour plan	Maintenance Team	A-0	
37	Conduct Arrival conference	LMA	First Week	Conducted during first senior management meeting after A-0.
38	Complete first 100-hour plan	Maintenance Team	A+5	
39	Conduct Progress Review	Maintenance Team	WEEKLY	
40	All Production Work Complete	Maintenance Team	C-4	
41	Complete Availability	Maintenance Team	C+0	
42	Conduct Departure and Assessment Conference	LMA	C+0	
43	Close out JCNs for availability	LMA	C+25	
44	Issue Departure and Assessment Report, Job Management Availability or End of Availability Report as applicable	LMA	C+30	Provide copy to TYCOM, SUBMEPP.
45	Conduct Lessons Learned	LMA	C+30	
46	Issue Final Availability Work Package	SUBMEPP	C+180	Final AWP will be only published electronically on SUBMEPP website

APPENDIX E

BUSINESS CASE ANALYSIS TOOL

To use this tool, first analyze the safety and mission impact of the damage to be repaired using Table 1. Determine the Hazard-Mission Index. Then consider the impact on schedule and cost using Table 2 and obtain the Cost - Schedule Index. On the next sheet, select the appropriate CO Modifier and sum the indices to obtain the Risk Index. Determine indicated action from the Business Case Analysis Table.

Table 1 - Hazard Severity and Impact to Mission

	Hazard Severity			
Impact to Mission	Catastrophic	Critical	Major	Minor
Frequent	1	1	3	6
Probable	1	2	4	7
Occasional	2	3	5	8
Remote	3	4	6	9
Improbable	5	5	7	10

Table 2 - Cost Severity and Impact to Schedule

	Cost Severity			
Impact to Schedule	Extreme	Significant	Major	Minor
Frequent			7	4
Probable			6	3
Occasional		8	5	1
Remote	7	6	4	1
Improbable	5	3	2	1

Impact to Mission Likelihood		Impact to Schedule Likelihood	
Description	Explanation	Description	Explanation
Frequent	Likely to adversely impact mission, operation of ship, ship's future schedule or critical systems regularly. Work to rectify this deficiency must be undertaken at the first opportunity.	Frequent	The undertaking of the work or combination of availability of Long Lead Time Material and Work Completion WILL delay the schedule greater than 5 working days.
Probable	Could adversely impact mission, operation of ship, ship's future schedule or critical system several times. Work to rectify this deficiency will be programmed in the current availability.	Probable	The undertaking of the work or combination of availability of Long Lead Time Material and Work Completion COULD delay the schedule greater than 2 working days.
Occasional	Unlikely, but could be reasonably expected to adversely impact mission, operation ship, ship's future schedule or critical system occasionally. Work to rectify this deficiency will be considered during the current availability depending upon schedule and cost.	Occasional	The undertaking of the work or combination of availability of Long Lead Time Material and Work Completion COULD BE REASONABLY expected to delay the schedule not greater than 2 working days.
Remote	Unlikely, but could possibly impact mission, operation of ship, ship's future schedule or critical system at some time. Work to rectify this deficiency will be considered and programmed to meet the ship's operational schedule.	Remote	The undertaking of the work or combination of availability of Long Lead Time Material and Work Completion is UNLIKELY BUT POSSIBLE to delay the schedule.
Improbable	So unlikely that there will be no adverse impact to mission, operation of ship, ship's future schedule or critical system. Work to rectify this deficiency will be programmed in due course.	Improbable	The undertaking of the work or combination of availability of Long Lead Time Material and Work Completion is SO UNLIKELY to delay the schedule it can be assumed it will not affect schedule.

Hazard Severity if Work Not Undertaken		Cost Severity Impact	
Description	Explanation	Description	Explanation
Catastrophic	Failure of System could result in total loss of ship or critical system. Resultant damage would be beyond economical repair.	Catastrophic	The increase in cost due to Growth & New Work, delay to start of work, cost or availability of material is so great that it either represents funding that would need to be sourced from another activity, or it constitutes a G&NW premium of 60% or higher.
Critical	Failure of System could result in significant damage to the ship or critical system. Resultant damage would require intervention of support agency. Usually damage to Primary structure or Water Tight Integrity.	Critical	The increase in cost due to Growth & New Work, delay to start of work, cost or availability of material, represents a very large increase that it either can be covered in the existing budget plan but would adversely impact the remaining financial plan or it constitutes a G&NW premium of 40% to 60%.
Major	Failure could result in the temporary loss or deterioration of the system requiring repair action.	Major	The increase in cost, while large, is either able to be covered inside the existing budget plan with little impact to the remaining financial plan or it constitutes a Growth & New Work premium of 20% to 40%.
Minor	Failure could result in the need for minor defect repair action, continued operation without significant loss of output is possible.	Minor	The increase in cost is very small and is either able to be covered inside the existing budget plan with no impact to the remaining financial plan or it constitutes a Growth & New Work premium of 0% to 20%.

Commanding Officer's Concern	CO's Top 5	Subtract 2
Commanding Officer's Concern	Concerned	Subtract 1
Commanding Officer's Concern	Not Concerned	Subtract 0

Business Case Analysis (Table 1 + Table 2 + CO's Concerns) = Risk Index			
Risk Index	Relative Level of Risk	Decision	Amplifying Comments
Less than 10	Low	MT continue	Represents work that is either a safety concern or mission critical, or is relatively low cost and no impact to schedule.
10 - 14	Med	MT reschedule or conduct more rigorous BCA	Represents work that is either of reasonably high cost or a high risk to schedule impact, or of little to no safety or mission critical concern. This work should either be rescheduled, cancelled, or subject to a more comprehensive BCA.
Greater than 14	High	MT reschedule or cancel	Represents work that is either of high cost or extreme schedule impact, or of little to no safety or mission critical concern.

APPENDIX F

CMAV KEY EVENT CODES

(BASED UPON TYPICAL MINIMUM 21 PRODUCTION DAY SCHEDULE)

EVENT #	KEY EVENT	SCHEDULING GUIDANCE
1	ARRIVAL

APPENDIX N

DOCK TRIALS GUIDELINES FOR IDD OR PIRA AVAILABILITIES

1. Dock Trials. Ship's Force Dock Trials provide the opportunity to test and check out systems, components and portable equipment prior to the Fast Cruise training period simulating underway conditions. Although normally a period of one day is assigned for integrated Ship's Force Dock Trials, tests and evolutions performed in the one to two weeks prior to the Dock Trial date may be accepted by the CO as fulfilling the requirements of this paragraph. The purpose of Dock Trials is to afford the ship an opportunity to demonstrate that major systems and equipment is in fact ready to support Sea Trials. It is expected that individual equipment will have been satisfactorily tested prior to commencement of the integrated operational tests afforded by Ship's Force Dock Trials.

1.1 Supervising Authority. The industrial activity may desire to conduct machinery checkouts, or system checks prior to the Ship's Force Dock Trials in order to test the propulsion plant or other ship's systems. In order to support these evolutions, close liaison between the ship's CO and the industrial activity will be required. For these evolutions, completion of repairs or modifications to all ship's systems are not required except for those systems which directly support the proposed tests.

1.2 Scheduling of Tests. The scheduling of Ship's Force Dock Trials is flexible. Ship's Force Dock Trials may be scheduled by mutual agreement between the ship and the supervising authority but must take place prior to certification of crew or material readiness with adequate time allowed for collection of deficiencies discovered during the Ship's Force Dock Trials. Preparation of the agenda and schedule for the Dock Trials is the CO's responsibility.

1.3 Extent of Trials. Ship's Force Dock Trials are conducted by the Ship's Force and are normally unhampered by repair work. This applies to the entire ship not just the propulsion plant. The trials may be witnessed by the industrial activity.

1.3.1 Tests. The term test must include, where applicable:

a. The review and use of a procedure for correct line-up, starting, operation and securing of systems or equipment.

b. Rigging, connecting and using all hoses, fittings and devices required for the test evolution.

c. Operation of systems in all modes, such as emergency, hand, override, cross-connected, normal, local, etc.

d. Checking all electrical and mechanical, local and remote indicators for proper readings.

e. Testing communications between normal control station and other locations involved in operating the system or performing the evolution.

f. Calibration and adjustment of equipment, systems and devices where required.

g. Inventory consumables, fittings, devices and portable test equipment to ensure that sufficient amounts are on board for proper operation throughout the trials.

1.3.2 Specific Test Areas. There are specific tests which relate to both systems and ship safety which must be conducted in preparation for Sea Trials.

a. The following are specific alongside tests which must be conducted during Dock Trials:

(1) Check the sound powered phone system between all stations.

(2) Check the announcing system between all stations.

(3) Test collision alarm and diving alarm.

(4) Test general alarm.

(5) Test each light on BCP.

(6) Test whistle.

(7) Check emergency lights.

(8) Operate all hydraulic plants using each installed pump.

(9) Conduct a complete air charge using only ship's compressors.

(10) Conduct a normal battery charge using shore power.

(11) Conduct low pressure blow of all Main Ballast Tanks (MBT). Thereafter conduct dockside operation portion of URO 022 (as appropriate).

(12) Flood sanitary tanks, then blow or pump them as required.

(13) Operate each main vent in hand and power. Following operation, with valves shut, conduct a controlled removal of MBT vent covers, one at a time, to check MBT vents for leaks.

(14) Operate the outboard induction in hand and power.

(15) Operate the diesel engine exhaust valve in hand and power.

(16) Operate inboard induction valves.

(17) Raise, train and lower periscopes, snorkel, radar and antenna masts and fairings as applicable.

(18) Test operation of radio transmitters and receivers on all antennas.

(19) Operate all sonar and radar equipment at rated conditions.

(20) Take and plot LORAN, OMEGA and NAVSAT fixes using each antenna.

(21) Test operation of drain pump using each bilge suction.

(22) Test operation of trim system and pump by pumping to and from each tank and by pumping to and from sea (if applicable).

(23) Calculate and enter the diving trim compensation.

(24) Test operation of portable submersible pump from each installed outlet.

(25) Fire inboard slugs from torpedo room.

(26) Fire inboard slugs from weapons launch console.

(27) Test magazine flooding system.

(28) Operate each lube oil system including pumps, controllers, purifiers and indicators.

(29) Start the Navigation System and gyrocompasses; determine that they settle out and take an azimuth; check all repeaters.

(30) Check fresh water system, have water samples analyzed.

(31) Test the capstans.

(32) Test bow plane rigging (where applicable).

(33) Test bow, sail and stern plane tilting in hand, normal power and emergency. Test normal and emergency plane angle indicators.

(34) Test rudder in hand, normal and emergency power. Test normal and emergency rudder angle indicators.

(35) Check alignment of periscopes, TBTs and all bearing and range repeaters.

(36) Test the engine order telegraphs.

(37) Test Automatic Bus Transfer Devices.

(38) Operate each watertight door and hatch, each bulkhead flapper and each inter-compartment air salvage valve.

(39) Check operation of escape hatch fittings.

(40) Operate signal ejectors by impulse and hand using dummy signal. Fire water slugs from all launchers, both locally and remotely.

(41) Turn on and check running lights for brightness and proper lenses (to be done at night).

(42) Check Freon air conditioning system.

(43) Check underwater log.

(44) Check 400 Hz MG sets.

(45) Check out galley equipment.

(46) Check fathometer.

(47) Check bilge flooding alarms.

(48) Check dummy log.

(49) Check ship service air system.

(50) Check out vapor compressor distilling units.

(51) Check anchor windlass and brake operation.

(52) Check out atmosphere monitoring equipment, both installed and portable.

(53) Operate oxygen generator, Carbon Dioxide scrubbers, CO burners and emergency air breathing system.

(54) If possible, lower, train, operate and raise the SPM.

(55) Ensure that all required PMS to ship depth detectors is complete.

(56) Test diesel engine high vacuum cut-out. Take altimeter to engine room or diesel generator room for test.

(57) Check main propulsion.

(58) Ensure seven-day supply of oxygen onboard, test operate the Electrolytic Oxygen Generator(s) (EOG).

APPENDIX O

FAST CRUISE REQUIREMENTS FOR IDD OR PIRA AVAILABILITIES

1. Fast Cruise Requirements. Asterisk items are the minimum requirements for an IDD or PIRA availability:

a. All Ships:

* (1) Station the maneuvering watch and check each system and piece of equipment for proper operation. (For availability less than six months duration, system and equipment checks are not required.)

* (2) Station the normal underway watch (section watches).

(3) Simulate getting underway and return to port (day and night).

* (4) Walk through all major Sea Trial evolutions, including cycling of hull and back-up valves to be tested during the deep dive.

* (5) Exercise the reduced visibility detail.

* (6) Rig for Emergency Ventilate.

(7) Spot check storage and availability of spare parts and tools. Verify adequacy of stores and provisions.

* (8) Rig for dive and rig for surface.

* (9) Simulate diving and surfacing.

* (10) Rig for deep submergence.

(11) Rig for various quiet conditions.

(12) Drill at loss of power to various circuits including lighting, communications, 400 Hz power, etc.

(13) Battery charge.

* (14) Conduct the following emergency drills:

* (a) Fire.

* (b) Collision.

* (c) Flooding.

* (d) Toxic Gas.

(e) Abandon Ship.

* (f) Man Overboard.

(g) Submarine Escape.

(h) Loss of AC Power.

(i) Emergency Ventilation.

(j) Loss of Air Conditioning.

(k) Loss of Lighting.

(l) Loss of Interior Communications.

(15) Exercise the crew at battle stations.

(16) Conduct communications and ECM drills.

* (17) Conduct an air charge to all air banks. (For availabilities less than six months duration, conduct an air charge.)

* (18) Bleed oxygen and ventilate ship. Ensure a seven-day supply of oxygen is onboard and EOGs are fully operational. Ships without EOGs may provide a seven-day supply of oxygen in O2 candle form and have oxygen banks inerted until after availability completion.

(19) Anchor.

(20) Operate atmosphere control equipment and take air samples.

* (21) Check out all interior communications circuits, including battle telephones.

(22) Simulate submerged patrol, performing all evolutions and operating equipment normally used.

* (23) Operate freshwater and seawater heat exchangers at sufficient load to verify proper operation (not fouled with marine growth).

(24) Nuclear powered submarines must meet all requirements of reference (n), Appendix D, Part 3.

b. Additional requirements for SSBN and SSGNs. SSBN and SSGNs must conduct exercises in casualties to missile tube breather valves which would result in:

(1) Flooding.

(2) Introducing toxic gases into the missile compartment from gas generators.

RMKS/1. REF A CERTIFIED THE SUBSAFE MATERIAL CONDITION OF THOSE PARTS OF USS <SHIP NAME/HULL NO.> INSTALLED, REPAIRED AND/OR TESTED BY THE SHIPYARD IS SATISFACTORY FOR SEA TRIALS TO TEST DEPTH.
2. REF B CONFIRMS THAT THE CERTIFICATION OF THE REMAINDER OF ITEMS WITHIN THE SUBSAFE CERTIFICATION BOUNDARY OF USS <SHIP NAME/HULL NO.> HAS BEEN SUSTAINED. ACCORDINGLY, THE STATUS OF THE SUBSAFE CERTIFICATION BOUNDARY OF USS <SHIP NAME/HULL NO.> IS SATISFACTORY FOR SEA TRIALS TO TEST DEPTH.
3. REF B AND C REPORTED COMPLETION OF FAST CRUISE AND READINESS TO PROCEED ON SEA TRIALS.
4. USS <SHIP NAME/HULL NO.> IS AUTHORIZED TO DIVE UNDER DELIBERATE AND CONTROLLED CONDITIONS TO <SPECIFIED DEPTH>.
NOTE: IF AN UNSATISFACTORY CONDITION OR SEAWATER LEAKAGE IN EXCESS OF THE SPECIFICATION IS FOUND DURING THE CONDUCT OF THE CONTROLLED DIVE TO TEST DEPTH, AT THE DISCRETION OF THE COMMANDING OFFICER THE SHIP MAY CONTINUE TO TEST DEPTH UNLESS THE COMMANDING OFFICER DETERMINES IT APPROPRIATE TO ABORT THE DIVE.
5. THIS DEPTH AUTHORIZATION IS AUTOMATICALLY SUSPENDED UPON RE-ENTRY TO THE SUBSAFE CERTIFICATION BOUNDARY OR CASUALTY AFFECTING RECOVERABILITY, SALVAGE, WATERTIGHT INTEGRITY, OR OPERATION OF

SHIP'S CONTROL SURFACES. THE SHIP MUST NOT OPERATE AT A DEPTH GREATER THAN 200 FEET UNTIL RE-ENTRY IS CERTIFIED. TYCOM APPROVAL IS REQUIRED PRIOR TO COMMENCING A SUBSEQUENT DEEP DIVE TO CERTIFY WORK ACCOMPLISHED TO CORRECT SUBSAFE DEFICIENCIES DISCOVERED DURING THE SEA TRIAL UNLESS SPECIFICALLY ADDRESSED IN THE SEA TRIAL AGENDAS.//
BT

NOTE: ENSURE MESSAGES ARE PER CURRENT MESSAGE FORMAT AND CURRENT PLAD IS UTILIZED.

APPENDIX R

MINIMUM SEA TRIALS REQUIREMENTS FOR IDD OR PIRA AVAILABILITIES

1. Sea Trial Agenda. This Appendix delineates the minimum requirements incident to Sea Trials following an IDD or PIRA availability. Additional events listed in Appendix O of Part III, Chapter 2, of this volume. Minimum Sea Trials Requirements for Chief of Naval Operations Availabilities Greater Than Six Months Duration, may be included by the repair activity based on the scope of work accomplished or as desired by the CO.

2. Sea Trial Policy. The following policies apply to conduct of trials and tests associated with IDD or PIRA availabilities:

a. No test or trial event must be conducted that requires crew intervention to avoid exceeding normal operating limits. Trial agendas will be based on the expectation that the ship will remain within normal operating limits of the SOE and at angles of less than 30 degrees.

b. Any run which will result in exceeding normal operating limits of the SOE or 30 degree angles but which is essential to provide adequate test data must be specifically approved by the TYCOM. The test or trial sponsor will obtain this permission.

c. A violation of the SOE limit or exceeding a 30-degree angle, not previously approved, will be reported by unit Situation Report. The TYCOM will resolve the situation.

d. Specific written approval by the TYCOM is not required to operate outside the upper limits of the SOE (i.e., shallow and fast) while conducting the following operations during Sea Trials or tests following an agenda approved by the ISIC, NAVSEA or higher authority:

(1) Conducting full power runs or cavitation curves.

(2) NAVSEA sponsored acoustic trials following a Naval Surface Warfare Center, Carderock Division acoustic trial agenda.

e. In cases where troubleshooting is required, it must meet the following criteria or a formally approved change to the agenda is mandatory.

(1) The troubleshooting does not violate any policy listed in paragraphs 2.a through 2.e of this Appendix or any other requirement of the trial agenda.

(2) The troubleshooting will not result in the ship being in a certain condition before that condition is reached during the normal testing sequence. For example, troubleshooting requiring the ship to be deeper than 200 feet cannot be done until after the deep dive. Likewise, troubleshooting requiring large angles or turn rates cannot be done until after the completion of the steering and diving operational tests and the large angle tests.

f. Each person involved in Sea Trials will be allowed to obtain a minimum of six hours of continuous, uninterrupted sleep during any 24-hour period.

3. Testing Phase. The Sea Trials will be scheduled and phased to support actions en route to the test dive area, in the test dive area, prior to the deep dive, etc., subject to the amplifying notes.

a. The following tests and evolutions must be carried out on the surface en route to the test dive area and prior to the initial tightness dive:

(1) Underway. Rig for dive.

(2) Ship's Force instruct Sea Trials riders on the proper use of Emergency Air Breathing System.

(3) At slow speed, conduct operational test of rudder in all modes (local and remote) per applicable class operating procedures.

(4) Navigation system check. Takes fixes by all means available and compare.

(5) Test underwater log(s) using the base course or reciprocal course method (i.e., inertial reference method) or other approved functional procedures to determine accuracy.

(6) Test accuracy of all bearing transmitters and indicators. Compare sonar, visual and radar bearings.

(7) Check operation of all radars. Demonstrate accuracy by conducting simultaneous radar and visual plot.

(8) Inspect stern tube packing gland and seals and circulating water flow for excessive heating, leakage and audible noise.

(9) Test fathometer(s) and compare with charted soundings.

(10) Run ahead, at maximum allowable surface speed, long enough for temperatures to reach a stable value. After readings have stabilized, at maximum allowable surface speed, operate the rudder through full throw in each direction, in all remote modes of operation.

(11) Ahead, at maximum allowable surface speed, to back emergency.
For SSBN or SSGN 726 Class only -Answer ahead standard. Once ship speed has stabilized, perform back emergency for 5 minutes.

(12) Run astern up to a back full bell. Full power run astern to be within the main engine limits of the applicable Steam and Electric Plant Manual.
For SSBN or SSGN 726 Class only - Run astern up to a back full bell for 5 minutes, followed by 60 SRPM for 5 minutes. (See Note 1.)

(13) Check operation and accuracy of ship's gyro compass.

(14) Rendezvous with escort, if an escort is required. Conduct radio and sonar communications checks (See Note 2).

(15) Rig out bow planes, if applicable. Test bow, fairwater and stern planes in all modes.

(16) Flood variable tanks to computed compensation less a safety factor.

(17) Operate trim and drain pumps.

(18) Test variable ballast system for proper operation.

(19) Perform a low pressure, normal and EMBT blow for as long as necessary to verify system operability. A static blow must not be used to test the EMBT blow system. For SSN 23 only: Perform an MBT 6 normal blow from the BCP for a minimum duration of 2 seconds to verify that air flows into MBT 6 as indicated by a reduction in air bank pressure.

(20) Check that initial EMBT Blow system actuating air pressure and air bank pressure is within +0 PSIG, -200 PSIG of nominal operating air pressure.

(21) Ensure all MBT blow systems are in a normal line up configuration.

(22) Additional requirements may be imposed at the discretion of the CO.

b. The following tests and evolutions must be carried out immediately prior to or during the initial tightness dive:

(1) Obtain navigational fix and take sounding. Maximum depth of water is 400 feet as specified in reference (p).

(2) Rig ship for deep submergence. Line up propulsion plant for maximum reliability. All systems must be in the maximum secure condition with unnecessary sea systems isolated (See Note 3).

(3) Station additional personnel throughout the ship to inspect for leaks.

(4) Transmit commencing initial tightness dive message. Submerge the ship per the Ship Systems Manual Operating Procedures. If desired to conduct periscope depth tests, the ship may be submerged to periscope depth.

(5) Check operation of ship control systems, including depth indication (See Note 4).

(6) When escort is required, communicate with escort on RAC or WQC at each depth increment or at 10-minute intervals, whichever is sooner. If communications are lost, return to depth at which communications can be established before continuing (See Note 2).

(7) All hands inspect for leaks and report them.

(8) Inspect the discharge of all automatic drains in each EMBT Blow quadrant for seawater leakage prior to the first dive when the ballast tanks are flooded (e.g., at periscope depth).

(9) At periscope depth, operate all masts checking optics and leakage. Observe speed and depth restrictions for masts without violation of the SOE (See Note 5). Event may be performed following initial dive, if sea state prevents operation at periscope depth.

(10) Test operation of trim and drain system discharging to sea.

(11) If not at 150 feet for SSN 688 Class submarines (155 feet for SSN 774 Class submarines), (160 feet for SSBN and SSGN 726 and SSN 21 Class submarines), proceed to 150 feet for SSN 688 Class submarines (155 feet for SSN 774 Class submarines), (160 feet for SSBN and SSGN 726 and SSN 21

Class submarines) and obtain SAT 1/3 trim per the Ship's Operating Manual. Take readings as required to make a check of ballasting.

(12) At 200 feet:

(a) Adjust trim (See Note 6).

(b) Inspect for leaks.

(c) Communicate with escort at each depth increment or at 10-minute intervals, whichever is sooner. If communications are lost, return to depth at which communications can be re-established before continuing (See Note 2).

(13) At 200 feet, per reference (o):

(a) Check accuracy of gauges and repeaters (See Note 4).

(b) Evaluate signal ejectors or launchers. Conduct operational test of each by hand and impulse methods, as applicable (See Note 7).

(c) Check shafting bearings and stern tubes for excessive heating, leakage and noise. Main shaft seals must be tested at each depth specified in reference (o) testing one seal for 20 minutes, and shifting to the other seal. Test the second seal for 20 minutes or until the boat is ready to go to the next depth, whichever comes first.

(d) Cycle rudder and planes through full throw at slow speed to check for binding.

NOTE: REQUIRED SYSTEMS ARE LISTED IN PARAGRAPH 4b OF REFERENCE (O). OBSERVE RESTRICTIONS ON OPERATION OF SYSTEMS LISTED IN PARAGRAPH 4d OF REFERENCE (O).

(e) Operate all Main and Auxiliary Sea Water hull and back-up valves and those other seawater system valves worked during the availability (using remote closures, as applicable, from flooding control stations) that are required to maintain propulsion and other functions vital to the ship's operation.

(f) Operate Trim and Drain pumps, discharging to sea.

(g) Cycle main ballast tank vents to check for binding. Main ballast tank vents will be cycled hydraulically except at test depth where they will be cycled manually.

(14) Test the SPM (See Note 13 in Appendix O of part I, chapter 3 of this volume).

(15) Additional requirements may be imposed at the discretion of the CO.

c. The following tests and evolutions must be carried out following the initial tightness dive and prior to the deep dive:

(1) Transmit initial tightness dive complete message (See Note 12).

(2) A minimum of six hours of ISE submerged for crew training.

(3) Charge air banks and battery as necessary. The ship may be submerged while charging air banks provided the depth of the ship does not exceed other guidelines in this instruction, or those of the flooding bill or ship's operating procedure.

(4) If escort is required, detach escort after initial tightness dive. Escort will then proceed to station for deep dive. Ensure that deep dive rendezvous time and location are clearly established before escort is released. The escort may be retained for additional testing during the transit as described in part I, chapter 3, Appendix P of this volume. Transit depths must not exceed depth as described in part I, chapter 3, Appendix P of this volume.

(5) Additional requirements may be imposed at the discretion of the CO.

d. The following tests and evolutions must be carried out immediately prior to or during the deep dive:

(1) Check that initial EMBT Blow system actuating air pressure and air bank pressure is within +0 PSIG, -200 PSIG of nominal operating air pressure.

(2) Verify MBT systems lined up for normal operation.

(3) Take sounding. Accurately fix ship's position within the specified dive area per reference (p). Transmit commencing deep dive message.

(4) Proceed to normal submergence depth and obtain a 1/3 speed trim. Use conservative angles and speed on initial dive.

(5) Trim ship to maintain neutral buoyancy (See Note 6).

(6) Rig ship for deep submergence. Line up propulsion plant for maximum reliability. All systems must be in the maximum secure condition with unnecessary sea systems isolated (See Note 3).

(7) Station additional personnel throughout the ship to inspect for leaks.

(8) At 400 feet and then in increments of 100 feet descending to one-half the maximum operating depth and every 100 feet or other lesser specified increments thereafter down to the maximum authorized operating depth:

(a) Adjust trim (See Note 6).

(b) Inspect for leaks.

(c) Communicate with escort (if escort required) at each 100-foot depth increment or at 10-minute intervals, whichever is sooner. If communications are lost, return to a depth at which communications can be re-established before continuing (See Note 2).

(9) At depths listed for hull valve cycling in reference (o) including the maximum authorized operation depth:

(a) Check accuracy of gauges and repeaters (See Note 4).

(b) Evaluate signal ejectors or launchers. Conduct operational test of each by hand and impulse methods, as applicable (See Note 7).

(c) Check shafting bearings and stern tubes for excessive heating, leakage and noise. Main shaft seals must be tested at each depth specified in reference (o) testing one seal for 20 minutes, and shifting to the other seal. Test the second seal for 20 minutes or until the boat is ready to go to the next depth, whichever comes first.

(d) Cycle rudder and planes through full throw at slow speeds to check for binding. Cycling of rudder and planes through full throw must be limited to 90 % of test depth. For SSN 21 Class follow the specific Sea Trial Agenda.

NOTE: REQUIRED SYSTEMS ARE LISTED IN PARAGRAPH 4b OF REFERENCE (O). OBSERVE RESTRICTIONS ON OPERATION OF SYSTEMS LISTED IN PARAGRAPH 4d OF REFERENCE (O).

(e) Operate all Main and Auxiliary Sea Water hull and back-up valves and those other seawater system valves worked during the availability (using remote closures, as applicable, from flooding control stations) that are required to maintain propulsion and other functions vital to the ship's operation at increments of depth specified in reference (o).

NOTE: TRASH DISPOSAL UNITS (TDU) WITH BALL VALVES WILL NOT BE OPERATED BELOW 200 FEET. TDUs WITH FLAPPER VALVES WILL NOT BE OPERATED BELOW 150 FEET.

(f) Operate trim and drain pumps, discharging to sea.

(g) Cycle main ballast tank vents to check for binding. Main ballast tank vents will be cycled hydraulically except at test depth where they will be cycled manually.

(10) Surface fully with EMBT blow per applicable URO MRC. Check air bank pressures before and after blow. For SSN 23 only: Perform an MBT 6 normal blow from the BCP until MBTs 6A and 6B are blown to residual water levels.

(11) Transmit completion of deep dive message (See Note 12).

(12) Additional requirements may be imposed at the discretion of the Commanding Officer.

e. The following tests and evolutions must be carried out submerged following the deep dive:

(1) Full power run (See Notes 8, 9 and 10).

(2) Emergency stop (See Notes 9 and 10).

(3) Steering and diving operation at full speed (See Note 11).

(4) Steep angles - operate ship through several depth changes using large up and down angles. Check operation of ship machinery (See Note 9).

(5) Time raising each periscope and mast at maximum depth and speed for which they are designed. Check training feature where applicable.

(6) Run and observe air conditioning plants throughout trials noting deficiencies. Operate the Lithium Bromide air conditioning plant (if installed) to demonstrate ability to carry entire maximum existing ship's air conditioning load or 100 percent capacity.

(7) Shoot water slugs from all torpedo tubes (See Note 13).

(8) Additional requirements may be imposed at the discretion of the Commanding Officer.

4. Sea Trial Conclusion. At the conclusion of Sea Trials, and based on a review of Sea Trial deficiencies and TYCOM concurrence, the submarine may transit to a port other than the overhauling activity. During this transit the submarine must not operate at depths greater than 400 feet (one-half test depth plus fifty feet for SSN 688 class), and must not be released for unrestricted operations until all RECs are closed and any deficiencies identified during the controlled dive to test depth have been reported and reviewed by the TYCOM and specific TYCOM approval for URO is granted.

NOTES

1. **For SSBN and SSGN 726 Class submarines only - This surface evolution, full power run astern, must be conducted only if maintenance was accomplished on the reduction gears, the astern throttle(s) or the main shaft thrust bearing.**
2. **In the execution of any Sea Trial, whether escorted or not, submarine COs are reminded of their responsibility to communicate with escorts, shore authorities, or both, within the prescribed previously agreed upon time limits to avoid initiation of lost submarine procedures.**
3. **Reference (n) prescribes procedures for system operation during the deep dive.**
4. **Compare all depth and pressure gauges. Depth and pressure gauges will be checked as soon as each next specified depth is reached.**
5. **Any evolutions (e.g., mast testing, propeller cavitation data collection, etc.) required by the Sea Trial Agenda, which violate the ship's SOE, must be approved by the TYCOM prior to Sea Trials, per paragraph 2 of this Appendix.**
6. **Deep dive will be conducted using moderate speed and constantly adjusting trim at depths indicated in paragraphs 3.b.(12)(a) and 3.d.(8)(a) of this Appendix, to maintain neutral buoyancy. Moderate speed must be defined as that range of speed that allows the ship to recover from a loss of stern plane control or flooding casualty or as otherwise directed by NAVSEA.**
7. **Integrity of launchers or signal ejectors must be established by admitting sea pressure through equalizing lines or flooding connection and the muzzle valve or door operated before conducting operational tests. Shoot water slugs from specified launchers or signal ejectors at depths specified by reference (o). Shoot pyrotechnics on initial dive and at test depth on deep dive only if work was accomplished on the launchers or signal ejectors or if an escort vessel is required for the trial.**
8. **Run full power submerged for at least two hours. Operate at minimum non-**

cavitating depth, but not to exceed 400 feet, per reference (p); water depth is not limited for this event.

9. **Note that the required sequence of events is initial dive, deep dive, full power run submerged, back emergency, then high-speed maneuverability, and steep angle tests. Initial high-speed ship control tests, steep angle tests and exercises at major casualties must be conducted in water that does not exceed one and one-half times design test depth.**

10. **The submerged full power run with an ahead flank bell is to be terminated with a back emergency bell, consistent with current Main Propulsion Operating Limits (shaft torque is not a limiting factor in this test). The duration of the back emergency bell will be limited to 45 seconds, to be followed immediately by an appropriate ahead bell. The 45-second limit will:**

    a. **Standardize the crash-back requirements throughout the submarine force.**

    b. **Provide a backing transient similar to that experienced in response to a stern plane jam.**

    c. **Be short enough that no ship will gather sternway.**

    For SSBN and SSGN 726 Class submarines only - The submerged full power run with an ahead flank bell is to be terminated by reducing the bell to ahead standard until speed stabilizes. The ship is then to conduct a back emergency bell consistent with current Main Propulsion Operating Limits (shaft torque is not a limiting factor in this test). The duration of the back emergency bell will be limited to 45 seconds, to be followed by an appropriate ahead bell. The 45-second limit will avoid developing sternway.

11. **At maximum safe speed, operate the rudder and planes through full throw in both directions, in all remote modes of operation.**

12. **If required, perform resistance measurement checks of communication antennas per volume IV, chapter 22, paragraph 22.4 of this manual.**

13. **Shoot water slugs at a speed and depth defined by the Commanding Officer unless otherwise specified in the Sea Trial Agenda.**

PART III

CHAPTER 4

SHIP MAINTENANCE VALIDATION, SCREENING AND BROKERING (SUBMARINES)

REFERENCES.

(a) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval Ships

LISTING OF APPENDICES.

A Availability Creation and Numbering
B NESD Customer Service

4.1 PURPOSE. This chapter provides procedures and guidance regarding ship maintenance work candidate validation, screening and brokering processes. These processes affect all Type Commanders (TYCOM), Regional Maintenance Center (RMC) Commanding Officers and ship Maintenance Teams.

4.2 MAINTENANCE MANAGEMENT AUTOMATED INFORMATION SYSTEM MANAGEMENT. As Navy Maintenance Management Automated Information System (MMAIS) applications (such as the Maintenance Data System (MDS), Automated Work Notification (AWN), Electronic Tag Out (eTagOut), and Electronic Shift Operations Management Solution (ESOMS) programs) evolve into a connected group of systems, criteria for the management of unit, shipboard, ashore databases, and a process for submitting account requests for these MMAIS systems is hereby established.

4.2.1 Unit and Shipboard Databases Afloat and Ashore. The following applies to shipboard and unit based MMAIS systems such as MDS, AWN, Organizational Maintenance Management System - Next Generation (OMMS-NG), R-Admin, R-Supply, eTagOut and ESOMS:

a. Will be managed locally by an assigned and designated administrator.

b. Account structures and role and privileges will utilize the TYCOM approved Privilege Matrix which is maintained by the TYCOM.

c. Systems settings will be set to local time not “Zulu” time for all processing.

d. No outside activity will be allowed direct access to the databases. Database copies require prior written TYCOM N43 approval.

e. All work candidate, job, Job Sequence Number (JSN), pre-OPNAV 4790/2K to OPNAV 4790/2K review and approvals along with sending of parts requests to supply will be conducted by Ships Force. No outside activities will approve work candidate, job, JSN, pre-OPNAV 4790/2K to OPNAV 4790/2K or the acquisition of shipboard parts. No outside activity will write work candidates directly into a Ships Force MDS system. All outside activities reporting or finding discrepancies will produce the required “bulkload” as per volume VI, chapter 42 of this manual.

4.2.2 Shore Databases. The following applies to shore-based MMAIS systems such as MDS, AWN, Afloat Toolbox for Maintenance (ATM), Validation Screening and Brokering (VSB), OMMS-NG, R-Admin, R-Supply, eTagOut, ESOMS and Electronic Work Acceptance Forms (EWAF).

a. Account requests.

(1) For RMC and Commander Navy Regional Maintenance Center (CNRMC) users including all Navy Maintenance Database accounts will be managed by the RMCs or CNRMC. VSB account requests from the RMCs or CNRMC users will be directed to the appropriate RMC or handled directly by CNRMC as per agreement with the appropriate TYCOM.

(2) Users requesting access to Unit, shipboard or command level, including remote hosted databases, will go to the local functional area supervisors, Local Area Network administrators or Information Technology (IT) support teams for access to the command level systems, see paragraph 4.2.1 of this chapter. The access level for the local users will be determined by the approved TYCOM matrix. No outside activity (personal not assigned to that unit) will be granted direct or remote access to any shipboard, command, unit or detachment database, for anything other than IT level troubleshooting and repairs, view only, writing of the alphanumeric JSN for bulkload by the TYCOM.

(3) User access to MDS, supply or personnel administrative systems who are not CNRMC or command level (including where the command level database is ashore) will submit a Navy Enterprise Service Desk (NESD) trouble ticket, refer to Appendix B.

b. All users requesting access through NESD will be approved by the TYCOM for that unit. NESD to establish the account. If upgraded roles or privileges are needed those roles or privileges will be implemented by the TYCOM. No outside activity will be granted direct or remote access to any shipboard, command, unit or detachment database, for anything other than IT level troubleshooting and repairs, view only, writing of the alphanumeric JSN for bulkload by the TYCOM.

c. Outside Activities (users not assigned to that unit) will not be granted access to the unit database (AWN, OMMS-NG, ETAG, EWAF, ESOMS, R-supply, and Mission Readiness Assessment System) for writing of jobs directly into the shipboard or ashore databases nor will they be granted work candidate brokering or approval, including the approval and or sending of parts to supply.

d. All user access levels and accounts will be tracked by the activity creating the account.

e. Every TYCOM will have at a minimum a primary and secondary account manager. Account manager names will be provided to the NESD.

f. Users with accounts missing the required forms will be deactivated until the required documentation is presented to the NESD, and the account is approved by the TYCOM.

4.2.3 Process for Account Requests NESD. The following guidance will be followed for obtaining access to MMAIS systems such as MDS, AWN, ATM, VSB, OMMS-NG, R-Admin,

R-Supply, eTagOut, ESOMS and EWAF. No accounts will be created, password reset or updated without using NESD and or the TYCOM, refer to Appendix B.

a. User submits NESD ticket for VSB, ATM, eTagOut, EWAF account creation:

b. User submits account request through the VSB ATM site.

c. NESD should provide the required documents to the user and the user should complete the following as per TYCOM guidance:

(1) Computer System Access Request.

(2) Maintenance Figure of Merit () Authorization Access Request (MAAR) NNPI user security form.

(3) MFOM Non-Disclosure Agreement or Contractor user justification (for contractors only).

d. User will provide proof of training and training completion certificates.

(1) EWAFS course number (SPAWAR-EWAFS-0001) available through the CAC-enabled site MyNavy Portal (https://my.navy.mil) under Navy eLearning > Online Courses, Course Catalog.

(2) AWN - Navy eLearning courses SPAWAR-ATMAWN-0002 or SPAWAR-EWAFS-0001.

(3) eTagOut - Completion certificate from Navy eLearning courses SPAWAR-ETAGOUT-USER-3.0.

(4) VSB - Completion certificate from Navy eLearning courses VSB SPAWAR-VSB-0002.

NOTE: DUE TO THE LOSS OF ADOBE FLASH, INFORM NESD IF THERE ARE ISSUES TO RECEIVE THE POWER POINT OF THE TRAINING. NO COMPLETION CERTIFICATE IS GRANTED, USER ACKNOWLEDGMENT THE MATERIAL WAS VIEWED.

e. NESD should review account request.

(1) Provide the applicable TYCOM completed training documents, SAAR-N and MAAR forms and Non-Disclosure Agreement, if applicable. TYCOM will authorize the NESD to create the user account.

(2) ATM or AWN accounts roles and privileges will be per the TYCOM AWN, ATM, VSB, eTagOut, EWAF Privilege Matrix.

(3) If certain roles and privileges are not listed under the Privilege Matrix, then the TYCOM will create additional roles and privileges for accounts as required.

(4) VSB account access will be “View Only”. TYCOM will create additional access roles or privileges for accounts as required.

(5) “ADMIN” and or “SUPER ADMIN” accounts will not be created. TYCOM will be the only entity to create that level of account.

(6) NESD will create and maintain an all-user listing that contains access levels for the MFOM systems. The User listing, SAAR, MAAR, Non-Disclosure Agreement (if applicable) and TYCOM approval forms will be retained for a minimum of three years.

f. Completion of the process.

(1) NESD will notify users via email noting which VSB, ATM, eTagOut or EWAF account has been approved.

(2) Users can then go to the login screen, enter their user "LOGIN_NAME", the "TEMPORARY PASSWORD" and login. The user will then create and confirm a new 15-character password.

NOTE: IF YOU DO NOT LOG INTO ATM WITH THE TEMPORARY PASSWORD WITHIN 24 HOURS, YOUR ACCOUNT WILL BE DISABLED.

g. User in a reply email verifies ability to log in.

h. NESD will update and close out the ticket in Remedy.

4.3 MAINTENANCE.

4.3.1 Regional Maintenance Centers. The command with overall responsibility for efficient planning and execution of all ship maintenance and modernization for assigned ships is the local RMC. The RMC is a subordinate command to Naval Sea Systems Command (NAVSEA). The RMC must report Additional Duty to the appropriate TYCOMs. This reporting relationship ensures that the TYCOMs continue to effectively carry out their responsibilities relating to material readiness of their ships. Contact information for the RMCs can be found in volume VI, chapter 2, Appendix A of this manual.

4.3.2 Maintenance Team. Each ship must have a formally structured Maintenance Team as identified in volume VI, chapter 41 of this manual.

4.3.3 Class Maintenance Plan. The Class Maintenance Plan (CMP) database is an engineered set of organizational, Intermediate and Depot-level maintenance tasks, including the following: material condition assessment tasks, qualified repair and life renewal tasks, availability routine tasks and authorized Fleet and Program ship change tasks. Tasks are either scheduled or unscheduled.

a. Scheduled tasks are those "I" Level and "D" Level tasks the cognizant technical authority (usually the designated In-Service Engineer) requires to be accomplished on a periodic basis. These tasks have been identified, using Reliability Centered Maintenance, to be both applicable and effective. The CMP system automatically pushes scheduled tasks for Maintenance Team screening and brokering based on last accomplished date and task periodicity.

b. Unscheduled tasks are pulled by the Maintenance Team based on evidence of need. This includes unscheduled assessment tasks, qualified repair tasks, approved ship changes with their associated support and service tasks and availability routine tasks. Additionally, if the need arises for a scheduled task to be accomplished before it has been pushed into the CSMP, the Maintenance Team has the ability to pull that scheduled task, and the last accomplished date will be appropriately updated.

4.4 WORK CANDIDATES.

4.4.1 Current Ship's Maintenance Project Composition. An accurate, up-to-date CSMP is essential for a well-maintained ship. The importance of documenting all discrepancies cannot be overemphasized because the CSMP is the basis for all funding. Only work that is documented in the CSMP will be authorized for accomplishment. The CSMP is maintained in two files, the organizational unit file and the shore file.

a. Shipboard File. This file contains information regarding all known material discrepancies that require corrective maintenance. These discrepancies are normally discovered either by Ship's Force personnel during routine operations and planned maintenance or by non-Ship's Force personnel during material assessment, training and assist visits, documented per volume VI chapter 42 of this manual. The criticality of the discrepancy determines the maximum length of time allowed to upload the information regarding the discrepancy to the RMC responsible for managing the shore file. Exceptions to this policy are made within the considerations of bandwidth availability and Operational Security conditions.

(1) Ship's Maintenance Action Forms (2-Kilo), OPNAV 4790/2K, associated with correction of C2 Casualty Reports must be uploaded within 24 hours.

(2) 2-Kilos associated with correction of C3 or C4 Casualty Reports must be uploaded within four hours.

b. Shore File. This file contains the material discrepancies uploaded from the shipboard file, other work identified by shore-based managers and tasks from the CMP. Tasks from the CMP include pushed scheduled tasks, pulled tasks, authorized program and fleet modernization work, and availability support routines. The type desk officer and ashore ships maintenance manager are responsible for pulling CMP tasks as required based on evidence of need, availability of support routines and fleet and program alterations to be screened to be accomplished as efficiently and expeditiously as possible using CMAVs, Window of Opportunities (WOO) or other in-port and underway periods consistent with the maintenance continuum strategy. Keeping shorter duration CMP work out of the CNO availability will depressurize and, therefore, de-risk the CNO availability to the greatest extent possible. Although only on the CSMP shore file, this work is visible to ship's force via reports sent to the ship.

4.4.2 Requirements. All work requiring an expenditure of man-hours, material or a combination of both requires a work candidate OPNAV 4790/2K (2-Kilo) to document the identified requirement. Pushed and pulled CMP tasks are already formatted as 2-Kilos when transferred to the CSMP shore file. The 2-Kilo requires certain information to be included by the identifying activity to support the maintenance request and may be authored by activities other than the affected ship. There are three levels of the validation process:

a. The ship (Ship Material Maintenance Officer or 3MC) must do an initial validation of the work statement to determine if there is enough information for the designated representative (e.g., Ashore Ship's Maintenance Manager, Fleet Maintenance Activity Ship Superintendent, Project Manager, etc.) to understand the requirement.

b. The Ashore Ship's Maintenance Manager working with members of the Maintenance Team is responsible for requirement validation, and will determine whether there is

real need citing objective evidence, and, if so, will also verify the requirement's urgency.

c. Final validation is the responsibility of the Ashore Ship's Maintenance Manager. The Ashore Ship's Maintenance Manager ensures that the scope of the work is adequately defined and technically accurate before authorizing the work. This is the final product screened and brokered to a planning or execution activity.

4.4.3 Elements. A valid work candidate will provide the following key data elements at a minimum. The blocked numbers to the right of each item reference a 2-Kilo data block.

a. Configuration information automatically entered from the master configuration database (Configuration Data Manager's Database or Ship's Configuration and Logistics Support Information System) by the shipboard system:

(1) Ship Unit Identification Code [1]

(2) Work Center Job Control Number [2]

(3) Allowance Parts List or Allowance Equipage List [4]

(4) Ship Name [A]

(5) Ship Hull Number [B]

(6) Equipment Noun Name [5]

(7) Equipment Identification Code [14]

(8) Location [16]

(9) Ship Work List Item Number [56]

(10) References

b. Job Sequence Number [3]

c. Equipment Status Code [7]

d. When Discovered Date [17]

e. Deferred Date [26]

f. Symptoms and Supporting Information [35]

g. First Contact Name [38]

h. Priority [41]

i. Type Availability - (Recommended Accomplishment Level) [42]

j. Required Delivery Date [28]

k. Recommended resolution [35]

(1) Master Job Catalog, if applicable

(2) Port Engineer's Notes

(3) Additional references

l.	Maintenance Action Requested	[35]
	(1) Assessment	
	(2) Repair	
	(3) Modernization	
m.	Maintenance Figure of Merit	In CSMP Shore File
n.	Initial Estimate (man days & material)	In CSMP Shore file
o.	TYCOM Screening Code	[45]
p.	TYCOM Screening Remarks	In CSMP Shore File

4.4.4 Guidelines. After a work candidate is created and uploaded by an assessment activity or provided and entered into the CSMP shore file by the CMP or other means, it will be reviewed by the Ashore Ship's Maintenance Manager with the Maintenance Team. The Ashore Ship's Maintenance Manager will use these guidelines to validate each work statement:

a. Initial validation will be conducted on each new work candidate to ensure there is sufficient information to understand the requested maintenance action. The originator must populate configuration data elements from the master database by selecting the correct configuration item in a configuration-based system and complete data elements (1) through (7) listed in paragraph 4.4.3.a. of this chapter. If the ship is the originator, then data element (8) must also be present. All work candidates created in an ad-hoc mode or with an incorrect configuration item (and therefore incorrect configuration data) will be returned to the originating activity for cancellation and recreation.

b. If configuration data in the master database is incorrect (e.g., Allowance Parts List or Allowance Equipage List, Hierarchical Structure Code (Ship Work List Item Number) references, location, etc.), the Ashore Ship's Maintenance Manager must act to correct the data at its source. The Ashore Ship's Maintenance Manager may request additional logistic assistance from the Configuration Data Manager to determine and document the correct data.

c. When an initially validated work candidate is accepted as complete, the Ashore Ship's Maintenance Manager will then determine if there is enough objective evidence of need to validate the requirement. If not valid, the work candidate will be returned to the originator and cancelled.

d. CMP material assessments should be accomplished outside of depot maintenance periods as much as practicable to allow for the resulting work to be planned and accomplished as efficiently and expeditiously as possible using CMAVs, WOOs or other in-port or underway periods consistent with the maintenance continuum strategy. Keeping the CMP material assessment and resulting work out of the CNO availability will depressurize and, therefore, de-risk the CNO availability to the greatest extent possible.

e. If during validation, the Maintenance Team finds inaccurate configuration data or has questions concerning the necessity of a "Pushed" CMP work candidate, they will

contact the appropriate maintenance planning activity prior to returning or cancelling the work candidate.

4.4.5 Validation.

a. Validation is the process of reviewing an off-ship work statement to ensure that the correct configuration item (lowest repairable unit, equipment, system, etc.) is properly identified and that there is enough information to determine if the work candidate is required (objective evidence) and, if valid, contains enough information to:

(1) Properly determine the correct resolution inclusive of the root cause.

(2) Screen the work candidate in accordance with the maintenance continuum strategy, selecting the earliest feasible repair opportunity, making every effort to keep the work out of a CNO availability, unless there is a specific need for duration or equipment only available in a CNO availability.

(3) Broker to the right activity to perform the work at the most practicable level.

(4) Pass to history.

b. The goal of the validation process is to provide a work candidate that is sufficiently defined, contains correct and complete information, provides an accurate diagnosis, and provides an applicable, effective, and feasible recommended resolution. A properly validated work candidate should provide the planning and executing activities with the ability to understand the requirement without expending additional manpower or time obtaining required information. The Ashore Ship's Maintenance Manager along with the Maintenance Team validates all off-ship (Type Availability 1, 2 and 3) work candidates before screening them to the planning activity by review of 2-Kilo documentation, personal shipboard observation of conditions, and knowledge of the quality of work candidates written by selected work centers or through additional technical assistance. All validated work candidates must be ship-checked by the Ashore Ship's Maintenance Manager or designated representative when practicable. The purpose of this check is to determine the best maintenance action and add to Block 35 (data elements k. and l. in paragraph 4.4.3 of this chapter).

4.4.6 Verification. The Ashore Ship's Maintenance Manager request additional assistance to determine and document the best corrective action. The recommended action will include all pertinent interferences, integration issues, verification of urgency and an initial estimate (data element n. in paragraph 4.4.3 of this chapter). The initial estimate for each job includes man-days, man-day rate and material costs. When validated, the Ashore Ship's Maintenance Manager will assign a TYCOM Screening Code (data element o. in paragraph 4.4.3 of this chapter) to the work candidate. This shows the job as valid and ready for screening and brokering.

4.5 SCREENING AND BROKERING.

4.5.1 Screening and Brokering Work Candidates. The Ashore Ships Maintenance Manager validates and screens work candidates continuously as they are documented. Work integration may entail screening multiple work candidates together when possible. Work screening also entails selecting the appropriate level of repair and the best opportunity in which to accomplish the work. The Ashore Ships Maintenance Manager makes recommendations on the lowest level of executing activity with the capability and the capacity to accomplish the work during the

required time frame, following the guidance of the TYCOM business rules. The screening and brokering process must be considered during the entire maintenance continuum (e.g., CNO availabilities, CMAVs, WOOs) and leverage opportunities to reduce depot level work package size in CNO availabilities.

a. Management of ship maintenance is best performed by individuals most familiar with the condition of the ship, budgetary considerations and available workforce. (This requires a cooperative effort from the Ashore Ships Maintenance Manager and the Lead Maintenance Activity (LMA) for Submarine Fleet Availabilities). They have the responsibility to accomplish maintenance, repair and modernization work within available financial resources while balancing operational and technical risk.

b. The Ashore Ship's Maintenance Manager shall consider all maintenance availability opportunities when screening work, and where possible, pull maintenance to the left (i.e., into CMAVs or WOOs) such that the depot-level work package in CNO availabilities may be reduced. The effective utilization of the entire maintenance continuum is critical to accomplishing work in a timely manner and limiting the duration of CNO availability periods.. Determination includes balancing operational schedule, material readiness requirements and cost concerns to maximize maintenance productivity (material readiness vs. related maintenance cost).

c. All work screened by the Ashore Ship's Maintenance Manager to be accomplished aboard ship will be electronically visible to the LMA. Work assigned to the LMA will be tasked following Ashore Ship's Maintenance Manager brokering determination. TYCOM approval is required if the initial brokering determination needs to be changed.

4.5.2 Screening and Brokering. Although they may appear to be accomplished simultaneously, screening and brokering are actually two distinct processes.

a. Screening. Determines and assigns the work candidate to the right time period and maintenance availability. Determination includes balancing operational schedule, material readiness requirements and cost concerns to maximize maintenance productivity (material readiness vs. related maintenance cost).

b. Brokering. Determines and tasks the right activity to perform the work based on business case analysis, material availability, experience, tool requirements, personnel requirements, special considerations (Environmental, Health and Safety) and capacity.

4.5.3 Key Data.

a. The validated work candidate contains the following key data elements to aid in the screening and brokering process:

(1) Configuration Item (maintenance object) identification.

(2) Symptom (2-Kilo - Block 35).

(3) Expected scope of preventive, corrective and alterative maintenance (2-Kilo - Block 35).

(4) Required Completion Date.

(5) Level of Maintenance (TYCOM Code 1, 2, 3).

(6) Identification of a Master Spec Catalog item (pre-planning data).

(7) Priority (Figure of Merit).

b. All 2-Kilos in the Master File will be screened and brokered to a maintenance availability within eight days after being uploaded from the Shipboard File.

c. Work candidates will be brokered to the appropriate maintenance activity with the capability and capacity to accomplish the work during the required timeframe. When practicable, Fleet Maintenance Activity capacity will be utilized first.

d. Available capacity will be judged after applying Maintenance Figure of Merit and Deadline Date.

e. The cause-and-effect relationship between screening and brokering must be exercised to maximize maintenance productivity. This may require negotiation with the ship, maintenance activity, or both, to adjust the Deadline Date.

f. Other considerations for screening and brokering:

(1) Synergistic relationship between work candidates exist.

(2) Splitting responsibility.

(3) Third party access.

(4) Port loading.

(5) RMC Production Department training requirements.

4.5.4 Guidelines.

a. Validating, screening and brokering will be accomplished continuously using the maintenance continuum strategy to depressurize and de-risk CNO availabilities and maximize fleet readiness. Once work has been rescheduled to an appropriate maintenance period, it should be completed in that maintenance availability to the maximum extent. The deferral of work from this scheduled maintenance period requires TYCOM concurrence to de-risk the CNO availability work package.

b. All work will be screened to an availability created and numbered per the business rules in Appendix A.

c. Work candidates will be screened to the following type of availabilities. CNO, Continuous Maintenance (CM), emergent or unfunded. No other type of availability will be used.

(1) CNO Availability. The work candidate is best performed during the scheduled CNO availability. These work candidates include major Ship Alterations and repairs that require support services and coordination.

(2) Continuous Maintenance Availability. Based on ship availability, priority of the job, business case analysis, periodicity or other consideration, the maintenance will be performed during a scheduled Continuous Maintenance Availability or during a window of opportunity permitted by ship's schedule.

(3) Emergent Availability. Emergent work is performed at greater cost than work planned and completed in other availabilities. The criteria to be used to qualify work as emergent is provided in TYCOM business rules.

(4) Unfunded Availability. This availability is reserved for work candidates, which will be shown as backlog or are of such low priority they are unlikely ever to be accomplished.

d. Brokering must follow these requirements:

(1) Work candidates for technical assistance, assessment or inspection will be brokered to the RMC Fleet Maintenance Activity or another technical activity.

(2) Work candidates will be brokered to the lowest level of maintenance activity, filling Fleet Maintenance Activity capacity first, based on the following criteria:

(a) Material availability.

(b) Capability:

1 Experience.

2 Available Production Resource Tools.

3 Available qualified and certified personnel.

4 Ability to comply with Environmental, Health and Safety regulations.

(c) Work center capacity.

(d) Funding.

4.6 ASSESSMENTS.

4.6.1 Maintenance Team.

a. All material condition assessments, including tasks for Combat Systems Command, Control, Communications and Computer Readiness Assessments or Total Ship's Readiness Assessment, must be derived from the CMP. Scheduled condition assessments have been validated by an approved Reliability Centered Maintenance analysis to be applicable and effective, and are pushed by the CMP system to the CSMP shore file for the Ashore Ship's Maintenance Manager action, based on the ship's last accomplished date and task periodicity. Unscheduled material condition assessments are not, without further evidence of need, considered effective and are thereby not pushed into the CSMP shore file, but can be pulled from the CMP by the Ashore Ship's Maintenance Manager or their representative if there is evidence of need (such as degraded performance, errors, or other indication of problems). Scheduled tasks can also be pulled if circumstances warrant, and the Last Accomplished Date will be properly updated. The Ashore Ship's Maintenance Manager with help from the Maintenance Team must review all 2-Kilos pushed from the CMP system just as for any other off-ship 2-Kilo, and broker to the appropriate assessing activity.

b. Only assessment tasks in the CMP or assessment procedures in the PMS database may be used for assessments. Information addressing assessment requirements found not to be included within the CMP or PMS databases, such as local practices, In-Service Engineering Activity unique items, RMC practices, etc., must be forwarded using the Technical Feedback Report for review and approval as an acceptable addition to the CMP and PMS databases. If not approved, these practices must not be used by any activity.

c. The Ashore Ship's Maintenance Manager will make the preliminary determination of the most appropriate source for all off-ship activity work for their assigned ships. Decisions made by the Ashore Ship's Maintenance Manager, with concurrence from the Maintenance Team, must be in compliance with policies in this instruction, reference (a), and guidance provided by the cognizant RMC.

4.6.2 Type Commander. The TYCOM must develop and execute a Memorandum of Agreement per volume II, part III, chapter 2 of this manual with each supporting RMC to define reporting and administrative relationships between the TYCOM and the RMCs.

APPENDIX A

AVAILABILITY CREATION AND NUMBERING

1. Specifying Availabilities. A uniform method of specifying availabilities is an essential part of availability management and data collection. No deviation from these protocols is permitted. An availability is defined as a specified period of time during which maintenance is conducted. Only Type Desk Officers, Type Desk Program Managers, and Ashore Ship's Maintenance Managers are authorized to create availabilities. Availabilities must include all work completed during a specific time period regardless of executing activity. With exception of the emergent availability, availabilities must not overlap and work by every activity (depot, Intermediate Maintenance Activity (IMA), Alteration Installation Team, tech assist and Ship's Force) must be entered into the same availability. Availability numbers are not to be used as a method of segregating the executing activity or the level of work performed. SSGN and SSBN will be exempt from the requirements of this appendix due to use of the existing Logistic Data System program. TRIDENT Availabilities are negotiated and established based on the Fleet Scheduling Conference and are not managed by Type Desk Officers, Type Desk Program Managers or Ashore Ship's Maintenance Managers.

2. Availability Numbering. The availability number consists of the first four digits -- the availability category code and the availability serial number. The Funding Activity Code (FAC) is used to identify the source of funding for any job and is entered at the time of job screening and authorization. The availability numbering system must consist of:

   a. A one-digit availability category code.

   b. A three-digit availability serial number.

   c. A two-digit funding activity code.

3. Availability Category Code. This code is the first character of the four-digit availability number. These codes are used by all TYCOMs and, therefore, not all codes are applicable to all ships.

CODE	TITLE
A	ALONGSIDE SCHEDULED CONTINUOUS MAINTENANCE
B	DOCKING SELECTED RESTRICTED AVAILABILITY
C	SELECTED RESTRICTED AVAILABILITY (SRA)
D	COMPLEX OVERHAUL
E	EXTENDED INCREMENTAL SELECTED RESTRICTED AVAILABILITY
F	EXTENDED DOCKING SELECTED RESTRICTED AVAILABILITY
G	EXTENDED SELECTED RESTRICTED AVAILABILITY
H	DOCKING INCREMENTAL SELECTED RESTRICTED AVAILABILITY
I	INTERMEDIATE MAINTENANCE AVAILABILITY
J	INCREMENTAL SELECTED RESTRICTED AVAILABILITY
K	INTERIM OR EMERGENT DRY DOCK
L	DOCKING PHASED MAINTENANCE AVAILABILITY

M	PHASED PLANNED MAINTENANCE AVAILABILITY
N	INACTIVATION AVAILABILITY
O	POST DELIVERY AVAILABILITY
P	CONTINUOUS AVAILABILITY (YEAR LONG CM)
Q	POST SHAKEDOWN AVAILABILITY
R	REGULAR OVERHAUL
S	SELF AVAILABILITY OR SHIP TO SHOP AVAILABILITY
U	UNFUNDED
V	PLANNED INCREMENTAL AVAILABILITY
W	DEPOT MODERNIZATION PERIOD
X	TECHNICAL AVAILABILITY OR ASSESSMENT
Z	VOYAGE REPAIRS (PER TITLE X) OR STRIKE FORCE INTERMEDIATE MAINTENANCE ACTIVITY
1	DOCKING PLANNED INCREMENTAL AVAILABILITY (DPIA1)
2	DOCKING PLANNED INCREMENTAL AVAILABILITY (DPIA2)
3	DOCKING PLANNED INCREMENTAL AVAILABILITY (DPIA3)
4	PLANNED INCREMENTAL AVAILABILITY (PIA1)
5	PLANNED INCREMENTAL AVAILABILITY (PIA2)
6	PLANNED INCREMENTAL AVAILABILITY (PIA3)
7	REFUELING COMPLEX OVERHAUL (RCOH)
8	FITTING OUT AVAILABILITY

4. Availability Serial Number. The availability serial number is the same three-character serial field currently used in Regional Maintenance Automated Information System (RMAIS). This entry is made in the "serial" field of the maintenance data system availability editor window. There are five authorized serial codes used to designate availabilities.

   a. Alongside Availability (XAZ). The XAZ availability is intended to be a planned CM availability, such as a Continuous Maintenance Availability, over a specified period of time determined by the ship's operational schedule. The TYCOM will schedule the availability during the normal fleet scheduling process. A nominal time frame for availability length is no less than two weeks and no more than six weeks. A ship is not to get underway during any period of the availability. There is no limit to the number of XAZ availabilities that may be scheduled during a year. The first character indicates FY at availability start. The last character indicates a specific XAZ availability during that FY. If the number of availabilities in a single FY results in the Z character being greater than 9, alphabetical characters will then be used beginning with "A". Sequential serial number assignment is desired, but the occasion may arise when a significant schedule change allows for a new availability to be scheduled prior to an existing availability. In this unique case, an availability may be created using an out of sequence serial number. This eliminates the need to move jobs that are already screened in RMAIS and Navy Maintenance Database and additional maintenance data systems. Availabilities may be scheduled in RMAIS for future years using notional

time frames and the exact dates can be adjusted later once a more precise schedule is issued. All executing activities may be scheduled to work during this availability. If a job scheduled for completion is not started, then it must be moved into another availability and the availability closed on the scheduled completion date. The fact that the job was not completed will be reported in the availability completion report.

b. CNO Scheduled Availability (XCZ). The XCZ availability is the scheduled CNO availability published in the OPNAV 4700 Notice. These availabilities are normally conducted in a shipyard under the direct supervision of the Naval Supervisory Authority. All major modernization programs will be scheduled for CNO availabilities. Other executing activities may conduct work during these availabilities pursuant to the contractual limits imposed by the shipyard and the Naval Supervisory Authority. Notional CNO availabilities may be established for years beyond the scope of the OPNAV Notice to support long-term work item placement. The first character indicates FY at availability start. The last character indicates a specific XCZ availability during that FY. Software programs require that only one contract solicitation may be recorded against a given availability, therefore the situation may arise when two availabilities must be simultaneously executed. In this case, the same type of availability will be used and the next sequential number assigned.

c. Yearlong Continuous Maintenance Availability (XCM). The XCM availability is a yearlong availability for the scheduling and completion of work items that are not accomplished during any other scheduled availability. A job is not to be kept in the XCM availability if it is accomplished in an XCZ or XAZ availability. The first character indicates the FY.

d. Yearlong Emergent Work Availability (XEM). The XEM availability is for the completion of emergent work items as defined in volume VI, chapter 31 of this manual. Jobs screened to an XEM availability are paid for using emergent work funding. Items assigned to this availability will not be moved into any other availability and will remain in the XEM availability. Emergent work will not be conducted in a XCZ availability. Emergent work that is discovered during a CNO availability will be added to the availability and paid for using CM funding, for example, work required to support light off or sea trials. The first character indicates the FY.

e. Multi-year Unfunded (UNF) availability. The UNF availability is for those items for which there is no realistic expectation that they will be funded even in the out-years but must be maintained for material history purposes. It is also for those jobs with a Maintenance Figure of Merit such that there is a low probability of accomplishment, but the job remains valid. These jobs will be screened to the UNF availability but will not be authorized in RMAIS.

5. Funding Activity Code. The FAC is a two-digit exportable field in RMAIS. A FAC must be entered for every non-TYCOM funded 2-Kilo prior to being screened and brokered. Any member of the maintenance team authorized to screen work may enter a FAC. The FAC table is NAVSEA controlled. The approved FACs are:

CODE	TITLE

AA	TYCOM CM NON-NUCLEAR
AB	TYCOM EM NON-NUCLEAR
AC	TYCOM DIVING SERVICES
AD	TYCOM FLEET ALTERATION (NON NUCLEAR)
AE	TYCOM FUNDED SEMAT (ETC) SHIP'S FORCE ASSISTANCE
AF	TYCOM NUCLEAR MAINTENANCE OR REPAIRS
AG	TYCOM NUCLEAR ALTERATION
AH	TYCOM FUNDED CNO SCHEDULED AVAILABILITY MAINTENANCE
BA	NAVSEA NUCLEAR ALTERATION
BB	NAVSEA ORDNANCE ALTERATION (ORDALTS)
BC	NAVSEA NON-NUCLEAR PROGRAM ALTERATION
BD	NAVSEA - UNIQUE - NON-NUCLEAR (INCLUDES ALTERATION DEVELOPMENT, TECHNICAL SUPPORT)
BE	NAVSEA - UNIQUE - NUCLEAR OR REFUELING
BF	NAVAL SHIPYARD MISSION FUNDED
BG	SRF MISSION FUNDED
CA	IMA FUNDED MAINTENANCE
CB	IMA FUNDED FLEET ALTERATION
DA	ADMINISTRATIVE SUPPORT NON-NUCLEAR (PRORATABLE) INCLUDING DSA FUNDED
DB	ADMINISTRATIVE SUPPORT SERVICES NUCLEAR (PRORATABLE)
EA	SHIP'S FORCE MAINTENANCE OR REPAIRS
EB	SHIP'S FORCE - SELF HELP HABITABILITY
FA	TECHNICAL SUPPORT: NAVWAR SSC, RMC (MISSION FUNDED)
FB	TECHNICAL SUPPORT: NAVWAR (SEPARATE FUNDING ONLY)
GA	VRT-N, VRT-M, ALRE
HA	NAVAIR (CAFSU, NAWC, FAA, ASIR)
HB	NAEC LAKEHURST NJ
HC	NAWC CHINA LAKE
HD	NAWC PT MUGU
HE	NAWC PAX RIVER
HF	NAWCAD ST INIGOES MD
IA	NSWCCD
IB	NSWCPD
IC	NSWCPHD
ID	NSWC CRANE
IE	NSWC PANAMA CITY
IF	NSWC NEWPORT

IG	NSWC KEYPORT
IH	NAVSURFWARCENIHEODTECHDIV DET PICATINNY
JA	NAVWAR (ALTERATION INSTALLATION TEAM)
KA	ESU
OO	OTHER - EXPLAIN IN REMARKS
VV	VISITING SHIP SUPPORT (FOREIGN NAVY)

6. Example Cases. The FAC is designed to be applied from a user perspective. For example, if Naval Surface Warfare Center, Philadelphia Division (NSWCPD) plans to use an Alteration Installation Team to install an alteration and they are funded for the installation, then the maintenance team would select the FAC for NSWCPD. The maintenance team is not expected to know if it was OPNAV or the TYCOM that funded NSWCPD, this is beyond their level of knowledge and those agencies are expected to track their own funds. In this case, a FAC of "IB" would be applied. The following table provides examples of how the various codes can be applied to common availabilities:

Availability Category	Availability Serial	Fund Activity Code
A, K, T, X, Z	XAZ	AA, AC, AD, AE, BB, BC, FA, FB, VV, OO (Note 1)
B, C, H, J, K, L, M, N, O, Q, R, W, 8	XCZ	AA, AC, AD, AE, AH, BB, BC, BF, DA, FA, FB, OO (Note 2)
P	XCM	AA, AC, AD, FA, FB, OO (Note 3)
P	XEM	AB, BF, BG, VV, OO (Note 4)
U	UNF	NONE

NOTES

NOTE 1: The primary fund activity code is AA for the alongside availability as most work is TYCOM funded maintenance. The voyage repair Availability Category will be used for scheduled voyage repairs using either the AA or AB activity code as appropriate, the XEM availability should not be used for voyage repairs.

NOTE 2: The primary fund activity code is AH and a common additional code is BC. In Atlantic Fleet, any IMA work would use the AA code, Pacific Fleet ships would use CA for IMA work performed during this availability.

NOTE 3: Primary FAC is AA for TYCOM funded maintenance.

NOTE 4: Primary FAC is AB indicating ERATA expenditure. In some cases, BF or BG may be used as dictated by each region.

Examples:

a. A ship entering a scheduled CNO docking availability in FY07 will have an availability number consisting of a "B" for the Availability Category Code and the

serial will use the XCZ format. The full availability number will be B7C1 as this will be the first CNO availability for this ship in FY07. The "B" is entered in its own field in RMAIS using the availability drop down menu. The three-digit serial is manually entered in the "serial" data field of the RMAIS window.

b. A ship entering an alongside three-week CM availability will use "A" as the Availability Category and the XAZ format for the serial. So the third alongside CM availability for FY06 will be an A6A3 availability. Again, the first digit and the last three digits are entered in separate RMAIS entry fields. The FAC is applied on a job-by-job basis and is not tied to the availability number. In a single availability, there can be several executing activities and multiple FACs across all the jobs screened to the availability. For example, Job EA04-1111 might be a pump repair screened to Supervisor of Shipbuilding and paid out of TYCOM CM funds so that job will have "AA" FAC assigned when it is screened to the A6A3 availability.

APPENDIX B

NESD CUSTOMER SERVICE

NESD is the Navy point of entry for technical support and should be the first source of support utilized for technical assistance. NESD provides Fleet users with a centralized source for receiving and routing support requests and is available 24/7/365. NESD issues a tracking number to the requester, coordinates assistance with the appropriate Subject Matter Experts (SME), and monitors the issue until it is successfully resolved.

The NESD Digital Workplace is the end user-facing Self-Service (Tier 0) solution to guide users to resolve issues on their own by utilizing Knowledge Articles and is the preferred method of trouble ticket entry. This platform enables user self-sufficiency, multiple communication channels – email, chat, and web form, and is simple to use. Follow the steps below to submit a trouble ticket:

Contact: Navy Enterprise Service Desk (NESD)

DWP: https://nesd-dwp.onbmc.mil (Search Knowledge Article/Ask for help)

Chat: https://nesd-dwp.onbmc.mil *(Select Chat with agent)*

Email: nesd@nesd-mail.onbmc.mil

Phone: 1-833-NESDNOW (637-3669)

DSN: NESD main menu is: 647-6373

SIPR Email Support: nesd.fct@navy.smil.mil

VOLUME II

PART III

CHAPTER 5

MAINTENANCE WORK CLOSEOUT (SUBMARINES)

REFERENCES.

(a) NAVSEA SI 009-99 - Ship Departure Report; Provide
(b) NAVSEAINST 4790.14 - Ship Departure and Alteration Completion Reports
(c) NAVSEAINST 4790.8 - Ship's Maintenance and Material Management (3-M) Manual

5.1 PURPOSE. This chapter provides procedures and guidance regarding submarine maintenance and modernization work candidate closeout. These rules apply to Maintenance Activities (MA), Maintenance Teams (MT), Regional Maintenance Centers, Fleet Maintenance Activities (FMA), Naval Shipyards, Systems Commanders sponsoring Program Alterations and other Alteration Installation Team sponsors.

5.2 SCOPE. This chapter covers the process and responsibilities for closing all Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), work candidates that were screened and brokered to an activity other than Ship's Force (SF).

5.3 BACKGROUND. Prior to changes in the work closeout process, 2-Kilos executed in shipyards, both public and private, by intermediate-level activities, and technical assistance organizations often did not get closed until long after the work was completed, and then often by someone unfamiliar with the actual work accomplished. Additionally, even though shipyards provide completion data in the form of departure reports following an availability, that information was either not captured in Ship's Maintenance and Material Management (3-M) History or captured manually. This means that useful data was not seamlessly making its way into the Navy's maintenance data warehouse. Since this data is used to determine troubled systems, identify trends in system health, identify causes and solutions to expensive growth work, update cost estimates in the Master Specification Catalogs, update return costs in the Open Architecture Retrieval System database, program for future maintenance budgets, identify the most cost-efficient periodicity for scheduled assessments, and identify candidates for alterations or assessments, it is critical that it be captured and made readily available to all users. This chapter provides the required means to close and report accurate completion data for all 2-Kilos executed by other than SF personnel.

5.4 WORK CLOSEOUT PROCEDURES.

5.4.1 Depot Maintenance Activity Responsibilities.

5.4.1.1 Private Shipyards Using the Navy Maintenance Database. Comply with reference (a) for submission of cost and completion information directly in Navy Maintenance Database (NMD) for each work specification and Request for Contract Change (RCC). No other ship departure reports should be created or distributed because stakeholders can print standardized departure reports that contain the required data directly from NMD. Submission of cost and completion

information is required within 60 days after the completion of an availability (including Continuous Maintenance Availability), or within 60 days after completion of the work for emergent maintenance or unscheduled continuous maintenance. This data can be entered either directly in NMD Planning or through a computer-to-computer connection to NMD. The MA must notify the MT when cost and completion information has been entered.

a. If the work item is a Class Maintenance Plan (CMP)(Periodic Maintenance Requirement or Unrestricted Operation), see volume VI, chapters 24 and 25 of this manual.

b. For Firm-Fixed-Price contracts, the completion costs are, by definition, the award costs for original work and the Regional Maintenance Center-approved RCC costs for growth and new work. As such, for Firm-Fixed-Price availabilities, cost information for original work items must be entered by the Project Manager directly in NMD Execution on the Work Item Management screen cost tab after award, and cost information for RCCs must be entered by the Negotiator directly in NMD Execution on the RCC Management screen during RCC settlement. These cost values will populate to the Actual Return Cost screen in NMD Planning and are not editable by the MA. However, completion information (Final Action and Completion Date) must still be entered in NMD just as it is for Cost contracts.

c. Once the MA enters the required information and the MT closes the availability, NMD automatically prorates completion costs from the work specification to the 2-Kilos that make up the specification based on the proportion of the most recent estimates. NMD also submits a "growth 2-Kilo" for each completed growth or growth on new work RCC. A growth 2-Kilo is used strictly for documentation purposes, getting its information from the "parent" 2-Kilo and cost and completion data from the RCC. It requires no additional actions by, and should be transparent to, the MA or MT.

5.4.1.2 Naval Shipyards and Facilities Using Advanced Industrial Management (AIM) or AIM Express (AIMXP). Comply with reference (b) for submitting Ship Departure Reports. AIM via AIMXP, transmits 2-Kilo cost and completion information to the brokering Information Technology (IT) system automatically based on labor entries and material transactions made during availability execution. Users should follow local instructions for AIM operations.

5.4.1.3 Depot Maintenance Activities Not Using Navy Maintenance Database or Advanced Industrial Management. The MA is responsible for providing to the Immediate Superior in Command for submarines, within 60 days after completion of the work, the man-days, labor costs, material cost, total cost, date completed, and the Final Action code (see reference (c), Appendix C for code definitions) for each 2-Kilo. At the time of submission, return costs must be the best prediction of the final costs for that 2-Kilo. If the costs are not finalized when the MA reports return cost data (i.e., there are outstanding invoices), report costs from the Final Cost Report or equivalent financial report. Additionally, if the 2-Kilo was a scheduled task generated by the CMP, the MA must report the As Found Condition (the second character in the Final Action code).

5.4.2 Fleet Maintenance Activity Responsibilities.

5.4.2.1 FMAs Managing 2-Kilos Using AIM, AIMXP, Advanced Industrial Management for Regional Maintenance Centers (AIM4RMC) or Fleet Technical Support. AIMXP, AIM via

AIMXP, AIM4RMC and Fleet Technical Support (FTS) transmit 2-Kilo cost and completion information to the brokering IT system automatically based on labor entries and material transactions made during 2-Kilo execution. FMAs working 2-Kilos assigned to these IT systems should follow local instructions for AIMXP, AIM, AIM4RMC or FTS operations.

5.4.2.2 FMAs Managing 2-Kilos Using Logistics Data System. Logistics Data System (LDS) transmits a portion of the required cost and completion information to the brokering IT system. The information that is transmitted can be used to calculate the missing information with a reasonable level of accuracy. Naval Sea Logistics Center has implemented a procedure in Ship's 3-M History to calculate and fill in the missing information. FMAs should follow local instructions for LDS operations.

5.4.2.3 FMAs Managing 2-Kilos in a System Other Than AIM, AIMXP, AIM4RMC, FTS or LDS. The FMA is responsible for coordinating with the applicable Ashore Ship's Maintenance Manager, within 60 days after completion of the work, to enter in the brokering IT system the man-days, labor costs, material cost, total cost, date completed, and the Final Action code (see reference (c), Appendix C, for code definitions) for each 2-Kilo. Additionally, if the 2-Kilo was a scheduled task generated by the CMP, the FMA must report the "As Found Condition" (the second character in the Final Action code).

5.4.3 Maintenance Team Responsibilities.

a. The MT, led by the Ashore Ship's Maintenance Manager, is administratively responsible for all work screened and brokered to an activity other than SF.

b. Depending on the settings of the brokering IT system, 2-Kilos may require both a "Maintenance Activity Completion" and a "Customer Completion" to fully close the 2-Kilo. The submarine's Immediate Superior in Command or SF must "Customer Complete" all remaining open 2-Kilos executed in the availability no later than 90 days after the completion of an availability (including Continuous Maintenance Availability), or no later than 90 days after completion of the work for emergent maintenance or unscheduled continuous maintenance.

c. If a 2-Kilo was created in the brokering IT system, it may not appear on the ship's Current Ship's Maintenance Project. These 2-kilos may need to be "Customer Completed" by the MT on behalf of the ship.

5.4.3.1 Work Executed by Private Shipyards Using the Navy Maintenance Database. The following steps must be followed by the MT to properly close out the work.

a. After notification that the MA entered cost and completion information data in NMD, but not later than 90 days after the completion of an availability (including Continuous Maintenance Availability), or no later than 90 days after completion of the work for emergent maintenance or unscheduled continuous maintenance, enter Government Furnished Material costs for each specification and RCC in NMD Planning and set the Actual Cost Tab to "Complete".

b. Change the Avail Status to "Closed" and enter the Closed Date in NMD Execution. This transmits the cost and completion information to the brokering IT system and creates a "Maintenance Activity Completion" for the executed 2-Kilos.

c. Obtain validation that the work was accepted by SF.

d. Close any 2-Kilos not closed by the ship or auto-closed by the brokering IT system by completing a "Customer Completion". They can be closed individually, or group selected and closed.

e. When an availability is closed in NMD, all 2-Kilos that were in the work package will be closed. It is not possible to keep 2-Kilos that were not accepted or not worked from getting a "Maintenance Activity Completion". For that reason, if the work is not acceptable by the end of the availability, a new 2-Kilo, referencing the original 2-Kilo in the narrative text, should be created to document the remaining deficiencies. This new 2-Kilo will then be screened and brokered to the appropriate MA for a future availability.

5.4.3.2 Work Executed by Maintenance Activities Using AIM, AIMXP, AIM4RMC, LDS or FTS. These IT systems automatically report cost information and create a "Maintenance Activity Completion" for 2-Kilos executed using those systems. The following steps must be followed by the MT to properly close out the work:

a. Obtain validation that the work was accepted by SF.

b. Close any 2-Kilos not closed by the ship or auto-closed by the brokering IT system by completing a "Customer Completion". They can be closed individually, or group selected and closed.

5.4.3.3 Work Executed by Maintenance Activities Not Using NMD, AIM, AIMXP, AIM4RMC, LDS or FTS. 2-Kilos executed outside of these IT systems will not automatically have their costs transmitted to the brokering system, nor will a "Maintenance Activity Completion" be recorded. Instead, the required cost and completion information must be entered directly in the brokering IT system. The following steps must be followed by the MT to properly close out the work:

a. Upon receipt of cost and completion information from the MA, enter this information in the brokering IT system and complete a "Maintenance Activity Completion".

b. Obtain validation that the work was accepted by SF.

c. Close any 2-Kilos not closed by the ship or auto-closed by the brokering IT system by completing a "Customer Completion". They can be closed individually, or group selected and closed.

VOLUME II

PART IV

FOREWORD

MISSION FUNDED FLEET MAINTENANCE ACTIVITIES

1. PURPOSE. Volume II, part IV of this manual provides procedures and guidance which reasonably ensures that accounting for work performed on or for a specific Navy ship's hull, ship class, or reimbursable customer's final product or service applies uniform costing policies and procedures for Fleet Maintenance Activities (FMA). Application of uniform costing practices and procedures is necessary to ensure comparability among FMAs costing procedures, reliability in development of activities' budget requirements and the proper funding of these requirements. The coordination of costing, budgeting and funding requirements will help ensure the maximum benefit from the consumption of resources by the FMAs.

2. SCOPE.

2.1 Applicability. The guidance contained in this part is directive in nature and applicable to each FMA performing work on specific ship's hull, ship class, or reimbursable customer's final product or service and to outside organizations (contractors) performing maintenance work on specific ship's hull, ship class, or reimbursable customer's final product or service. This volume does not currently apply to organic depot maintenance organizations (naval shipyards) when a maintenance availability is conducted by organic assets of the depot facility or the reimbursable customer's order specifies the use of other specifications. It does apply to all contract maintenance work.

2.2 Authority. This part is directive in nature and may be cited as authority for action as the need dictates. Where higher authority imposes more stringent requirements or conflicts exist, such requirements have precedence. Where conflicts exist with previously issued Commander, United States Fleet Forces Command, Commander, Pacific Fleet Command, Commander, Naval Reserve Force, Type Commander letters, transmittals and instructions, this manual takes precedence. When such conflicts are identified, they should be reported immediately to the Fleet and Type Commanders for resolution.

3. ORGANIZATION.

3.1 Basic Principles for Costing Maintenance. In order for maintenance costs records to be accurate, reliable and uniform, several principles must be adhered to:

a. The individual worker must have a process that guides the worker in accurately charging performance of maintenance. See part IV, chapter 3 of this volume.

b. The supervisors (shop supervisors, Leading Petty Officers, etc.) and individual workers must be trained so work can be charged correctly and in a timely manner. This training will provide the craftsmen with the basic principle related to identifying direct versus indirect charges. See part IV, chapter 3 of this volume.

c. The maintenance charges recorded by the individual worker must have proper oversight and supervisory direction to assure management of the accuracy and completeness of the information. See part IV, chapter 5 of this volume.

d. The worker must be provided with the correct charge number prior to commencing work. In the case where an individual worker utilizes multiple charge numbers, the supervisors are critical to ensure the proper charge number is used. Uniform costing policies and procedures responsibilities are located in part IV, chapter 3 of this volume.

e. In order for all levels of management to have confidence that costs are accurate and complete, an appropriate level of independent testing or audit must be performed. The specific metrics and an assessment check list is provided in part IV, chapter 5 of this volume.

3.2 Special Requirements Associated with Maintenance Costing. In the course of accumulating maintenance costs, special actions may be required to achieve certain goals. Other actions not directly related to accumulating maintenance costs are required to assure accuracy and completeness of cost information. Other chapters in this volume discuss these:

a. Procedure responsibilities (Organization) are located in part IV, chapter 3.

b. Retention of records are located in part IV, chapter 4.

c. Audits and assessments are located in part IV, chapter 5.

4. BENEFITS OF CAPTURING COSTS. In periods of increased competition for limited available funding, it is imperative that budget submissions and other requests for these limited funds be thoroughly justified. One of the more effective means of justifying funding requests is through the demonstration of the benefits and results achieved with previous successful funding efforts. As part of this justification, it is essential that these benefits and outcomes be tied to a specific result, that is in terms of maintenance to specific ship hulls, ship class or customer orders. Direct costs are those expenditures which result in a specific definable benefit to a specific Navy ship's hull, ship class, or reimbursable customer's final product or service. In contrast, indirect cost, while essential at some level, cannot be defined as benefiting a specific outcome. Obviously, it is not reasonable to have zero indirect costs, but it is vital that costs identified as benefiting a specific outcome be so identified. Programs having the minimum indirect cost or overhead are generally looked upon as being more efficient and thus it is far easier to justify resources for efficient programs to support vital maintenance requirements than programs with high overhead.

VOLUME II

PART IV

CHAPTER 1

UNIFORM COSTING POLICIES AND PROCEDURES FOR FLEET MAINTENANCE ACTIVITIES

REFERENCES.

(a) DoD 7000.14-R – Department of Defense Financial Management Regulation (DoD FMR)

1.1 PURPOSE. To provide procedures and guidance necessary to accurately allocate cost for work performed on or for Navy ships, ship classes or customer projects by Fleet Maintenance Activities (FMA). Uniformly applying these costing practices and procedures will ensure comparability among FMAs costing procedures, reliability in development of activities' budget requirements and the Highest probability of successfully funding these requirements. The requirements contained in part IV of this volume are directive in nature and mandatory for all FMAs.

1.2 UNIFORM COSTING POLICIES AND PROCEDURES. The following principles and guidelines were applied in establishing these uniform costing policies and procedures:

1.2.1 Function. Each function will be identified as being either a mission overhead (indirect) or a direct cost. Direct costs may be funded by either mission funds or by a reimbursable customer as appropriate. Overhead costs will be funded with mission funds.

1.2.2 Classification. Reclassification from overhead to direct or from direct to overhead must be fully justified and based on generally accepted accounting principles. Commander, United States Fleet Forces Command authorization is required prior to any reclassification.

1.2.3 Uniformity. The rules contained herein are mandatory, therefore, if all FMAs consistently apply these rules, a significant level of uniformity in their financial operations will be achieved. Where ambiguity exists with this guidance, the activity should immediately report the ambiguity to the Commander, United States Fleet Forces Command for clarifying guidance.

1.2.4 Control. Focus will be on controlling total cost and not the classification of costs. Controlling total cost of maintenance will help ensure the greatest return from the expenditure of the limited funding provided. Adherence to these requirements in this volume by the FMAs should eliminate the issues related to classification of cost, direct versus indirect.

1.2.5 Proration. Accurate costs are desired within reasonable economic considerations. Proration techniques are allowed under strict control when absolutely necessary due to the magnitude of the cost. Proration will be employed only when it is either not possible to accurately classify the cost or too expensive to classify the cost (cost versus benefit).

1.2.6 Unique or New Requirements. Unique customer requirements resulting in procedures, methods, etc., which have no foreseeable use for the same or another customer's work, will be charged, in their entirety, to the requesting customer.

1.2.7 Performance. The decision to charge cost incurred to direct or indirect will be completely dependent on the function or operation being performed and not the employee's title.

1.2.8 Direct Cost Basic Definition. Reference (a), volume 4, chapter 19, defines a production operation as a direct cost center. Direct costs, whether funded with direct mission funds or customer reimbursable funds, are defined as those items that can be identified to a specific ship's hull, ship class, end product or a customer order. Reference (a), volume 4, chapter 19, also identifies direct costs as including labor of identifiable individual employees, material required for the job, travel and contracts or services required to complete the end product. Costs may be charged to direct when the following criteria are met:

a. Readily identifiable with the benefiting ship's hull, ship class, end product or customer order.

b. The effort expended is conducive to uniform costing to a specific ship's hull, ship class, end product or a customer order.

c. Readily definable and appraisable for planning, estimating and authorization of effort to be expended to a specific ship's hull, ship class, end product or a customer order.

d. An individual employee's hours must be identifiable and measurable to a specific job. The FMA may not prorate labor hours at the end of a shift between direct and overhead or between direct Job Order Numbers. Cost proration within direct is permitted when absolutely necessary to accurately charge costs to the benefiting customers. Proration should be a rare occurrence.

e. Direct labor may include:

(1) Craft and trade skill labor, production support such as crane operators and material handlers, planners and schedulers, project management team members, waterfront maintenance teams and class teams (including clerical support), Engineering Services (including Chief Test Engineers, Assistant Chief Test Engineers, Shift Test Engineers, Shift Refueling Engineers, and Chief Refueling Engineers), Technical Support which includes inspections, certifications, assessments, distance support and on-site technical assistance.

(2) Direct labor may also include project-related contract and fund administration, including but not limited to contract managers, contracting officer's representatives, price and cost analysts, cost monitors, and quality assurance specialists.

f. Where direct charging is indicated but the cost of the effort (including clerical) required for such charging makes it impractical or burdensome (cost versus benefit) and the direct charge is not material to the total cost of the project, the effort should be charged to overhead.

1.2.9 Mission Overhead Costs Basic Definition. Reference (a), volume 11B, chapter 13, states that overhead costs are those costs which pertain to departments supporting production departments. Overhead costs are defined as costs incurred at a FMA that CANNOT be directly identified and charged to a specific ship's hull, ship class, or end product, or customer order, but are necessary for the operation of the FMA.

(i) OPNAVINST 11010.20 - Facilities Project Instruction Manual
(j) DoD Directive 7220.1 - Regulations Governing the Use of Project Orders

2.1 PURPOSE. The purpose of this chapter is to provide detailed guidance regarding direct versus overhead (indirect) cost charges. While this chapter attempts to address all foreseeable categories of costs, it is recognized an unforeseen cost category will likely materialize. In that case, please notify appropriate Fleet Commander, United States Fleet Forces Command or Commander, Pacific Fleet Command so the situation may be addressed.

2.2 TYPES OF COSTS.

2.2.1 Accommodation Storage and Handling. Accommodation storage and handling represents the cost of handling and storing ship's equipment and stores taken off the ship when it is in the Fleet Maintenance Activity (FMA) for a conversion, alteration or repair.

a. Overhead.

(1) Accommodation storage and handling, principally warehouse operations, which cannot be specifically identified and conveniently charged on a direct labor basis, must be charged to the overhead of the performing cost center.

(2) Warehouse operations related to accommodation storage provided by Supply Department personnel, which cannot be specifically identified and charged directly to a job order, must be charged to overhead.

b. Direct Cost. The handling of a ship's equipment and stores and the subsequent accommodation storage, while the ship is undergoing conversion, alteration or repair, which can be identified with the ship involved, must be charged direct or to a service type productive job order. When production schedules dictate the presence of a safety monitor during hazardous operations, such as loading and offloading of military explosives from ships, the safety monitor will be costed to direct. Also, it includes Q-COSAL actions. Warehouse operations related to accommodation storage for a

specific ship's hull, ship class, end product or customer order must be charged to direct for the specific Job Order Number assigned the maintenance effort.

2.2.2 Administrative Assistance to Managers and Supervisors. Employees are assigned to assist managers and supervisors with administrative duties, paperwork, messenger services, correspondence, scheduling, etc. The duties consist of a number of operations, none of which are normally directly connected with a productive job order. This permits the supervisors to function more actively in a supervisory capacity.

a. Overhead. Employees assigned as assistants to managers and supervisors must be considered as overhead personnel and must be charged to the expense of the parent shop or code.

b. Direct Cost. When an administrative assistant is performing duties as part of project management or specific to a direct-funded job, such administrative assistance must be charged direct to the job.

2.2.3 Administrative Services for Tenants.

a. Overhead. None.

b. Direct Cost. Administrative services for tenants should be charged direct. Administrative services rendered tenant activities, which can be identified, in sufficient increments of time must be charged on a direct labor basis.

2.2.4 Allowance List Outfit Material Items - Outfit Supply Activity Furnished Material.

a. Overhead. None.

b. Direct Cost. All labor expended in obtaining, receiving, packing, stowing and delivery of Outfit Material items must be directly charged to Naval Supply funds.

2.2.5 Issue and Return of Anti-Contamination Clothing.

a. Overhead. None.

b. Direct Cost. When the cost of issue and return of anti-contamination clothing is identifiable to a specific Navy ship's hull, ship class, or reimbursable customer's final product or service it must be charged to that effort. All other costs associated with issue and return of anti-contamination clothing must be charged to a service type job order for prorating to nuclear work customers. The percentages for the prorating are to be determined by the Planning Department.

2.2.6 Funding Support of Board of Inspection and Survey. Per chapter 20 of the U.S. Navy Regulations, the Board of Inspection and Survey (INSURV) is required to conduct acceptance trials, material inspections, surveys and such other inspections and trials of naval vessels. The regulations also provide that representatives from the systems commands and other naval activities will assist the INSURV on request. It is recognized that qualified maintenance personnel may be utilized to meet INSURV requirements, therefore, the responsibility for financing these services is established so that INSURV requests will receive prompt and effective response.

a. Overhead. None.

b. Direct Cost. The cost of personnel (salaries and overtime), travel and per diem required by the INSURV to assist in the conduct of trials and material inspections must be charged to customer funds.

c. Reimburse Actual Cost. The cost of personnel (salaries and overtime), travel, and per diem required by the RMC to assist in the coordination and conduct of trials and material inspection must be reimbursed by INSURV per reference (a), chapter 15, section 1535.

2.2.7 Calibration of Instruments. All instruments, i.e., electrical, electronic and mechanical standards and non-standard instruments are included.

a. Overhead. The cost of calibration for activity-owned mechanical and electrical or electronic test equipment and calibration standards must be charged to overhead. Exceptions are described under Direct Cost.

b. Direct Cost.

(1) The cost of calibration of non-indigenous instruments to FMA electrical, electronic and mechanical standards, both local and reference, are to be charged to funds provided by the customer.

(2) All calibration of fleet-held electrical, electronic instrumentation and standards are to be charged to funds provided by the customer.

(3) The cost of special calibration performed on test equipment dedicated to specific programs and utilized for those programs will be funded by the appropriate customer.

2.2.8 Clerical and Office Automation Staff.

a. Overhead. Clerical and Office Automation staff must be charged overhead, except as provided under Direct Cost.

b. Direct Cost. When the clerical and Office Automation staff services are a significant ingredient to the end product or project and can be identified as directly supporting a project, these charges may be charged to the project.

2.2.9 Administration and Review of Contractor Work.

a. Overhead. All design administrative services supporting contractor work, which are undertaken in conjunction with and in support of other productive services within the activity, must be charged to overhead.

b. Direct Cost. Administrative and technical services supporting contractor work, not in support of other or additional productive effort of the activity, must be charged to a job order under the applicable customer order. Technical services supporting contractor work and the checking of plans returned by contractors, which is undertaken in conjunction with and in support of other productive services within the activity, must be charged direct. If the administrative and technical services are in direct support of a specific ship's hull, ship class, end product, or customer order, the services must be charged to direct cost.

2.2.10 Crane Operators.

a. Overhead. Inside crane operators' time must be charged to overhead, when not dedicated to a single direct project.

b. Direct Cost.

(1) Waterfront crane operators' and crane walkers' time must be charged as identified to service-type job orders, or to specific job orders when feasible. Crane operators used in the prefabrication of major ship structures, regardless of location, will be charged to the customer.

(2) Crane services necessary for loading and unloading material or parts which, though not directly involved in productive work, must be removed to permit the performance of productive work on a ship incident to an availability are chargeable to the customer order as a service type productive job order.

(3) In the case where the FMA has a contract for the provision of crane services and the specific cost for crane services can be identified to a specific Navy ship's hull, ship class, or reimbursable customer's final product or service, those costs will be charged as direct. If information is not available, the cost of the contract will be charged as an indirect cost.

2.2.11 Special Test and Certification of Cranes.

a. Overhead. Regular test of cranes performed per Naval Facilities Engineering Command directives must be charged to overhead.

b. Direct Cost.

(1) The cost of testing cranes performed at a customer's direction that are outside the time frames or with more stringent requirements than those specified by Naval Facilities Engineering Command directives must be charged to the customer establishing the requirement. When the more stringent requirement is applicable to a specific type of work or a specific task and more than one customer benefits, the cost will be charged to a service job order and prorated to the benefiting customers on the basis to be determined by the Planning Department.

(2) The cost to perform a technical assistance visit to a ship to troubleshoot or perform required test on a ship's crane is a direct charge.

2.2.12 Continuous Process Improvement.

a. Overhead. Assigned as a Team Member to a process improvement event that is not directly associated with a specific Navy ship's hull, ship class or reimbursable customer's final product or service.

b. Direct. Assigned as a Team Member to process improvement event that is directly associated with a specific Navy ship's hull, ship class or reimbursable customer's final product or service.

2.2.13 Data Processing Resources. Includes cost of administrating, programming, operating, rental and maintenance of FMA Automatic Data Processing Equipment, supplies and operating Automatic Data Processing Equipment in direct support of activity's Management Information System (MIS) applications and local applications, as well as claimant approved pilot installations.

a. Overhead. The following categories of Data Processing Resources are considered overhead and properly chargeable to the Data Processing Office or Information Technology Department:

(1) All costs identified for operating the various standard activity MIS applications.

(2) All costs identified to the development and maintenance of the activity MIS applications as assigned by their major claimant.

(3) All costs identified to the programming, testing and debugging of activity MIS improvement Automatic Data Processing (ADP) programs, except hardware, of local programs or the testing of corporate programs commencing at the point at which Central Design Agent provides the package to the activity.

(4) All labor costs identified to the implementation of the various activity MIS improvement program applications, (e.g., provide material, support, material requirements, etc.).

(5) Rental and maintenance cost including terminal and required ancillary equipment such as uninterrupted power supply.

(6) Augmentation to the standard activity MIS computer equipment configuration in support of activity MIS.

b. Direct Cost.

(1) Direct costs are recoverable via direct labor charges and through reimbursement rates when supported by an acceptable method of accounting which clearly identified the time used on various equipment for each job identifiable to a specific ship's hull, ship class, end product or customer order.

(2) Systems analysis and programming services as well as equipment rental and ADP material costs when provided for ADP applications which are either the end product or provided in support of activity customers. These provisions are not to be interpreted as authorization to charge activity customers for standard activity MIS reports.

(3) All costs where a clearly identifiable industrial customer is the principal beneficiary of the ADP resource, e.g., analysis, programming and associated material identified to the propeller profiler, rental of terminals, timesharing costs used for engineering or scientific calculations.

2.2.14 Decontamination of Equipment and Tools.

a. Overhead. None.

b. Direct Cost. The cost of decontamination of equipment or tools identified to a specific Navy ship's hull, ship class, or reimbursable customer's final product or service must be charged to that effort. All other costs associated with decontamination of equipment or tools must be charged to a service type job order for prorating to nuclear work customers.

NOTE: DELAY TIME SHOULD NOT BE CONFUSED WITH LOST TIME. LOST TIME OCCURS DUE TO EVENTS THAT ARE SIGNIFICANT OR CATASTROPHIC IN NATURE. LOST TIME IS TIME IN A WORK STATUS PRIOR TO RELEASE CHARGEABLE TO ADMINISTRATIVE LEAVE. FOR SPECIFICS, REFER TO LOST TIME.

2.2.15 Delay Time.

a. Overhead. None.

b. Direct Cost. Delay time occurs during the performance of productive work due to inherent causes which prevent the work from being accomplished in the most efficient manner. Delay time is charged directly to the actual work being performed when the delay occurs. Delay time may be a result of internal or external causes.

NOTE: EXAMPLES (1) THROUGH (7) ARE CAUSES OF DELAY TIME INTERNAL TO THE ACTIVITY AND THEREFORE WITHIN THE ACTIVITY'S RESPONSIBILITY. EXAMPLES (8) THROUGH (10) ARE CAUSES OF DELAY TIME EXTERNAL TO THE PERFORMING ACTIVITY.

(1) Material. Time spent by mechanics waiting for material that should be available or time spent by mechanics procuring material beyond the designated point of delivery.

(2) Tools and Equipment. Time spent getting or waiting for tools and equipment the use of which should have been anticipated and brought to the job or their delivery scheduled.

(3) Plans and Instruction. Time spent waiting for plans and instructions or getting plans from a location beyond the designated point of delivery.

(4) Waiting for Assist Trade. When an assist has been requested and the mechanic is unable to continue working.

(5) Waiting for Supervisor.

(6) Trade Interference. Held up by another trade which is not an assist to the trade held up.

(7) Minor Power Failures. Time spent due to minor power failures caused by faulty temporary utility connections.

(8) Waiting for ship to conduct required steps, (e.g. Tag Out).

(9) Held up by the ship while conducting a drill or security alert.

(10) Held up during fueling or ammo handling.

2.2.16 Dive Lockers.

a. Overhead. Diving services performed within the shop are for planning, administrative management, diving equipment maintenance, diver's life support systems maintenance, training, inspections, quality assurance, boat maintenance and cleanliness and cofferdam inventory control and are charged to overhead.

b. Direct. Diving services performed outside shop areas are for underwater ships husbandry, dry-docking support of a particular ship and emergency salvage support. These are charged as direct costs to the appropriate productive job orders.

2.2.17 Dosimetry Issuing and Processing. Dosimetry processing is defined in reference (b), article 216.

a. Overhead. None.

b. Direct Cost. The cost of issuing and processing dosimetry used to monitor personnel radiation exposure must be charged to the benefiting customer.

2.2.18 Drills - Conducting and Participation. The time and costs for employees vacating the work site during mock or actual drill and employees assisting in the drill, i.e., street and building wardens and monitors. It does not include the time and costs of employees whose job is primarily associated with security and prevention such as fire, security and police personnel. These people will charge their normal cost class or function as well as the personnel who are conducting, supervising or administering the drill. Drills include radiological control, communication, disaster preparedness, perimeter security and fire (nuclear and non-nuclear).

a. Overhead. All labor associated with conducting and participating in drills is considered overhead. Employees should be provided specifics to properly account for this time.

b. Direct Cost. None.

2.2.19 Dry Dock Blocks and Dock Caps. Dry dock blocks are fabricated, reusable composite concrete and wooden timber structures. Dry dock caps are wooden structures which are appended to the dry dock block.

a. Overhead. Fabrication or purchase of reusable dry dock blocks or caps.

b. Direct Cost. Fabrication or purchase of dock wood caps, shapes, wedges, ties and shims to support a specific hull's requirement is charged to customer funds.

2.2.20 Dry Dock Operation.

a. Overhead. Cost associated with the overall effectiveness of the Dry Dock Operation and not specifically identified to a customer.

b. Direct Cost. Labor of operators during docking and undocking and while the vessel is in dock, including the costs of cleaning dry docks and caissons, must be charged on a direct labor basis against the productive job orders (multiple dockings must be prorated to the respective productive job orders).

2.2.21 Preparation of Engineering Procedures for Specific Authorized Work. Preparation of engineering procedures (i.e., Nuclear Power Engineering Authorizations, Engineering Authorized Technical Procedures, Authorized Technical Procedures), for specifically authorized work must be charged as:

a. Overhead. The development of engineering procedures for specific authorized work that can be used for other customers.

b. Direct Cost. The development of engineering procedures for specific authorized customer work is chargeable to the customer authorizing the work.

2.2.22 Equipment Maintenance. The cost of equipment maintenance includes maintenance of equipment, machine tools, machinery, plant equipment and office furniture. Government Furnished Equipment provided to the activity for use will be maintained in a similar preventive maintenance program.

a. Overhead.

(1) The cost of labor and material incident to preventive maintenance inspection, lubrication and minor adjustments, repair, overhaul and subsequent performance testing of all equipment and their attachments.

(2) In the event routine maintenance and inspection indicate the necessity of major overhaul or repair, the maintenance cost will be charged to overhead.

b. Direct Cost. When the maintenance of equipment is the service being requested by a customer, it will be charged direct. When repairs are due to customer negligence, the customer is responsible. Government Furnished Equipment certification and return of equipment to certification standards will be charged direct. For example: Processing of Hazardous Waste, Oil Waste.

c. Equipment used in support of a project should be placed in a Ready for Use Condition for the next customer. The customer (last user) is to provide a post-use job order for equipment refurbishment, replacement of worn out, damaged and lost equipment. The customer should also be charged for the labor for sorting and establishing equipment after use.

NOTE: OPERATOR'S COST REQUIRED BY THE EQUIPMENT RENTAL AGENCY TO ACCOMPANY RENTAL EQUIPMENT SHOULD BE CHARGED TO THE SAME JOB OR EXPENSE ORDER THAT AN ACTIVITY OPERATOR WOULD BE CHARGED.

2.2.23 Equipment Rental. A lease contract is considered an operating cost of the activity. However, if such a lease is for property or equipment, which may be offered for sale at a certain point in time, the activity may exercise an option to purchase. When this option is exercised, the cost to purchase may be changed from an operating cost to an investment cost. If the cost to acquire title at the time the option is exercised per reference (c), Section 8039, and the item has a remaining useful life of more than two years, it is considered a purchased fixed asset, financed using Other Procurement Navy funds. Conversely, if at the time of conversion, the cost to acquire title is less than the threshold amount listed per reference (c), Section 8039, or the item has a remaining useful life of less than two years, such financing will be expensed. Regardless of the amount of credit given toward purchase, rental costs will remain an operating cost as initially charged and costs to purchase will be recorded as a capital investment. It is the responsibility of the maintenance activity to have general purpose equipment on hand to perform the required work.

a. Overhead. Rental costs of equipment procured because there is insufficient equipment available to meet FMA workload requirements are charged to the overhead of the cost center with functional custody.

b. Direct Cost. Rental costs of equipment rented to meet a specific customer's unique requirement or to fulfill a specific unique work requirement for a customer are charged as direct costs. The direct charging of equipment rental costs to a specific customer

order is limited to the particular customer's requirements. Direct charging of rental costs required to supplement inoperative activity equipment is not authorized.

2.2.24 Disposal of Excess Plant Property.

a. Overhead. The cost of removing, preparing and transporting of excess Class 3 or Class 4 plant property to be disposed of, which is incurred prior to acceptance of accountability by the property disposal officer, must be charged to overhead.

b. Direct Cost. The cost of preparation for shipment, packing, loading, shipping and transporting incident to reference (d) donations of excess plant property must be charged to the applicant for such donation. After the property disposal officer accepts accountability for excess Class 3 or Class 4 plant property to be disposed of, costs incurred are properly chargeable to disposal funds.

NOTE: FUEL APPLIES TO NON-GENERAL SERVICES ADMINISTRATION VEHICLES ONLY. FUEL FOR GENERAL SERVICES ADMINISTRATION VEHICLES IS INCLUDED IN THE LEASE COST. GENERAL SERVICES ADMINISTRATION VEHICLES DO NOT USE THE ON-BASE FUEL STATION. FUEL FOR VEHICLES TO SUPPORT SPECIFIC CUSTOMERS (OTHER COMMANDS, PROJECTS) IS A COST REIMBURSABLE DIRECT CHARGE.

2.2.25 Fuel.

a. Overhead. Fuel such as petroleum products consumed in the generation of power or motor gas, for operating vehicles, weight handling, service craft and other such equipment.

b. Direct. Fuel must be charged direct if special delivery arrangements were set up for a particular Ship project where deliveries were made exclusively.

2.2.26 Guarantee Work. Work performed by a maintenance activity must be guaranteed, i.e., deficiencies attributable to actions of the activity must be corrected at activity expense. The guarantee applies to work performed and materials procured by the activity, and to Government Furnished Materials and equipment only to the extent that the failure or deficiency directly results from the activity's acts or failure to act (in area of local responsibility).

a. Overhead. None.

b. Direct. When maintenance (Chief of Naval Operations, Continuous Maintenance, Emergent Availability, etc.) is complete the warranty period starts. The Maintenance Team will be notified and take appropriate action.

2.2.27 Incentive Awards Program for Civilian and Military Personnel Assigned to the Activity.

a. Overhead. All supervisor's efforts and administrative services supporting the incentive awards programs within an individual productive or general expense cost center must be charged to overhead.

(1) Administration. Each activity should provide internal guidance on specific accounting structures for tracking award programs.

(2) Cash Awards. All cash awards are to be charged at the discretion of each activity.

(3) Cash Incentive Awards for Military Personnel. These are limited to awards for scientific achievement, inventions and beneficial suggestions. No cash incentive can be given to a military person for performance based on reference (e).

(4) Civilian and Military Non-Monetary Awards. These awards are to be modest in cost (up to $100.00 maximum), have no significant utilitarian value (e.g., medal, certificate, plaque, citation, badge, tie-tack, coffee mug, belt buckle or other similar item that carries an honorary award connotation).

b. Direct. Awards paid on behalf of another activity.

2.2.28 Inspection, Including Non-Destructive Testing.

a. Definitions.

(1) Level I is the highest level of inspection and applies to inspections performed on material identified as Level I per reference (f) or (g).

(2) Non-level I inspection is all other inspections identified in references (f) and (g).

(3) Non-level inspection is authorized for specific material per reference (h).

b. Policy.

(1) All direct costs incurred in Level I inspections, non-level inspections and controlled industrial material inspections must be charged to the job and customer order. Overhead type functions (e.g., material handlers, clerks, supervisors, etc.), may be charged direct if dedicated to Level I inspections and the criteria for direct labor are met.

(2) Level II and III inspections may be charged direct if the criteria for costing direct labor in this manual are met.

(3) Non-level inspection costs will be charged the same as Level I.

2.2.29 Inspection Services. The general principle involved is that the customer is entitled to have the completed work given a normal inspection for proper accomplishment. If the cost of inspection is part of a package, then no additional costs should be incurred by the customer.

When an activity is providing quality assurance and oversight of contractor work as its mission, the quality assurance and oversight effort will be charged to the appropriate funds to support the specific customer.

a. Overhead. The cost of developing procedures for conducting inspections or other quality control actions or the maintenance of records of such, is an overhead function of the performing cost center except when development of procedures is one time and will not be used for other customers, such work must be charged direct.

b. Direct Cost.

(1) The cost of inspection or test of productive work and the associated or related engineering or technician costs must be charged direct when the criteria for direct costs in this volume, part, is met.

(2) The time of Inspector Foreman, when engaged in the aforementioned inspection duties must be charged as direct labor.

(3) Inspection services performed to determine the productive work to be accomplished must be charged direct, i.e., services rendered by engineers, inspectors, laboratory technicians and others performing inspection tests, Sea Trials and Dock Trials are also charged direct. Inspection work specifically requested by the customers is considered as a direct cost.

2.2.30 Installation of Equipment.

a. Overhead. The cost of installation of activity equipment is charged to overhead. Exceptions are noted under Direct Cost. The cost of installation of customer equipment is direct.

b. Direct Cost.

(1) The cost of installation of capital investment equipment (the purchase cost is equal to or more than the reference (c) Section 8039, threshold with useful life of at least two years) is charged to the Other Procurement, Navy (OPN) funds purchasing the equipment if the installation is part of the contract (turnkey). In-house labor for installation would be overhead funded; material to support installation of equipment would be OPN funded.

(2) The cost of installation of built-in equipment associated with a military construction project is Military Construction funded; considered to be part of the bid (elevators, paint booths, etc.).

(3) The cost of installation of collateral equipment (Class III & IV) associated with military construction projects is charged to in-house overhead labor for installation unless the purchase cost of the equipment exceeds the reference (c), Section 8039, threshold, the guidance provided under Overhead applies.

2.2.31 Janitorial Services and Work Area Clean-Up.

a. Overhead.

(1) General cleanup details in shop's high security areas not accessed by contractor employees are charged to that shop or shop group.

(2) Cleanup of approved eating areas must be charged to the shop or shop group that uses it.

b. Direct. Productive personnel, when required to clean up their own immediate work areas or equipment incident to work on a productive job order, must be charged direct to the productive job.

2.2.32 Laundry Service.

a. Overhead. Laundry service for military uniforms related to specific tasks such as color guard, linens for watch standers and shop rags.

b. Direct Cost. Laundry service, which is provided by outside sources and is in support of customers or multiple ships, must be prorated and charged to all benefiting customers.

2.2.33 Lean.

a. Overhead. This includes the permanently assigned staff, as well as those loaned from other shops and departments. If they are located in the "Lean Office", they charge to the "Lean Office" job order. Employees attending Lean events, but not assigned to the "Lean Office", will charge to their shop and department's overhead job orders, except as noted in paragraph under Direct Cost.

b. Direct. Employees working on a "Lean" event that are for a specific customer will charge to the project's job order.

2.2.34 Lost and Damaged Tools.

a. Overhead. All tools that are lost, damaged or require refurbishment after use over a period of time by activity employees.

b. Direct. Any tool in a Tool Kit that is damaged, needs refurbishment, or is wasted for a reason after being used to accomplish work on a project will be direct charged to the project.

NOTE: LOST TIME SHOULD NOT BE CONFUSED WITH DELAY TIME. DELAY TIME IS CHARGED TO A DIRECT JOB ORDER NUMBER ASSOCIATED WITH A SPECIFIC NAVY SHIP'S HULL, SHIP CLASS, OR REIMBURSABLE CUSTOMER'S FINAL PRODUCT OR SERVICE, OCCURS DURING THE PERFORMANCE OF PRODUCTIVE WORK DUE TO INHERENT CAUSES WHICH PREVENT THE WORK FROM BEING ACCOMPLISHED IN THE MOST EFFICIENT MANNER. (SEE DELAY TIME IN THIS CHAPTER.)

2.2.35 Lost Time.

a. Overhead. Employees assigned to productive work and prevented from performing such work because of events, primarily unavoidable, but always of a significant or catastrophic nature. This would include but is not limited to, major power plant failures, fire or severe weather conditions that cause most, if not all, productive work to cease. Lost time is charged while the employees are in a working status. If the employees are released from duty, administrative leave would apply.

b. Direct Costs. None.

2.2.36 Upkeep of Maintenance Equipment.

a. Overhead. Upkeep costs of equipment used in the maintenance of grounds, streets, roads and walks, including the upkeep of equipment used in the collection of trash and garbage material.

b. Direct. When maintenance represents the specific service requested by the customer, it will be charged direct.

2.2.37 Maintenance of Nuclear Equipment.

a. Overhead. The costs of maintenance of equipment used exclusively in the area of nuclear work.

b. Direct. Equipment used in support of a project should be placed in a Ready for Use Condition for the next customer. The customer (last user) is to provide a post-use job order for equipment refurbishment, replacement of worn out, damaged and lost equipment. The customer should also be charged for the labor for sorting and establishing equipment after use.

2.2.38 Management and Industrial Engineering Studies.

a. Overhead.

(1) Routine management engineering studies undertaken for activity departments.

(2) Special one-time studies requiring more than 40 man-hours on the part of Most Efficient Organization and initiated upon the request of the Type I Supply Department.

b. Direct Cost. A special one-time study for another activity must be charged directly to funds provided by requesting activity.

2.2.39 Material Handling and Expediting.

a. Overhead. Those costs related to general material handling, i.e., those persons not directly supporting a specific project, that are responsible for checking, processing, moving and distributing material, must be charged to the overhead expense of the performing shop. This includes shipping clerks, material runners, expediters, handlers and equipment operators. The general operators of material stations or centers that support multiple projects are charged to overhead.

b. Direct Cost.

(1) The time of mechanics and helpers devoted to material handling functions must be charged direct when this work is directly related to the productive work which the employees are assigned.

(2) Personnel involved in material expediting and material issue or staging may be charged direct if their time is dedicated to a specific Navy ship's hull, ship class or reimbursable customer's final product or service when it is clearly identifiable to that project. This would include all personnel involved in the operation of a material cage or station that is dedicated to a single project, or individual personnel that are operating out of a multi-project support cage or station, but whose specific individual efforts are dedicated to a single project, e.g., material kitting for a specific availability. Such personnel inside a production shop do not normally meet the criteria for direct charging.

(3) At times, the activity may be required to receive, store and issue material owned outside the Navy Supply System and the Navy Working Capital Fund, in the categories of Government Furnished Material and Naval Sea Systems Command or Fleet-owned items. All labor and material costs incurred by the FMA in connection with such storage and handling are properly chargeable to funds provided by the owner of the material.

(4) Material Inventory Managers or Specialists dedicated to a single project.

2.2.40 Fitness for Duty Medical Examination.

a. Overhead. When an agency obtains a fitness for duty medical examination (in connection with a separation for medical unfitness) whether by a federal medical officer or an employee-designated physician, there must be no cost to the employee or the Office of Personnel Management. The Comptroller General has ruled that agencies have authority to pay for such medical examinations, which are made by employee-designated physicians under those conditions.

b. Direct Cost. Medical examinations required by a specific customer prior to work performance.

2.2.41 Metal Stock Cutting (Bar, Pipe, Plate, Cable, etc.).

a. Overhead. The function of cutting metal is charged against overhead when the purpose of the cutting is in support of an overhead job because the benefiting customer of the end-product is not readily identifiable.

b. Direct Cost. When the benefiting customer of the end-product is readily identifiable, the function of cutting metal is charged against the appropriate direct project.

2.2.42 Acquisition of Minor Property.

a. Overhead. The acquisition of all minor property.

(1) Items of equipment with a purchase cost less than the reference (c) threshold.

(2) Items of equipment with a purchase cost of the reference (c) threshold or more but with a useful life of less than two years.

b. Direct. None.

2.2.43 Miscellaneous Expenses of the Production Resources Department Shops.

a. Overhead. Provides for the accumulation of miscellaneous costs and labor, identifiable with the productive cost centers of the Production Resources Department. Work performed by cost centers outside the Production Resources Department will not be charged to this cost center. This center is primarily established to cover such items as maintaining common use grounds and shipways, printing for shops and maintenance of shop equipment benefiting more than one cost center or more than one common services group cost center. It is the intent of Commander, United States Fleet Forces Command that this cost center be highly restrictive and charged only with those productive expense costs that cannot be identified to a productive shop or common services group cost center. Various Cost Classes will be utilized to meet the correct costing requirements.

b. Direct Cost. None.

2.2.44 Mock-Up Work. Mock-ups include those full-size replicas which are used to facilitate production efforts by saving time or reducing material costs. Included in the cost of mock-ups are the labor, material and other direct costs associated with producing replicas, such as the interior of a space replica of materials or parts to be test welded, etc. Mock-ups do not include construction of facilities required for test purposes when such construction requires various levels

of approval and special funding as specified in reference (i). Mock-ups that qualify as plant equipment must follow the rules concerning the acquisition of plant property.

a. Overhead. The cost of mock-up to reconstruct a specific problem condition such as a mock-up to reinstruct personnel involved in deficient work aboard ship.

b. Direct Cost.

(1) The cost of mock-ups is chargeable to customer funds under the following conditions:

(a) It is specifically authorized as chargeable to the initial ship of a class; or

(b) Is required for accomplishment of a specific job.

(2) If the mock-up will be used for more than one customer or ship, the cost of the mock-up may be distributed to the benefiting customers.

2.2.45 Pilot and Tug Service.

a. Overhead. The cost of all pilot and tug services (naval and commercial) are the cost of the movement or rearrangement of various types of floating equipment such as sludge barges, Wheelerizing equipment, floating cranes, etc., used in connection with FMA support, but not directly related to the immediate productive efforts, will be charged to overhead except as provided herein.

b. Direct Cost. The cost of the pilot and tug services must be charged to customer funds, based on a unit rate which includes the costs of maintenance and operation of the naval craft and the rental costs of commercial tugs.

(1) For ships (U.S. Navy and Financial Management Supervisor cases) with an assigned Naval FMA availability - the cost of tug and pilot services in connection with the overhaul.

(2) For ships without a Naval FMA industrial availability, such as loading and unloading equipment and supplies onto a commercial ship.

(3) For ships under construction at the Naval FMA.

(4) For assist services provided to activities which have the responsibility for providing pilot and tug services.

(5) The costs for movement of the various types of floating equipment discussed under Overhead will be charged to customer’s funds when such movements are directly related to immediate productive efforts.

2.2.46 Planning and Estimating Services.

a. Overhead.

(1) Planning and Estimating support personnel.

(2) Estimators who provide basic ("boilerplate") estimates used for several customers, e.g., Baseline Cost Estimating Standards Program.

(3) Production Resources Department estimators other than identifiable to direct labor.

(4) All planning and estimating services in support of estimating potential work that is not subsequently assigned to the activity.

b. Direct Cost.

(1) All planning and estimating services performed for assigned work must be charged to sponsor funds.

(2) Cost of scoping and estimating work assigned to the FMA which is subsequently eliminated at work definition conference or thereafter because of a shortage of funds, rescheduled for ships force, deferred or cancelled because of non-availability of material or funds.

(3) Services performed for the Inactive Ship Maintenance Facility in preparing and updating estimates for ship activation during mobilization are chargeable to Inactive Ship Program Funds.

(4) Cancellation of work. Reference (j), chapter 10, paragraph VIII must apply to any reimbursable order. "Costs incurred in the termination of project orders must be reimbursable to the performing establishment when such orders are terminated by the ordering component, to the extent such costs do not exceed the amount of the fixed price, or the current ceiling amount in the case of cost reimbursement project orders. In determining termination costs for reimbursement purposes, the performing establishment must be guided by the principles stated in this directive. When military departments cannot agree on the costs of terminations, the case will be referred to the Assistant Secretary of Defense (Comptroller) for settlement".

(5) Preparation of data in support of work to be accomplished by Ship's Force during overhaul.

(6) The effort utilized in collating the authorized work into a Ship Alteration and Repair Package, including printing and mailing.

2.2.47 Acquisition of Plant Property Equipment.

a. Overhead.

(1) The purchase cost of an equipment type item costing less than reference (c) threshold (i.e., minor property) will be expensed to overhead.

(2) Acquisition of OPN equipment with a purchase cost of over the reference (c) threshold and a useful life of more than two years will be purchased using OPN funds, including transportation, installation, training, discounts, etc.

b. Direct Costs. Procurement, transportation and installation of equipment specifically authorized to be acquired by a reimbursable order for use in fulfilling the requirements thereof may be financed by the customer. Equipment acquired specifically for a customer in this manner is the property of the customer and will be disposed of following the customer's instruction.

2.2.48 Pollutant Clean-Up. Naval activities are called upon to remove and dispose of contaminated waste from a variety of sources, e.g., ships under an availability, ships without an availability, general pollution cleanup and ships under the jurisdiction of the FMA. Examples are oil, chemical spills, etc. If the pollution resulted in a fine from the Environmental Protection Agency or other agency, the cost of the fine would be charged in the same way the cleanup is charged. If the cleanup is charged as a direct expenditure, the corresponding fine is charged as a direct expenditure.

a. Overhead. When pollution is caused by an activity effort, no matter where it occurs, the cost of pollution cleanup is chargeable to overhead. Also, the disposal costs of pollutants are charged to overhead.

b. Direct Costs. The cost of cleanup and disposing of pollutants are charged direct under the following circumstances:

(1) When the pollution is caused by the action of Ship's Force personnel, the cost of cleanup will be funded by the ship.

(2) When the cause of the pollution is not the activity, and the activity is required to perform cleanup in a non-activity designated area of responsibility, the activity responsible for the area will be required to provide the funds.

(3) Disposal cost resulting from pollution cleanup that is chargeable to ship or station is chargeable to the same ship or station as the pollution cleanup.

2.2.49 Pre-Expended Bins.

a. Overhead. The cost of stocking and replenishing pre-expended bins of items with a unit cost of $50.00 or less. Items of unit cost in excess of $50.00 may be authorized by the Activity Commander.

b. Direct Costs. None.

2.2.50 Printing, Reproduction and Duplication.

a. Overhead. Charges of all purchased printing, reproduction and duplicating when not chargeable to a project.

b. Direct. Charges that can be readily identifiable to a project, for example, copies of project drawings.

2.2.51 Programming Effort for Numerically Controlled Machines.

a. Overhead. The cost of programming effort for numerically controlled machines is usually charged to overhead, since they are used by more than one sponsor.

b. Direct Costs. The cost of programming effort is chargeable to customer funds when the programs are planned for use by a specific program or project.

2.2.52 Purchase of Gas, Liquid or Solid.

a. Overhead. The cost of natural gas consumed in the generation of power.

b. Direct. The cost of gas, (argon, nitrogen, etc.) , which represents the level of service required for a customer is charged direct.

2.2.53 Radiological Control Engineering.

a. Overhead. Costs associated with the FMA, whose objective is to ensure the continual overall effectiveness of the Radiological Engineering effort and not specifically identified to a particular availability, are charged to overhead. For example:

(1) Preparation and maintenance of local FMA procedures which are formulated to implement directives from higher authority.

(2) Evaluation of FMA Functional Area and Radiological Trend Analysis.

(3) Training or travel related thereto.

(4) Review and evaluation of applicable improvement suggestions.

(5) Production support-type work where it is difficult to charge direct.

b. Direct Cost. Radiological Engineering activities, whose associated costs are clearly identified to a specific availability or would not have been incurred were it not for the presence of that availability, are direct. This activity consists of providing engineering and technical services in direct support of maintaining the radiological control effort of a specified availability. For example:

(1) Review and concurrence of work instructions, such as Nuclear Power Authorizations or Production Engineering Memos, to verify compliance with applicable Radiological regulations or requirements.

(2) Initiation and preparation of Nuclear Power Engineering Authorizations.

(3) Preparation and issue of local Radiological agreements between activity arriving ships.

(4) Planning and scoping the Radiological Engineering effort for a particular availability. This includes the allocation of resources required to perform this effort, and the identification and analysis of those areas which are unique to this availability and require special emphasis.

(5) Direct technical support of the daily in-progress Radiological effort on an availability.

(6) The design and modification of radiological containments that are to be used only on a specific availability.

2.2.54 Radiological Waste Processing.

a. Overhead. Costs associated with activity, whose objective is to ensure the continual overall effectiveness of the Radiological Waste Processing effort and not specifically identified to a particular availability, are charged to overhead. For example:

(1) Preparation and maintenance of local activity procedures which are formulated to implement directives from higher authority.

(2) Review and evaluation of applicable improvement suggestions. Production support-type work where it is difficult to charge direct.

b. Direct Cost. The cost of processing should be charged to a Mission Funded Process Shop.

2.2.55 Refueling Equipment. Assembly and certification for use and decontamination, disassembly and preparation for storage (nuclear) of refueling equipment are charged:

a. Overhead. Cost of preventative and storage maintenance on the equipment while in storage.

b. Direct Costs. The cost of assembly and certification for use and the decontamination, disassembly and preparation for storage after use must be charged to the refueling customer orders.

2.2.56 Ripout Material. Ripout of equipment component, etc., is defined as the removal action for accessibility, interference, Ship Alteration or other repair work. It is performed during a specific key operation of the ship's availability.

a. Overhead. None.

b. Direct Cost. Costs incurred during rip-out operation aboard ship will be charged to the customer job order.

2.2.57 Satellite Steam Boiler. High pressure steam generated from auxiliary steam boilers used for Quality Assurance test evaluation. High pressure steam may be generated from steam barges, portable boilers, Mobile Utility Support Equipment or satellite steam boilers. High pressure steam is used in the testing phase of the ship's operating system. The steam is not utility steam to provide heat for the ship.

a. Overhead. The repair and maintenance of the auxiliary steam generating facility is charged to the overhead.

b. Direct Cost. Costs associated with the operations (and set-up for operation) of the auxiliary steam generating equipment or facility, including fuel and chemicals.

2.2.58 Security Furnished by the Fleet Maintenance Activity.

a. Overhead. Providing security for the general safety of property including routine services for customers.

b. Direct Cost. When required by the customer or his agent, the cost of providing special security may be charged to ship project funds. For example, the cost of civilian personnel performing shipkeeper duties, which is usually performed by ship's crews when available, is to be charged to a service job order under the Type Commander's funds. The cost of marines for refueling security, including their travel, per diem, etc., is also direct chargeable to the project they are supporting.

2.2.59 Service Craft and Floating Equipment (Other Than Nuclear).

a. Overhead. The costs of maintenance of service craft, floating dry docks, camels, dredges, work barges, floating cranes and other floating equipment and costs of miscellaneous overhead functions performed for such craft.

b. Direct. Only for customer owned items (i.e., United States Fleet Forces Command barges).

NOTE: ACTIVITIES WILL CHARGE OPERATING TARGET FUNDS FOR COST OF TOOLS BORROWED BY SHIP'S FORCE AND NOT RETURNED PRIOR TO COMPLETION OF THE SHIP'S AVAILABILITY. IF OPERATING

TARGET FUNDS ARE NOT AVAILABLE (E.G., MANAGEMENT ACTION PLAN SHIPWORK), ACTIVITIES SHOULD OBTAIN FUNDS FROM THE CUSTOMER FINANCING THE MAJOR SHIP CUSTOMER ORDER.

2.2.60 Services in Support of Centralized Tools and Equipment.

a. Overhead.

(1) The cost of labor and material incident to preventive maintenance inspection and normal corrective maintenance including lubrication, minor adjustments, repair, overhaul, alignment and subsequent performance testing of all machine tools and industrial shop equipment and their attachments under cognizance and inventory control of the activity.

(2) Manning and operating of all inside and outside tool rooms.

(3) Conditioning and sharpening of all cutting tools, including saws.

(4) Heat treating of tools regardless of physical location of the facilities.

(5) Procurement initiation, inventory control, maintenance, storage, issue, accountability and development of statistics on tool life, usage, cost and performance of craftsmen's furnished by the activity, abrasion wheels and devices, and special issue of industrial clothing and safety equipment.

(6) Minor layouts.

(7) The acquisition of safety shoes, safety goggles and lenses (including prescription lenses) and the custody, maintenance and issue of such equipment and other safety equipment.

b. Direct.

(1) Purchase or manufacture of tools required for work outside of the activity assigned missions or functions, and such other tools as are necessary to fill a particular need under a specific customer order and their future use on other work is not contemplated. Such tools become the property of the customer and are disposed of following his direction.

(2) Overhaul and repair of equipment in the Navy supply system.

(3) Overhaul and repair of ship equipment and allowance materials.

(4) Miscellaneous services for the Inactive Ship Maintenance Facility.

(5) Loaned tools lost or damaged beyond economical repair must be charged to the customer.

2.2.61 Temporary Services.

a. Overhead.

(1) Maintenance of facilities required to perform assigned functions such as storage bins and racks, workbenches, cleaning vats, lines, blowers, ventilation equipment, pumps, etc.

(2) Manufacture, stage and store items such as electrical distribution equipment, such as air, water, hoses, strainers, values, sewage lift stations built by the FMA, air and water filter systems, chilled water units, refrigeration units (chill and freeze boxes), air conditioning units, heaters, etc., for nuclear as well as non-nuclear. Build or repair tool air hose for the tool rooms. Assemble and maintain emergency response gear (electrical and mechanical) for disaster relief support, nuclear and non-nuclear (spills, earthquakes, etc.).

(3) Maintenance work (cleaning, lubricating and minor adjustment of temporary service equipment). This excludes the regular maintenance of equipment which is under the responsibility of Shop 06.

(4) Security patrol, emergency response, of temporary service connections provided dry docks and berthing areas must be charged to the overhead of the performing cost center.

b. Direct Cost. Cost of installation, connection, maintenance and removal for utilities services such as fresh and salt water, steam and hot water, steam power, hydraulic power, electricity, gas and compressed air furnished ships and communication systems at an activity or off-site location.

2.2.62 Severance Pay.

a. Overhead. Severance pay costs will be charged to overhead.

b. Direct Cost. None.

2.2.63 Special Programs (External or Claimant Authorized). To provide a better focus on the costs of this type, only programs specifically authorized by the claimant will be included. Basically, such programs will be approved only if they are directed by the claimant and are not an inherent functional responsibility of a specific department or activity, e.g., activity assignments under the FMA MIS program are usually automated information systems assignments and will continue to be charged as such.

a. Overhead. The cost of activity-wide special programs that have been specifically authorized for reporting in this category must be charged to overhead. Each program must be separately identifiable, so that the cost of each individual program can be readily determined.

b. Direct Cost. None.

NOTE: THE DIRECT COSTING OF SUPERVISION IS NOT ALLOWED WHEN THE SUPERVISION IS OF EMPLOYEES WHOSE EFFORTS ARE FOR A MULTITUDE OF END PRODUCTS OR CUSTOMERS. THE PRORATION OF SUPERVISORY COSTS FOR DIRECT CHARGING, WHERE THE BASIS OF PRORATION IS OF AN ARBITRARY NATURE AND THE TIMEKEEPING EFFORT IMPRACTICAL, IS PROHIBITED.

2.2.64 Supervision.

a. Overhead. When performing administrative functions, or supervisory functions which cannot be readily identified to one project, the supervisory effort will be charged to overhead.

b. Direct Cost. Time spent when working on a specific project where the supervisory effort is directly identifiable to the end product. This could include any level of supervision, e.g., project managers, if the effort is identified to one project. This also applies to engineering codes if the supervisor's employees are clearly costed to only one sponsor. Supervisors may not be charged direct to a productive job when working in an administrative capacity.

2.2.65 Consumable Supplies.

a. Overhead. Consumable supplies, such as x-ray film, tracing cloth and office supplies, including those consumed in the process of serving tenants, must be charged to the appropriate overhead classification.

b. Direct Cost. Industrial x-ray film and other specialized consumable supplies issued in quantities that can be identifiable to a specific customer may be charged direct. Direct costs should be easily identifiable items not of the pre-expended bin type.

2.2.66 Operation and Maintenance of Tank Cleaning System.

a. Overhead. Maintenance costs are charged to the overhead for this equipment.

b. Direct Cost. Operating costs for productive work will be charged direct.

2.2.67 Telephone Services.

a. Overhead. The following costs should be charged to overhead:

(1) Activity telephone services - all costs including installation or removal, lease lines, basic service, relocation, message units (or current electronic texting devices) and toll charges when the service is for the benefit of the activity will be charged to overhead.

(2) Ships with an availability - basic services and toll call charges related to activity's industrial effort will be charged to overhead.

b. Direct Cost. The following costs should be charged direct:

(1) Voice - the charge for toll calls and identifiable additional message units, installation and relocation costs, special services and devices such as data phones, speakerphones, call directors and private leased lines.

(2) Data or record - the charges for private line services and leased equipment, such as TWX, TELEX and FACPHONE and off-line message preparation using optical character reading machines or other special equipment when such equipment is not required by the Naval Communication Telecommunication Service Center.

(3) Tenant activities and other users - costs under Overhead which cannot be identified to the users will be charged direct.

(4) Cable installation connections for ships with an availability are charged to ship funds. Connections for those telephones needed to coordinate or support the FMA's ship availability work both aboard ship and ashore are chargeable to ship overhaul funds. Connections for additional convenience telephones are properly chargeable to the ship's Operating Target Fund.

(5) The cost of telephone services, including cable connections, rentals, etc., including toll calls, rendered to ships in the activity for berthing only, must be charged to the ship funds.

2.2.68 Issue of Uncontaminated and Contaminated On Return Tools.

a. Overhead. None.

b. Direct Cost. When the effort requires the use of a special tool crib and can be readily identified to a specific ship, the costs must be charged to a service job order and to the sponsors. Proration will be based on auditable, consistent accounting methods.

2.2.69 Training of Personnel.

a. Overhead.

(1) All training on the job by supervisors is a regular duty of supervision and the supervisors' time will be charged to the supervisor's regular job order. Any formal training of apprentices on jobs will be treated as an expense of the job order on which the apprentice is working.

(2) Apprentices while attending Apprentice School Training will charge so that the expense is separately identifiable. All other training not associated with the Apprentice School will be charged to overhead.

(3) Apprentice Instructors charge overhead in their applicable shop or department.

(4) The time of trainees while they are receiving scheduled instruction away from productive work and the instructor's time will be charged as overhead. Related training duties applicable to instructors are the preparation and revision of course and lesson plans and related materials.

(5) The training and qualification of personnel to perform special skills, within their cognizance, which are required by advanced technology being applied. Examples are train and qualify welders to perform welding per applicable standards, train and qualify personnel for reactor plant work, i.e., radiological control, quality control and all classroom work to qualify or periodically requalify Shift Refueling Engineers, Shift Test Engineers, Chief Test Engineers, etc. Retraining and requalification are required based on lapsed time.

(6) The cost related to sending employees to the equipment manufacturer's plant for in-house training to undergo training for a new product or system must be treated as an overhead expense. This includes the training and qualification of employees to perform special skills, within their cognizance, which are required by advanced technology. In such instances, the costs (travel, per diem and labor) are chargeable to overhead expense.

(7) The cost of training after the initial training for a new product or function that has been introduced into the Navy must be treated as overhead expense.

b. Direct Cost.

(1) Apprentices' time when working (not merely observing or other non-contributive conduct) on productive jobs is chargeable to the job order on which the apprentice is working.

(2) The training and qualification of personnel to perform specific functions when such training and qualification is required each time the function is performed is chargeable directly to the benefiting customer.

(3) The development and qualification of employees requested by activities outside the activity must be a direct charge to the requesting customer.

(4) It is suggested that, initially, training be provided to state and local government employees on a space available basis and the activity not require reimbursement for this service. If, however, the scope, frequency or other characteristics of the training requested by the state or local government requires significant alteration to the activity's existing training program, reimbursement should be requested for the costs incurred from the appropriate state or local government.

(5) The adaptation of standard activity procedure to specific application is chargeable to the benefiting customer.

(6) The cost of providing the initial training for new products or weapons systems is chargeable to the organization introducing the new product or system. These costs include instructional material and instructors' costs which occur as a result of contracts placed with equipment manufacturers or within the Navy to teach maintenance and repair techniques to employees of the Government. After an initial training for a new product or system has been introduced, the training program is chargeable to overhead.

(7) Training and qualification of personnel to perform specific functions, when such training and qualifications are required each time the function is performed, is chargeable directly to the benefiting customer. In this instance, the training is peculiar to and identifiable to a specific product or system and expertise is lost through non-use. Examples of this exception include the training of personnel to overhaul or repair unique equipment, which is not within their normal cognizance or expertise, nor is it expected that such unique equipment will be overhauled or repaired for other customers in the future. In addition, if a customer imposes additional training or re-qualification of personnel even though the personnel may be properly certified per current training manuals, then the additional training costs would be properly charged to the benefiting customer.

2.2.70 Traumatic Injuries - Continuation of Pay. When an employee sustains a traumatic injury, Public Law 93-416 provides that the employee can be retained in full pay status for up to 45 calendar days for each injury without charge to leave.

a. Overhead. The labor cost for employees sustaining traumatic injuries will be charged to a separate overhead job order.

b. Direct Cost. None.

2.2.71 Utilities for Ships. Utilities, excluding telephone service, include fresh and salt water, steam and hot water heat, steam power, hydraulic power, electricity, gas and compressed air, whether delivered to the vessels proper or used by shore activity personnel in dockside operation.

a. Overhead. None.

b. Direct Cost.

(1) All utilities for ships with an assigned availability must be charged to a service type job order based upon utility rates.

(2) Utilities for ships not in an availability must be charged to funds provided for this purpose.

LISTING OF APPENDICES.

A Foreign Ship Repair Request

B Foreign Ship Repair Reply

3.1 DIRECT AND INDIRECT COST IDENTIFICATION FUNCTIONS AND TASKS OVERVIEW. Since the consolidation of the Repair Supervisors of Shipbuilding, Conversion and Repair, USN into the Regional Maintenance Centers (RMC), RMCs have assumed responsibility, within their geographic region, for all ship maintenance work contracted for accomplishment by commercial shipyards as well as organic intermediate level maintenance efforts. Along with operational responsibility came the responsibility to prepare and manage financial budgets and budget execution. This chapter provides an overview of the RMC functions and responsibilities regarding uniform costing of direct versus indirect expenditures within the maintenance enterprise. Uniform costing of direct versus indirect is an important tool in the budget process. The financial management program with regard to maintenance is managed at various levels of the Department of the Navy.

a. Chief of Naval Operations (CNO).

b. Naval Sea Systems Command (NAVSEA).

c. Commander, United States Fleet Forces Command or Commander, U.S. Pacific Fleet.

d. Type Commanders (TYCOM).

e. Ship Commanding Officer or Officer in Charge.

f. Naval Shipyard Commander or Commanding Officer, Fleet Maintenance Activity (FMA).

3.2 ORGANIZATIONAL RELATIONSHIPS FOR FINANCIAL MANAGEMENT OF MAINTENANCE ACTIVITIES.

3.2.1 General. The following sections discuss the basic responsibilities of various levels of the Navy as they affect the financial management of maintenance funding within each organization.

3.2.2 Chief of Naval Operations. The CNO is responsible to the Secretary of the Navy for the readiness, operations and logistics support of all U.S. Naval Forces. As the military chief of the Navy, the CNO is the principal advisor to the Secretary of the Navy and the executive branch of

the Government on naval military matters, including funding of ship maintenance. The CNO formulates detailed budget submissions which identify the resources required to carry out the missions assigned to the Navy. These budget submissions are based on detailed support from subordinate commands and include funding requests to Congress for the resources necessary to carry out specific ship modernization, repair and maintenance programs.

3.2.3 Systems Commands.

a. To provide support for the operating Fleet, the Navy has established five Systems Commands (SYSCOM) with specific support responsibilities. These SYSCOMs are:

(1) NAVSEA.

(2) Naval Air Systems Command.

(3) Naval Information Warfare Systems Command).

(4) Naval Supply Systems Command (NAVSUP).

(5) Naval Facilities Engineering Systems Command (NAVFAC).

b. The SYSCOMs are responsible for establishing technical requirements and meeting logistics, maintenance and support requirements of Fleet Commanders in the area of new construction and ship maintenance. In addition, these SYSCOMs provide technical requirements for all varieties of maintenance and conduct detailed analyses to determine the proper balance between design improvement and logistics support to achieve the required operational availability.

3.2.4 Naval Sea Systems Command.

a. For procurement purposes, Commander, NAVSEA, is Head Contracting Agency with delegated authority in the Federal Acquisition Regulation to enter into and administer contracts for materials and services for which NAVSEA is responsible. NAVSEA, in turn, has delegated this authority to the Deputy Commander for Contracts (NAVSEA 02). Delegation of authority to the Public Shipyard Contracts Department Head is addressed in the NAVSEA Contracts Handbook and in other volumes of this manual. Only NAVSEA and individuals designated by NAVSEA 02 who are duly authorized and acting within the limits of their written delegated authority can commit the Government to any contractual action.

b. As the agent of the CNO, NAVSEA maintains the Navy Data Environment and develops documentation for all authorized alterations. NAVSEA also authorizes and funds all program alterations not authorized and funded by the cognizant TYCOM. The maintenance, repair and modernization of ships, submarines, craft and boats assigned to the operating forces may be carried out by procurement of services and material from private industry through the RMCs, organic assets of the RMCs, or the Naval Shipyards (organic depot maintenance).

c. NAVSEA is also responsible for developing, validating and maintaining Organizational, Intermediate, and Depot-level maintenance requirements and tasks in the Planned Maintenance System.

3.2.5 The Atlantic and Pacific Fleets. The Commanders, Atlantic and Pacific Fleets under the direction of the Commander, United States Fleet Forces Command are responsible for all aspects of their assigned ships including adequate funding of maintenance requirements. The Commanders must balance the competing needs of funding the operational Fleets with the funding need for maintenance and modernization of the Fleet. Ships and craft under their cognizance comprise the largest portion of the repair and overhaul budget. Fleet Commanders, through their respective Fleet Maintenance Officers, are responsible for the budgeting, scheduling and executing CNO-scheduled ship maintenance and modernization availabilities plus emergent maintenance requirements. Through the respective TYCOMs, the Fleet Commanders provide funding for advance planning and execution of scheduled ship maintenance availabilities.

3.2.6 Type Commanders.

a. TYCOMs and RMCs are responsible for preparing budget submissions and managing budget execution in support of ship modernization, repair and maintenance availabilities as well as the material readiness and training of their assigned ships. The basis of the TYCOM budget should be historical cost incurred for similar efforts. These historical costs are generated by the RMC or FMA based on direct versus indirect maintenance cost identification. In this regard, the TYCOM is one of the most important activities involved in scheduling and managing ship repair planning activities.

b. Under guidelines established by the CNO and Fleet Commanders, the TYCOMs and RMC manage funds for advance planning for repairs and some selected alterations, and execution of the availabilities. TYCOMs are responsible for providing advanced planning funds to the respective ships Maintenance Team for availability planning. After the availability work package has been identified and documented, the TYCOM provides a level of funding to accomplish necessary repairs and some of the alterations. Depending on the availability of funds, the funds provided may not be sufficient to accomplish the entire work package.

3.2.7 Regional Maintenance Centers or Fleet Maintenance Activities.

a. The CNO has delegated authority to RMC Commanding Officers to assign availabilities for ships under their cognizance. The local RMC has overall responsibility for efficient planning, brokering and execution of all ship maintenance and modernization for assigned ships. Contact information for the RMCs can be found in Appendix A of volume VI, chapter 2 of this manual. This section outlines RMC or FMA responsibilities related to financial budgeting, execution and reporting.

b. From a budget formulation perspective, the individual RMC or FMA is the first step in preparing the annual budget submission for ship maintenance. Based on cost incurred in prior periods, the RMC or FMA determines the resources necessary to perform the anticipated level of maintenance effort. The charges passed on to the reimbursable customers form the basis for preparing their budget submission for the maintenance the activity plans for the future period. Therefore, it is critical that all costs are properly classified as direct or indirect. With regard to reimbursable customers, the RMC or FMA is only allowed to pass on direct cost incurred for their project since

indirect costs are supported with direct mission funding. If direct costs are misclassified as indirect, the RMC or FMA is not able to recoup the cost of the effort and the customer's historical record shows a flawed lower cost for the effort and consequently future funding requests may not be sufficient to support future maintenance efforts. The RMC will perform the following related to direct versus indirect charge:

(1) Providing detailed guidance regarding identifying, charging, classifying, collecting and reporting expenditures related to maintenance cost with the exception of organic depot level maintenance.

(2) Review budget submissions from subordinate commands.

(3) Prepare budget submissions, with appropriate supporting documentation, for submission to higher headquarters.

(4) Provide necessary training and supervision to internal intermediate level resources to ensure the requirements of this manual are implemented.

(5) It is the responsibility of the local RMC to provide necessary oversight to subordinate FMAs ensuring the requirements of this manual are executed.

3.2.8 User Commands or Activities (Users). Per reference (a), the CNO assigns service craft and boats to Users. These crafts and boats are maintained and overhauled using funds granted by Support Commanders to their subordinate Users activities. Service craft and boats under the cognizance of the Users comprise a portion of the RMC or FMA repair and overhaul workload and the User Commands must provide the required funding through reimbursable orders for the RMC or FMA to maintain the User's assets. For example, the Naval Station Port Operations are assigned service craft that support home ported or visiting ships. When one of these craft requires maintenance, Naval Station Port Operations provides a reimbursable order to the RMC or FMA to provide the required maintenance.

3.2.9 Naval Inactive Ship Maintenance Facilities. The RMC or FMA may be required to support the inactivation of ships scheduled for retention at Inactive Ship Maintenance Facilities. The TYCOM normally authorizes the work and NAVSEA funds such work using reimbursable orders. In some cases, inactive ships may be reactivated for delivery to foreign Governments through the Foreign Military Sales Program. This work is normally authorized and funded by NAVSEA or higher authority using reimbursable orders.

3.2.10 Naval Reserve Force Vessels. Ships assigned for training Naval Reserve Force personnel comprise a portion of the RMC or FMA workload. The TYCOM who has cognizance over these ships authorizes and funds the repair and overhaul work using the reimbursable order process.

3.2.11 Foreign Governments. RMCs or FMAs may interact with foreign Governments, when requested and authorized by the CNO or NAVSEA, to procure commercial repair work to:

a. Recondition and otherwise repair Navy ships that are to be, or have been, transferred to foreign Governments.

b. Effect emergency voyage repairs or other services for vessels of foreign Governments, when approved and authorized by CNO. Request authorization using sample message

of Appendix A. CNO may reply with sample C in Appendix B or other message format.

c. Unless specific legal authority to price on other than a full cost basis, Department of War services and materials must be priced on a full cost basis per reference (b), volume 12, chapter 9. In order to accomplish this requirement, it is critical the RMC or FMA accurately identify and accumulate direct and indirect cost. Full cost basis requires that the RMC or FMA accumulate all costs associated with the maintenance effort. This includes all direct costs that are normally captured as well as a portion of the indirect cost. In a situation like this, if the system for capturing cost is not accurate, the RMC or FMA may recoup more or less than the cost incurred and if it were discovered later, a refund or additional bill would have to be issued.

3.2.12 Private Companies - Demilitarizing and Stripping. The RMC or FMA may be required to arrange for the demilitarization and stripping of ships that are programmed for disposal or for sale to private concerns. In the case of ships programmed for disposal, these functions, when not performed by the activity having cognizance of the vessel, are carried out by the responsible RMC or FMA. When the ships are sold to private concerns, the work will be performed by the purchasing contractor as a condition of sale. In these cases, the RMC or FMA will be requested to provide surveillance over the work to ensure its proper performance. Of particular concern is the compliance with Environmental Protection Agency rules and regulations where there is potential for environmental impacts resulting from work associated with disposal action. The cost of this surveillance would be considered a direct cost and charged to the contract.

3.3 STANDARDS OF CONDUCT.

a. Congress has passed numerous laws which place significant controls over funds management such as those identified in volume VII, chapter 6, of this manual. The Department of Defense has issued additional regulations in the form of reference (b), volume 12, chapter 9. Practices that may be acceptable in the private business world regarding funds management are not necessarily acceptable for naval personnel. Individuals who manage, control, expend or report on government funding are held to high standard regarding the control of those funds. In order to accomplish the intent of these legal requirements it is critical the RMC or FMA accurately identify and accumulate direct and indirect cost.

b. All personnel must exercise special diligence to prevent fraud, collusion, larceny, embezzlement or other improper conduct within the area of their responsibilities and must report immediately to the FMA Commanding Officer any instance of fraud or other improper conduct they observe or suspect. Failure to accurately record expenditures could be considered improper conduct in certain circumstances.

PART IV

CHAPTER 4

RETENTION OF FINANCIAL RECORDS

REFERENCES.

(a) SECNAV M-5210.1 - Records Management Manual
(b) DoD 7000.14-R – Department of Defense Financial Management Regulation (DoD FMR)
(c) General Records Schedules (GRS), National Archives and Records Administration

4.1 PURPOSE. This chapter provides guidance and policy for maintaining and retaining financial records related to the charging of direct and indirect maintenance expenditures.

4.2 GENERAL. Maintenance cost records provide a historical record of financial resources required to perform a specific level of maintenance and cost history of repairs and alterations performed on individual ships by the Fleet. These records must be accurate and complete to "stand alone" documents, without additional explanation. These records will provide a basis to estimate the cost of similar efforts in the future and to support future budget requests. Records will be maintained for direct mission funded efforts, indirect mission funded efforts, and reimbursable orders.

4.2.1 Maintenance Cost Record Requirements. The process of maintaining financial related records can affect the perceived validity of completed financial record. If the process used to maintain the financial records appears to have inadequate controls, then the accuracy and completeness of the information produced will be questionable. To maintain confidence in Fleet maintenance financial records, and to provide the necessary support for budgeting, the following record keeping rules are specified:

a. When recording labor or materials against a specific Job Order Number it is critical for all entries to be legible and in ink. Erasures, write-overs, white outs, ditto marks, continuation arrows, signature stamps, etc., are not acceptable. When corrections are required, the employee must initial all changes.

b. Neatness and readability of the original record is paramount. Copying records to "make them neat": is prohibited. Original documentation must be maintained to support summary reports.

c. When an error is made, draw a single line through the error, record the correct entry, initial and date the correction. This allows the original record to be available and provides an audit trail through the entire process.

d. When a questionable item is identified, research will be initiated to determine the validity of the item. The research will be fully documented and if the research determines the original item was correct or incorrect, that will be clearly identified and the documentation will fully explain the decision and be added or appended to the original record as appropriate.

4.2.2 Record Retention in General. The following paragraphs summarize the general requirements for retaining financial records and how long they will be retained:

a. Records required to be maintained for periods exceeding 12 months may be reduced in size (such as .pdf format). The Fleet Maintenance Activity (FMA) is responsible for the maintenance cost of records and therefore will ensure that the reduced records sizes are clearly legible, reproducible, and certified prior to destroying the original records. The following procedure will be followed for record reduction:

(1) Record reduction must be per reference (a), part III, chapter 7.

(2) Compare the reduced size record against the original record to ensure each page of the original record has been reduced, is clearly legible and reproducible. This comparison must ensure that the front and the associated back of documents have been reproduced.

(3) Reproduce two randomly selected pages of the reduced record into paper copy. Verify completeness and legibility of reproduced pages by comparing them against the original record.

(4) Person making comparison will sign the logbook or some other permanent record to certify that the reduced size record is complete and legible after being reproduced.

b. After steps (1) through (4) are satisfactorily completed, the original record may be destroyed.

4.3 IMMEDIATE SUPERIOR IN COMMAND RECORD RETENTION.

4.3.1 Financial Record Retention. Copies of documents used to provide maintenance funds to FMAs and Immediate Superiors In Command will be retained per reference (b), volume 1, chapter 9.

4.3.2 Inspection Record Retention. Copy of last Immediate Superior In Command or Type Commander inspection of the FMAs financial records including copies of identified discrepancies, root cause analysis performed and corrective action implemented.

4.3.3 Command Evaluation and Independent Audit Record Retention.

a. Records of command evaluation reviews related to financial management will be retained for 5 years after cutoff of corrective actions as required by reference (b), volume 1, chapter 9, and reference (c).

b. Copy of last independent audit (if any) of FMA financial management procedures and processes.

4.3.4 Assessments, Evaluations and Audits. The Financial Management Officer will retain records of assessments and evaluations for the past 24 months (unless otherwise stated). The records will consist of:

a. A log will be maintained of all Financial Management Discrepancy Forms, part IV, chapter 5, Appendix E of this volume. Financial Management Discrepancy Form identifies the Job Order Number reviewed, work center responsible, discrepancy

identified (if any), corrective action to be taken, and estimated date corrective action is expected to be complete.

b. Copy of last higher authority assessment and the corrective action for all discrepancies identified.

c. Results of all reviews of the financial reporting program, including the corrective action taken or pending. (This may be kept with the rest of the monitor program records).

d. Last annual evaluation of the financial reporting program performed.

4.3.5 Training. Each employee will be trained on how to accurately charge their labor and materials to direct and indirect Job Order Numbers. Records related to this training will be retained following Type Commander or Immediate Superior In Command instructions.

4.4 FLEET MAINTENANCE ACTIVITY FINANCIAL MANAGEMENT RECORD RETENTION. Financial records, including those focusing on direct versus indirect costs, will be maintained for 3 years, per reference (b), volume 1, chapter 9, and reference (c). Reference (b) volume 1, chapter 9, requires the financial information "be maintained for at least the minimum period specified in the applicable National Archives and Records Administration General Records Schedules and longer if compelling reasons exist or supplemental guidance directs". The specific records addressed by this volume relate to cost accounting, which must be maintained for at least 3 years from the date the actions are closed.

4.5 LOST RECORDS.

a. If the financial records have been lost or destroyed, an investigation will be performed to document the circumstances. The RMC or FMA Commanding Officer will appoint, in writing, an investigating officer. The written appointment will identify, in detail, the lost records and the circumstances, as they are known. The investigating officer will make sufficient inquiries to determine the most likely disposition of the records.

b. The investigating officer will prepare a written report to the Commanding Officer, detailing the results of the investigation. The report will include recommendations designed to correct the control weakness that allowed the records to be lost.

CHAPTER 5

FINANCIAL AUDITS, EVALUATIONS AND ASSESSMENTS

REFERENCES.

(a) SECNAVINST 5239.24 - Department of the Navy Digital Signature Policy

LISTING OF APPENDICES.

A Vertical Audits
B Horizontal Audits
C Checklist for Evaluating Direct versus Indirect Costing
D Financial Management Audit Discrepancy Form
E Financial Management Discrepancy Form

5.1 PURPOSE. This chapter provides requirements, procedures and criteria for audits, evaluations and assessments regarding direct versus indirect expenditures incurred by the Fleet Maintenance Activities (FMA). The expenditures include both Direct Mission Funded Resources and funds received through reimbursable orders and the provisions of this chapter apply to both.

5.2 GENERAL. An effective command evaluation program is essential to ensure the accuracy and completeness of the cost data associated with maintenance efforts. Audit, evaluation and assessment programs are objective, constructive tools to monitor the accuracy and completeness of the maintenance cost data collected. These same tools also evaluate the effectiveness and efficiency of the collection process. The purpose of the command evaluation program is to determine the activity's compliance with established directives and their ability to capture and correctly classify the overall cost of maintenance and provide an opportunity to correct any discrepancies. The command evaluation program must be flexible and dynamic. Focusing on specific areas of interest or current issues should be done on a regular basis to increase the benefit of the audit. Focusing reviews would prove most beneficial when the activity is involved with infrequent repair efforts, components with an abnormally high cost of maintenance and modernization or first-time repair or modernization efforts. Review guides should be developed which lend themselves to evaluating recent command, division or cost center efforts related to identifying the accuracy and completeness of direct versus indirect expenditures. The involvements of the highest levels of the command are essential to ensure the Department of the Navy gets the greatest return from the limited maintenance or modernization funds available.

5.2.1 Audits. Audits are an independent systematic comparison of financial cost reports with the supporting documentation to ensure the accuracy and completeness of maintenance cost reported to higher headquarters and used to support budget requests. Different types of audits may be performed depending on the area to be audited and the purpose of the audit. The general audit categories are:

a. Vertical Audit. These audits review all aspects of the cost of one repair or maintenance action or Job Order Number (JON). They track the maintenance task

from inception to completion. This is done by verifying all cost aspects of the technical, material, process and documentation requirements associated with the work. These audits include attributes covering the entire spectrum of the cost charged to the effort. Reviewing the direct versus indirect charging of cost will be just one part to the audit. Appendix A provides guidelines for the preparation and execution of vertical audits.

b. Horizontal Audit. These audits are conducted on only one specific area or aspect of the direct or indirect cost program (e.g., material charges or a specific category of labor on multiple JONs, administrative efforts within the activity, etc.). They focus on the particular area and do not track a complete JON from inception to completion but rather track expenditures across the activity for a specific function. Appendix B provides guidelines for preparation and conduct of horizontal audits.

c. Repeat Findings. Once an audit is conducted and findings are identified, it is expected the command will take action to correct the identified discrepancy and institute controls to prevent reoccurrence of the condition. If during an audit a repeat finding is identified, the recommended corrective actions must be addressed to the Immediate Superior In Command (ISIC). A repeat finding is one that was identified in the preceding audit.

5.2.2 Evaluation. The results of evaluations provide the Commanding Officer with an unbiased review of the overall accuracy and completeness of cost reported. Based on these results the Commanding Officer can, if discrepancies are noted, make an informed decision to apply additional emphasis or resources against the program to improve the condition. If the results of the evaluation reveal no significant discrepancies, the Commanding Officer has independent verification of the effectiveness of the function.

5.2.3 Assessments. Assessments are an external programmatic review of processes to ensure compliance with parent directives. The assessment could include a review of the accuracy and completeness of direct versus indirect costing. Assessments are normally conducted by the activity's Type Commander or ISIC with participation of other commands if the Type Commander or ISIC determines additional expertise is necessary.

5.2.4 Key Elements of an Effective Command Evaluation Review. Fleet Activities will use, as a minimum, the following key elements to assure the effectiveness of their command evaluation program.

a. Conduct training for all personnel assigned to the command evaluation effort on techniques for preparation, execution, documentation and the evaluation of findings prior to conducting an audit for the first time. Subsequent evaluations, performed with experienced personnel, will only require refresher training. The training should be adequately documented for other independent reviewers to ascertain what was and who were trained.

b. Development and use of attribute sheets or guides. These should be based on key attributes from the source documents and are not meant to limit the scope of the review.

c. Develop a thorough review process focusing on previously identified audit deficiencies to disclose potential adverse trends and recurring deficiencies.

5.2.5 Record Retention. The retention of records for audits will be per chapter 4 of this part and volume.

5.2.6 Signatures. Digital or electronic signatures are authorized on all forms and records. Electronic signatures will be per reference (a) and must be defined and approved for use by local instruction.

5.3 RESPONSIBILITIES AND PROCEDURES.

5.3.1 Fleet Maintenance Activity Audit and Evaluation Program.

a. Audits. FMAs will schedule and conduct the following command evaluation audits:

NOTE: IF THE AUDITOR ONLY OBSERVES PERSONNEL WORKING ON SHIPS, EXPECT TO FIND VIRTUALLY 100% DIRECT. THEREFORE, WHEN SELECTING THE PERSONNEL TO OBSERVE, ENSURE THE AUDITOR GETS A REPRESENTATIVE SAMPLING.

(1) Annual audits to be conducted:

(a) Perform an evaluation of the percentage of direct versus indirect expenditures using Appendix C as a guide. Identify and evaluate any unusual results to determine the root cause of the anomaly. Also, based on the results of this review, evaluate whether it is possible to economically reduce the indirect percentage. The command is required to review the percentage of indirect expenditures on a monthly basis and provide a report to the ISIC.

(b) Perform an audit on the accuracy of direct charges versus indirect. This will involve observing the recording of cost against selected JONs.

(2) Perform post closeout audit of the expenditure charge for selected Controlled Work Packages (CWP). Determine if the total direct expenditures recorded were within the range of what was expected. The CWPs selected should be representative of the maintenance efforts performed during the period.

(3) Written audit guides must be used for each audit. The activity performing the audit will develop audit guides based on the unique nature of the audit planned. The audit guides should be tailored and customized for the specific organization or area being audited. One successful technique is to acquire a collection of audit findings from other FMAs and incorporate these into the audit guides. Once an audit guide is prepared, it will be filed and reused when similar audits are performed. It is also recommended the FMAs share audit guides.

(4) The results of each step in the audit guides will be documented sufficiently to support the final conclusion or finding.

(5) Audits should be conducted on an annual basis unless a shorter period is specified. Those areas identified as weak should be followed up on more frequently. The periodicity of these audits must be adjusted by the Financial Management Officer (FMO) based upon the results of previous audits.

(6) Report results of all audits to the Commanding Officer with copies to the FMO and cognizant Department Head or Division Officer.

(7) A copy of the final report will be provided to Commander, Navy Regional Maintenance Center (CNRMC) or appropriate ISIC after the FMA Commanding Officer has accepted and implemented the corrective actions.

b. Evaluations. The FMA FMO will conduct a semi-annual evaluation of the overall adequacy and effectiveness of the FMA's direct versus indirect program. This effort is less than an audit, requiring less documentation and of shorter duration. The results of this evaluation will provide an indication of the effectiveness of the program. If the results indicate a significant, widespread problem, the evaluation will be expanded into an audit.

(1) Results of this evaluation will be provided to the appropriate Department Head, and Commanding Officer if the results indicate a significant problem.

(2) A copy of the final report will be provided to CNRMC or appropriate ISIC after the FMA Commanding Officer has accepted and implemented the corrective actions.

5.3.2 Management Metrics for Direct Versus Indirect Costing.

5.3.2.1 Metric Number 1, Total Indirect Time.

5.3.2.1.1 Activity Goal. Recognizing that establishing an activity goal for indirect cost before the FMAs have had an opportunity to evaluate and implement the guidance is arbitrary and will probably require adjustment after more detailed information is accumulated. The initial goal for indirect expenditures is 10% of total expenditures. Total expenditures are the sum of total direct mission funding plus the total of reimbursable order expenditures. This metric is computed at the organizational level.

5.3.2.1.2 Activity Level. On a monthly basis, the financial manager will determine the total expenditures for the overall FMA; this includes both direct mission funding expended and reimbursable order funding expended for the period. Based on the collection of cost information using the guidance in parts I, II, or III, as applicable, of this volume, determine the total indirect cost reported by the FMA for the period. Using this information and the following formulas, determine the percentage of expenditures which are attributable to indirect efforts. The following formula will be used:

Direct Mission Funds Expended	+	Reimbursable Order Funding Expended	=	Total Expenditures by Maintenance Activity for Period

Total Indirect Expenditures for Period	÷	Total Expenditures by Maintenance Activity for Period	=	Percentage of Indirect Expenditure for Period

5.3.2.1.3 If the total indirect percentage exceeds the goal, the FMA should determine what events caused the increase. The FMA should identify what actions are necessary to bring the

indirect into the acceptable range. The results of the evaluation will be provided to the CNRMC not later than the 15th day following the close of the month.

RATINGS: GREEN 10% or less

RED More than 10%

5.3.2.2 Metric Number 2, Direct Positions Charging Indirect.

5.3.2.2.1 Activity Goal. The goal of the FMA with regard to direct versus indirect costing is to minimize indirect expenditures. Minimizing indirect expenditures will help maximize the return that the Fleet gets from resources committed to maintenance efforts. The FMA is staffed with personnel who are primarily working on direct maintenance efforts and some personnel who would primarily be performing overhead assignments. For personnel who are primarily working on direct maintenance efforts, occasionally they will be required to charge their efforts against an indirect JON. Charging personnel who are primarily assigned to the activity to perform direct maintenance efforts against indirect JONs should be minimized. Therefore, another metric that should be measured is the amount and percentage of indirect cost generated by personnel in direct maintenance positions.

5.3.2.2.2 Activity Level. On a quarterly basis, obtain a listing of all personnel who charged to an indirect JON for the preceding month. Determine if personnel who normally work on direct maintenance efforts are identified on the list. If any of the direct personnel charged over 10% of their available efforts to an indirect JON, determine why the indirect JON was used. Document the results. If the charges were inappropriate, document corrective actions taken to prevent a recurrence of the error.

5.3.2.2.3 Using the same listing, review the charges for personnel who potentially could have charged a direct effort, such as contract specialists, and identify their direct charges for the period. Determine if there were other opportunities for them to charge a direct JON.

RATINGS: GREEN 10% or less

RED More than 10% without adequate explanation

5.3.2.3 Metric Number 3, Indirect Charges Against Reimbursable Orders.

5.3.2.3.1 Activity Goal. The FMA is allowed to pass along all direct costs incurred in the completion of a reimbursable order. Those costs include materials, direct labor, and contracts or any other cost that must be incurred to complete the work requested. All indirect costs must be borne by the activity using direct mission funding. The indirect cost must be captured because in certain instances, such as performing work for private parties or foreign government, they must be recouped.

5.3.2.3.2 Activity Level. On a quarterly basis, randomly select five reimbursable orders which were completed during the period. Evaluate the cost charged to them to determine if any indirect costs were charged to the efforts. If as a result of the evaluation it is determined indirect cost has been improperly charged to the reimbursable orders reviewed, document the control that failed and the actions taken to prevent future inappropriate charges against reimbursable orders.

5.3.2.3.3 Using the same five reimbursable orders, review the charges for personnel who would normally charge an indirect effort, such as administrative staff, and identify their direct charges

for the period. Determine if those charges were appropriate. This test provides assurance that the direct charges reported are supportable.

RATINGS: GREEN 0
RED More than 0

5.3.3 Immediate Superior In Command Financial Management Assessments and Audits.

a. Financial Management Program Assessment.

(1) The ISIC must schedule and conduct a financial management program assessment periodically, but not less than annually of all assigned Regional Maintenance Centers (RMC) or FMAs. This assessment will review the following areas:

(a) Vertical audit of selected JONs.

1 Material charges to those JONs.

2 Contract charges to those JONs.

3 Evaluate whether direct versus indirect cost charging training for personnel working on those JONs was conducted.

(b) Review selected financial management records to determine if they are complete and retention is per regulations.

(2) Copies of the assessment reports will be provided to the RMC or FMA Maintenance Officer and the FMA Commanding Officer. Written responses will be provided by the FMA Commanding Officer if any significant findings or if findings of an unusual or serious nature were identified.

(3) Copies of the assessment reports will be forwarded to the ISIC Maintenance Officer, to include the FMA Commanding Officer's comments, if there are any significant findings or if findings of an unusual or serious nature are found requiring corrective action by the ISIC or higher authority.

b. ISICs will conduct the following additional periodic audits:

(1) Conduct periodic monitoring of RMC or FMA direct versus indirect cost charges related to controlled work and on all assigned ships during maintenance availabilities.

(2) Conduct monitoring of assigned FMAs direct versus indirect cost charges. This monitoring will include:

(a) Review of direct versus indirect cost charges procedures including practices related to opening and closing of maintenance efforts.

(b) Monitoring of direct versus indirect cost charges for progress work both on tended ships and in FMA work centers.

5.4 REPORTING AUDIT RESULTS AND CORRECTIVE ACTION.

5.4.1 Reporting Requirements for External Audits and Assessments.

a. Audit Reports. Each finding should be a concise statement of the situation, complete to the extent that it will stand on its own as a summary of the condition. It should include the requirement for defined corrective action where discrepancies are identified. A discussion should generally be included to amplify the nature of the finding. If not included in the finding, identify positively what directives were violated. Audit findings will be reported using the format of Appendix D. Each finding will provide space for the command response to the recommended corrective action, which includes a root cause, immediate corrective action, permanent corrective action, and when returned to the originator, ensuring the single document provides the complete record of the finding and actions taken. The ISIC cover letter forwarding the Financial Management Audit Discrepancy Form, (Appendix D) will include a summary of all areas where discrepancies were identified. When repeat findings are noted, the effectiveness of the corrective action taken in response to previous audits should be addressed. RMC or FMA will provide a report to the ISIC of completed corrective action, proposed corrective action and schedule of accomplishment within 60 days of receipt of the ISIC Official Audit Report. Those items determined to require immediate correction should be addressed on a case-by-case basis.

b. ISIC, RMC or FMA Reports. Joint Fleet Maintenance Manual will use standardized reports to simplify and improve audit functions. A Financial Management Discrepancy Form, (Appendix E) should be used to report deficiencies that require investigation and program evaluation.

5.4.2 Correcting Deficiencies in Job Order Numbers or Financial Records. When deficiencies are identified in Financial Records associated with certified and closed, CWPs or JONs corrective action is required. The action must focus on updating or correcting those records to reflect the correct data and be thoroughly documented to leave an adequate audit trail. The CWP and financial record must be annotated to associate the additional information to the document(s) as:

a. A Financial Management Discrepancy Form must be generated for each JON deficiency identified. Each Financial Management Discrepancy Form must identify the deficiency, root cause and corrective action required or completed. The corrective action taken must clearly identify the overall impact on the financial records of the RMC or FMA and any customer records.

b. Once all required actions are completed to revise or update the financial records, a copy of the completed Financial Management Discrepancy Form and any additional documentation generated must be attached to the CWP and financial record such that it is clear the record was revised or updated. The Financial Management Discrepancy Form index log must be updated to indicate the action was completed.

5.4.3 Assessments, Evaluations and Audits. The FMAs' FMO will retain records of assessments and evaluation for the past 24 months (unless otherwise stated). The records will consist of:

a. Financial Management Discrepancy Form index log that has the document numbers, work center responsible for correcting and estimated date corrective action is expected to be complete.

b. Copy of all Financial Management Discrepancy Forms that have been completed during the period.

c. Copy of last higher authority assessment and the corrective action for all identified deficiencies.

d. Last annual financial management program evaluation performed.

APPENDIX A

VERTICAL AUDITS

1. The function of a vertical audit is to determine if a single job, JON, or maintenance effort has been completed per the financial management requirements. It tracks the JON from inception to completion by evaluating the documentation associated with the job (labor, material, contract charges, etc.) against the financial records. The following steps are considered the minimum requirements to conduct an audit:
   a. Assemble the documentation for the job being audited.
   b. Assemble the references.
   c. Assign auditors who are familiar with the job being audited. If the assigned auditors are not familiar with the area to be audited, provide sufficient training.
   d. Develop (if not already existing) attribute sheets to be used during conduct of audit.
   e. Assemble previous audit discrepancies, if applicable.
   f. Brief and train auditors on the following:
      (1) Purpose of vertical audit.
      (2) Common discrepancies from previous audits.
      (3) Audit attributes.
   g. Conduct audit:
      (1) Review procedure against the governing references and documentation to ensure they reflect what was supposed to be accomplished, if it was accomplished, and how it was accomplished.
      (2) Review all documentation pertaining to financial records to ensure they actually reflect the job was charged correctly. Additionally, a check for accuracy and completeness of forms is required of the financial records and supporting documentation.
      (3) All deficiencies noted, that require a more detailed investigation or program evaluation to identify root cause and permit effective and permanent corrective action, will be documented on a Financial Management Audit Discrepancy Form (Appendix D), or Financial Management Discrepancy Form (Appendix E), as appropriate, and presented to the activity being audited.
2. There is no specific formula for the successful completion of a vertical audit other than time and attention to detail. If properly performed, this audit provides an excellent method to assess the effectiveness of the financial management program regarding direct versus indirect costing process, since it provides small concise snapshots of several areas of the entire program.

APPENDIX B

HORIZONTAL AUDITS

1. Horizontal Audit. These audits are conducted on only one specific area or aspect of the direct or indirect cost program (e.g., material charges or a specific category of labor on multiple JONs, administrative functions of the activity, etc.). These audits focus on the particular area and do not track a complete JON from inception to completion but rather track the funds expended across the activity for a specific function. This appendix provides guidelines for preparation and conduct of horizontal audits.

   a. Assemble the source documents and references for the area being audited.

   b. Assemble the documentation and records of area being audited.

   c. Develop (if not already existing) attribute sheets and audit guide to be used during conduct of the audit. These attribute sheets will be posted to the Fleet Desk Guide web site https://flankspeed.sharepoint-mil.us/sites/NAVSEA_CNRMC/FleetDeskGuide/ for use by other commands and will initially focus on the standard processes.

   d. Assemble previous audit findings (if applicable) for area being audited.

   e. Assemble, brief and train auditors on the following:

      (1) Purpose of audit.

      (2) Audit attributes.

      (3) Common discrepancies from previous audits (if applicable).

   f. Conduct audit:

      (1) Review area being audited using attribute sheets and audit guide.

      (2) Review the organization's implementation and adherence to the source documents.

      (3) Review the documentation used to certify the organization is in compliance with the governing requirements.

      (4) Document deficiencies which require investigation or program evaluation to determine root cause and permit effective and permanent corrective action on a Financial Management Audit Discrepancy Form (Appendix D), or Financial Management Discrepancy Form (Appendix E), as appropriate, and present it to the organization being audited.

2. If properly performed this type of audit provides an excellent command-wide assessment of a specific area within the overall financial management program.

APPENDIX C
CHECKLIST FOR EVALUATING
DIRECT VERSUS INDIRECT COSTING

Evaluation Step	Discrepancy Identified	Corrective Action Recommended
1. Determine if all personnel have been trained on the identification of direct versus indirect costing.		
2. Evaluate charges placed against 5 randomly selected JONs that were completed in the prior period.		
a. Determine if there are charges against the JON which should have been indirect.		
b. Determine if there were any charges against the JON by personnel who predominantly charge indirect JONs and evaluate the accuracy of those charges.		
3. Review the process used by the FMA to compute the monthly direct versus indirect percentage. Ensure that all expenditures were included in the computation.		
4. Randomly select 25 FMA personnel who should predominantly charge direct cost. Determine if any of those personnel charged over 10% of their available time to indirect efforts.		
a. If any of these personnel charged over 10% indirect, determine the reason.		
5. Obtain a listing of personnel who charged 100% of their efforts to an indirect JON. Select 20 personnel randomly and determine if there should have been an opportunity to charge some portion of their efforts to direct.		
6. Randomly select 5 reimbursable orders that were completed in the preceding period. Evaluate the charges against these orders to ensure that no indirect charges were applied.

FINANCIAL MANAGEMENT DISCREPANCY FORM INSTRUCTIONS

SURVEILLANCE, MONITORING, AUDIT DISCREPANCY RECORD

PURPOSE: Provide a method or means of documenting and reporting discrepancies identified by reviewers during audits, evaluations and assessments of the financial management records process. The form also provides a means to document and monitor corrective actions taken by the FMA, Work Center or division. This form is intended for use in documenting the results of command evaluations, internal audits and inspections. When completed and maintained in an accurate, auditable fashion, the form provides a record of completed corrective action. This form can also be used to evaluate trends to improve overall financial management and reporting of FMA.

NOTE: A COPY OF ALL ASSOCIATED FINANCIAL MANAGEMENT DISCREPANCY FORMS MUST BE INCLUDED WITH THE FINAL CWP, ALONG WITH RECORD DEFICIENCIES FOUND IN A CLOSED CWP. FINANCIAL MANAGEMENT RECORDS REQUIRING CORRECTION MUST BE DOCUMENTED ON A FINANCIAL MANAGEMENT DISCREPANCY FORM. NO CHANGE TO THE CLOSED CWP OR FM RECORD IS PERMITTED EXCEPT AS CITED IN THIS NOTE. THE FINANCIAL MANAGEMENT DISCREPANCY FORM SERIAL NUMBER WILL BE ANNOTATED TO CLEARLY INDICATE THE FORM WAS WRITTEN AFTER THE CWP OR FINANCIAL MANAGEMENT RECORD WAS CLOSED AND CERTIFIED AND ADDITIONAL OBJECTIVE EVIDENCE IS ASSOCIATED WITH THE CLOSED PACKAGE.

NOTE: THE REPAIR OFFICER, RESPONSIBLE DEPARTMENT HEADS, DIVISION OFFICERS AND FINANCIAL MANAGEMENT OFFICER (FMO) MUST ENSURE THAT ALL FINANCIAL MANAGEMENT DISCREPANCY FORMS ARE APPROPRIATELY PROCESSED TO ENSURE THE ACCURACY AND COMPLETENESS OF THE FINANCIAL RECORDS.

PROCEDURE: The numbered blocks in Financial Management Discrepancy Form correspond with the instructions listed.

BLOCK 1 - JON REVIEWED

The Financial Management Supervisor (FMS) will enter the appropriate Job Order Number (JON) for the specific maintenance cost being reviewed. This allows the original submission to be compared with the validated charges.

BLOCK 2 - WC

Person performing the review will enter the original Work Center (WC) responsible for the maintenance cost input.

BLOCK 3 - DATE

Person performing the review will enter the date the review was performed.

BLOCK 4 - DISCREPANCY DESCRIPTION

Person performing the review will enter a description of the discrepancy, if any are noted. Enter the CWP serial number if appropriate. If no discrepancies are noted, the details of the review should be included and note that no discrepancies were identified.

BLOCK 5 - REVIEWER'S SIGNATURE

The individual performing the review will sign, and legibly print, type or stamp his or her name.

BLOCK 6 - WC SUPERVISOR SIGNATURE

The WC Supervisor will sign, and legibly print, type or stamp his or her name signifying a review of and concurrence of the results of the review.

BLOCK 7 - CORRECTIVE ACTION

a. ROOT CAUSE: If discrepancies are identified, the FMO, with the assistance of the Division Officer of the WC where the discrepancy was identified (Block 2), will identify and enter the root cause of the discrepancy. The root cause should address the control failure that allowed inaccurate data to be reported.

b. CORRECTIVE ACTION: If discrepancies are identified, the FMO, with the assistance of the Division Officer of the WC where the discrepancy was identified, will enter a description of the corrective action that has been initiated to correct the erroneous data and address actions taken to prevent recurrence, including any process improvements and policy or procedural changes.

BLOCK 8 - ECD

If discrepancies are identified, the FMO, with the assistance of the Division Officer of the WC where the discrepancy was identified, will enter the Estimated Completion Date (ECD) of the corrective action identified in Block 7. The reviewer will follow up to ensure the actions were effective.

BLOCK 9 - DIVISION OFFICER AND DATE

The Division Officer of the WC reviewed will enter signature and date, and legibly print, type or stamp his or her name after Blocks 7 and 8 are complete.

BLOCK 10 - RE-INSPECTION AND AUDIT COMMENTS

Upon completion of any required corrective actions or reaching the ECD of Block 8, the FMO or an FMS designated by the FMO and the individual who performed the review, should perform a re-inspection audit and enter the re-inspection results and any additional comments. This must include a statement regarding effectiveness of the corrective action. The re-inspection audit will pay special attention to actions taken to prevent a recurrence of the problem.

BLOCK 11 - FINANCIAL MANAGEMENT OFFICER OR FINANCIAL MANAGEMENT SUPERVISOR SIGNATURE

The FMO or FMS will enter signature and date, and legibly print, type or stamp his or her name indicating acceptance of the actions taken and the results of those actions identified in

Block 10. This will indicate that the actions are complete and the Financial Management Discrepancy Form is closed.

COPY TO:

The appropriate WC will be identified to receive a copy of the completed or closed form.

NOTE: AFTER ALL SECTIONS OF THE FORM HAVE BEEN COMPLETED AND THE ACTIONS COMPLETE, ALL PREVIOUS COPIES OF THE FORM MAY BE DISCARDED AND THE FINAL COMPLETED OR CLOSED FORM RETAINED.

INTRODUCTION

REFERENCES.

(a) OPNAVNOTE 5400 - Establishment Of U.S. Naval Ship Repair Facility Detachment Singapore
(b) COMSEVENTHFLT OPORD 201
(c) NTRP 1-03.1 - Navy Tactical Reference Publication, Operational Reports

1.1 NOTICE. Listed references, Operational Orders, instructions, policies and procedures will remain in effect and continue to be used until all references can be revised to reflect these changes and are incorporated into this manual.

1.2 PURPOSE. To provide in one publication essential information concerning the maintenance policy for ships deployed in Commander, U.S. Naval Force, Europe (COMUSNAVEUR), Commander, U.S. Naval Forces, Africa (COMUSNAVAF), Commander, Sixth Fleet (COMSIXTHFLT), Commander, Fifth Fleet (COMFIFTHFLT), and Commander, Seventh Fleet (COMSEVENTHFLT) Areas of Responsibility (AOR).

1.3 SCOPE.

a. COMUSNAVEUR, COMUSNAVAF and COMSIXTHFLT N43s oversee matters pertaining to repair and maintenance of Naval Surface Force ships in the COMUSNAVEUR AOR. Day-to-day administration of Surface Ship Maintenance in COMSIXTHFLT has been delegated to Forward Deployed Regional Maintenance Center (FDRMC) Naples. Administration of repair and maintenance for Submarine Force ships has been delegated to Commander, Task Force (CTF) 69 and Commander, Submarine Group (COMSUBGRU) Eight. COMFIFTHFLT administers maintenance related matters and maintenance scheduling in the COMFIFTHFLT AOR. Day to day administration and scheduling of deployed submarine maintenance in the COMFIFTHFLT AOR is accomplished by CTF 54. Ship Repair Facility oversees matters pertaining to repair and maintenance of ships in COMSEVENTHFLT AOR. Day-to-day administration and scheduling of deployed submarine maintenance in the COMSEVENTHFLT AOR is accomplished by CTF 74 Commander, Submarine Group Seven. Commander, Naval Surface Group Western Pacific (CNSGWP) is the TYCOM Delegated Authority responsible for the prioritization of conflicting depot level work and the overall cognizance for major work with operational impacts for COMSEVENTHFLT. Commander, Logistics (COMLOG) Western Pacific provides logistical support and is the Executive Agent for diving and salvage commander for COMSEVENTHFLT AOR.

b. This manual authorizes overseas maintenance facilities to accomplish repairs on Military Sealift Command and United States Coast Guard ships and service craft, carrying out missions for the Navy in AORs specified in section 1.3.a of this chapter, when authorized by the area commander. The procedures apply to all Navy ship maintenance, to include Aegis Ashore Missile Defense System sites, administered and

funded within the COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT, COMFIFTHFLT and COMSEVENTHFLT AORs.

c. The COMSEVENTHFLT area and chop procedures are defined and governed by references (a) through (c). These maintenance procedures are not applicable in all cases to planned availabilities such as Selected Restricted Availabilities, Drydock Selected Restricted Availabilities, Phased Maintenance Availabilities, and planned availabilities, which are assigned to ship repair facility shore repair activities, for ships assigned to the Forward Deployed Naval Forces. Forward Deployed Naval Forces ships may also be assigned availabilities with Ship Repair Units when deployed.

d. Task Force Commanders and Commanding Officers must be guided by this manual to obtain maintenance assistance while deployed. Commanding Officers of RMCs and Shore Fleet Maintenance Activities, Repair Officers of Afloat Fleet Maintenance Activities and Officers-In-Charge of Naval Information Warfare Centers Guam and Japan, as well as other activities involved in maintenance of deployed ships must comply with the direction provided in this manual.

e. The Foreword of this manual contains a master list of references. These references are arranged in alphanumeric order to facilitate the ordering of documents. References used in specific chapters are listed at the beginning of each chapter.

f. Equipment under the cognizance of the Strategic Systems Programs and Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) is maintained following Strategic Systems Programs and NAVSEA 08 directives, respectively.

1.4 CHANGES AND CORRECTIONS. Changes and corrections will be issued as required. Comments and suggestions for improving or changing this volume are invited. Address comments, recommendations and requested changes to Submarine Maintenance Engineering, Planning and Procurement (SUBMEPP) Activity utilizing the change request form located in the front of this manual. If changes are submitted in electronic format, facsimile or E-mail, each change request must contain the information required on the change request form.

VOLUME III

CHAPTER 2

MAINTENANCE ORGANIZATIONS AND CAPABILITIES

REFERENCES.

(a) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval

2.1 COMMAND RELATIONSHIPS.

a. Commander, U.S. Naval Force, Europe (COMUSNAVEUR) - Commander, U.S. Naval Forces, Africa – (COMUSNAVAF) - Commander, Sixth Fleet (COMSIXTHFLT) assigns maintenance reporting responsibilities to subordinate Task Force commanders while operating in the Area of Responsibility (AOR). Commander, Submarine Group (COMSUBGRU) Eight is the maintenance representative for all deployed Commander, Submarine Force, U.S. Atlantic Fleet units. Ships deployed to the COMUSNAVEUR-COMUSNAVAF-COMSIXFLT or Commander, Fifth Fleet (COMFIFTHFLT) AOR will address maintenance related correspondence to Forward Deployed Regional Maintenance Center (FDRMC) Naples and FDRMC Bahrain. Submarines deployed to COMSIXTHFLT address maintenance related correspondence to COMSUBGRU Eight, with information copy to their homeport Regional Maintenance Center (RMC) or Regional Support Group (RSG). Submarines deployed to COMFIFTHFLT, address all maintenance related correspondence directly to Commander Task Force (CTF) 54 with information copy to COMSUBGRU Eight.

b. Commander, Naval Service Force, Fifth Fleet (COMSERVFORFIFTHFLT) is responsible for scheduling of maintenance and utilization of maintenance assets in the COMFIFTHFLT AOR. COMSERVFORFIFTHFLT has one other assignment: CTF 53, Force Logistics Commander for COMFIFTHFLT. COMSUBGRU Seven is responsible for coordination and execution of all deployed submarine maintenance in COMFIFTHFLT AOR as CTF 54.

c. Commander, Naval Surface Group Western Pacific (COMNAVSURFGRU WESTPAC) is the Type Commander Delegated Authority responsible for the prioritization of conflicting depot level work and the overall cognizance for major work with operational impacts for Commander, Seventh Fleet (COMSEVENTHFLT) forward deployed naval force (FDNF) homeported ships during the Maintenance and basic phases of the Optimized Fleet Response Plan (OFRP) cycle in accordance with reference (a). Working relationships with ship repair facility (SRF) Yokosuka and Sasebo are maintained to address high priority and conflicting priority work items for COMSEVENTHFLT FDNF homeported ships and ships deployed in the COMSEVENTHFLT AOR. COMNAVSURFGRP WESTPAC provides operational impacts and risk items directly to Commander, Naval Surface Pacific. COMNAVSURFGRU WESTPAC commanding officer is the area commander for major fires in FDNF-Japan.

d. Commanding Officer, Ship Repair Facility (SRF) is the Commander, Pacific Fleet Maintenance Officer's (CPF N43) representative for the COMSEVENTHFLT AOR and coordinates ship repair and maintenance, executes Fleet Technical Assistance (FTA) and Assessment in the entire COMSEVENTHFLT AOR. Policy, procedures and guidance regarding utilization of FTA program resources are contained in volume VI, chapter 2 of this manual. SRF also acts as the maintenance representative for Commander Naval Surface Force, Pacific Fleet, Commander Naval Surface Force Atlantic Fleet and Commander Naval Air Force Pacific Fleet (COMNAVAIRPAC) Forward Deployed Naval Forces ships for all maintenance accomplished in Japan and Okinawa. COMNAVAIRPAC, Commander Naval Surface Force, Atlantic Fleet and COMNAVAIRPAC ships permanently forward deployed to COMSEVENTHFLT AOR as part of the Forward Deployed Naval Forces will address maintenance correspondence to SRF for all maintenance in Japan and Okinawa, information copy to their Immediate Superior In Command (ISIC), information copy to their ISIC for all maintenance outside of Japan and Okinawa. All other deploying surface ships outside of Japan and Okinawa will address maintenance related correspondence directly to COMNAVSURFGRU WESTPAC and copy to SRF Detachment SINGAPORE, SRF, and ISIC.

e. COMSUBGRU Seven is the Maintenance Representative for all deployed Commander, Submarine Force, U.S. Pacific Fleet ships. Submarines deployed to the COMSEVENTHFLT AOR will address all maintenance correspondence directly to CTF 74 (COMSUBGRU Seven), information copy to ISIC and SRF for maintenance that will be accomplished in Japan and Okinawa.

2.2 MAINTENANCE ORGANIZATIONS AND CAPABILITIES. The following organizations support maintenance on ships in their respective AORs:

2.2.1 Sixth Fleet Organizations.

a. COMUSNAVEUR-COMUSNAVAF-COMSIXFLT.

(1) Fleet Maintenance Officer (N43). Sole staff advisor on subjects regarding naval surface aviation maintenance and salvage. Coordinates with COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT Maritime Integrated Operation Center (MIOC) Logistics, Operations (Log Ops) and CTF Commanders on maintenance support requirements. Provides liaison with FDRMC Naples for in-theater ship repairs. Monitors programs relating to aircraft, Surface Force ship's (to include Aegis Ashore Missile Defense System), and aircraft carrier maintenance, engineering and material support.

(2) CTFs. Task Force commanders are responsible for monitoring the material condition of units assigned and coordinating emergent repairs and requests for technical assistance. Coordinate changes to operational scheduling due to maintenance related problems (must be approved by MIOC). CTF Commanders also provide recommendations regarding operational delays of C3 and C4 Casualty Reports (CASREP).

(3) CTF 63. COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT Task Force Commander for Logistics. Responsible for the scheduling and execution of

Combat Logistics Force and Navy Unique Fleet Essential Airlift assets in charge of logistic support and distribution. MIOC Log Ops fulfills this responsibility for the CTF Commander.

(4) MIOC Log Ops. Provide logistical support to units operating in the COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT AOR. (PLAD: NAVEURLOGCOORD CENTER).

(a) Air Log. Manages Navy Unique Fleet Essential Airlift assets used to transport personnel and material in COMSIXTHFLT AOR and adjoining AORs.

(b) Passenger, Mail, Cargo and CASREP. Passenger, Mail, Cargo and CASREP division tracks all material movement from Continental U.S. to AOR. Once in the AOR, they direct material shipments to the unit via the most economical means possible using Military Air, Defense Distribution Depot Sigonella, Italy (DDSI) (Commercial Air or Ground) or Combat Logistics Force.

(c) Sustainment. Provides logistical coordination for provisions, hazardous material, ordnance and fuel.

(5) COMSUBGRU Eight. Screens and coordinates maintenance for submarine-specific voyage repair. Assists CTF-69 in monitoring material condition of submarines assigned. Coordinates Voyage Repair (VR) repair brokerage through homeport maintenance activity. Monitors Technical Assistance requests submitted to FDRMC Naples.

b. FDRMC Naples. Commander, Navy Regional Maintenance Center Repair representative in the COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT AOR. Additional Duty to COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT as Fleet Surface Maintenance Officer (N43A). Coordinator of FTA for surface and subsurface units and sole coordinator of voyage repair efforts for surface units. Provide contract maintenance support in all ports when required. Functions include shipcheck of screened work packages, specification writing, contract technical representation, and Quality Assurance of contracted work. Working closely with Fleet Logistics Center (FLC) Sigonella which performs the Primary Contracting Officer functions. FDRMC Naples ensures completion of all work accepted for accomplishment as VR is on time and per specifications. (PLAD: FDRMC NAPLES IT).

c. FLC Sigonella provides fleet and base support for U.S. Navy, Military Sealift and Coast Guard ships; U.S. bases and facilities located in Europe, Africa and Southwest Asia; contingency operations; and continental U.S. activities requiring supplies and services from Europe, Africa and Southwest Asia.

d. DDSI provides the full complement of physical distribution services to all four service components and other federal agencies located south of the Italian Alps. It provides forward stock positioning support and enhanced physical distribution services. Specialized handling and support services include managing the Navy's hazardous materials, depot level repair part storage and distribution, and a complete range of

material packing and shipping services. DDSI also provides expedited requisitioning and centralized receiving support to the military community.

2.2.2 Commander, Naval Service Force, Fifth Fleet Organizational Structure. COMSERVFORFIFTHFLT N43 provides all organizational services. FDRMC Bahrain provides local management for the following services:

a. Combat Systems and Hull, Mechanical and Electrical assists, provided by local RMC.

b. Gas Turbine Change-out Vans.

c. Waterjet Machines.

d. Availability scheduling.

2.3 COMMON MAINTENANCE FACILITIES - ALL AREAS OF RESPONSIBILITY. The following types of maintenance facilities are common to all AORs and provide the services indicated.

2.3.1 Afloat Fleet Maintenance Activities.

2.3.1.1 Capabilities. For purposes of this volume, the Repair Department of a submarine tender will be referred to as Afloat Fleet Maintenance Activity (AFMA). AFMAs offer the broadest range of industrial capabilities of any afloat Navy activity. AFMAs are capable of repairs in all areas (e.g., hull, mechanical, electrical, electronic and ordnance equipment). Where there are shortfalls in shipboard expertise, AFMAs will be augmented by outside resources.

2.3.1.2 Workload. Maintenance Managers, Operational Commanders and AFMA Commanding Officers will maximize use of deployed AFMA Fly Away Teams (FAT), deployed or otherwise.

2.3.1.3 Afloat Fleet Maintenance Activity Fly Away Team. FATs provide a unique method of rapid deficiency correction which stresses mobility, initiative and maximization of resource utilization. AFMA FATs can only be used for CASREP correction and technical assistance for ships not collocated with the AFMA. AFMA FATs are tasked by the Maintenance Manager only after the following conditions have been established:

a. Casualty is not correctable by any ship, element or unit of the Strike Force Intermediate Maintenance Activity (SFIMA). Chapter 6 of this volume contains Strike Force Intermediate Maintenance Activity details.

b. Ship will provide parts or FAT can carry all required parts.

Each AFMA will establish procedures to enable the deployment of FATs within hours of receiving tasking. The procedures will include pre-designation of FAT members, rapid preparation for travel orders, travel regulation briefings, advances in travel funding, area briefings, and area clearance messages as appropriate.

2.3.1.4 Fly Away Team Funding. FAT funding will be provided following Fleet direction.

2.3.1.5 Afloat Fleet Maintenance Activity Tasking. Tasking AFMA for performance of VRs, FAT assistance or other availabilities will be: Maintenance Brokers for Fifth, Sixth and Seventh Fleet assigned units will request AFMA support and availability periods, via CTF 74, who will directly task AFMAs located in Guam. For AFMAs in other locations in Fifth, Sixth or Seventh Fleets, Maintenance Brokers will request AFMA support and availability periods via the CTF (54, 69, 74) exercising Operational Control of the tender. The CTF exercising Operational

Control will directly task the appropriate tender. CTF (54, 69, 74) or COMSUBRON 15, as applicable, must provide the required support based on AFMA operational considerations and resource limitations (e.g., manpower and materials).

2.3.2 Regional Maintenance Center (RMC). RMCs provide contract maintenance support in all ports when assigned. RMC functions include shipcheck of screened work packages, specification writing, contract technical representation and Quality Assurance of contracted work. Working closely with FLC-Naval Regional Contracting Detachment (NRCD), which performs the Primary Contracting Officer functions; RMCs ensure all work accepted for accomplishment as VR is completed on time and per specifications. RMCs are located in Naples, Bahrain and Japan. SRF has detachments in Sasebo, Japan and Singapore.

2.3.3 Regional Maintenance Center and Technical Assistance. The RMC Technical Support mission is to promote shipboard self-sufficiency. This is carried out by providing system and equipment Subject Matter Experts to assist and train Ship's Force in casualty prevention and correction. When the assistance required is not resident in the AOR, the responsible RMC will arrange technical assistance from other sources. Each RMC publishes a list of their organic technical capabilities. RMCs can request additional resources to provide assistance per volume VI, chapter 2 of this manual. RMCs can provide assistance for all non-nuclear shipboard systems. Additional details on FTA are available in volume VI, chapter 2 of this manual.

2.3.4 Naval Regional Contracting. FLC-NRCD Naples and Singapore, provide contracting in support of Afloat and Ashore activities. In support of afloat maintenance, FLC-NRCDs can perform all pre- and post-award contracting functions. They execute a variety of contract actions to support ship maintenance such as: issue Master Agreements for Repair and Alterations of Vessels (MARAV); place calls against Blanket Purchase Agreements, award Contracts or Purchase Orders; and compete job orders among MARAV holders. Please note that establishment of a MARAV only pre-qualifies industrial activities to accomplish Navy work which streamlines the procurement process. Being a MARAV holder does not guarantee the industrial activity can accomplish all types of work.

2.4 UNIQUE MAINTENANCE FACILITIES - COMMANDER, UNITED STATES NAVAL FORCES, EUROPE-COMMANDER, UNITED STATES NAVAL FORCES, AFRICA-COMMANDER, SIXTH FLEET AREA OF RESPONSIBILITY.

2.4.1 U.S. Navy Facilities. Maintenance piers and limited shore power are available at Naval Station Rota, Spain; Naval Support Activity Naples Detachment Gaeta, Italy; and Naval Station Souda Bay, Greece. Host nations also provide basic pier side services at the following ports: Faslane, Scotland; Gibraltar; Naples and Augusta Bay, Italy.

2.4.2 Repairs in Ports Without Navy Ship Maintenance Organizations.

a. VRs are accomplished in many ports where there is no permanent Navy presence. This is accomplished by FDRMC Naples Surveyors and FLC-NRCD Naples Contracting Officers. FDRMC will develop contract specifications from ship's work packages, and NRCD will contract the work out to local contractors who have MARAV with FLC-NRCD. See Chapter 3, paragraph 3.4 of this Volume for additional information.

b. FLC-NRCD contracted Husbanding Services Contractors may be used to obtain contract repair services using ship's operating budget. This should be done only on a

very limited basis in emergency type situations. When used, Quality Assurance and conformance to Navy specifications are entirely the responsibility of Ship's Force.

c. Submarine maintenance personnel and repair equipment will be assigned from the unit's homeport Fleet Maintenance Activity or brokered by the Fleet Maintenance Activity to another organization as necessary.

2.4.3 Commercial Industrial Activities. FLC-NRCD Naples maintain lists of commercial industrial activities in most major Mediterranean and some North Sea ports which have MARAVs with the Navy. Since this list changes with business conditions, it is not included here but can be obtained from FLC-NRCD Naples.

2.5 UNIQUE MAINTENANCE FACILITIES - COMMANDER, FIFTH FLEET AREA OF RESPONSIBILITY. FDRMC Bahrain maintains a list of commercial industrial activities in Manama Bahrain, Jebel Ali United Arab Emirate, and Dubai United Arab Emirate, which have MARAVs with the Navy. Since this list changes with business conditions, it is not included here but can be obtained from FDRMC Bahrain.

2.6 UNIQUE MAINTENANCE FACILITIES - COMMANDER, SEVENTH FLEET AREA OF RESPONSIBILITY. Maintenance piers, shore power and basic pier side services for routine U.S. Navy use in the COMSEVENTHFLT AOR are available at Fleet Activities Yokosuka, Sasebo and Okinawa, Japan; Fleet Activities Chinhae, Republic of Korea; Naval Base Guam; and Changi Naval Base and Sembawang Naval Installation (minus shore power), Singapore. FLC-Yokosuka maintains a list of commercial industrial activities in select major ports in the COMSEVENTHFLT AOR which have MARAVs with the Navy. Since this list changes with business conditions, it is not included here but can be obtained from FLC-Yokosuka.

2.6.1 Ship Repair Facility - Japan Regional Maintenance Center Yokosuka, Japan. SRF Yokosuka, Japan is the Naval Supervisory Authority responsible for non-nuclear repair work in Yokosuka, Japan that has the resources to undertake voyage repairs, routine repairs, alterations, Continuous Maintenance Availabilities (CMAV), Surface Incremental Availabilities (SIA), Selected Restricted Availability (SRA), and Drydocking Selected Restricted Availability (DSRA). SRF Yokosuka, Japan is capable of repairing Hull, Mechanical, Electrical, Electronics, Ordnance, Gas Turbine equipment, boilers, etc., on all fossil-fueled ships including mechanical and electronic test equipment repair and calibration. Graving docks are available for all classes of ships. Cold iron and feed water services are available. Portable tools are available for loan. Messages relating to repair matters in Yokosuka should be addressed to SRF (PLAD: YOKOSUKA JA).

2.6.2 Ship Repair Facility - Detachment Sasebo, Japan. SRF DET Sasebo is the Naval Supervisory Authority responsible for arranging CMAV, SIA, SRA, DSRA and repair work during upkeep and VR periods in Sasebo. Because most of the SRA and DSRA work in Sasebo is contracted to Japanese industrial activities, repairs to classified weapons, electronics, or cryptological equipment is accomplished by work force augmentation from SRF Yokosuka, Japan. Calibration must be accomplished per the requirements of volume VI, chapter 9 of this manual. The production shop can perform intermediate and depot level installs and repairs. Portable tools are available for loan. Messages relating to repair matters in Sasebo should be addressed to COMFLEACT SASEBO JA, with information copies to COMNAVSURFGRU WESTPAC DET SASEBO JA, COMFLEACT YOKOSUKA JA, and COMNAVSURFGRU WESTPAC YOKOSUKA JA.

2.6.3 Ships Repair Facility - Detachment Singapore. SRF Detachment Singapore is responsible for maintenance and repair of U.S. Navy vessels outside of Japan. FLC-Yokosuka maintains a list of commercial industrial activities in the C7F AOR which have MARAVs with the Navy, located in: Yokosuka, Sasebo and Okinawa, Japan; Busan Korea; Cairns and Henderson, Australia; Manila, Subic and Cebu, Philippines; Singapore; Sri Racha, Thailand; Chennai and Mumbai, India; and Colombo, Sri Lanka; Since this list changes with business conditions, it is not included here, but can be obtained from FLC-Yokosuka.

2.6.4 Naval Information Warfare Center Pacific Yokosuka, Japan. Naval Information Warfare Center (NIWC) Pacific is chartered and tasked to manage installations of all Naval Information Warfare Systems Command (NAVWARSYSCOM) sponsored Command, Control, Communications, Computers, Intelligence, Surveillance and Reconnaissance (C4ISR) systems (e.g., hardware, software and networking) aboard all ships assigned to COMSEVENTHFLT. Integrated installations aboard individual ships will be completed so that the overall Strike Group command, control and communications interoperability is achieved. The overall NIWC Pacific management and oversight for Fleet C4ISR installations consists of an Integrated Installation Team (IIT). Members of the IIT include but are not limited to the following:

a. Installation Management Office. Functions as the conduit by which NIWC Pacific receives installation related advanced planning, execution tasking and funding. The Installation Management Office ensures product delivery within cost, schedule and performance.

b. IIT Leader. Overall management and oversight of the IIT, Strike Group Officers, Strike Group Superintendents and Ship Superintendents. Long-range planning for execution of installations in ships of respective Strike Groups. Ensures all parties (e.g., ship and chain of command, IIT and chain of command, system managers and chain of command) are informed. Liaisons with NIWC Fleet Readiness Directorate and applicable Program Executive Officers for engineering related issues.

c. IIT Strike Group Officer. Works scheduling conflicts and issues. Liaisons with NIWC Fleet Readiness Directorate for Strike Group scheduling issues. Responsible to IIT Team leader for Strike Group scheduling, availability and system readiness to install. Ensures timely submission of reports and other engineering documentation. Liaisons with Ship Repair Facility, Naval Supervising Activity, Naval Sea Systems Command Ship Platform Manager, Fleet Commands, Type Commanders, Strike Group Commanders and Commanding Officers to resolve Strike Group availability, scheduling and Strike Group C4ISR composition issues. Coordinate final authorization to install in Strike Group ships.

d. IIT Strike Group Superintendent. Project Manager for Strike Group IIT installations. Scheduling for Strike Group availabilities. Work scheduling conflicts and issues. Liaison with NIWC Fleet Readiness Directorate for Strike Group scheduling issues. Responsible to IIT Team leader for Strike Group scheduling, availability and system readiness to install. Ensure timely submission of reports and other engineering documentation. Liaison with Ship Repair Facility, Naval Supervising Activity, Naval Sea Systems Command Ship Platform Manager, Fleet Commands, Type Commanders, Strike Group Commanders and Commanding Officers to resolve Strike Group

availability, scheduling and Strike Group C4ISR composition issues. Coordinate final authorization to install in Strike Group ships.

e. IIT Ship Superintendent. Represents Commanding Officer, NIWC Pacific, to Fleet Commanding Officers. Verifies work performed adheres to prescribed scope of tasking, policy and guidance. Designated person with overall responsibility for the conduct of the IIT. Has technical authority over contractor team members; must be knowledgeable of and responsible for team adherence to all invoked requirements including safety and quality. Provides a single point of contact between ships and various waterfront activities. Coordinates installations with the Regional Maintenance and Modernization Coordination Office.

f. Alteration Installation Team Manager. Responsible for installation of individual C4ISR systems in Strike Group ships. Ensures system has current funding, approved Ship Change Document and Government-Furnished Equipment ready for installation. Writes Statement of Work; provides and reviews cost estimates for contractor support as required. Provides system engineering and technical specifications before and during installation. Conducts System Operational Verification Testing and provides operator and maintenance training. Delivers drawings, configurations change forms and other system Integrated Logistics Support to ship's company as necessary. Updates ship selected record as necessary. Reports to NAVWAR Technical Code for installation assignment, pay, travel and other administrative matters. Reports to Ship Superintendent for operational matters concerning individual system installations.

g. Integrated Logistics Support Manager. Implements Integrated Logistics Support policies and procedures following Integrated Logistics Support guidance to the Installation Management Office and IITs.

VOLUME III

CHAPTER 3

MAINTENANCE MANAGEMENT

REFERENCES.

(a) 10 USC – United States Code Title 10 – Armed Forces
(b) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval Ships
(c) COMNAVAIRFORINST 4790.2 - Naval Aviation Maintenance Program
(d) NAVSEAINST 4790.8 - Ship's Maintenance and Material Management (3-M) Manual

3.1 PURPOSE. To implement the policies of references (a) through (d) when conducting deployed maintenance. Commanding Officers will keep their operational, administrative, and logistic commanders fully apprised of their material readiness status. The effectiveness of maintenance availabilities, as well as technical assistance is highly dependent on the detailed information provided.

3.2 CASUALTY REPORT SUMMARY. To assist maintenance and logistics activities in maintaining current readiness status for all ships assigned to various Areas of Responsibility (AOR), in-chopping ships will report all outstanding Casualty Reports prior to in-chop following the applicable area Operational Orders.

3.3 DEPLOYED MAINTENANCE PERIODS. Commander, Fifth Fleet (COMFIFTHFLT), Commander, U.S. Naval Force, Europe-Commander, U.S. Naval Forces, Africa-Commander, Sixth Fleet, Commander, Seventh Fleet, Commander, Naval Surface Group Western Pacific, Commander, Submarine Group (COMSUBGRU) Seven or COMSUBGRU Eight schedule all Availability periods for ships and submarines in their respective AORs per reference (a) after receiving proposals from Operational Commanders. A Ship's Force Upkeep is a maintenance period during which steaming notice is extended sufficiently to facilitate the maintenance of equipment and systems. A ship may accomplish self-maintenance or be assigned any of the following upkeep maintenance availability types.

3.3.1 MAINTENANCE AVAILABILITY. A Maintenance Availability is an availability for the accomplishment of scheduled or emergent maintenance and may be further categorized based on scope, location and type.

3.3.2 VOYAGE REPAIR AVAILABILITY. A Voyage Repair (VR) Availability is assigned solely for the accomplishment of corrective maintenance on mission or safety essential items necessary for a ship to deploy or to continue on its deployment.

a. Per reference (a), chapter 863, section 8680, a naval vessel or any other vessel under the jurisdiction of the Secretary of the Navy, the homeport of which is in the United States or Guam may not be overhauled, repaired, or maintained in a shipyard outside of the United States or Guam. Exemption to references (a) exist as outlined below:

(1) An exception to paragraph 3.3.2.a. under Australia, the United Kingdom, and the United Sates Submarine Transfer Authorization Act (AUKUS) agreement such that the President may determine appropriate public or private shipyards

in the United Kingdom or Australia to perform repairs on submarines operating in support of AUKUS.

(2) A naval vessel described in paragraph 3.3.2.a. may be repaired in a shipyard outside the United Sates or Guam if the repairs:

(a) Voyage Repairs.

(b) Necessary to correct damage sustained due to hostile action or intervention.

(3) In the case of a naval vessel classified as a Littoral Combat Ship (LCS) and operating on deployment, corrective and preventive maintenance or repair (whether intermediate or depot level). Additional information on LCS corrective and preventive maintenance scheduling can be found in chapter 4, paragraph 4.9.1 of this volume. Facilities maintenance may be performed on the vessel:

(a) In a foreign shipyard.

(b) At a facility outside of a foreign shipyard.

(c) At any other facility convenient to the vessel.

(4) Work on non-FDNF home ported vessels is allowed for CMAVs less than 21 days in duration, in support of AUKUS, or LCS work accomplished per chapter 4 of this volume. Details are contained in reference (a), chapter 863, section 8680.

b. Forward Deployed Regional Maintenance Center (FDRMC) Naples, Commander Logistics Western Pacific (COMLOG WESTPAC), and Ship Repair Facility (SRF) will submit to Congress, via Fleet Commanders and the Chief of Naval Operations, quarterly reports of work items accomplished during VRs.

3.4 VOYAGE REPAIR POLICY (NON-NUCLEAR WORK).

3.4.1 Surface Force Ship and Aircraft Carrier Policy.

a. VR work package screening guidelines in reference (a) limit the type of work which may be accomplished. A shipyard is any facility that repairs naval vessels and is located outside the United States or its territories.

b. VR work screening activities provide the results of screening to customer ships in a screening message. Approved work candidates are forwarded to the cognizant Regional Maintenance Center (RMC) for accomplishment or contract award. After authorized jobs are received by the RMC, the following steps take place:

(1) RMC Surveyor accomplishes shipcheck as ship schedule permits.

(2) Cognizant RMC Surveyor writes work specifications or contract work specifications prior to ship arrival.

(3) RMC or Contractor ship-checks take place upon ship's arrival. For VR that must be contracted, competitive bidding constraints require not less than three contractors be considered for contract award if possible.

(4) When VR contracting is required, contract award occurs not later than arrival plus one day.

c. Voyage Repair Availability Execution.

(1) The Naval Regional Contracting Detachment (NRCD) representative will award the contract and liaison with the contractor on contractual matters, including new work and payment.

(2) The assigned Ashore Ships Maintenance Manager and Ship Superintendent or Surveyor will meet ship on arrival and will ensure the Job Order Specification or contract is in place, as applicable. The assigned Ashore Ships Maintenance Manager and Ship Superintendent or Surveyor will ensure the Job Order Specification or technical portion of the contract is adhered to and provide liaison with the local industrial activity on technical matters. It is the RMC Ship superintendent or Surveyor and Ship's Force responsibility to ensure the activity performing the VR complies with work specifications.

(3) Where applicable, the Fleet Logistics Center (FLC) NRCD representative will award the contract and provide liaison with the contractor on contractual matters, including new work and payment.

(4) A pre-production meeting will be scheduled, after the contractor shipcheck. Purpose is for assigned Ashore Ships Maintenance Manager and Ship Superintendent or Surveyor to review with the Ship's Force, contents of the Job Order Specification or Contract Specification, ship-contractor coordination requirements (if applicable), Quality Assurance (QA) requirements of Ship's Force and repair activity performing the VR, and list of government furnished material to be provided by the ship. The ship should provide the RMC Ship Superintendent or Surveyor a list of the ship's Quality Assurance Inspectors (QAI) to be used during the VR period.

(5) Daily Production Meeting. The Ship's Maintenance Management Officer, Surveyor, and other essential personnel will meet daily to review progress, discuss daily production efforts, and remove possible "interferences" with the intent of minimizing length of the availability. Early and frequent communication between all parties involved in the repair and maintenance process will help to ensure the overall success and effectiveness of any availability.

d. Growth and New Work are defined in volume VII, FWD, appendix A of this manual and require authorization by cognizant Naval Supervisory Authority.

e. Constructive changes are changes to contracts in the intent of work specifications directed at the contractor by anyone other than the surveyor or FLC-NRCD representative. Since they are not pre-negotiated with the contractor, constructive changes are against the law. Ship's Force personnel should be cautioned **not** to direct or otherwise influence contractor personnel to accomplish work not clearly delineated by contract specifications.

f. Contractor Support.

(1) Military Specification material may be available from SRF or requisitioned by the SRF for contractor VR conducted on ships inport Yokosuka and Sasebo, Japan. Some parts can be manufactured, but the ship should provide the material and parts requirement for work package execution. The ship should provide only the parts require by the work specification.

(2) With the exception of lagging, Military Specification parts and material are not available to local contractors in other ports.

CAUTION: THE SHIP SHOULD PROVIDE ONLY THE PARTS REQUIRED BY WORK SPECIFICATIONS. WITH THE EXCEPTION OF YOKOSUKA AND SASEBO, JAPAN, DRAWINGS AND TECHNICAL MANUALS ARE GENERALLY NOT AVAILABLE IN THEATER. SHIP'S FORCE SHOULD BE PREPARED TO PRODUCE ASSOCIATED TECHNICAL INFORMATION AS REQUIRED.

g. Schedule Restrictions. Ships in VR should support the workweek schedule provided by local contractors to make the most productive use of personnel resources during the maintenance period.

(1) In the COMFIFTHFLT AOR, the Arab work week is Sunday through Thursday with the weekend being on Friday and Saturday.

(2) In Israel, the weekend is on Friday and Saturday. Ships in VR Availabilities should support this schedule for the most productive use of the maintenance period.

(3) Contractor ability to accomplish work is sometimes limited by Port Captain regulations, and local strikes. Although generally short term in nature, the FLC-NRCD representative and RMC surveyor should be notified immediately of any indication of problems.

h. Ship's Force QA responsibilities during VRs for work performed by non-Navy Maintenance Activities.

(1) Planning. Increased emphasis is required by Ship's Force to identify the level of control of maintenance of systems being worked and proper equipment, Allowance Parts List, technical manuals and drawings. Early identification of controlled work or work requiring Material Identification and Control or Material Identification Code (MIC)-LEVEL I material, per volume V of this manual, will assist RMC Surveyors in producing correct work specifications.

(2) Execution. Although the name implies quick repairs, VRs require no less stringent QA procedures than any other routine planned repair. While Ship's Force is ultimately responsible for ensuring that the QA level is maintained on all repairs, regardless of who performs the work, the RMC overseeing the VR is responsible to Ship's Force to ensure all required specifications are met. Ship's Force QA responsibilities during execution include:

(a) Witnessing all tests and inspections specified in the contract work specification. Witnesses must be qualified QAIs who are aware of the technical requirements to be fulfilled by the test or inspection. For

steam systems, final inspections will consist of two steps: unlagged and lagged.

(b) Ensuring that documentation of each contractor test or inspection is provided to the QAI at its conclusion. If not provided, the QAI will use the applicable form from Volume V, Part I, Chapter 11 of this manual to document the test or inspection. Records of all Ship's Force and contractor tests and inspections will be maintained per volume V, part I, chapter 10 of this manual.

(c) Insisting on verbatim compliance with the work specification, through the QAI, during the test or inspection. The QAI will immediately inform the Department Head of any discrepancies noted.

(d) Ensuring that any material provided by Ship's Force by direction of the work specification is in strict accordance with technical requirements.

(e) Ensuring that no other material, tools, or physical assistance is provided to the contractor unless it is specifically required by the contract specification. The entire Ship's Force will be briefed on this prior to the start of the VR period.

(f) Providing continual in-process inspections of work being accomplished aboard ship. In-process inspections of work accomplished off-ship will be accomplished as deemed necessary by the Department Heads and as agreed to by the RMC Surveyor.

(g) Providing ship-specific operating and design system parameters to aid in determining actual testing requirements. Reporting specified test results on appropriate QA forms to the RMC Surveyor prior to the end of the VR period.

(h) Providing all MIC LEVEL I material required to the RMC Surveyor. Material will not be accepted unless properly controlled by Ship's Force. A face-to-face turnover by a designated Controlled Material Petty Officer to the RMC Surveyor is required.

i. RMC Quality Assurance and Quality Control responsibilities during VR availabilities.

(1) An RMC Surveyor will be present on the site of the VR for the duration of the availability. The RMC Surveyor will be the sole point of contact between Ship's Force, FLC-NRCD and the contractor for all questions and actions concerning work specifications.

(2) The RMC Surveyor will assist Ship's Force in QA monitoring of each job. The surveyor will:

(a) Provide a working copy of the work specifications and all modifications to be used for each job to the ship availability coordinator prior to job start or as soon as they are developed.

(b) Brief the ship availability coordinator and ship supervisory personnel on the nature of the industrial environment and the need to insist on

verbatim compliance with the job specification by the contractor, stressing that failure of the contractor to provide required material, perform required tests, or otherwise conform to the specification requirements of the work, should be reported immediately. The briefing will specify that Ship's Force will not obligate the government or diminish the requirements of the work specification by direct interface with the contractor personnel on any level.

(c) Identify in the work specifications all tests and inspection check points which require Ship's Force witness or participation.

(d) Identify in the work specifications all tests which the ship must complete. Provide test parameters. If operational design and test information are not available or are unclear, the RMC will request assistance from the Type Commander (TYCOM).

(e) Identify in writing the specifications for material to be provided by the ship to the contractor.

(f) Inspect all material to be turned over to the contractor by Ship's Force for controlled work with the designated Ship's Force QAI. If the controlled material is MIC-Level I, the material inspection must be a joint inspection, to include the designated Ship's Force QAI and the Ship's Controlled Material Petty Officer, prior to a turnover of the material to the contractor.

(g) Inspect each completed controlled work job with the designated Ship's Force QAI prior to final acceptance.

(h) Advise the ship availability coordinator of any condition where the lack of references, Military Specification material, or qualified contractor personnel will require Ship's Force submission of a Departure from Specification per volume V, part I, chapter 8 of this manual.

(i) Unsatisfactory Work or Work Practices. Any unsatisfactory work accomplished or work practice conducted by any maintenance activity must be promptly reported to the activity involved and the applicable Maintenance Manager. Reports should include sufficient detail to ensure timely and proper corrective action may be taken. Prior to informing the Maintenance Manager, direct liaison between customer and repair activity in identifying and clarifying deficiencies is required.

j. Post-Production Meeting. The RMC Surveyor will provide to Ship's Force all appropriate documentation, including objective quality evidence, to verify the VR was satisfactorily completed. As necessary, technical justification will also be provided when a Departure from Specification request is required to be submitted.

k. Following the completion of the VR Availability, Ship's Force must generate and transmit a Post-VR Assessment Report for transmission via message or e-mail.

3.4.2 Submarine Policy.

a. Mission essential VR support will be coordinated by COMSUBGRU Seven, COMSUBGRU Eight and applicable TYCOM, with information copies to Mid-Atlantic Regional Maintenance Center Detachment (Det) Bahrain, COMLOG WESTPAC, and homeport Fleet Maintenance Activity (RMC or Regional Support Group).

b. With the exception of Japanese National Master Labor Contract personnel employed by SRF and platforms being repaired under the AUKUS agreement, foreign nationals must **not** be contracted to perform VRs onboard submarines. Japanese National Master Labor Contract personnel employed by SRF may perform VR work in non-nuclear areas only. Repairs and refurbishments for submarine operating as part of AUKUS agreement may be carried out by personnel and contractors of the United States, the United Kingdom or Australia.

c. When required, Mobile Utility Support Equipment (MUSE) support can be provided in some WESTPAC foreign ports. Ship requests for MUSE support must be submitted to COMSUBGRU Seven, with information copies to FDRMC Det Bahrain, SRF and COMLOG WESTPAC. Commander, U.S. Naval Force, Europe-Commander, U.S. Naval Forces, Africa-Commander, Sixth Fleet has no MUSE support.

3.4.3 Nuclear Propulsion Plant and Related Equipment. Only qualified Navy or Naval Industrial Activity personnel must perform maintenance on nuclear propulsion plant and related equipment. Ship requests for VRs to this equipment must be forwarded to the TYCOM, with information copies to the parent Immediate Superior In Command, FDRMC Det Bahrain, COMLOG WESTPAC, COMSUBGRU Seven or COMSUBGRU Eight.

3.5 COMMANDER, SEVENTH FLEET FUNDING AND MANAGEMENT FOR NAVAL SHIP REPAIR FACILITY AVAILABILITIES.

3.5.1 Funding. Funds for the accomplishment of repairs in WESTPAC are centrally budgeted and managed by Commander, Pacific Fleet, with the WESTPAC availability funds being provided direct to each individual repair activity for the accomplishment of authorized repairs to Seventh Fleet ships.

3.5.2 Current Work Package. The Port Engineer as designated by Commander, Naval Surface Group WESTPAC will validate, budget and broker ship's 2 Kilos to repair facilities, COMLOG WESTPAC, SRF, or FLC-NRCD for local contracting (via RMC) following current FLEET and TYCOM policies and procedures.

VOLUME III

CHAPTER 4

SCHEDULED MAINTENANCE PLANNING, PREPARATION AND PRIORITIES

K COMSEVENTHFLT FFP LCS RAV Milestones
L Milestone Acronyms

4.1 PURPOSE. To implement the policies of reference (a) when planning deployed maintenance and to describe the process for the submittal and review of work packages and message work candidates for deployed ships.

4.2 SURFACE FORCE SHIP WORK PACKAGE PREPARATION. Volume II, part II, chapter 5 of this manual establishes Surface Force ship maintenance work item and specification package preparation procedures and business rules. A sample Work Screening message appears in Appendix A of this chapter. Volume II, part II, chapter 3 of this manual provides Surface Force ship milestones. Forward Deployed Naval Forces (FDNF) Surface Ship milestones for Continuous Maintenance Availabilities (CMAV), Surface Incremental Availabilities (SIA), Restricted Availabilities (RAV), Selected Restricted Availability (SRA), and Docking Selected Restricted Availability (DSRA), Littoral Combat Ship, and Preventative Maintenance Availabilities (PMAV) are in Appendix B through Appendix K of this chapter. Appendix L provides the various acronyms utilized within the FFP milestones: Appendix B through Appendix K of this chapter. These business rules apply to Regional Maintenance Centers (RMC), Surface Type Commanders (TYCOM), Systems Commanders (sponsoring Program Alterations) and other Alteration Installation Team Sponsors.

4.3 CONTINUOUS MAINTENANCE PLANNING. In this Chapter on Deployed Maintenance, the term Continuous Maintenance (CM) Planning refers to FDNF ships, and to work brokered to the Afloat Fleet Maintenance Activity (AFMA) for all other ships. A vital part of CM is the scheduling and accomplishment of work outside of Chief of Naval Operations availabilities. This allows the ship to be consistently maintained at acceptable readiness levels. Private Sector Industrial Activity contracts create a long-term relationship with the executing activity that

facilitates the execution of CM. The ship's maintenance teams should recognize every scheduled in-port period as an opportunity to accomplish CM. Funding for CM is included in the ship's Maintenance and Modernization Business Plan. Discussions with Private Sector Industrial Activity contractors and I-Level service providers indicate that in order to get the most efficient use of CM maintenance dollars there are some minimum planning thresholds that should be adhered to in order to prevent premiums from being accrued. A minimum of 30 days should be allotted between the time depot level work is brokered to the executing activity and work is scheduled to start. A minimum of 40 days should be allotted for work brokered to I-Level activities. This assures there is adequate time to plan the work and acquire the necessary material in an efficient manner. If these minimum thresholds cannot be complied with, the work should be postponed until the next CM opportunity. The Maintenance Team may run a business case if there are other factors that might justify the addition of work inside these preferred windows.

4.4 CURRENT SHIP'S MAINTENANCE PROJECT MAINTENANCE WHILE DEPLOYED.

a. Under the CM concept, parent Maintenance Team, RMC, Immediate Superior In Command (ISIC) and the Fleet Maintenance Activity (FMA) will not transfer the Current Ship's Maintenance Project to the deployed unit's maintenance activity. Parent Maintenance Team, RMC, ISIC and the FMA will maintain control of the Current Ship's Maintenance Project and will broker work, as a continuous process, per this manual (volume II, part I, chapter 3 for aircraft carriers, volume II, part II, chapter 3 for Surface Force ships, or volume II, part III, chapter 3 for submarines).

b. Parent Maintenance Team, RMC, ISIC and the FMA will identify work candidates brokered to a deployed screening activity in the appropriate Information Technology (IT) system and report them to the ship through weekly Work Package Summary reports.

c. When normal screening systems are down, parent Maintenance Team, RMC, ISIC and the FMA will receive automatic feedback on status of brokered work candidates through the appropriate IT system(s). The forward screening activity can identify work candidates that will **not** be undertaken during deployment by using the "Return to Broker" function.

4.5 WORK CANDIDATE PREPARATION AND PRIORITY.

a. Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), must be prepared in strict accordance with reference (a). Use a message work candidate per volume II, part I, chapter 3 for aircraft carriers, volume II, part II, chapter 3 for Surface Force ships, or volume II, part I, chapter 3 for submarines of this manual whenever a 2-Kilo **cannot** be sent by any other means.

b. Following End-to-End Maintenance Process procedures, an appropriate Figure of Merit should be assigned.

c. Priority assignment in 2-Kilo is a major factor in determining whether a work candidate is approved for accomplishment during deployment and must be accurate. Table 4-1 illustrates the interrelationships.

PRIORITY	DESCRIPTION	ACTIVITIES
1	Voyage Repairs.	AFMA, Technical Assistance or Foreign Contractor, Naval Ship Repair Facility, Strike Force Intermediate Maintenance Availability (SFIMA)
2	Urgent repairs during Unscheduled Maintenance Availabilities.	AFMA, Technical Assistance or SFIMA
3	Routine repairs.	AFMA or SFIMA
4	Desirable ship work.	AFMA or SFIMA

Table 4-1
Deployed Accomplishment For Non-Forward Deployed Naval Forces Ships

4.6 SUBMISSION OF WORK PACKAGES. Screened work packages should be continuously available to Commander, Logistics (COMLOG) Western Pacific (WESTPAC), Forward Deployed Regional Maintenance Center (FDRMC) Naples, Det Bahrain and the AFMAs from the ship's parent Maintenance Team Ship Repair Facility (SRF) Yokosuka, Detachment Singapore, Detachment Sasebo, and ISIC. These work packages will form the basis for each availability. To ensure clearly defined work packages at availability start, the accomplishing activity (FMA, RMC or Maintenance Manager) will provide a screening message at arrival minus ten days to all concerned with an information copy to responsible ISICs and RMC (See Appendix A of this chapter).

4.7 WORK CANDIDATE SCREENING AND BROKERING.

a. For Commander, U.S. Naval Forces, Europe-Commander, U.S. Naval Force, Africa-Commander, Sixth Fleet (COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT) Area of Responsibility (AOR), FDRMC Naples will screen, budget and broker surface ship's maintenance work candidates to Fleet Maintenance Activities, stateside repair facilities or to the Naval Regional Contracting Department for local. Commander, Submarine Group (COMSUBGRU) Eight will screen submarine Message Work Candidates, and coordinate with the Unit's home Fleet Maintenance Activity to broker the work to the appropriate repair facility.

b. For Commander, Fifth Fleet (COMFIFTHFLT) AOR, the Maintenance Team will screen, budget and broker ship's OPNAV 4790/2Ks to repair facilities, COMLOG WESTPAC, RMC, Fleet Logistics Center (FLC) or Naval Regional Contracting Department for local contracting (via RMC or COMLOG WESTPAC) following current Fleet and TYCOM policies and procedures.

c. For Commander, Seventh Fleet (COMSEVENTHFLT) AOR. For all maintenance actions in COMSEVENTHFLT, Port Engineer designated by COMNAVSURFGRU WESTPAC will validate, screen, and broker surface ship's maintenance work candidates to FMAs, stateside repair facilities, FLC Yokosuka , FLC Det Sasebo, FLC Det Singapore for local contractor accomplishment. COMSUBGRU Seven will screen submarine Message Work Candidates, and coordinate with the Unit's home FMA to broker the work to the appropriate repair facility. COMSUBGRU Seven will

also screen surface ship OPNAV 4790/2Ks to its assigned AFMA referred to them from COMLOG WESTPAC.

4.8 SCREENING OF WORK CANDIDATES AND WORK PACKAGES.

a. Table 4-2 provides AOR activities authorized to conduct screening of work packages:

AOR	ACTIVITY	REMARKS
COMUSNAVEUR-COMUSNAVAF-COMSIXTHFLT	FDRMC Naples	Screening for surface ships, to include Aegis Ashore Missile Defense System, deployed to Sixth Fleet
	COMSUBGRU Eight	Screening for submarines deployed in Sixth Fleet.
COMFIFTHFLT	FDRMC Det Bahrain	Screening for all Arabian Gulf, Arabian Sea, Red Sea activities (AFMA, Contractor).
	COMFIFTHFLT AFMA	Screening for assigned MAVs only.
	COMSUBGRU Seven	Screening for all deployed submarines.
COMSEVENTHFLT	COMNAVSURGRU WESTPAC	Screening for FDNF assigned ships and deployers visiting to COMSEVENTHFLT AOR.
	WESTPAC AFMA	Screening for AFMAs only.
	COMSUBGRU Seven	Screening for all submarine and assigned surface ship AFMAs.
	COMSUBRON Fifteen	Screening for all deployed submarines.
		Screens all work candidates and work packages brokered to the assigned AFMA.

Table 4-2 - AOR Work Package Screening Authority

b. When AFMAs visit ports with substantial Naval repair facilities or are in commercial ports during times of high port loading, it is often desirable to divide availabilities and primary work screening functions between the shore activity and the AFMA on a ship-by-ship basis. When this happens, the applicable maintenance manager will, by message, assign the primary availability and work package screening responsibility to either the shore activity or the AFMA. When assigned, the primary activity will request and screen the work package. The primary activity will also screen work candidates for referral to the secondary activity for review and acceptance or rejection. The secondary activity will then issue its own screening message concerning only the work candidates referred by the primary activity. Ports where this may be routinely expected to happen are:

PORT	ACTIVITY
Yokosuka	SRF
Sasebo	SRF
Singapore	SRF

c. The following guidance applies to work to be accomplished by all maintenance activities on ships not permanently homeported overseas:

(1) Work candidates which are clearly within the capability of Ship's Force will not normally be accomplished by repair activities, but technical assistance will be provided if the need is substantiated.

(2) Work candidates for material only or manufacture of standard stock items will not be approved, unless the item is not available in time to ensure timely correction of Casualty Reports or major safety items only.

(3) Unless previously authorized by the TYCOM, work candidates for ship changes will not normally be approved while deployed.

(4) Activities authorized to accomplish work screening will use screening messages prepared per Appendix A of this chapter, or via E-mail (SIPRNET or NIPRNET) as applicable.

4.9 FDNF LITTORAL COMBAT SHIP. The limited capacity of the crew to conduct maintenance requires a fundamentally different approach to material readiness. Preventive Maintenance execution is unique in that the crew is not responsible for oversight and execution for the entirety of the Preventive Maintenance System (PMS) effort. Additionally, due to the limited capacity of the crew, periodic basic facility maintenance support for housekeeping, corrosion control, and industrial cleaning is required. Volume II, part II, chapter 3 of this manual contains further information on facility maintenance.

a. In order to comply with reference (b) the notional two-week availability, at a minimum accomplished every four months by Littoral Combat Ship (LCS) ships, must be identified as a RAV. Use availability category code per volume II, part II, chapter 4, Appendix A of this manual while FDNF. Non-FDNF LCS maintenance information can be found in volume II, part II, chapter 3 of this manual. Planning and execution of FDNF homeported or deployed LCS RAVs will be accomplished per Appendix F or Appendix K of this chapter, as applicable to AOR.

b. Preventative Maintenance Availability. A scheduled availability dedicated for off-hull based personnel to perform PMS, normally five days, scheduled notionally once per month during a period when the ship will be in port. PMS must be accomplished in accordance with volume VI, chapter 19-6 of this manual and Appendix D or Appendix J of this chapter, as applicable to AOR.

APPENDIX B

FDRMC FFP SURFACE SHIP AVAILABILITY MILESTONES

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
1.	Establish CNO Availability Schedule	TYCOM N1, OPNAV	A-880	Schedule established per the Fleet Response Plan maintenance cycle. TYCOM will publish routine updates in NDE as they occur.
2.	Issue APL	SPM	A-850	Issue APL announcing CNO availability dates, cognizant NSA, RMC, and additional modernization planning requirements.
3.	Establish Work Split Strategy for Modernization	SPM	A-850	PARM will update APS at A-850 and provide to SPM.
4.	All SCD Approved at Any Decision Point Scheduled in NDE-NM	PARM	A-720	All ship changes planned for installation will be scheduled in the NDE-NM.
5.	Issue A-700 LOA	TYCOM, SPM	A-700	NAVSEA and TYCOM LOA are issued showing all modernizations scheduled for the CNO Availability. The SPM LOA specifies to the NSA the SCs approved to be accomplished during a specific ship CNO availability. Forecasted ship changes may be viewed through the NDE database and continuing throughout the BAWP to AWP development process. This list will be reviewed at each BAWP Milestone Meeting. Items from this list will not be entered into the ship's CSMP until they have been reconciled with an issued LOA. Authorized and PNA SC must be planned for execution.
6	Third Party SID Development Request Submitted to SPM for Approval of Work Executed by MSR IND/SIA Method of Install	PARM, AIT Sponsor, Third Party Sponsor	A-660	Pending Planning Yard workload assessment and GFI maturity, if PARM desires to utilize a Third Party ID developer vice designated planning yard, PARM must request and obtain permission from SPM. Third Party SIDs must be reviewed and approved by designated planning yard.
7	Fund and Task SID Development for Work Executed by MSR IND/SIA Method of Install	TYCOM, PARM, SPM	A-660	SIDs will be tasked and funded. For first time install SC, PARMS are required to provide the PY with the planned execution strategy (work split between shipyard and AIT) to support development of SID or trade-level manpower estimates for advance planning, schedule integration, and subsequent work specification development. TDPs and GFI will be provided in support of ship checks and SID development. Drawings are to be developed per NMP-MOM Appendix L, TECH SPEC 9090-600B.
8	ICD and IRD Delivered to Alteration	PARM	A-660	As indicated, ICDs and IRDs for IND/SIA installs provided to the Developer or PY.

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
	Developer/PY for IND/SIA Installs			
9	Provide Availability Target Control	TYCOM	A-655	A financial control is required in order to establish the Availability Planning Requirements.
10	Provide Incremental Funding for Ordering LLTM	TYCOM, PARMs	A-650	Provide incremental funding for ordering LLTM for both Maintenance (Repair) and Modernization (Alterations).
11	Establish Availability in the Applicable IT Maintenance System	RMC C300	A-649	Availabilities will be established in the applicable IT Maintenance System when known or work is ready to be screened.
12	All BAWP Tasks Screened to Appropriate Avail	TYCOM PE	A-639	Maintenance Team screens all BAWP WNs to the appropriate current or future maintenance availability within the respective Information Technology brokering system.
13	Issue A-600 LOA	SPM, TYCOM	A-600	The SPM must prepare and issue the LOA, identifying all Authorized and PNA modernization ship changes scheduled for installation. The SPM LOA specifies to the NSA the SCs to be accomplished during specific ship CNO availability. Authorized and PNA SCs must be planned for execution.
14	Finalize Method of Install for Modernization	TYCOM, PARM	A-600	PARMs will provide final updates to work split strategy to SPM for inclusion in the A-600 LOA.
15	Issue MML Letter	SURFMEPP	A-550	Provides a list of required material necessary to accomplish DMS tasks (information currently in Paragraph 5 of applicable Class Standard Work Templates). RMC request funding to order DMS task material.
16	Modernization Ship Checks Complete for Ship-Specific SIDs for Work Executed by MSR IND/SIA	Planning Yard	A-540	Ship checks (Design, Verification, Production and Proofing) are accomplished in support of the development of SIDs. All ship checks will incorporate a validation and verification of actual Hull or Site configuration. This is a Modernization milestone to ensure all design ship checks are complete in support of the SID delivery milestone.
17	Drawings for any SC Authorized to Use Third-Party SID Development Submitted to the Applicable Planning Yard for Review (for work executed by MSR)	PARM	A-500	If PARM obtained permission from SPM to utilize a Third Party SIDs developer by A-600, PARM must submit Third Party SIDs to designed planning yard for review. Planning Yard requires 60 days for initial review. SID tasking status to be documented in NDE-NM.
18	Task and Fund Planning Yard for SID Development of	PARM	A-500	If approved by SPM to use Third Party Developer, PARM must task and fund the planning yard to conduct SID review and approval when delivered to the planning yard. GFI (approved IRD or TDP) is required at this milestone.

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
	Work Executed by AIT			
19	ICD/IRD Delivered to Alteration Developer/PY for AIT Installs	PARM	A-500	If PARM obtained permission from SPM to utilize a Third Party SIDs developer by A-600, PARM must submit Third Party SIDs to designed planning yard for review. Planning Yard requires 60 days for initial review.
20	Third Party SID Development Request Submitted to SPM for Approval of Work Executed by AIT	PARM	A-480	Pending Planning Yard workload assessment and GFI maturity, if PARM desires to utilize a Third Party SID developer vice designated planning yard, PARM must request and obtain permission from the SPM. Third Party SIDs must be reviewed and approved by designated planning yard.
21	Send Habitability Project Advance Planning Notice	TYCOM N43	A-450	This TYCOM-generated notice identifies Projects proposed for accomplishment, and provides work scope details including, if applicable, Ship's Force manpower requirements. This notice also requests Commanding Officer's comments, concurrence and commitment of resources to the proposed projects.
22	Accomplish Mid-Cycle Review	SURFMEPP	A-440	Meeting to review the ship's BAWP, CSMP, active DFS, Class Advisories, routines, services, and the latest Availability Duration. SSEOC applicable WNs will be branded as Mandatory Technical Requirements per the JFMM. The BAWP Status Letter is the output.
23	PYs Issue or Deliver SIDs for Work Executed by MSR IND/SIA	Planning Yard	A-435	A SC without PY-approved SIDs must be considered not executable by the MSR and at risk of deferral from the SPM authorization letter.
24	Maintenance Ship Checks Complete	RMC or WFO	A-420	Intent is that all maintenance-related ship checks will be completed as early as possible within the planning process; however, no later than this milestone.
25	C5IMP Baseline Lock Event	SEA 05H	A-420	1. Provide C5IMP baseline assessment to Fleet Commander for review and C5IMP baseline lock approval. 2. Review all SFI Category 1 and 2 planned and scheduled SCs to establish the planned C5IMP baseline. 3. SCDs past the first Decision Point must be scheduled in NDE. SCDs that are planned but do not have a phase approval will be reviewed for inclusion in the C5IMP baseline. 4. SCs that are scheduled in NDE will be reviewed and presented to the Fleet Commander for addition to the approved C5IMP baseline in an Authorized or Planned Not Authorized status. 5. Any C5IMP SC baseline change after this baseline lock will be submitted via C5IMP ECCB.
26	Provide AIT Support Requirements and Required Milestones	TYCOM, PARM	A-415	Identification of AIT support requirements provided: When an AIT requires industrial support, (e.g., crane and rigging services, welding/burning, compressed air), during

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
	for Work item Development			accomplishment of the alteration or SC, coordinate with local RMC for Support. Services requests, the AIT manager or designated representative must utilize Exhibit K1 Template "AIT Support Services Request Form" of the TS9090-310G to provide requirements to the Maintenance Team and the planning activity to generate a 4E-compliant support work item to be included in the availability work package.
27	Issue BAWP Status Letter	SURFMEPP	A-410	Confirms completion of the Mid-cycle Review milestone. It includes any End-to-End Process non-compliance concerns, "AS"-branded MSA WNs due within the cycle, discusses the disposition of Class Advisories and DFS, TSRA and Dry-Docking concerns (if applicable).
28	Issue A-400 LOA	SPM	A-400	The SPM prepares and issues the LOA, identifying all authorized and PNA modernization SCs scheduled for installation. The SPM LOA specifies to the NSA the SCs to be accomplished during the specific ship CNO availability. Authorized and PNA SCs should be planned for execution.
29	Modernization Package Lock	SPM, TYCOM	A-365	Work Package 2Ks Locked Based on Target Control for Program Modernization Alts (LMA IND/SIA/AIT with Support Services) Based on LOA: Intent is that 100% of the expected 2Ks have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next package development milestone. Missing GFI (SIDs, BOM/4720, SOW, and SSR) results in WN being removed from work package.
30	50% of D-level Maintenance Work Package 2Ks Locked Based on Target Control to Include All BAWP Items	Ashore Ships Maintenance Manager	A-365	Intent is that 50% of the expected 2Ks (work, not services) have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next lock milestone.
31	Submit Third Party SIDs to PY for Review and Approval	PARM	A-360	If PARM obtained permission from SPM to utilize a Third Party SID developer by A-480, PARM must submit Third Party SIDs to designated planning yard for review.
32	Validate Availability Target Control	TYCOM	A-360	Provide the latest funding requirements (target controls) for the CNO availability based on the budget cycle (PRESBUD, DON/FAST, OSD).
33	Final Funding Provided for LLTM	TYCOM, PARM	A-360	Provide incremental funds for ordering LLTM for both repair and alt or mod work to meet required dates. This is an iterative process as LLTM is identified and funding is requested and authorized based on the lead time. It is incumbent on the Execution Planning Activity or MT to identify LLTM as soon as possible. LLTM is defined as any material with a delivery date in excess of 30 days.

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
34	LLTM Delivery Order Awarded	FLC Contracts	A-345	FLC Contracts awards the CFM delivery order that supports availability CFM procurements.
35	Complete P&E of Work Assigned by the 50% Work Package Lock Milestone to Include All BAWP Items and Program Modernization Updates Based on LOA	Planning Activity	A-345	The requirement is that all work brokered by the 50% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with minimum quality as described as a "Class C" estimate.
36	Begin Continuous Estimating and Incremental Planning Review Process	Executing Activity	A-345	Work items will be delivered to the Executing Activity through the contracting officer to begin incremental planning and proposal development.
37	Planning Yard Issues RFP to SUPSHIP in support of LLTM Procurement	Planning Yard	A-330	RFP delivered to SUPSHIP to support LLTM procurement for Modernization material.
38	80% of D-level Maintenance Work Package 2Ks Locked Based on Target Control to Include All BAWP Items and Program Modernization Updates Based on LOA	Ashore Ships Maintenance Manager	A-325	Intent is that 80% of the expected 2Ks (work, not services) have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next lock milestone.
39	Submit Deferral Letter with Maintenance Team Assist to SURFMEPP	TYCOM N43	A-325	TYCOM will submit a Change Deferral Request Letter to SURFMEPP, which will include a list of Change Deferral Requests for subject OFRP Maintenance Cycle.
40	Submit Deferral Recommendation Letter to SDM (SEA05)	SURFMEPP	A-315	SURFMEPP receives TYCOM's Deferral Request Letter, adjudicates the Mandatory Technical Requirement requests (if any), and provides recommended actions for review by the SDM (SEA 05) via the Deferral Recommendation Letter.
41	Funding for Procurement of LLTM Provided to SUPSHIP by Planning Yards	PARMS or TYCOM	A-315	All funding required for the procurement of Modernization LLTM available for award by SUPSHIP.
42	SDM Deferral Letter Response Submitted to TYCOM	SEA 05 SDM	A-305	SEA 05 issues final adjudication of TYCOM's Mandatory Technical Requirement deferral request.

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
43	Complete P&E of Work Assigned by the 80% Work Package Lock Milestone to Include All BAWP Items and Program Modernization Updates Based on LOA	Planning Activity	A-295	All work brokered by the 80% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with the minimum quality described as a "Class C" estimate.
44	Planning Yard Issue Shortage Reports	Planning Yard	A-285	PY identify any LLTM that is in jeopardy of not meeting delivery dates and provide notification to the SPM and SC sponsor.
45	100% of D-level Maintenance Work Package 2Ks Locked Based on Target Control to Include All BAWP Items and Program Modernization Updates Based on LOA	TYCOM PE	A-275	Intent is 100% of the expected WNs have been screened and brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost-effective manner and does not batch this work in front of the next package development milestone. GFI submission deadline for all work notifications.
46	Issue TYCOM 100% Lock Letter	TYCOM, RMC	A-275	The Lock Letter is the complete list of all TYCOM work with the JSNs that are screened and brokered to the identified CNO availability. It includes a short CSMP summary and Class "F" cost estimate for each JSN. Lock letter includes: Mandatory Class Maintenance Plan tasks, Fleet alterations, TYCOM repairs, option items and service and routines.
47	Complete P&E of Work Assigned by the 100% Work Package Lock Milestone to Include All BAWP Items and Program Modernization Updates Based on LOA	Planning Activity	A-255	The requirement is that all work brokered by the 100% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with the minimum quality described as a "Class C" estimate.
48	Issue Specification Package to FLC	RMC C300	A-250	Issue a final specification package for the availability upon which proposals will be based. All work after this date will be handled as supplemental and/or new work.
49	Accurate and Complete Planning Package Verified and Ready for Solicitation. Turnover to FLC Contracts	RMC C300	A-250	Requirements Packages must include all necessary data as required in the Requirements Package Checklist. RMC C300 is responsible for ensuring all required data is compiled and submitted to the cognizant PCO.

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
	(CD/References /Key Events/Work Items/CLIN Structure)			
50	Solicitation for Proposals	FLC Contracts	A-240	100% Package turned over to the executing activity for pricing.
51	PYs Issue or Deliver SIDs for Work Executed by AIT	Planning Yard	A-240	(AIT ONLY) Planning Yard will issue or deliver SIDs intended for execution by AIT. Approved SIDs will be loaded into NSDER.
52	WSIA	SEA 05H	A-240	Provide to the Warfare SIM a validated baseline for scheduled SCs in NDE-NM.
53	80% KTR Proposal	Executing Activity	A-225	80% package proposal allow MT/KO to gage the need for package scope or budget adjustments.
54	Conduct WPIC	RMC C300	A-220	Provides a forum for early identification of work requirements that require integration to avoid conflicts with other work during execution.
55	ILS Submitted to SPM for Review/Certification	PARM	A-210	PARMs must ensure ILS certification packages are submitted to ensure certification is met by the A-120 milestone. (PMS 505: Interim/Hull cert may be approved with immature ILS products, if all ILS products are mature a final/class ILS cert must be approved by the SPM).
56	100% KTR Proposal	Executing Activity	A-195	100% package proposal allow MT/KO to gage the need for package scope or budget adjustments.
57	Authorize C5IMP Baseline in NDE-AMPS	SEA 05H	A-190	All SCs in baseline must be approved for SPM A-95 LOA Authorization.
58	All Modernization Risk Assessments Approved	TYCOM, FLT CDR	A-180	Perform an impact assessment for SCs that have not achieved maturity per the Navy Modernization milestone charts to determine whether or not to proceed with installation planning. Excludes SPM approved LI-TYPE alterations.
59	ILS Certification Status, are to be, at minimum, UD	PARM	A-180	It is the responsibility of the associated activities to ensure timely submittal of ILS packages to ensure milestone compliance.
60	Pre-BCM Route for Approval	FLC Contracts	A-170	Pursuant to DFARS 215.306(c)(1), for all contract actions valued at over $100 Million, PCOs should conduct discussions; however, discussions are highly encouraged by the FAR/DFARS irrespective of dollar value. When discussions are anticipated, the PCO prepares a Pre-Business Clearance Memorandum, which documents the findings of the PAT and TERP/SSEB, establishes the competitive range and requests approval to enter into discussions.
61	Pre-BCM Approved	FLC Contracts	A-165	The Pre-BCM has been approved through the proper chain of command.

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
62	100% of O-level Maintenance Work Package Locked	Ship's Force	A-160	Develop a Ship's Force concurrent Work Package that includes all major maintenance actions such as PMS, repairs, alterations and testing to be conducted by Ship's Force during the availability, as applicable. Review PMS, CSMP and Testing requirements and ensure all Ship's Force maintenance actions scheduled for accomplishment during the availability are identified.
63	Identify Availability Funding for Modernization Work	NSA	A-150	Identify modernization execution funding requirements to SPM. Provide a no later than date for required funding.
64	Final BCM Submitted	FLC Contracts	A-145	The Post-Negotiation BCM submitted for approval through the appropriate chain of command.
65	All Funding Received at FDRMC	TYCOM	A-135	All availability funding available for execution.
66	Final BCM Approved	FLC Contracts	A-135	The Post-Negotiation BCM has received approval through the appropriate chain of command.
67	Award Contract	FLC Contracts	A-120	Notification by the Contracting Officer to a bidder that his offer, or a negotiated proposal, has been accepted. This award establishes a legal obligation between the parties.
68	Award AIT Contracts for Work Not Being Done by Prime Contractor and Identify All Outside Activities Participating in the Availability and Associated Support Requirements	AIT Manager, TYCOM, PARM	A-120	The AIT Manager must award AIT contracts for work not to be accomplished by the prime contractor and identify all outside activities participating in the availability.
69	Availability Definitized in NMD	RMC C300, FLC Contracts	A-115	The work package is locked from any further changes to support accurate and complete requirement package turnover to FLC Contracts.
70	ILS Certification Packages Complete/SPM Approved	SPM	A-95	All Ship Changes planned for installation during a CNO availability must have completed ILS certification by A-95 or the Ship Change is at risk of deferral.
71	Issue A-95 LOA Message	SPM, TYCOM	A-95	Issue A-95 LOA Message: The SPM must prepare and issue the LOA. All modernization SCs must have an authorized RA in place or must meet full modernization maturity. All fully mature Low Impact (LI), ST I and II, internal AIT-only installs that do not require LMA support services or require SIDs, and software installation SCs must be scheduled in NDE-NM no later than A-100 for inclusion in the A-95 LOA. Fully mature LIs, ST I and IIs, internal AIT-only installs, and software SCs that do not have significant integration impact on a CNO availability, do not require an LMA support work item may be added to the

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
				package without an approved late add request up to A-95, pending full maturity after C5IMP Baseline push.
72	Schedule I-level Work Integration	RMC C900	A-90	I-level work for a CNO availability is reviewed, planned, and integrated into the schedule to not interfere with contractor work. Any work that arrives afterward will be tied to a Key Event or Milestone, or assigned to a specific POP agreed upon by the RMC I-level and the Maintenance Team.
73	Deliver Material (LLTM and Kitted Materials) to Executing Activity	Planning Yard, PARM	A-90	100% of LLTM will be delivered to awarded MSR in support of on-time availability start and execution. Per NAVSEAINST 4490.5 Ser SEA21/019 of 29Jun21, guidance and policy of GFM by A-90 as the new objective requirement with A-30 remaining as the threshold requirement.
74	AIT Production POAM Submission to LMA and NSA for Schedule Integration	AIT Manager	A-85	The A-85 AIT Production POAM must be submitted to the NSA RMC by A-85 for validation and integration into the overall IPS. Format requirements are specified in TS9090-318H.
75	Conduct WPER	RMC C300	A-60	Review of the integrated work production schedule that has been prepared by the Executing Activity. The complete LMA Availability work package is defined and agreed upon at the WPER.
76	SMR	Executing Activity	A-59	All involved stakeholders performing work (e.g., D-Level, O-Level and I-Level and MOD work) will be de-conflicted and integrated into a package to meet availability schedule.
77	Submit I-Level work package; I-Level Lock	RMC C900	A-60	Intent is that 100% of the expected WNs have been screened and brokered to the I-Level planning activity.
78	I-Level Work Package Accepted	RMC C900	A-55	RMC 900 accepts I-Level work package and assigns resources to accomplish I-Level work package.
79	SOA	Executing Activity	A-0	The first day of the production period for the executing activity.
80	Conduct Departure and Assessment Conference	RMC C300	C+0	To verify the completion of all work assigned to the availability or to document exceptions. Exceptions must have a plan for completion with an estimated completion date and must be tracked through completion. This conference will establish the date and conditions under which the TYCOM and NAVSEA will accept re-delivery of the ship.
81	Issue Completion Report	NSA	C+60	NAVSEAINST 4710.8 series details the requirements for availability completion which must include financial as well as production and exception reporting.
82	Upload BAWP Part 1 of 2 Tasks to Ship's CSMP	SURFMEPP	C+65	SURFMEPP will upload a data file with all mandatory maintenance actions and expected CNO Availability services, with the exception of Tanks and Voids, into the ship's CSMP in support of ship-specific MT screening and brokering requirements. The data file will span the entire

EVENT #	TASK OR MILESTONE	RESPONSIBLE ACTIVITY	FDRMC	DESCRIPTION
				OFRP and will include the requirements through the next cycle's LCPC.
83	Conduct SURFMEPP BAWP Closeout Meeting	MT, RMC, TYCOM, SURFMEPP	C+70	Identifies "A"-branded BAWP requirements that were completed, not completed or deferred; establishes requirements for the next OFRP Maintenance Cycle and reviews outstanding DFS.
84	Verify Completion of Departure Report and Closeout of Avail in the Appropriate IT System	RMC C300	C+90	Purpose is to verify that financial information, AWRs and work items, as applicable, have been uploaded and closed out in the appropriate IT system as required by NAVSEA Standard Item 009-99.
85	Submit Final BAWP Closeout Report	SURFMEPP	C+100	Purpose is to document the results (including follow up action items) from the Closeout Meeting.
86	Conduct LCPC	SURFMEPP	C+115	The LCPC agenda will include a review of the planning schedule, Corrosion Plan, required CMP assessments, NDE modernization forecasts, CNO Availability services/routines as applicable, organizational responsibilities and DFS.
87	Upload BAWP Part 2 of 2 Tasks to Ship's CSMP	SURFMEPP	C+125	SURFMEPP will upload a data file with all mandatory Tank and Void maintenance tasks into the ship's CSMP in support of ship-specific MT screening and brokering requirements. The data file will span the entire OFRP and will include the Tank and Void requirements through the next cycle's LCPC.
88	Issue Post-LCPC Letter	SURFMEPP	C+125	Confirms completion of the LCPC, lists all attendees, provides action items and associated POCs. SURFMEPP tracks all action items to completion.

APPENDIX G

SRF FFP SURFACE SHIP AVAILABILITY MILESTONES

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
1	Establish CNO Availability Schedule	TYCOM N1, OPNAV	A-880	A-880	Schedule established per the Fleet Response Plan maintenance cycle. TYCOM will publish routine updates in NDE as they occur.
2	Issue APL	SPM	A-850	A-850	Issue SPM APL announcing CNO availability dates, cognizant NSA, RMC, and additional modernization planning requirements.
3	Establish Work Split Strategy for Modernization	SPM	A-850	A-850	PARMS will update APS at A-850 and provide to SPM.
4	All SCD Approved at Any Decision Point Scheduled in NDE-NM	PARM	A-720	A-720	All ship changes planned for installation will be scheduled in the NDE-NM.
5	Issue A-700 LOA	TYCOM, SEA 21 SPM	A-700	A-700	NAVSEA and TYCOM LOA are issued showing all modernizations scheduled for the CNO Availability. The SPM LOA specifies to the NSA the SCs approved to be accomplished during a specific ship CNO availability. Forecasted ship changes may be viewed through the NDE database and continuing throughout the BAWP to AWP development process. This list will be reviewed at each BAWP Milestone Meeting. Items from this list will not be entered into the ship's CSMP until they have been reconciled with an issued LOA. Authorized and PNA SCs must be planned for execution.
6	Request Funding for Work Item Development – Maintenance and Repair	RMC C1200	Varies	Varies	Request necessary funding (IY-2) from TYCOM to plan Availability.
7	Third Party SID Development Request Submitted to SPM for Approval of Work Executed by MSR IND/SIA Method of Install	PARM, AIT Sponsor, Third Party Sponsor	A-660	A-660	Pending Planning Yard workload assessment and GFI maturity, if PARM desires to utilize a Third Party SID developer vice designated planning yard, PARM must request and obtain permission from SPM. Third Party SIDs must be reviewed and approved by designated planning yard.
8	Fund and Task SID Development for Work Executed by MSR	TYCOM, PARM, SPM	A-660	A-660	SIDs will be tasked and funded. For first time install ship changes (SC), Participating Acquisition Resource Managers (PARMS) are required to provide the (PY) with the

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
	IND/SIA Method of Install				planned execution strategy (work split between shipyard and AIT) to support development of SID or trade-level manpower estimates for advance planning, schedule integration, and subsequent work specification development. TDPs/ GFI will be provided in support of ship checks and SID development. Drawings are to be developed per NMP-MOM Appendix L, TECH SPEC 9090-600B.
9	ICD and IRD Delivered to Alteration Developer/PY for IND/SIA Installs	PARM	A-660	A-660	As indicated, ICDs and IRDs for IND/SIA installs provided to the Developer/PY.
10	Provide Availability Target Control	TYCOM	A-649	A-649	A financial control is required in order to establish the Availability Planning Requirements.
11	Provide Incremental Funding for Ordering LLTM and Execution Planning to Planning Activity	TYCOM, PARMS	A-649	A-540 (PARMS) A-649 (TYCOM)	Provide incremental funding for ordering LLTM for both Maintenance (Repair) and Modernization (Alterations).
12	Establish Availability in the Applicable IT Maintenance System	RMC C1200	A-649	A-649	Availabilities will be established in the applicable IT maintenance system when known or work is ready to be screened.
13	BAWP Tasks Screened to Appropriate Avail	TYCOM PE	A-639	A-639	Maintenance Team screens all BAWP WNs to the appropriate current or future maintenance availability within the respective Information Technology brokering system.
14	Issue A-600 LOA	SPM, TYCOM	A-600	A-600	The SPM must prepare and issue the LOA, identifying all Authorized and PNA modernization ship changes scheduled for installation. The SPM LOA specifies to the NSA the SCs to be accomplished during specific ship CNO availability. Authorized and PNA SCs must be planned for execution.
15	Finalize Method of Install for Modernization	TYCOM, PARM	A-600	A-600	PARMs will provide final updates to work split strategy to SPM for inclusion in the A-600 LOA.
16	Notify each Funding Sponsor/PARM Availability Funding Required for Execution Planning and LLTM Procurement	NSA	A-560	A-560	Notify each modernization sponsor/PARM and TYCOM of planning and LLTM funding requirements. Provide a no later than date for required funding.

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
17	Issue MML Letter	SURFMEPP	A-550	A-550	Provides a list of required material necessary to accomplish DMS tasks (information currently in Paragraph 5 of applicable Class Standard Work Templates). RMC request funding to order DMS task material.
18	Modernization Ship Checks Complete for Ship-Specific SIDs for Work Executed by MSR IND/SIA	Planning Yard	A-540	A-540	Ship checks (Design, Verification, Production and Proofing) are accomplished in support of the development of SIDs. All ship checks will incorporate a validation and verification of actual Hull or Site configuration. This is a Modernization milestone to ensure all design ship checks are complete in support of the SID delivery milestone.
19	Drawings for any SC Authorized to Use Third-Party SID Development Submitted to the Applicable Planning Yard for Review (for work executed by MSR)	PARM	A-500	A-500	If PARM obtained permission from SPM to utilize a Third Party SIDs developer by A-600, PARM must submit Third Party SIDs to designed planning yard for review. Planning Yard requires 60 days for initial review. SID tasking status to be documented in NDE-NM.
20	Task and Fund Planning Yard for SID Development of Work Executed by AIT	PARM	A-500	A-500	If approved by SPM to use Third Party Developer, PARM must task and fund the planning yard to conduct SID review and approval when delivered to the planning yard. GFI (approved IRD and/or TDP) is required at this milestone.
21	ICD/IRD Delivered to Alteration Developer/PY for AIT Installs	PARM	A-500	A-500	If PARM obtained permission from SPM to utilize a Third Party SIDs developer by A-600, PARM must submit Third Party SIDs to designed planning yard for review. Planning Yard requires 60 days for initial review.
22	Third Party SID Development Request Submitted to SPM for Approval of Work Executed by AIT	PARM	A-480	A-480	Pending Planning Yard workload assessment and GFI maturity, if PARM desires to utilize a Third Party SID developer vice designated planning yard, PARM must request and obtain permission from the SPM. Third Party SIDs must be reviewed and approved by designated planning yard.
23	Send Habitability Project Advance Planning Notice	TYCOM N43	A-450	A-450	This TYCOM-generated notice identifies Projects proposed for accomplishment, and provides work scope details including, if applicable, Ship's Force manpower requirements. This notice also requests Commanding Officer's comments, concurrence and commitment of resources to the proposed projects.

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
24	Accomplish Mid-Cycle Review	SURFMEPP	A-440	A-440	Meeting to review the ship's BAWP, CSMP, active DFS, Class Advisories, routines, services, and the latest Availability Duration. SSEOC-applicable WNs will be branded as Mandatory Technical Requirements per the JFMM. The BAWP Status Letter is the output.
25	PYs Issue or Deliver SIDs for Work Executed by MSR IND/SIA	Planning Yard	A-435	A-435	A SC without PY-approved SIDs must be considered not executable by the MSR and at risk of deferral from the SPM authorization letter.
26	C5IMP Baseline Lock Event	SEA 05H	A-420	A-420	1. Provide C5IMP baseline assessment to Fleet Commander for review and C5IMP baseline lock approval. 2. Review all SFI Category 1 and 2 planned and scheduled SCs to establish the planned C5IMP baseline. 3. SCDs past the first Decision Point must be scheduled in NDE. SCDs that are planned but do not have a phase approval will be reviewed for inclusion in the C5IMP baseline. 4. SCs that are scheduled in NDE will be reviewed and presented to the Fleet Commander for addition to the approved C5IMP baseline in an Authorized or Planned Not Authorized status. 5. Any C5IMP SC baseline change after this baseline lock will be submitted via C5IMP ECCB.
27	Provide AIT Support Requirements and Required Milestones for Work Item Development	TYCOM, PARM	A-415	A-415	Identification of AIT support requirements provided: When an AIT requires industrial support, (e.g., crane and rigging services, welding/burning, compressed air), during accomplishment of the alteration or SC, coordinate with local RMC for Support. Services requests, the AIT manager or designated representative must utilize Exhibit K1 Template "AIT Support Services Request Form" of the TS9090-310G to provide requirements to the Maintenance Team and the planning activity to generate a 4E-compliant support work item to be included in the availability work package.
28	Issue BAWP Status Letter	SURFMEPP	A-410	A-410	Confirms completion of the Mid-cycle Review milestone. It includes any End-to-End Process non-compliance concerns, "AS"-branded MSA WNs due within the cycle, discusses the disposition of Class

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
					Advisories and DFS, TSRA and Dry-Docking concerns (if applicable).
29	Issue A-400 LOA	SPM	A-400	A-400	The SPM prepares and issues the LOA, identifying all authorized and PNA modernization SCs scheduled for installation. The SPM LOA specifies to the NSA the SCs to be accomplished during the specific ship CNO availability. Authorized and PNA SCs should be planned for execution.
30	50% of D-level Maintenance Work Package 2Ks Locked Based on Target Control to Include All BAWP Items	Ashore Ships Maintenance Manager	A-370	A-240	Intent is that 50% of the expected 2Ks (work, not services) have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next lock milestone.
31	Modernization Package Lock	SPM, TYCOM	A-365	A-365	Work Package 2Ks Locked Based on Target Control for Program Modernization Alts (LMA (IND/SIA/AIT with Support Services)) Based on LOA: Intent is that 100% of the expected 2Ks have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next package development milestone. Missing GFI (SIDs, BOM/4720, SOW, and SSR) results in WN being removed from work package.
32	Submit Third Party SIDs to PY for Review and Approval	PARM	A-360	A-360	If PARM obtained permission from SPM to utilize a Third Party SID developer by A-480, PARM must submit Third Party SIDs to designated planning yard for review.
33	Final Funding Provided for LLTM	TYCOM, PARM	A-360	A-360	Provide incremental funds for ordering LLTM for both repair and alt or mod work to meet required dates. This is an iterative process as LLTM is identified and funding is requested and authorized based on the lead time. It is incumbent on the Execution Planning Activity or MT to identify LLTM as soon as possible. LLTM is defined as any material with a delivery date in excess of 30 days.
34	Validate Availability Target Control	TYCOM	A-360	A-360	Provide the latest funding requirements (target controls) for the CNO availability based on the budget cycle (PRESBUD, DON/FAST, OSD).

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
35	PY Issues RFP to SUPSHIP in support of LLTM Procurement	Planning Yard	A-330	A-330	RFP delivered to SUPSHIP to support LLTM procurement for Modernization material.
36	Updated Notification to Sponsor/PARM of Funding Requirement for Execution Planning and LLTM Procurement Based on SID Delivery	NSA	A-330	N/A	Notify each modernization sponsor/PARM and TYCOM of planning and LLTM funding requirements. Provide a no later than date for required funding.
37	Funding for Procurement of LLTM Provided to SUPSHIP by Planning Yards	PARMs or TYCOM	A-315	A-315	All funding required for the procurement of Modernization LLTM available for award by SUPSHIP.
38	Planning Yard Issue Shortage Reports	Planning Yard	A-285	A-285	PY identify any LLTM that is in jeopardy of not meeting delivery dates and provide notification to the SPM and SC sponsor.
39	Complete P&E of Work Assigned by the 50% Work Package Lock Milestone to Include All BAWP Items and Program Modernization Updates Based on LOA	Planning Activity	A-260	N/A	The requirement is that all work brokered by the 50% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with minimum quality as described as a "Class C" estimate.
40	Accurate and Complete Planning Package Verified and Ready for Solicitation. Turnover to SEA 21C/RMC C400 (CD/References /Key Events/Work Items/CLIN Structure) (FLC-J)	RMC C300	A-260 (Main Grouping) A-140	A-130	FLC-J Requirements Packages must include all necessary data as required in the Requirements Package Checklist. RMC C300 is responsible for ensuring all required data is compiled and submitted to the cognizant PCO.
41	Solicitation for Proposals	FLC Japan	A-245 (Main Grouping) A-130	A-120	Non-Multi-Option Contracting Vehicles. The Federal Acquisition Regulation designates FedBizOpps as the mandatory " GPE" for posting of Government business opportunities, including proposed contract actions, solicitations and associated information.
42	WSIA	SEA 05H	A-240	A-240	Provide to the Warfare SIM a validated baseline for scheduled SCs in NDE-NM.
43	IGE Complete in support of 50% Package Lock	RMC C1200	A-240	N/A	IGE Complete in support of 50% Package Lock: All work planned in support of the 50% lock milestone must be estimated by the government with minimum quality as described as a "Class C" estimate.
44	80% of D-level Maintenance Work	Ashore Ships	A-240	A-210	Intent is that 80% of the expected 2Ks (work, not services) have been screened and

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
	Package 2Ks Locked Based on Target Control to Include All BAWP Items and Program Modernization Updates Based on LOA	Maintenance Manager			WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next lock milestone.
45	PYs Issue or Deliver SIDs for Work Executed by AIT	Planning Yard	A-240	A-240	(AIT ONLY) Planning Yard will issue or deliver SIDs intended for execution by AIT. Approved SIDs will be loaded into NSDER.
46	Submit Deferral Letter with Maintenance Team Assist to SURFMEPP	TYCOM N43	A-220	A-220	TYCOM will submit a Change Deferral Request Letter to SURFMEPP, which will include a list of Change Deferral Requests for subject OFRP Maintenance Cycle.
47	Submit Deferral Recommendation Letter to SDM	SURFMEPP	A-210	A-210	SURFMEPP receives TYCOM's Deferral Request Letter, adjudicates the Mandatory Technical Requirement requests (if any), and provides recommended actions for review by the SDM (SEA 05) via the Deferral Recommendation Letter.
48	ILS Submitted to SPM for Review/Certification	PARM	A-210	A-210	PARMs must ensure ILS certification packages are submitted to ensure certification is met by the A-120 milestone. (PMS 505: Interim/Hull cert may be approved with immature ILS products, if all ILS products are mature a final/class ILS cert must be approved by the SPM).
49	SDM Deferral Letter Response Submitted to TYCOM	SEA 05 SDM	A-200	A-200	SEA 05 issues final adjudication of TYCOM's Mandatory Technical Requirement deferral request.
50	Authorize C5IMP Baseline in NDE-AMPS	SEA 05H	A-190	A-190	All SCs in baseline must be approved for SPM A-95 LOA Authorization.
51	All Modernization Risk Assessments Approved	TYCOM, FLT CDR	A-180	A-180	Perform an impact assessment for SCs that have not achieved maturity per the Navy Modernization milestone charts to determine whether or not to proceed with installation planning. Excludes SPM approved LI-TYPE alterations.
52	ILS Certification Status, are to be, at minimum, UD	PARM	A-180	A-180	It is the responsibility of the associated activities to ensure timely submittal of ILS packages to ensure milestone compliance.
53	100% of D-level Maintenance Work Package 2Ks Locked Based on Target Control to Include All BAWP Items and Program Modernization Updates Based on LOA	TYCOM PE	A-170	A-170	Intent is 100% of the expected WNs have been screened and brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next package development milestone. GFI submission deadline for all work notifications.

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
54	Issue TYCOM 100% Lock Letter	TYCOM, RMC	A-170	A-170	The Lock Letter is the complete list of all TYCOM work with the JSNs that are screened and brokered to the identified CNO availability. It includes a short CSMP summary and Class "F" cost estimate for each JSN. Lock letter includes: Mandatory Class Maintenance Plan tasks, Fleet alterations, TYCOM repairs, option items and service and routines.
55	Maintenance Ship Checks Complete	RMC or WFO	A-165 (Main Grouping) A-75	N/A	Intent is that all maintenance-related ship checks will be completed as early as possible within the planning process; however, no later than this milestone.
56	Identify Availability Funding for Modernization Work	NSA	A-150	A-150	Identify modernization execution funding requirements to SPM. Provide a no later than date for required funding.
57	Complete P&E of Work Assigned by the 80% Work Package Lock Milestone to Include All BAWP Items and Program Modernization Updates Based on LOA	Planning Activity	A-130	N/A	All work brokered by the 80% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with the minimum quality described as a "Class C" estimate.
58	Conduct WPIC	RMC C300	A-120	A-120	Provides a forum for early identification of work requirements that require integration to avoid conflicts with other work during execution.
59	Award AIT Contracts for Work Not Being Done by Prime Contractor and Identify All Outside Activities Participating in the Availability and Associated Support Requirements	AIT Manager, TYCOM, PARM	A-120	A-120	The AIT Manager must award AIT contracts for work not to be accomplished by the prime contractor and identify all outside activities participating in the availability.
60	IGE Complete in Support of 80% Lock	RMC C1200	A-115	N/A	All work planned in support of the 80% lock milestone must be estimated by the government with the minimum quality described as a "Class C" estimate.
61	Complete Offeror's Ship Checks	Offerors, Executing Yard	A-105	N/A	In solicitations where the subject ship or a sister ship is made available to prospective offerors, this milestone marks the date where ship checks have been completed.
62	Cutoff for Offeror's Questions	FLC Japan	A-100	N/A	The NLT date, issued by the PCO, is the date the government will no longer accept pre-bid inquiries for a particular solicitation. The time frame established allows the PCO time to respond to the inquiry while still

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
					maintaining adequate time for the contractor to produce a proposal or bid.
63	ILS Certification Packages Complete/SPM Approved	SPM	A-95	A-95	All Ship Changes planned for installation during a CNO availability must have completed ILS certification by A-95 or the Ship Change is at risk of deferral.
64	Issue A-95 LOA Message	SPM, TYCOM	A-95	A-95	The SPM must prepare and issue the LOA. All modernization SCs must that have an authorized RA in place or must meet full modernization maturity. All fully mature LI, ST I and II, internal AIT-only installs that do not require LMA support services or require SIDs, and software installation SCs must be scheduled in NDE-NM no later than A-100 for inclusion in the A-95 LOA. Fully mature LIs, ST I and IIs, internal AIT-only installs, and software SCs that do not have significant integration impact on a CNO availability, do not require an LMA support work item may be added to the package without an approved late add request up to A-95, pending full maturity after C5IMP Baseline push.
65	Solicitation Amendment for Offeror's Questions	FLC Japan	A-90	N/A	The deadline by which the Government must respond to all outstanding pre-bid inquiries, in the form of an Amendment to the Solicitation, to ensure all necessary changes/updates are incorporated and provide adequate time for contractors to produce proposals.
66	Initial Proposals Received	Offerors, Executing Yard	A-90	N/A	This is the date, provided by the PCO, when a FFP offeror must submit their bid to be considered responsive. Submissions after this date are typically rejected.
67	Initiate CHINFO Drafting	RMC C1200	A-86	A-71	Pursuant to DFARS 205.303, public announcement is required for all contract awards (or modifications) with a value of over $7 million (excluding options). The PCO prepares a press release for publication to the CHINFO after obtaining legal approval.
68	Provide AIT Production POAM	AIT Manager	A-85	A-85	1. AIT Managers will submit AIT Production POAMs to the LMA (with info to the NSA) for all planned modernization to allow the LMA to properly integrate AIT work into the IPS. 2. The initial production POAM submission must contain the data elements specified in NAVSEA Standard Item 009-60 using

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
					exhibit 2 template in NAVSEA TS9090-310 (SERIES) to integrate schedule. 3. SCs which do not meet milestone are at risk for deferral from the availability.
69	Final Proposal Request	FLC Japan	A-85	N/A	The Government requests FPRs to clarify and document issues addressed during discussions from all offerors in the competitive range.
70	Final Proposal Revision Received	Offerors, Executing Yard	A-80	A-90	The date where FPRs from offerors within the competitive range may be submitted in response to the Discussion Questions.
71	All Funding Available for Award	RMC C1200	A-80	A-64	All availability funding available for execution.
72	CHINFO Released	RMC C1200	A-77	A-62	Pursuant to DFARS 205.303, public announcement is required for all contract awards (or modifications) with a value of over $7 million (excluding options). This information will be used in a public news release announcing the award. Congressional members whose states or districts are affected by the contract (either the contractor lives in the state or district or the work will be performed there) will be provided similar information concurrent with the public announcement. Contract award information will be provided to the appropriate PAO in the form of a news release.
73	100% of O-level Maintenance Work Package Locked	Ship's Force	A-75	A-75	Develop a Ship's Force concurrent Work Package that includes all major maintenance actions such as PMS, repairs, alterations and testing to be conducted by Ship's Force during the availability, as applicable. Review PMS, CSMP and Testing requirements and ensure all Ship's Force maintenance actions scheduled for accomplishment during the availability are identified.
74	IGE Complete in Support of 100% Lock	RMC C1200	A-75	A-105	All work planned in support of the 100% lock milestone must be estimated by the government with the minimum quality described as a "Class C" estimate.
75	Award Contract	FLC Japan	A-75	A-60	Notification by the Contracting Officer to a bidder that his offer, or a negotiated proposal, has been accepted. This award establishes a legal obligation between the parties.

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
76	Conduct Post-Award Conference	RMC C1200	A-70	A-55	One conference for Government only, followed by a conference with Government and Contractor.
77	Complete P&E of Work Assigned by the 100% Work Package Lock Milestone to Include All BAWP Items and Program Modernization Updates Based on LOA	Planning Activity	A-60	A-110	The requirement is that all work brokered by the 100% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with the minimum quality described as a "Class C" estimate.
78	Final Work Item Review and Approval	RMC C300	A-55	A-100	Work Item reviews must be accomplished on a routine drumbeat established by the MT with the final work item review being completed in support of the established publishing date for the specification package. This will include the final quality, technical and contractual review of the work items. Contractual must include legal requirements, i.e., if sole source, is there sole source justification?
79	Conduct WPER	RMC C300	A-55	A-30	Review of the integrated work production schedule that has been prepared by the Executing Activity. The complete LMA Availability work package is defined and agreed upon at the WPER.
80	SMR and Integrated Schedule Approved	Executing Activity	A-54	A-30	All involved stakeholders performing work (e.g., D-Level, O-Level and I-Level and MOD work) will be de-conflicted and integrated into a package to meet availability schedule.
81	Deliver Material (LLTM and Kitted Materials) to Executing Activity	Planning Yard, PARM	A-30	A-75	100% of LLTM will be delivered to awarded MSR in support of on-time availability start and execution. Per NAVSEAINST 4490.5 Ser SEA21/019 of 29Jun21, guidance and policy of GFM by A-90 as the new objective requirement with A-30 remaining as the threshold requirement.
82	SOA	Executing Activity	A-0	A-0	The first day of the production period for the executing activity.
83	Conduct Departure and Assessment Conference	RMC C300	C+0	C+0	To verify the completion of all work assigned to the availability or to document exceptions. Exceptions must have a plan for completion with an estimated completion date and must be tracked through completion. This conference will establish the date and conditions under which the TYCOM and NAVSEA will accept re-delivery of the ship.

EVENT #	Task or Milestone	Responsible Activity	SRF Yokosuka	SRF Sasebo	DESCRIPTION
84	Issue Completion Report	NSA	C+60	C+60	NAVSEAINST 4710.8 series details the requirements for availability completion which must include financial as well as production and exception reporting.
85	Upload BAWP Part 1 of 2 Tasks to Ship's CSMP	SURFMEPP	C+65	C+65	SURFMEPP will upload a data file with all mandatory maintenance actions and expected CNO Availability services, with the exception of Tanks and Voids, into the ship's CSMP in support of ship-specific MT screening and brokering requirements. The data file will span the entire OFRP and will include the requirements through the next cycle's LCPC.
86	Conduct SURFMEPP BAWP Closeout Meeting	MT, RMC, TYCOM, SURFMEPP	C+70	C+70	Identifies "A"-branded BAWP requirements that were completed, not completed or deferred; establishes requirements for the next OFRP Maintenance Cycle and reviews outstanding DFS.
87	Verify Completion of Departure Report and Closeout of Avail in the Appropriate IT System	RMC C1200	C+90	C+90	Purpose is to verify that financial information, AWRs and work items, as applicable, have been uploaded and closed out in the appropriate IT system as required by NAVSEA Standard Item 009-99.
88	Submit Final BAWP Closeout Report	SURFMEPP	C+100	C+100	Purpose is to document the results (including follow up action items) from the Closeout Meeting.
89	Conduct LCPC	SURFMEPP	C+115	C+115	The LCPC agenda will include a review of the planning schedule, Corrosion Plan, required CMP assessments, NDE modernization forecasts, CNO Availability services/routines as applicable, organizational responsibilities and DFS.
90	Upload BAWP Part 2 of 2 Tasks to Ship's CSMP	SURFMEPP	C+125	C+125	SURFMEPP will upload a data file with all mandatory Tank and Void maintenance tasks into the ship's CSMP in support of ship-specific MT screening and brokering requirements. The data file will span the entire OFRP and will include the Tank and Void requirements through the next cycle's LCPC.
91	Issue Post-LCPC Letter	SURFMEPP	C+125	C+125	Confirms completion of the LCPC, lists all attendees, provides action items and associated POCs. SURFMEPP tracks all action items to completion.

APPENDIX H

SRF FFP SURFACE SHIP CMAV MILESTONES

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
1	Establish CMAV Schedule	TYCOM N1	Annually	Schedule established per the Fleet Response Plan maintenance cycle. TYCOM will publish routine updates in NDE as they occur.
2	Validate Availability Target Control	TYCOM	A-240	Provide the latest funding requirements (target controls) for the CM availability based on the budget cycle (PRESBUD, DON/FAST, OSD, EYG).
3	Request Funding for Work Item Development – Maintenance and Repair	RMC C1200	Varies	Request necessary funding from TYCOM to plan Availability.
4	Final Funding Provided for LLTM	TYCOM	A-190	Provide incremental funds for ordering LLTM for both repair work to meet required dates. This is an iterative process as LLTM is identified and funding is requested and authorized based on the lead time. It is incumbent on the Execution Planning Activity or MT to identify LLTM as soon as possible. LLTM is defined as any material with a delivery date in excess of 30 days.
5	Establish Availability in the Applicable IT Maintenance System	RMC C1200	A-180	Availabilities will be established in the applicable IT maintenance system when known or work is ready to be screened.
6	All Funding Available for Award	RMC C1200	A-80	All availability funding available for execution.
7	100% of D-level Maintenance Work Package 2Ks Locked Based on Target Control	TYCOM PE	A-60	Intent is 100% of the expected WNs have been screened and brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next package development milestone. GFI submission deadline for all work notifications.
8	Issue TYCOM 100% Lock Letter	TYCOM	A-60	The Lock Letter is the complete list of all TYCOM work with the JSNs that are screened and brokered to the identified CNO availability. It includes a short CSMP summary and Class "F" cost estimate for each JSN. Lock letter includes: Mandatory Class Maintenance Plan tasks, Fleet alterations, TYCOM repairs, option items and service and routines.
9	Accurate and Complete Planning Package Verified and Ready for Solicitation. Turnover to FLC-J (CD/References /Key Events/Work Items/ CLIN Structure)	RMC C1200	A-55	Requirements Packages must include all necessary data as required in the Requirements Package Checklist. RMC C1200 is responsible for ensuring all required data is compiled and submitted to the cognizant PCO.

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
10	Solicitation for Proposals	FLC Japan	A-50	Non-Multi-Option Contracting Vehicles. The Federal Acquisition Regulation designates FedBizOpps as the mandatory "Government-wide point of entry (GPE)" for posting of Government business opportunities, including proposed contract actions, solicitations and associated information.
11	Complete Offeror's Ship Checks	Offerors, Executing Yard	A-40	In solicitations where the subject ship or a sister ship is made available to prospective offerors, this milestone marks the date where ship checks have been completed.
12	Cutoff for Offeror's Questions	FLC Japan	A-35	The NLT date, issued by the PCO, is the date the government will no longer accept pre-bid inquiries for a particular solicitation. The time frame established allows the PCO time to respond to the inquiry while still maintaining adequate time for the contractor to produce a proposal or bid.
13	100% of O-level Maintenance Work Package Locked	Ship's Force	A-33	Develop a Ship's Force concurrent Work Package that includes all major maintenance actions such as PMS, repairs, alterations and testing to be conducted by Ship's Force during the availability, as applicable. Review PMS, CSMP and Testing requirements and ensure all Ship's Force maintenance actions scheduled for accomplishment during the availability are identified.
14	Solicitation Amendment for Offeror's Questions	FLC Japan	A-30	The deadline by which the Government must respond to all outstanding pre-bid inquiries, in the form of an Amendment to the Solicitation, to ensure all necessary changes/updates are incorporated and provide adequate time for contractors to produce proposals.
15	Proposals Received	Offerors, Executing Yard	A-20	This is the date, provided by the PCO, when a FFP offeror must submit their bid to be considered responsive. Submissions after this date are typically rejected.
16	Complete P&E of Work Assigned by the 100% Work Package Lock Milestone	Planning Activity	A-20	The requirement is that all work brokered by the 100% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with the minimum quality described as a "Class C" estimate.
17	Final Work Item Review and Approval	RMC C300	A-15	Work Item reviews must be accomplished on a routine drumbeat established by the MT with the final work item review being completed in support of the established publishing date for the specification package. This will include the final quality, technical and contractual review of the work items. Contractual must include legal requirements, i.e., if sole source, is there sole source justification?
18	Final Review IGE Complete	RMC C1200	A-10	All approved work planned must be estimated by the government with the minimum quality described as a "Class C" estimate.
19	Award Contract	FLC Japan	A-10	Notification by the Contracting Officer to a bidder that his offer, or a negotiated proposal, has been accepted.

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
				This award establishes a legal obligation between the parties.
20	Conduct WPER	RMC C300	A-10	Review of the integrated work production schedule that has been prepared by the Executing Activity. The complete LMA Availability work package is defined and agreed upon at the WPER.
21	Conduct Post-Award Conference	RMC C1200	A-8	One conference for Government only, followed by a conference with Government and Contractor.
22	Deliver Material (LLTM and Kitted Materials) to Executing Activity	NSA	A-8	100% of LLTM will be delivered to awarded MSR in support of on-time availability start and execution.
23	SOA	RMC C300	A-0	The first day of the production period for the executing activity.
24	Issue Completion Report	NSA	C+60	NAVSEAINST 4710.8 series details the requirements (greater than 3K MDs) for availability completion which must include financial as well as production and exception reporting.
25	Verify Completion of Departure Report and Closeout of Avail in the Appropriate IT System	RMC C1200	C+90	Purpose is to verify that financial information, AWRs and work items, as applicable, have been uploaded and closed out in the appropriate IT system as required by NAVSEA Standard Item 009-99.

APPENDIX I
SRF FFP SURFACE SHIP SIA MILESTONES

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
1	Establish CNO/CMAV Availability Schedule	TYCOM N1, OPNAV	A-720	Schedule established per the Fleet Response Plan maintenance cycle. TYCOM will publish routine updates in NDE as they occur.
2	Provide Availability Target Control	TYCOM	A-540	A financial control is required in order to establish the Availability Planning Requirements.
3	Third Party SID Development Request Submitted to SPM for Approval of Work Executed by MSR IND/SIA Method of Install	PARM, AIT Sponsor, Third Party Sponsor	A-465	Pending Planning Yard workload assessment and GFI maturity, if PARM desires to utilize a Third Party SID developer vice designated planning yard, PARM must request and obtain permission from SPM. Third Party SIDs must be reviewed and approved by designated planning yard.
4	Fund and Task SID Development for Work Executed by MSR IND/SIA Method of Install	TYCOM, PARM, SPM	A-465	SIDs will be tasked and funded. For first time install SC, PARMS are required to provide the PY with the planned execution strategy (work split between shipyard and AIT) to support development of SID or trade-level manpower estimates for advance planning, schedule integration, and subsequent work specification development. TDPs/ GFI will be provided in support of ship checks and SID development. Drawings are to be developed per NMP-MOM Appendix L, TECH SPEC 9090-600B.
5	Notify each Funding Sponsor Availability Funding Required for Execution Planning and LLTM Procurement	NSA	A-460	Notify each modernization sponsor/PARM and TYCOM of planning and LLTM funding requirements. Provide a no later than date for required funding.
6	Provide Incremental Funding for Ordering LLTM and Execution Planning to Planning Activity	TYCOM, PARMS	A-400	Provide incremental funding for ordering LLTM for both Maintenance (Repair) and Modernization (Alterations).
7	Validate Availability Target Control	TYCOM	A-390	Provide the latest funding requirements (target controls) for the CNO availability based on the budget cycle (PRESBUD, DON/FAST, OSD, EYG).
8	Request Funding for Work Item Development – Maintenance and Repair	RMC C1200	Varies	Request necessary funding from TYCOM to plan Availability.
9	Submit Third Party SIDs to PY for Review and Approval	PARM	A-360	If PARM obtained permission from SPM to utilize a Third Party SID developer by A-480, PARM must submit Third Party SIDs to designated planning yard for review.

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
10	Modernization Ship Checks Complete for Ship-Specific SIDs for Work Executed by MSR IND/SIA	Planning Yard	A-345	Ship checks (Design, Verification, Production and Proofing) are accomplished in support of the development of SIDs. All ship checks will incorporate a validation and verification of actual Hull or Site configuration. This is a Modernization milestone to ensure all design ship checks are complete in support of the SID delivery milestone.
11	Updated Notification to Sponsor/PARM of Funding Requirement for Execution Planning and LLTM Procurement Based on SID Delivery	NSA	A-330	Notify each modernization sponsor/PARM and TYCOM of planning and LLTM funding requirements. Provide a no later than date for required funding.
12	Drawings for any SC Authorized to Use Third-Party SID Development Submitted to the Applicable Planning Yard for Review (for work executed by MSR)	PARM	A-305	If PARM obtained permission from SPM to utilize a Third Party SIDs developer by A-600, PARM must submit Third Party SIDs to designed planning yard for review. Planning Yard requires 60 days for initial review. SID tasking status to be documented in NDE-NM.
13	Task and Fund Planning Yard for SID Development of Work Executed by AIT	PARM	A-305	If approved by SPM to use Third Party Developer, PARM must task and fund the planning yard to conduct SID review and approval when delivered to the planning yard. GFI (approved IRD and/or TDP) is required at this milestone.
14	Finalize Method of Install for Modernization	TYCOM, PARM	A-300	PARMs will provide final updates to work split strategy to TYCOM for inclusion in the A-240 LOA.
15	Third Party SID Development Request Submitted to SPM for Approval of Work Executed by AIT	PARM	A-285	Pending Planning Yard workload assessment and GFI maturity, if PARM desires to utilize a Third Party SID developer vice designated planning yard, PARM must request and obtain permission from the SPM. Third Party SIDs must be reviewed and approved by designated planning yard.
16	Final Funding Provided for LLTM	TYCOM	A-250	Provide incremental funds for ordering LLTM for both repair and alt or mod work to meet required dates. This is an iterative process as LLTM is identified and funding is requested and authorized based on the lead time. It is incumbent on the Execution Planning Activity or MT to identify LLTM as soon as possible. LLTM is defined as any material with a delivery date in excess of 30 days.
17	Modernization Package Lock	TYCOM	A-240	Work Package 2Ks Locked Based on Target Control for Program Modernization Alts (LMA IND/SIA/AIT with Support Services) Based on LOA: Intent is that 100% of the expected 2Ks have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
				specs in the most cost effective manner and does not batch this work in front of the next package development milestone. Missing GFI (SIDs, BOM/4720, SOW, and SSR) results in WN being removed from work package.
18	Issue Initial Letter of Authorization (LOA)	TYCOM	A-240	TYCOM LOA are issued showing all modernization scheduled for the availability. This list will be reviewed at the TYCOM 100% package lock milestone.
19	PYs Issue or Deliver SIDs for Work Executed by MSR IND/SIA	Planning Yard	A-240	A SC without PY-approved SIDs must be considered not executable by the MSR and at risk of deferral from the SPM authorization letter.
20	PYs Issue or Deliver SIDs for Work Executed by AIT	Planning Yard	A-240	(AIT ONLY) Planning Yard will issue or deliver SIDs intended for execution by AIT. Approved SIDs will be loaded into NSDER.
21	Establish Availability in the Applicable IT Maintenance System	RMC C1200	A-240	Availabilities will be established in the applicable IT maintenance system when known or work is ready to be screened.
22	50% of D-level Maintenance Work Package 2Ks Locked Based on Target Control	Ashore Ships Maintenance Manager	A-200	Intent is that 50% of the expected 2Ks (work, not services) have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next lock milestone.
23	80% of D-level Maintenance Work Package 2Ks Locked Based on Target Control	Ashore Ships Maintenance Manager	A-160	Intent is that 80% of the expected 2Ks (work, not services) have been screened and WNs brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next lock milestone.
24	100% of D-level Maintenance Work Package 2Ks Locked Based on Target Control to Include All Modernization Updates Based on LOA	TYCOM PE	A-100	Intent is 100% of the expected WNs have been screened and brokered to the planning activity via tasking memo. The planning activity continually develops specs in the most cost effective manner and does not batch this work in front of the next package development milestone. GFI submission deadline for all work notifications.
25	Issue TYCOM 100% Lock Letter	TYCOM, RMC	A-100	The Lock Letter is the complete list of all TYCOM work with the JSNs that are screened and brokered to the identified CNO availability. It includes a short CSMP summary and Class "F" cost estimate for each JSN. Lock letter includes: Mandatory Class Maintenance Plan tasks, Fleet alterations, TYCOM repairs, option items and service and routines.
26	Conduct WPIC	RMC C300	A-100	Provides a forum for early identification of work requirements that require integration to avoid conflicts with other work during execution.

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
27	Award AIT Contracts for Work Not Being Done by Prime Contractor and Identify All Outside Activities Participating in the Availability and Associated Support Requirements	AIT Manager, TYCOM, PARM	A-90	The AIT Manager must award AIT contracts for work not to be accomplished by the prime contractor and identify all outside activities participating in the availability.
28	Accurate and Complete Planning Package Verified and Ready for Solicitation. Turnover to FLC-J (CD/References /Key Events/Work Items/CLIN Structure)	RMC C1200	A-80	Requirements Packages must include all necessary data as required in the Requirements Package Checklist. RMC C300 is responsible for ensuring all required data is compiled and submitted to the cognizant PCO.
29	Solicitation for Proposals	FLC Japan	A-75	Non-Multi-Option Contracting Vehicles. The FARdesignates FedBizOpps as the mandatory " GPE" for posting of Government business opportunities, including proposed contract actions, solicitations and associated information.
30	Complete P&E of Work Assigned by the 80% Work Package Lock Milestone	Planning Activity	A-65	All work brokered by the 80% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with the minimum quality described as a "Class C" estimate.
31	Provide AIT Support Requirements and Required Milestones for Work Item Development	TYCOM, PARM	A-65	Identification of AIT support requirements provided: When an AIT requires industrial support, (e.g., crane and rigging services, welding/burning, compressed air), during accomplishment of the alteration or SC, coordinate with local RMC for Support. Services requests, the AIT manager or designated representative must utilize Exhibit K1 Template “AIT Support Services Request Form” of the TS9090-310G to provide requirements to the Maintenance Team and the planning activity to generate a 4E-compliant support work item to be included in the availability work package.
32	Complete Offeror’s Ship Checks	Offerors, Executing Yard	A-60	In solicitations where the subject ship or a sister ship is made available to prospective offerors, this milestone marks the date where ship checks have been completed.
33	All Funding Available for Award	RMC C1200	A-55	All availability funding available for execution.
34	Cutoff for Offeror’s Questions	FLC Japan	A-55	The NLT date, issued by the PCO, is the date the government will no longer accept pre-bid inquiries for a particular solicitation. The time frame established allows the PCO time to respond to the inquiry while still maintaining adequate time for the contractor to produce a proposal or bid.

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
35	Solicitation Amendment for Offeror's Questions	FLC Japan	A-50	The deadline by which the Government must respond to all outstanding pre-bid inquiries, in the form of an Amendment to the Solicitation, to ensure all necessary changes/updates are incorporated and provide adequate time for contractors to produce proposals.
36	Proposal Received	Offerors, Executing Yard	A-40	The date where FPRs from offerors within the competitive range may be submitted in response to the Discussion Questions.
37	100% of O-level Maintenance Work Package Locked	Ship's Force	A-40	Develop a Ship's Force concurrent Work Package that includes all major maintenance actions such as PMS, repairs, alterations and testing to be conducted by Ship's Force during the availability, as applicable. Review PMS, CSMP and Testing requirements and ensure all Ship's Force maintenance actions scheduled for accomplishment during the availability are identified.
38	Complete P&E of Work Assigned by the 100% Work Package Lock Milestone	Planning Activity	A-35	The requirement is that all work brokered by the 100% lock milestone must be planned (Work Item complete and LLTM identified) and estimated with the minimum quality described as a "Class C" estimate.
39	Award Contract	FLC Japan	A-30	Notification by the Contracting Officer to a bidder that his offer, or a negotiated proposal, has been accepted. This award establishes a legal obligation between the parties.
40	Conduct Post-Award Conference	RMC C1200	A-25	One conference for Government only, followed by a conference with Government and Contractor.
41	Final Work Item Review and Approval	RMC C300	A-25	Work Item reviews must be accomplished on a routine drumbeat established by the MT with the final work item review being completed in support of the established publishing date for the specification package. This will include the final quality, technical and contractual review of the work items. Contractual must include legal requirements, i.e., if sole source, is there sole source justification?
42	Deliver Material (LLTM and Kitted Materials) to Executing Activity	NSA, PARM	A-25	100% of LLTM will be delivered to awarded MSR in support of on-time availability start and execution.
43	Conduct WPER	RMC C300	A-15	Review of the integrated work production schedule that has been prepared by the Executing Activity. The complete LMA Availability work package is defined and agreed upon at the WPER.
44	Integrated Schedule Approved	RMC C300	A-14	All involved stakeholders performing work (e.g., D-Level, O-Level and MOD work) will be de-conflicted and integrated into a package to meet availability schedule.

EVENT #	Task or Milestone	Responsible Activity	SRF	DESCRIPTION
45	SOA	RMC C300	A-0	The first day of the production period for the executing activity.
46	Issue Completion Report	NSA	C+60	NAVSEAINST 4710.8 series details the requirements for availability completion which must include financial as well as production and exception reporting.
47	Verify Completion of Departure Report and Closeout of Avail in the Appropriate IT System	RMC C1200	C+90	Purpose is to verify that financial information, AWRs and work items, as applicable, have been uploaded and closed out in the appropriate IT system as required by NAVSEA Standard Item 009-99.

APPENDIX J

COMSEVENTHFLT FFP SURFACE SHIP PMAV MILESTONES

A +/- Dates	Milestone	Action	Responsible
A-100	Proposed Work Package	Coordinate PMAV Work Package with Planning Yard Planner	LCSRON/SURFDIV Advanced Planner
A-95	Review Proposed Work Package	Complete Availability WO list review. Submit proposed AWP to NSA PM for review.	LCSRON/SURFDIV AP/CDS 7 N4
A-90	Proposed PMS Work Package	Submit proposed Work Package to Executing Activity and PM Material Manager	NSA PM
A-90	FOS/ROS Determination	Notify NSA PM of intended availability location	CDS 7 N4
A-80	Special Tools	Notify NSA PM of any required special tools	PM Material Manager
A-60	LLTM Review	Notify NSA PM of any PMS/WO which have LLTM issues	PM Material Manager
A-50	Reconcile AWP	o Identify issues with the WP, notifying NSA PM of any concerns o Start creating WAFs and tag-outs for the proposed WP	Executing Activity
A-50	Review Reconciled AWP	Complete review of PMS for R checks/hours-based checks	LCSRON/ SURFDIV AP/ CDS 7 N4
A-30	100% Locked Work Package	100% PMS Work Package Locked NSA PM	LCSRON/SURFDIV AP
A-30	100% Locked Meeting	Conduct 100% Lock Meeting. Attendees are CDS 7 N4, Executing Activity, PM Material Manager, and S/F. Purpose of meeting is to: 1. Finalize the availability plan. 2. Ensure all parties agree with final task list. 3. Ensure all WAFs and tag-outs are identified. 4. All space utilization conflicts are resolved. 5. All parts, tools, and special equipment will be available as	NSA PM

A +/- Dates	Milestone	Action	Responsible
		required. 6. Special services are available (bilge pumping, cranes, man-lifts diving services, etc.)	
A-30	Notify S/F of 100% Locked WP	Forward 100% Locked WP to 3MC and Executive Officer	CDS 7 N4
A-30	Authorize WP	Submit Executing Activity's WP to Contracting	NSA PM
A-30	Notify WAF/Tag-out Requirements	Provide WAF/Tag-out information to NSA PM	Executing Activity
A-30	R-check Material Procurement	Submit R checks for accomplishment to Contracting for PM Material Manager procurement	NSA PM
A-28	Authorize Work Package	Submit RCC for Executing Activity’s 100% Locked WP to Contracting	NSA PM
A-28	Publish WAF/Tag-out Requirements	Provide WAF/Tag-out information to S/F and CDS 7 N4	NSA PM
A-23	COPA Submission	KTR submit proposal for RCC of Work Package Checks	Executing Activity
A-21	SKED Check	Ensure all crew responsible PMS is scheduled to coincide with contractor PMS in schedule (SKED).	S/F 3MC
A-17	RCC Award	Award RCC for 100% Locked Checks	Contracting activity
A-14	Process Control Procedures	All required material on-site	PM Material Manager
A-14	Notify WAF and Tags	All required material on-site	PM Material Manager
A-14	Publish WAFS and Tags	All required material on-site	PM Material Manager
A-14	Lessons Learned Review	All required material on-site	PM Material Manager

A +/- Dates	Milestone	Action	Responsible
A-10	WPER	Conduct WPER ensure review of 8010 and OP4 requirements	
A-10	Material On-site	All Required Materials On-site	PMM Contractor
A-10	Arrival Brief	Arrival Brief provided to NSA PM	Executing Activity
A-10	WAF/TAG-Out List	S/F Provide deconflicted WAFs/Tags to NSAPM	S/F 3MC
A-7	Arrival Brief Distributed	Arrival brief distributed to S/F and all others concerned	NSA PM
A-1	Ship Arrival	Arrival Conference	NSA PM
A+0	Start	Start of Availability	
C-1	Technical Adjudication	All DFS requests are adjudicated with TWH	NSA PM
C+0	Complete	Availability Complete o All WAFs are closed o All CFRs complete	
C+0	Out-Brief	Out-Brief with Ship's Force and Maintenance Providers	NSA PM
C+3	CFR Submission and Completion Report	All CFRs Submitted and checks updated in Maximo	Executing Activity
C+6	CFRs Complete	All CFRs answered and complete	NSA PM
C+7	Lessons Learned Submission	Submit Lessons Learned to NSA PM for consolidation.	NSA, CDS7, LCSRON APS, S/F, Executing activity, PMM, Contracting Activity

APPENDIX K

COMSEVENTHFLT FFP LCS RAV MILESTONES

A +/- Dates	Milestone	Action	Responsible
A-150	Availability Created for Brokering	Establish availability in MFOM - VSB	Port Engineer
A-136	50% RAV Work Package Brokered	50% WNs brokered to NMD for review and screening	Port Engineer
A-136	50% Review of WNs for Planning	Commence determining WNs for either 3rd Party Planning or In-House Planning NSA Project Team confirmed.	NSA PM & Supv MS
A-136	Availability Created for Planning	NSA Project Team creates the availability in NMD.	NSA PM
A-136	Initiate Screening of WNs to the Availability	Continuous determination of WNs for either AOR ABR/MSRA or for Navy Contracted LCS provider. Establish weekly TELCON/Meeting review with the 3rd Party Planners. Begin communication and coordination with 3rd Party Planners to develop specifications.	NSA PM & MS
A-120	80% RAV Work Package Brokered	80% WNs brokered to NMD for review and screening	Port Engineer
A-120	80% Review of WNs for Planning	Determine WNs for either 3rd Party Planning or In-House Planning NSA Project Team confirmed.	NSA PM & Supv MS
A-110	Initiate Work Specification Review	Conduct continuous reviews of the specs developed by the 3rd Party Planner. Ship check as necessary to finalize the draft work specs.	NSA PM & MS
A-110	LLTM Screening	LLTM requirements in excess of 75 days communicated.	3rd Party Planner / NSA MS
A-90	100 % RAV Work Package Brokered	All WNs submitted (any late WNs) will be handled in a case-by-case basis as required for execution	Port Engineer

A +/- Dates	Milestone	Action	Responsible
A-90	100% Review of WNs for Planning	Determine WNs for either 3rd Party Planning or In-House Planning NSA Project Team confirmed.	NSA PM & Supv MS
A-80	LLTM Procurement Plan	LLTM Identified. LLTM Procurement Plan submitted to NSA.	3rd Party Planner/ NSALOGISTICS/PM
A-80	Specifications Planned	100% Work Specifications Planned.	3rd Party Planner / NSA MS
A-78	Specifications Review	Initial Specifications review with 3rd Party Planner; providing clarification on specification corrections. 3rd Party Planner updates specifications and returns for final review and approval.	CLWP SRU PM & MS / 3rd Party Planner
A-75	LLTM Review	NSA reviews LLTM Procurement Plan. LLTM Procurement Plan submitted to Contracting Activity for procurement.	NSA PM & MS
A-75	Initial Risk Assessment	Potential risk items identified and communicated in writing to NSAACoS for Maintenance/SRU OIC.	NSA PM & MS
A-75	100 % D-level Specifications Approved	Detailed review of work specifications complete technical review of specifications complete.	NSA PE & Supv MS
A-72	IGE Submitted	IGE Submitted to Contracting Activity in support of RFP	NSA PM
A-72	Work Package review complete	Work Specifications bundled for procurement and submitted to Contracting Supporting Statement of Work language (if needed) provided for Procurement.	NSA PM
A-72	Funding Provided	Approved Funding Document submitted to Contracting Activity.	NSA PM
A-70	Request for Proposal	Issue RFP to executing activities.	Contracting Activity
A-49	Proposals Submitted	Complete Proposal submitted to Contracting Activity.	Executing Activities
A-42	Initial Proposals Reviewed	Initial Technical Evaluation of proposals complete	NSA PM & MS

A +/- Dates	Milestone	Action	Responsible
A-40	Discussions	Discussions Complete	Contracting Activity/ Executing Activities
A-38	Final Proposals	Final Proposal Submitted	Contracting Activity/ Executing Activities
A-35	Proposal Reviewed	Final Technical Evaluation of proposals complete.	NSA PM & MS
A-30	Contract Award	Contracts are awarded to Executing Activity.	Contracting Activity
A-29	Post Award Meeting	Completion of Post Award Meetings for all awarded contracts.	Contracting Activity
A-20	WPER	The complete Availability Work Package is defined and agreed upon; the AWP is executable within the RAV time frame, budget, and LMA's capacity.	NSA PM & MS
A-10	Arrival Brief Submitted	Arrival Brief submitted to NSA	NSA PM
A-5	IMS	IMS submitted to NSA PM.	LMA
A-1	Ship Arrival	Arrival Conference	LMA
A+0	Start	Start of Availability	NSA PM
A+7	50% Conference	Conduct 50% Conference	
A+7	Execution Risk Assessment	Potential risks for on-time availability completion communicated in writing to NSAACoS for Maintenance /SRU OIC.	LMA
C-1	Technical Adjudication	All DFS requests are adjudicated with TWH	NSA PM
C+0	Completed	Completion of Availability	
C+3	Closeout Meeting	Completion of Closeout Meeting for all completed contracts	NSA PM / MS
C+7	Lessons Learned	All lessons learned submitted and documented.	NSA PM
C+60	Invoices Received	All invoices settled and fund recoupment completed	NSA PM/TDO
C	Contract Closeout	All completed contracts are closed-out.	Contracting Activity

VOLUME III

CHAPTER 5

MAINTENANCE SUPPORT FOR NON-UNITED STATES NAVY SHIPS AND ACTIVITIES

5.1 PURPOSE. Maintenance activities addressed in this volume must provide support to Military Sealift Command (MSC) ships, United States Coast Guard (USCG) ships and other craft and activities on a not to interfere with primary mission basis, at the discretion of the Commanding Officer or Officer In Charge. Generally, all material directly chargeable to the work accomplished must be funded by the requesting activity. Requesting activity should also fund any related temporary additional duty and travel expenses. If the requesting activity is non-United States Navy, man-day rates for military and civilian personnel will be chargeable.

5.2 MILITARY SEALIFT COMMAND VESSELS. Before the acceptance of work by the industrial activity, MSC vessels must obtain prior authorization and funding from the cognizant MSC program manager via the ship's MSC port engineer and MSC type desk. Where prior authorization has not been received, the Master and Chief Engineer of the requesting vessel should be directed to submit their Voyage Repair request to their MSC Port Engineer and MSC type desk for work authorization and brokering. After the MSC type desk authorizes the work, and it is accepted by the industrial activity, the industrial activity will use their standard procedures for work candidate processing, planning, Quality Assurance, and work execution methods. The MSC ship Chief Engineer or Port Engineer will be the primary points of contact to coordinate jobs. Work performed by Fleet Maintenance Activities must be included in the Maintenance Resource Management System for tracking and up line reporting. Note that MSC ships do not use the 3M system. A maintenance tracking number and a point of contact must be provided to the Chief Engineer and Port Engineer for tracking the job.

5.3 UNITED STATES COAST GUARD VESSELS. USCG vessels assigned to Navy operational control will be treated the same as Navy vessels for the purposes of maintenance, with the exception that the USCG will fund any direct material, or contractor charges.

5.4 OTHER SERVICE CRAFT AND ACTIVITIES. Work requested by non-Navy activities must be carefully screened to ensure the work is authorized by higher authority, funding arrangements are in place and technical requirements are fully understood prior to acceptance.

LISTING OF APPENDICES.

A Sample SFIMA Program Instruction
B Sample SFIMA Capabilities Guide Index
C Sample SFIMA Roster
D Sample SFIMA Organizational Chart
E Sample SFIMA Request for Assistance Form
F Sample SFIMA Support Tracker
G Sample SFIMA Monthly Report

6.1 PURPOSE. This chapter describes the policies and assigns roles, responsibilities, and actions necessary to align deployed organic self-repair capability efforts in support of establishing and maintaining Strike Force Intermediate Maintenance Activity (SFIMA) readiness.

6.2 BACKGROUND. The primary mission of the SFIMA program is to promote self-sufficiency through an effective organizational structure, supported by policies and processes that enable Carrier Strike Groups (CSG) and Expeditionary Strike Groups (ESG) to conduct self-contained organic repair in contested or uncontested environments, without the need for shore support facility training, technical assistance, or transient maintenance augmentations or detachments.

6.3 DISCUSSION. References (a), (b) and (c) task Fleet Commanders to promote self-sufficiency of fleet ships and assigned activities. Deployed Strike Group maintenance self-sufficiency is vital to sustaining mission readiness. Combat operations, contested environments, and other operational barriers greatly limit onboard technical assistance and diminish remote

distant support efforts. When properly tasked and utilized, the SFIMA capable Strike Group significantly enhances the ability to respond to assigned units and other combatants in theater.

6.4 ROLES AND RESPONSIBILITIES.

6.4.1 Fleet Commanders. Fleet Commanders will:

a. Be responsible for the administration and updates of this chapter to include the widest dissemination and implementation of requirements pertaining to SFIMA and organic repair.

b. Participate in the development and implementation of the SFIMA program for each Force Level ship class and coordinate with Strike Groups to develop an instruction following Appendix A to meet the requirements of the Strike Group SFIMA to complete its mission of Strike Group self-sufficiency.

c. Coordinate with CSGs and ESGs and other commands to ensure the development of metrics and key performance indicators (KPI) to be utilized during the optimized fleet response plan (OFRP) in assessing the Strike Group's ability to perform assigned duties related to SFIMA actions. Metrics and KPIs will be included in readiness and after-action reporting.

d. Approve changes, additions, and deletions to the CSG and ESG capabilities matrices as recommended by the Type Commanders (TYCOMs).

6.4.2 Commander Second Fleet and Commander Third Fleet. Numbered Fleet Commanders will coordinate with CSG and ESG Commanders to track SFIMA deployment readiness during the OFRP phases to ensure readiness for deployment.

6.4.3 Type Commanders. TYCOMs will:

a. Codify the baseline requirements ships will be measured against and will develop into CSG and ESG metrics and KPIs with input from the Fleet Commanders.

b. Establish assessment schedules (e.g., Operational Repair Capability Assessment), identify deficiencies, and ensure correction is accomplished to ensure ships are mission-ready in meeting the operational commander's SFIMA and self-sufficiency requirements. Assessments will include manning, training, shop facilities, Navy Afloat Maintenance Training Strategy (NAMTS) qualifications, Industrial Plant Equipment (IPE) per volume VI chapter 6 of this manual, Fiber Optic Test and Repair readiness assessment and certification, Miniature/Microminiature (2M) Electronic Repair Program, and Module Test and Repair (MTR) Site Certification. For CVNs, assessments will be performed by the TYCOM Assessment Team. Aviation capable units will continue to meet the CV/CVW support milestones identified in reference (d), in support of the aviation logistics review conference process.

c. Coordinate with Naval Sea Systems Command (NAVSEA) 00 for services and support outlined in reference (e) to include identifying the 2M, MTR, and Fiber Optic Test and Repair capabilities necessary to repair circuit card assemblies, electronic modules, and fiber optic cable or assemblies. Consider inclusion of repairs to Test, Measurement, and Diagnostic Equipment within the SFIMA to sustain Strike Group maintenance capability.

d. Coordinate with NAVSEA 06M and Naval Air Systems Command (PMA260B) Metrology and Calibration programs to receive a SFIMA calibration support plan. The SFIMA calibration support plan will identify ship or aviation critical safety items including systems, associated Test, Measurement, and Diagnostic Equipment, tools, or fixtures, test equipment repair and calibration capability within the SFIMA program to sustain Strike Group maintenance capability.

e. In collaboration with SYSCOMs, perform data analysis on mission limiting Casualty Reports (CASREP) and update manning, training, and equipment requirements to enhance to the greatest extent possible, the organic repair capabilities of identified systems.

f. Report assessment (e.g., Operational Repair Capability Assessment) results to the Fleet Commander including "as found" conditions and any readiness gaps. Provide regular status updates via readiness reporting channels in preparation for deployment.

g. Manage emergent IPE maintenance, including the identification and prioritization of corrective maintenance actions.

h. Utilize lessons learned to revise SFIMA strategies and upgrade SFIMA capabilities.

6.4.4 Commander, Naval Sea Systems Command. Manage the Naval Afloat Maintenance Training Strategy (NAMTS) program per reference (c). The NAMTS program is designed to ensure that qualified and proficient craftsman are available to fill core SFIMA billets identified by the fleet and is managed by Commander, Navy Regional Maintenance Center. NAMTS Afloat Training Activities (NATA) are afloat activities with Sailors enrolled in the NAMTS Job Qualification Requirement training programs leading to Sailors being awarded NAMTS Navy Enlisted Classifications.

6.4.5 Commander Carrier Strike Group. COMCARSTKGRU FOUR and FIFTEEN will:

a. Assess and certify CSG and ESG SFIMA program pre-deployment readiness through demonstration of SFIMA capability based on requirement identified in references (f), (g) and (h), and volume VI chapter 6 of this manual.

b. Ensure Strike Group SFIMA program instruction (see Appendix A) is completed completion prior to 90 days prior to Composite Training Exercise (C2X).

6.4.6 Carrier Strike Groups and Expeditionary Strike Groups. CSGS and ESGs will:

a. Implement the SFIMA program to enhance the self-sufficiency capability within their Strike Group per with references (f), (g) and (h), and volume VI chapter 6 of this manual.

b. Develop an instruction per Appendix A to meet the requirements of the Strike Group SFIMA to complete its mission of Strike Group self-sufficiency.

c. Coordinate with TYCOMS to ensure that all critical staff billets are filled as expeditiously as possible to maintain program continuity throughout the OFRP process.

d. Maintain a SFIMA Capabilities guide per Appendices B and G to illustrate organic Strike Force capability to provide first response to units needing assistance by

providing maintenance candidates beyond their capability to correct while deployed, at sea, or away from regular support

e. Designate the CVN Commanding Officer for CSGs and the LHD or LHA Commanding Officer for ARGs as the Strike Group Repair Coordinator (RC) and develop and organizational chart per Appendix D. Responsibility of the RC include:

(1) Coordinate with TYCOMs, Cruiser Destroyer Squadrons, and Amphibious Squadrons throughout the OFRP to ensure that ships are on-track to meet SFIMA compliance to their developed Appendices B and C to include monitoring of manning and Navy Enlisted Code (NEC) discrepancies critical to SFIMA operations, including NAMTS NECs, and that IPE is available and operational per reference volume VI chapter 6 of this manual.

(2) Develop and maintain a SFIMA roster per Appendix C with associated NEC, rate, rank, name, and ship assigned to within the Strike Group.

(3) For CVNs designate their AIMD Officer and CHENG as Assistant RCs, responsible to the RC to execute the SFIMA program per Appendix D.

(4) For LHD or LHAs designate their AIMD Officer and CHENG as Assistant RCs, responsible to the RC to execute the SFIMA program per Appendix D.

(5) Coordinate with the CSG and ESG N4 and N6 to solve repair supply parts and SFIMA material issues across the Strike Group and assist the RC with gathering SFIMA metrics.

(6) Develop SFIMA instruction or review and update existing SFIMA instruction that identifies the requirement and purpose of the SFIMA program along with establishing policy, procedures, and enclosures identifying the processes for intra-Strike Group SFIMA support per reference (f), reference (g), and volume VI chapter 6 of this manual per Appendix A through Appendix G. At a minimum, the instruction should:

(a) Outline the processes for requesting support and documenting repair actions performed by other ships within the Strike Group as per applicable guidance and instructions. Appendix E provided the standardized SFIMA request for assistance form.

(b) Develop a list of qualified repair NEC personnel, including NAMTS NECs, for all ships within the Strike Group. Appendix C provides a standardized SFIMA roster sheet.

(c) Include a listing of available repair capabilities for all ships within the Strike Group.

(d) Require that all Strike Group and Amphibious Ready Group requests for off-ship Fleet Technical Assistance (FTA) and Onboard Technical Assistance (OBTA) be screened by the originating activity for SFIMA repair and support capability within the Strike Group and Amphibious Ready Group prior to being sent.

(e) Collect and track all FTAs and OBTAs for support utilizing Appendix F.

(f) Collect, analyze, and report via readiness channels the following metrics:

1 The number of requests processed through the SFIMA process per Appendix F and Appendix G.

2 The number of requests completed per Appendix F and Appendix G.

3 Provide completed monthly reports per Appendix G to Strike Group Commander and NAVSEA 00.

f. Complete the Strike Group SFIMA program instruction 90 days prior to C2X.

g. Ensure Strike Group SFIMA program instruction includes or is updated to reflect new technology and repair capabilities and associated support capabilities per Appendix B.

h. Ensure SFIMA program policy is promulgated throughout the CSG and the ESG. CSG and ESG N4 shall review SFIMA instructions.

i. Ensure the execution of deployed maintenance in the Western Pacific area of responsibility is accomplished within the guidelines of reference (i), section 863.

j. Incorporate SFIMA status into the Commander's pre-deployment and post-deployment briefs.

6.4.7 All CSG and ESG ship or unit Commanding Officers. Commanding Officers (COs) will:

a. Designate a SFIMA coordinator responsible for managing the ships SFIMA program.

b. Ensure all Executive Officers, Command Master Chiefs, Department Heads and Departmental Leading Chief Petty Officers are thoroughly familiar with the SFIMA instructions.

c. Coordinate with TYCOMs throughout the OFRP cycle to identify and address potential shortfalls at the appropriate levels. This includes manning and IPE per volume VI chapter 6 of this manual.

d. Follow CSG and ESG N4 guidance regarding SFIMA processes and procedures to exhaust all possible SFIMA support options prior to requesting assistance outside the Strike Group.

e. Ensure that all off-ship requests for FTA and OBTA are screened by responsible Department Head, Maintenance Manager, SFIMA coordinator, and CASREP releasing authority to validate intra-Strike Group capability prior to releasing requests outside of the Strike Force.

f. Submit an end of deployment report identifying all SFIMA capabilities utilized throughout the cycle to the CSG and ESG SFIMA.

g. Coordinate with Commander, Regional Maintenance Center to establish ship as a NATA. CVNs, LHAs, and LHDs are required to have NATAs and other ship classes

are encouraged to establish a NATA to increase the number of NAMTS qualified sailors to improve SFIMA capability, capacity and ship self-sufficiency.

APPENDIX A

SAMPLE SFIMA PROGRAM INSTRUCTION

NOTE: STRIKE GROUPS SHOULD TAILOR THIS INSTRUCTION TO MEET THE NEED OF THE STRIKE GROUP SFIMA TO COMPLETE ITS MISSION OF STRIKE GROUP SELF-SUFFICIENCY. ALL REFERENCED ENCLOSURE ARE APPENDICES B THROUGH G OF THIS CHAPTER.

CSG/ESG/ARG INSTRUCTION 4790.X

From: Commander, CSG/ESG/ARG

Subj: STRIKE FORCE INTERMEDIATE MAINTENANCE ACTIVITYPROGRAM

Ref: (a) COMFLTFORCOMINST 4790.3 - Joint Force Maintenance Manual
(b) COMNAVAIRFORINST 4790.2 - Naval Aviation Maintenance Program
(c) COMNAVSEASYSCOM 4790.8 - Ships' 3M Manual

Encl: (1) SFIMA Capabilities Guide Index
(2) SFIMA Request for Assistance Form
(3) SFIMA Monthly Report
(4) SFIMA Support Tracker
(5) SFIMA Organizational Chart
(6) SFIMA NEC Roster

1. Purpose. To establish the organization, procedures, and responsibilities per references (a) through (c) of the Strike Force Intermediate Maintenance Activity (SFIMA) Program for [Carrier Strike Group (CSG) xxx, Expeditionary Strike Group (ESG) xxx, or Amphibious Readiness Group (ARG)] units.

2. Cancellation. Not Applicable.

3. Discussion. [Commanding Officer CVN, LHA, and LHD] manages the SFIMA program as the [CSG-x, ESG-x, or ARG] Repair Coordinator (RC) and will coordinate all SFIMA requests throughout the Strike Group. Per reference (a), the SFIMA Program promotes self-sufficiency in sustaining material and logistics readiness of the Strike Group in contested or uncontested environments, without the need for shore support facility training, technical assistance, or transient maintenance augmentations or detachments. The [CSG-x, ESG-x, or ARG] SFIMA organization is comprised of the collective [CSG-x, ESG-x, and ARG] elements, qualified Sailors and industrial plant equipment (IPE), capable of performing maintenance beyond the organizational level. [CSG, ESG, and ARG] units may request technical or repair assistance from the SFIMA within the scope of enclosure (1), using enclosure (2). SFIMA does not replace existing repair capabilities and procedures nor logistics nodes and processes. SFIMA is designed to supplement existing facilities, capabilities and processes and offer support to organic capabilities prior to requesting onboard technical assistance from outside activities.

4. Policy. Per reference (a), technical and repair assistance will be requested through the [CSG-x, ESG-x, and ARG] RC. Requests will be made via daily OPREP-5 feeder reports, under "Commander Comments," or via Secret Internet Protocol Network email to the [CSG-x, ESG-x,

and ARG] RC using enclosure (2). For time critical and mission essential repairs, communicate via quickest means possible and follow up with an OPREP-5 Feeder report as required. All requests will be per the capabilities listed in enclosure (1). The [CSG-x, ESG-x, and ARG] RC will track all incoming requests per enclosure (4) to completion. The program organizational chart is listed in enclosure (5) and will be managed by the [CSG-x, ESG-x, and ARG] RC. [CSG-x, ESG-x, and ARG] units shall designate a SFIMA Manager to manage this program within their command. The unit SFIMA Manager shall update all critical SFIMA NECs as designated in enclosure (6) and send to the RC to consolidate SFIMA NECs across the strike group.

5. Responsibilities.

a. [CSG-x / ESG-x / ARG] Assistant Chief of Staff for Material Readiness

(1) Act as the Area Repair Coordinator.

(2) Assist the [CSG-x, ESG-x, and ARG] RC in the management of [CSG-x, ESG-x, and ARG] SFIMA program.

(3) Assist the theater Force Repair Coordinator (FRC) for all repairs beyond SFIMA capability.

(4) Coordinate with the Joint Force Maritime Component Commander to set material readiness casualty report battle damage repair priority and location.

(5) Act as the Staff SFIMA Coordinator.

b. [CSG-x / ESG-x / ARG] Material and Electronics Officer

(1) Assist the [CSG-x, ESG-x, and ARG] RC in the management of [CSG-x, ESG-x, and ARG] SFIMA program, focused on C5I issues.

(2) Act as the assistant Staff SFIMA coordinator.

(3) Coordinate with [CSG-x, ESG-x, and ARG] SFIMA personnel to assist ships to execute required maintenance or repairs, test equipment calibration requirements and coordinate organic technical assists from FRC assets.

c. [CSG-x, ESG-x, and ARG] Personnel Officer

(1) Assist the [CSG-x, ESG-x, and ARG] RC in developing and tracking SFIMA critical NECs using enclosure (6). Report manning shortfalls to appropriate TYCOM.

d. USS [Ship Name – CVN and LHD or LHA] Commanding Officer

(1) Act as the [CSG-x, ESG-x, and ARG] RC.

(2) Designate SFIMA Assistant RCs. (Note: normally the ship's AIMD Officer and CHENG assist the [CSG-x / ESG-x / ARG] RC in the day to day operations of the SFIMA.)

(3) Coordinate receipt of SFIMA requests across the strike group with the [CSG-x, ESG-x, and ARG] N4 and N6. Ensure SFIMA requests are screened to the appropriate supporting SFIMA organization. (i.e. [CVN, LHA or LHD departments

AIMD, Combat Systems, Engineering, Reactor, etc] or appropriate SFIMA Sailors across the strike group).

(4) Coordinate with [CSG-x, ESG-x, and ARG] Personnel Officer to track SFIMA critical NECs using enclosure (6).

(5) Report SFIMA support actions and statistics to the [CSG-x, ESG-x, and ARG] N4 monthly using enclosure (3).

(6) Per reference (a), coordinate with Commander, Navy Regional Maintenance Centers to establish ship as a NATA. CVNs and LHA or LHDs are required to have NATAs and other ship classes are encouraged to establish a NATA to increase the number of NAMTS qualified Sailors to improve SFIMA capability and capacity and ship self-sufficiency.

6. Review and Effective Date. Per OPNAVINST 5215.17A, [CSG-x, ESG-x, and ARG] N4 will review this instruction annually around the anniversary of its issuance date to ensure applicability, currency, and consistency with Federal, Department of Defense, Secretary of the Navy, and Navy policy and statutory authority using OPNAV 5215/40 Review of Instruction. This instruction will be in effect for 10 years, unless revised or cancelled in the interim, and will be reissued by the 10-year anniversary date if it is still required, unless it meets one of the exceptions in OPNAVINST 5215.17A, paragraph 9. Otherwise, if the instruction is no longer required, it will be processed for cancellation as soon as the need for cancellation is known following the guidance in OPNAV Manual 5215.1 of May 2016.

[CSG-x, ESG-x, or ARG Commander's Signature]

APPENDIX B

SAMPLE SFIMA CAPABILITIES GUIDE INDEX

NOTE: STRIKE GROUPS SHOULD TAILOR THIS ENCLOSURE LIST THE STRIKE GROUP SFIMA CAPABILITIES TO COMPLETE ITS MISSION OF STRIKE GROUP SELF-SUFFICIENCY. THE MAINTENANCE CAPABILITY GUIDES (E.G. STRUCTURAL REPAIR) ARE ONE WAY TO SHOW THE CAPABILITY OF STRIKE GROUP TO SUPPORT OTHER SHIPS. THE ENCLOSURE SHOULD BE FREQUENTLY UPDATED TO SHOW ALL THE SFIMA CAPABILITIES ACROSS THE STRIKE GROUP.

SFIMA CAPABILITIES GUIDE INDEX

Overview of (CVN or LHD xx) Capabilities	
Engineering	2
AIMD	3
Combat Systems and Electronics	4
Reactor	5
Limitations	5
Structural Repair	
Ship fitting and Sheet metal (ENG or AIMD)	7
Welding (ENG or AIMD)	8
Pipefitting, Three Feet or Less (ENG)	9
Composite Material (AIMD)	10
Mechanical Repair	
Inside Machining (ENG)	11
Outside Machining (ENG)	13
Hydraulic or Pneumatic Repair (AIMD)	14
Flex Hose Repair (AIMD)	15
Internal Combustion Engine (ENG or RX)	15
Air Conditioning and Refrigeration (ENG)	16
Pumps (ENG)	17
Valves (ENG)	18
Electrical Repair	
Motor Rewind (ENG)	19
Services	
Weight Testing (AIMD)	20
NOAP and JOAP (AIMD)	20
Certified Air Recharge (AIMD)	21
Repair Support	
NDT and NDI (ENG or AIMD)	22
Level I Material Control (ENG)	23
Technical Information Resources (ENG)	23

ENGINEERING HULL, MECHANICAL, AND ELECTRICAL

Machine Shop: Manufacture parts or assemblies from available blueprints and sketches. Shop is well equipped and has capabilities similar to a tender. Sample capabilities include manufacture of valve stems, pump shafts, wearing rings, etc., if the raw stock is available.

Ship Fitter Shop: Welding, burning, and fabrication using carbon steel, brass, copper, aluminum, and stainless steel.

Pipe Shop: Perform various types of welding services, pipe bending, up to six inches.

Carpenter Shop: Limited carpentry services, i.e. shipping crates.

NDT: Ultrasonic Testing, Mechanical Testing, Visual Testing, and Penetration Testing services available.

Motor Rewind and Balancing: Alternating current (AC) motors up to 80 horsepower (HP). Motor alignment. In an emergency, rewinding fire pump motors (rated at 150 HP) is possible; limited by size of onboard dip tank.

Outside Machinery Repair: Pump repair, computer alignment. Small galley and laundry equipment. Shipboard hydraulic systems (steering, elevators). Deck machinery (capstans, winches, B&A crane).

Air Conditioning & Refrigeration (AC&R): Overhaul York two-cylinder, six cylinder, and nine cylinder. Carrier SF20, SF40, SF60, SH40, SH46 (onboard only). York centrifugal compressors. Customer must provide parts.

Interior Communications: MK19 Gyros, Dimension 2,000 and Definity 75 telephone system, Dead Reckoning Track (DRT) and Dead Reckoning Analyzer and Indicator (DRAI) repair services available.

Technical Support: Maintenance Support Center Technical Library, to include ship plan indexes, plans, specifications, drawings, technical manuals, process instructions, Allowable Equipment List, Allowable Parts List, technical repair standards, ship information, books, and training aids.

AIRCRAFT INTERMEDIATE MAINTENANCE DEPARTMENT (AIMD)

Oil Lab: Joint Oil Analysis Program (JOAP)

Composite Repair: General fiberglass repair, general and advanced composite repair (graphite epoxy, Kevlar, and carbon fiber).

Non-Destructive Inspection (NDI): X-Ray, dye penetrant, magnetic particle, Eddy current, and ultrasonic inspections (Ultrasonic inspections may require a standard to be provided). All NDI inspection requests will require a publication reference or instruction prior to completion.

Hydraulic Shop: Test and checking of various hydraulic and pneumatic components and some testing criteria onboard. Manufacture flexible hose up to 1½ inch (NR32) with operating pressures up to 10,000 pounds per square inch (PSI). Assembly of rigid line from ¼ to 1 inch outside diameter.

Welding or Brazing: Mild steel, stainless steel, aluminum, cobalt, nickel. Braze copper and brass.

Tire and Wheel: Have build-up capability and qualified for, FA-18, C-2, E-2, and H-60R/S.

3-D Printing and Additive manufacturing: have capability to 3-D print or manufacture miscellaneous piece parts.

NOTE: 3-D Printing requests for Aircraft or Support Equipment SHALL have approved technical publication stating 3-D printing is authorized, Approved Engineering drawing, and or Approved Technical Drawing.

Paraloft: General cloth type fabrication. Full test and repair of flotation equipment. Test and inspection of survival vest, Search and Rescue kits, helicopter hoist straps, and helicopter emergency egress devices. Can refill SEA servicing tanks. Oxygen regulator test and check capability.

Airframes: Heat treatment of metals up to 1,000 degrees Fahrenheit. Fabrications of aluminum metals only, in shop, off aircraft. Repair of components include Heli-Coil replacement, stud removal, seal, rivet, and fastener replacement.

Battery Lockers: Limited capability for lead acid and nickel battery recharging.

Calibration Lab: Pressure gauge up to 10,000 PSI, differential gauge, compound gauge and pressure-activated switches. Torque tools up to 20,000-foot pounds, tension meters, force gauge, and spring scales. Bimetallic thermometers for -40 to +1,200 degrees Fahrenheit. Temperature actuated switches. Dial indicators and vernier calipers. Able to support a three Fly Away Team to support installed equipment that cannot be removed. Limited test equipment repair with proper technical manual. Contact SFIMA Coordinator prior to shipment.

Comm/Nav/Electrical Instruments Branch: Miscellaneous communications, navigation, or IFF repair capability common to surface units. Communication and Navigation common to Helo Dets in Strike Group. Panel and switchboard meters, current to 10 amps, signal generators to 18 gigahertz (GHz), attenuators to 18 GHz, IFF test sets, decade resistors 37 phase packages currently supported. Contact prior to shipment to ensure repair capability available.

Cable Connector Repair: Provide coaxial, Threaded Neill-Concelman (TNC), Bayonet Neill-Concelman (BNC), and cannon plug connector repairs utilizing connector schematics. No fiber optic capability.

AN/USM-674 Module Test and Repair: Printed circuit board screening and fault diagnostics. AIMD will attempt to repair any circuit card except those which cannot be identified by:

a. Technical screening and documentation.

b. Component and circuit identification.

c. Circuit Cards with damage up to 1” circumference.

d. Cards with Electronic Erasable Programmable Read-Only Memory (EEPROM) without documentation or duplicate circuitry cards with complex Radio Frequency (RF) or Infrared Frequency (IF) tuned circuitry as found in frequency determining and intermediate frequency amplifier sections of equipment.

LAMPS: Limited support.

Micro Miniature (2M): Three stations capable of miniature electronic repair consisting of removal and installation of discrete and multi-lead components and integrated circuits (IC) on

single, double. Diagrams required for connector pronged repair. All parts must be provided by the customer and failed components must be identified for replacement. (Removed FLEXPRINT repair capability. That repair is authorized for depot level only.)

COMBAT SYSTEMS AND ELECTRONICS

AN/USM-674 Module Test and Repair: Printed circuit board fault diagnostics. Per the Navy-wide 2M instruction, attempt to isolate cause of failure and repair any electronic circuitry except:

a. Weapon systems that are deemed by higher authority as restricted from 2M.

b. Cards more than 50 percent destroyed.

c. Cards with EEPROM without documentation or duplicate circuitry cards with complex RF or IF tuned circuitry as found in frequency determining and intermediate frequency amplifier sections of equipment.

Micro Miniature (2M): Two stations capable of miniature electronic repair consisting of removal and installation of discrete and multi-lead components and IC on single, double, and multi-layer PCB and flexible pronged cable repair.

Fiber Optic Repair: Per Fiber Optic Repair Program, attempt to isolate and repair fiber-optic breaks.

REACTOR

Disassemble, inspect, overhaul, repair, align and test:

a. Main propulsion and Auxiliary components.

b. Miscellaneous installed mechanical systems and components.

Inspect, repair, and overhaul: Low Pressure and High Pressure Air Compressors.

Maintain steam propulsion engines and associated machinery.

Maintain and repair main, auxiliary, and waste heat boilers.

Maintain and repair Underway Replenishment (UNREP) mechanical equipment and systems.

Maintain and repair Shipboard Cargo, Weapons, and Aircraft Elevators.

Some capability to test and repair diesel engines and components.

Replace diesel engines in Rigid Hull Inflatable Boat (RHIB) rescue boats.

Repair portable fire pumps.

LIMITATIONS

Parts and Material: [CSG-x, ESG-x and ARG] can requisition parts for repairs through SFIMA (Type Commander SFIMA) funding. However, to expedite repair, requesting ship should deliver available repair parts with equipment.

Technical Manual and APL and Drawings: The [CVN, LHD and LHA] Maintenance Support Center (MSC) has many of the Battle Group ship's technical manuals, Allowance Parts Lists

(APL), and drawings, but not all. Therefore, all applicable manuals, APL, and drawings, if available, should accompany the equipment in support of repairs.

Rigging Support: [CVN, LHD and LHA] [does or does not] maintain rigging equipment or qualified riggers for use off-ship. Each platform should ensure they have means of accomplishing any equipment rigging in a safe and controlled manner

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE		
USS [NAME OF SHIP] (CVN, LHD or LHA - XX)	ENG Division: R AIMD Division: IM2	
Capability Area: Structural Repair	Maintenance Capability: Shipfitting/Sheetmetal (ENG/AIMD)	
SFIMA Maintenance Capabilities: Repair hull plating and fittings. Repair and install structural components on ships, such as Watertight doors, hull and deck fittings, hatches, damage control fittings, and tanks. Repair and install miscellaneous aluminum sheet metal and stainless-steel items such as saltwater strainers, fuel oil and lube oil strainers, drip pans, pipe flashing, metal gaskets, equipment lockers, Self-Contained Breathing Apparatus (SCBA) lockers, ladder backs, ventilation ducting, bulkheads, partitions, and overheads. Support Aviation needs per NAVAIR requirements.		
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available:	
	ENG	AIMD
Anvil, 75 Lb.	Y	N
Brake, box and pan, 72" Wide x 10 gauge	Y	Y
Universal bending machine, pipe & bar to 2"	N	N
PAK 100 plasma arc cutter	Y	N

Dial indicator, magnetic base	N	Y
Drill, magnetic base	N	N
Drill press, sensitive	N	N

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	ENG Division: A
Capability Area: Mechanical Repair	Maintenance Capability: Air Conditioning & Refrigeration (ENG)
SFIMA Maintenance Capabilities: Inspect and repair AC compressors and systems. Inspect and repair refrigeration compressors and systems. Inspect, repair and test air systems and dehydrators. Perform flushing and testing services. Clean, evacuate, and recharge refrigerant systems.	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: ENG
Analyzer, compressor, hermetic, 10 hp, portable	N
Cleaner, tube, water brush, portable	Y
Charging and test manifold, refrigeration, portable	Y
Charging rig, nitrogen, 0-400 PSI	N
Dial-A-Charge	N
Dew point indicator	Y
Detector, leak, refrigeration, electronic, portable	Y
Meter, air velocity, anemometer, model A4-4	N
Pump, vacuum, electric, 15 CFM, portable	Y
Pump, hydrostatic test, 0-10,000 PSIG, portable	Y
Recovery unit, refrigerant, pump R12 & R134A	Y
Thermometer, TC, digital, 500 degrees F	N
Washer, parts, 15 gallon, electric	N

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	ENG Division: R
Capability Area: Mechanical Repair	Maintenance Capability: Pumps (ENG)
SFIMA Maintenance Capabilities: Disassemble, inspect, and overhaul, repair and test: Centrifugal, rotary, reciprocal, propeller, and jet pumps. Hydrostatically test pumps. Align pumps to drivers. Remove or replace broken studs from pump casings. Resurface or reface flanges in place up to 11" diameter. Abrasive blast pump bodies. Clean, repair, and replace internal pump parts.	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: ENG
Analyzer, compressor, hermetic, 10 hp, portable	N
Blast cleaning machine, sand	N
Dial indicator magnetic base	Y
Drill press, sensitive	N
Drill, magnetic base	Y
Disintegrator, metal, portable	Y
Machine, flange refacing, 11" capacity, portable	N
Grinding machine, bench mounted	Y
Lapping components, bench	Y
Oven, bearing heater, 400 degrees F	N
Press, hydraulic, 25 ton	Y
Puller, bearing, hydraulic, 50 ton, portable	N
Pump, hydrostatic test, portable	Y
Test stand, hydrostatic, 5,000 PSI	Y

[CVN, LHD, LHA, or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	ENG Division: R
Capability Area: Mechanical Repair	Maintenance Capability: Valves (ENG)
SFIMA Maintenance Capabilities: Inspect, repair, and test the following types of valves: Gate, globe, ball, butterfly, stop check, swing check, left check, plug, relief valves (water, steam, & air). Clean, inspect, repair, and test: Strainers (simplex, duplex, & wye) Manifolds (water, oil, gas, & steam) Perform leak test, hydro test. Test and set de-aerating feed tank spray nozzles.	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: ENG
Drill press, ½"capacity 15" swing	Y
Lapping components, bench	Y
Press, hydraulic, 25 ton	Y
Test stand, hydrostatic, 5,000 PSIG	Y
Test stand, pneumatic	N
Test device, DFT nozzle pressure set, portable	N
Special tools, valve assemble & disassemble	N
Resurfacer, valve area, port & seal ring	N
Reseating machine, gate valve	N

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
[NAME OF SHIP] (CVN/LHD/LHA - XX)	ENG Division: E
Capability Area: Electrical Repair	Maintenance Capability: Motor Rewind (ENG)
SFIMA Maintenance Capabilities: Balancing motors. Pre-overhaul inspection and test. Overhaul motors up to 100 hp (AC motors only). Rewind motors up to 100 hp (AC motors only). Overhaul motor generators up to 75 kilowatts. Rewind motor generators up to 75 kw. Perform testing of motors to include: DC high potential — AC high potential Voltage surge comparison test — Core testing Rotor balancing — Vibration analysis	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: ENG
Balancing machine	Y
Blast cleaning machine, sand	Y
Coil rewinder	Y
General purpose electrical/electronic test equipment (GPETE)	Y
Heads, concentric continuity winding	Y
Oven, bake, 650 degrees F double door	Y
Oven, bearing heater, 400 degrees F	Y
Oven, burn-out 100-850 degrees F	Y
Measuring system, precision resistance	Y
Press, hydraulic, 25 ton	Y
Slot cutter or creaser, slot insulation	Y
Strobotac, handheld	Y
Stand, wire with tensioner	Y
Surge tester, portable	Y
Tester, core loss, Lexseco® 1081	Y
Varnish dip tank	Y

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	AIMD Division: IM4
Capability Area: Services	Maintenance Capability: Weight Testing (AIMD)
SFIMA Maintenance Capabilities: Provide crane and rigging services. Operate weight handling equipment. Maintain, test, and repair weight handling equipment. Perform weight testing: Jacks, B-1, B-4, & 6k	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: AIMD
Dynamometers, 0-50k	Y
Press, swage	N

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	AIMD Division: IM2
Capability Area: Services	Maintenance Capability: NOAP/JOAP (AIMD)
SFIMA Maintenance Capabilities: Analyze lubricating greases and fuel oil. Analyze lube oil and hydraulic fluid (NOAP and JOAP lab certified) to include: Lubricating oil, neutralization number, fuel oil dilution (flash point), oil residue, microscopic examination, particle count, precipitation number, and wear metals.	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: AIMD
Aquatest	Y
Moisture analyzer	N
Counter, particle, automatic	Y
Emission spectrometer	Y
Flash point tester, portable	N
Fuel analyzer (spectrometer)	N
Hood, exhaust with blower & light	Y
Hot plate	Y
Oven, laboratory	Y
PODS	Y
Scale, triple beam, balance	Y
TAN (total acid number)	Y
Viscometer	Y
Wear metals (spectrometer)	Y

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	AIMD Division: IM2
Capability Area: Services	Maintenance Capability: Certified Air Recharge (AIMD)
SFIMA Maintenance Capabilities: Inspect and recharge Helicopter Aircrew Breathing Device (HABD) and Survival Egress Air (SEA). Replace regulators, check valves, pressure indicators, and associated components.	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: AIMD
Adapter fitting for HABD & SEA recharge	Y
Consumables for SEA recharge and Maintenance Kit	Y
Compressor, breathable air, portable, 1.3 SCFM at 3,000 PSIG (BAUER)	Y
Manifold, charging, HABD & SEA	Y
HABD & SEA maintenance kit	Y
Rotatable pool, HABD & SEA units	Y
Kit, spare parts, with rotatable pool of regulators	Y
Aviators Breathing Oxygen Sampling	Y

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE		
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	ENG Division: R AIMD Division: IM2	
Capability Area: Repair support	Maintenance Capability: NDT/NDI (ENG/AIMD)	
SFIMA Maintenance Capabilities: Perform per OPNAVINST 4790.2 and NAVAIR 01-1A-16 Tech manual: Visual, magnetic particle, liquid penetrant, and ultrasonic test and inspection of weldments. Ultrasonic thickness inspection, X-ray radiography Perform per NAVSEA 0900-LP-001-7000: Ultrasonic inspection of brazed piping. Fabrication and inspection of brazed piping systems. Perform: Semi-quantitative analysis of level 1 material. Provide NDI flyaway team for Aviation Detachment support.		
SFIMA Maintenance Shop Equipment	Shop Equipment Available:	
Recommended:	ENG	AIMD
Analyzer, metal allow, x-ray	N	N
Dye penetrant kit	Y	Y
Eddy current tester, portable	N	Y
Magnetic particle tester, heavy duty	Y	Y
Ultrasonic flaw detector, pulse echo, portable	Y	Y
Hardness testing	Y	Y
IACS conductivity testing of alloys	N	Y
X-ray, machine, fixed or portable	N	Y
Assorted measurement tools including: 5X & 10X magnifiers, fillet gauges, contour & radius gauges, optical comparators, machinist rules	Y	Y

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	ENG Division: R
Capability Area: Repair Support	Maintenance Capability: Level 1 Material Control (ENG)
SFIMA Maintenance Capabilities: Receive, inspect, store and issue Level 1 material. Conduct semi-annual inventories of Level 1 material. Maintain Level 1 material disposition records.	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: ENG
Level 1 storage facility for pipe, machine stock, fittings and welding material	Y

[CVN, LHD, LHA or OTHER SHIP] MAINTENANCE CAPABILITY GUIDE	
USS [NAME OF SHIP] (CVN/LHD/LHA - XX)	ENG Division: SMM
Capability Area: Repair Support	Maintenance Capability: Technical Information Resources (ENG)
SFIMA Maintenance Capabilities: Maintain technical library documentation and automated library systems per NAVSEA S005-AF-PRO-101/CTMM (NAVSEA command technical manual management). To include ship plan indexes, plans, specifications, drawings, technical manuals, process instructions AEL, APL, technical repair standards, ship information books and training aids. Advanced Technical Information Support (ATIS) system and Technical Library Management System (TLMS).	
SFIMA Maintenance Shop Equipment Recommended:	Shop Equipment Available: ENG
TLMS software	Y
ATIS station, stand alone	Y
Printer or plotter, large paper	Y
Printer, aperture card or microfiche	Y

APPENDIX C

SAMPLE SFIMA ROSTER

NOTE: STRIKE GROUPS SHOULD TAILOR (ADD OR SUBTRACT) TO THIS LIST TO MEET THE NEED OF THE STRIKE GROUP SFIMA TO COMPLETE ITS MISSION OF STRIKE GROUP SELF-SUFFICIENCY. ALL SAILORS ACROSS THE STRIKE GROUP SHOULD BE LISTED UNDER THE NECS THEY HOLD FOR THE NECS LISTED.

LISTING OF APPENDICES.

A EXRAV Planning Milestones
B RMC EXRAV Capability Matrix

7.1 PURPOSE. To implement the policies of references (a) through (h) when conducting Expeditionary Repair Availability (EXRAV). Commanding Officers will keep their operational, administrative, and logistic commanders fully apprised of their material readiness status. The effectiveness of maintenance availabilities, as well as technical assistance, is highly dependent on the detailed information provided.

7.2 DEPLOYED MAINTENANCE PERIODS. Commander, Fifth Fleet, Commander, U.S. Naval Force, Europe-Commander, U.S. Naval Forces, Africa-Commander, Sixth Fleet, Commander, Seventh Fleet, Commander, Naval Surface Group Western Pacific, Commander, Submarine Group Seven, or Commander, Submarine Group Eight, schedule all Availability periods for ships and submarines in their respective Area of Responsibilities (AOR) per reference (a) after receiving proposals from Operational Commanders. A ship may accomplish self-maintenance or be assigned an EXRAV.

7.2.1 Expeditionary Repair Availability. EXRAVs are a component of reference (b) supporting events defined in detail in reference (c). EXRAVs are executed on deployed ships utilizing a Forward Deployed Ship Repair Team (FDSRT) and Expeditionary Maintenance Repair Containers in support of the force generation packages as defined in reference (d) assigned for the accomplishment of:

a. Intermediate Maintenance Activity level work.

b. Emergent shipboard repairs.

c. Clearing Fleet Departure from Specifications (DFS).

d. Resolving shipboard Casualty Reports.

7.2.2 Work Package Execution Review. The EXRAV Project Manager (PM) or Project Officer will conduct a Work Package Execution Review per the appropriate milestones listed in Appendix A. The purpose of this briefing is for the EXRAV Team to demonstrate its readiness to execute, test, and validate the maintenance availability. The EXRAV Team must review the Availability Work Package and Current Ship's Maintenance Project (CSMP) for risks that would threaten the EXRAV Team's ability to accomplish the work in the expected scheduled time. The EXRAV Team must develop and provide execution planning and strategies to Fleet N43s, Type Commander (TYCOM), and the Naval Supporting Activity (NSA) Immediate Superior In Command (ISIC) (e.g., Commander, Navy Regional Maintenance Center (CNRMC)) as directed within Naval Message Planning Order or Executive Order. This meeting may be in conjunction with a ship's Continuous Maintenance Availability per chapter 3 of this volume.

7.2.3 Work Package Execution Review Brief.

a. All required team members identified and supporting at minimum include: EXRAV Project Manager (PM), NSA's ISIC representative, TYCOM Port Engineer (PE) and Combat Systems Port Engineer (CSPE), Ship's representative (as applicable).

b. All parameters of Initiating Directive are outlined, discussed, and adhered to.

c. The required repair parts, materials (including pre-fabrication) and test equipment are available or will be available to support the work.

d. Review of the proposed work package by TYCOM PE and CSPE; Event schedule and critical path; highest risks work items and mitigations.

e. Per reference (i), an OP-4 Brief- discussion of ammunition onboard between the ship's Damage Control Assistant, Ship's Fire Marshall, Ship's Weapons Officer, EXRAV PM or Project Officer, and Local Technical Authority (LTA). Fire safety council must identify hot work jobs in proximity to ammunition storage locations and affected firefighting systems.

f. Safety brief and emergency reporting.

g. Daily Production Meeting Schedule.

h. Team points of contact information.

7.3 EXPEDITIONARY REPAIR AVAILABILITY POLICY (NON-NUCLEAR WORK).

7.3.1 Policy.

a. Work screening guidelines in reference (a) apply to EXRAVs, limiting type of work which may be accomplished using overseas shipyards, Forward Deployed Regional Maintenance Center (FDRMC) or Ship Repair Facility (SRF) Japan.

b. TYCOM provided the results of screening to customer ships in a screening message. Work candidates are finalized by the RMC appointed PM.

(1) Screening for EXRAV is per reference (f) with exception to Ship Wartime Repair and Maintenance (SWARM) exercises in which TA2, TA3, and TA4 type jobs will be validated by ship's PE or CSPE, and the RMC PM.

(2) TA2, TA3, and TA4 jobs screened shall include reference to SWARM event to identify and distinguish between SWARM and mission tasked jobs. Example SWARM XX-XX execution.

c. Technical Authority.

(1) Technical Authority follows the geographic NSA designation as noted in volume II of this manual. SRF Yokosuka is the NSA for EXRAVs executed in the Seventh Fleet. FDRMC is the NSA for EXRAVs executed in Fifth or Sixth Fleet. The work performed by the FDSRT falls under the technical authority of the NSA.

(2) Each RMC that provides personnel for an FDSRT will establish a memorandum of agreement with the cognizant NSA (SRF or FDRMC). The memorandum of agreement will also specify that:

(a) The RMC providing personnel retains responsibility and authority for all personnel issues of the FDSRT members.

(b) The RMC providing personnel will ensure each FDSRT includes adequate senior enlisted leadership.

(c) The NSA will assign a commissioned Project Officer to the EXRAV. This may be the same officer assigned to a Continuous Maintenance Availability or other concurrent availability.

(d) The active-duty members will be issued temporary duty orders assigning them temporarily to the NSA, reporting to the designated Project Officer.

(e) The FDSRT will support the NSA's work certification process.

(f) The NSA's work certification process will support the intermediate level work process of the RMC providing the FDSRT.

d. Reporting Discrepancies. DFS are reported to AOR LTA by SWARM Project Officer and are processed per reference (f).

e. The NSA will ensure that no other material, tools, or physical assistance is provided to the contractor unless it is specifically required by the contract specification. Ship's force will be briefed on this prior to the start of the EXRAV period.

f. Oversight of EXRAV execution is the responsibility of the area NSA to include area Lead Maintenance Activity execution of contractor work package and other supporting RMC EXRAV work package.

g. The NSA is responsible for documentation and reporting of final condition at end of availability.

h. An NSA Certification letter of availability work requires a rigorous, multi-faceted NSA plan ensuring technical correctness, complete with qualified execution, approved requirements, integrated testing, NSA oversight, and meticulous documentation and review.

i. Out Brief. The NSA PM and supporting RMC PM will provide to ship's force all appropriate documentation, including objective quality evidence (OQE), to verify the EXRAV was satisfactorily completed. As necessary, technical justification will also be provided to the AOR LTA when a DFS request is required.

7.3.2 Execution.

a. The NSA and supporting PM, in conjunction with the TYCOM, will generate a work package and coordinate with the ship to determine scope of work and support required to execute work package.

b. Arrival.

(1) The NSA Project Officer, supporting PM and Logistician, and NSA contract representative will meet ship on arrival and ensure temporary services are in place prior to the commencement of work. The NSA PM will ensure the technical portion of the work package is satisfied and NSA contract representative will coordinate with local industrial activity on temporary services. It is both the NSA contract representative and ship's force responsibility to ensure the contractor complies with temporary services work specification.

(2) One week prior to arrival, EXRAV PM or Project Officer, supporting RMC PM, and supporting RMC Lead Logistician shall ensure identification of husbanding service provider point of contact to the ship for advanced coordination prior to ship arrival to minimize delays upon ship arrival and execution of EXRAV.

c. In Brief. An arrival conference shall be scheduled, during which the NSA and supporting RMC PM, and ship's force will review the work package, coordination requirements, Quality Assurance (QA) requirements, and required materials to be provided by the ship. Concurrently with the arrival conference, the EXRAV team will perform shipchecks to validate that work areas are clear and safe to commence work.

d. Daily Production Meeting. The NSA and supporting RMC PM, Ship's Maintenance Management Officer, and other personnel as required will meet daily, at a minimum, to review progress with the intent being to identify possible problem areas that may require specific attention.

e. Growth and New Work. Growth and New Work identified during EXRAV will be reviewed for technical risk and schedule impacts and incorporated in the work package by the supporting RMC PM and AOR LTA, as applicable and shall be validated by local TYCOM representative, and NSA ISIC representative.

f. Material Support.

(1) Military Specification parts and materials are often not available in theater. Some parts can be manufactured, but the ship should provide the material and parts required for work package execution or materials should be procured by the executing or supporting RMC.

(2) If unable to manufacture or procure Military Specification parts or material, suitable substitution may be used after a full review of technical risk and schedule impacts (if applicable) with concurrence from the AOR LTA. Per reference (f), a DFS shall be drafted and submitted for proper adjudication to AOR LTA and local TYCOM.

g. Technical Support. Drawings and Technical Manuals are generally not available in theater. Ship's Force and executing RMC should be prepared to produce associated technical information as required. Additional reach back to appropriate NAVSEA organizations for drawing and technical manuals may be utilized.

h. Schedule Limitations. Work schedule will be determined by the scope of work, ship schedule requirements, initiating directive, the discretion of the supporting RMC PM and NSA PO and shall be validated by the NSA.

i. QA Responsibilities. While Ship's Force is ultimately responsible for ensuring that appropriate QA is maintained on all repairs, regardless of who performs the work, the EXRAV QA representative is required to ensure all work requiring OQE is properly documented. Specific EXRAV QA responsibilities may include:

(1) Provide personnel to witness tests and inspections as required by the EXRAV work package. Witness must be a qualified Quality Assurance Inspector (QAI) who is aware of the technical requirements to be fulfilled by the test or inspection.

(2) Ensure that documentation of each test or inspection is provided to the EXRAV PM at its conclusion via applicable form from volume V, part I, chapter 11 of this manual to document the test or inspection. Records of all Ship's Force tests and inspections will be maintained per volume V, part I, chapter 10 of this manual.

(3) Insisting on verbatim compliance with the work specification, through the QAI, during the test or inspection. The QAI will immediately inform the EXRAV PM or designated representative of any noted discrepancies.

(4) Ensuring that any material provided by ship's force by direction of the work specification is in strict accordance with technical requirements unless approved by EXRAV PM through AOR LTA concurrence.

(5) Assisting the EXRAV Team in providing continual in-process inspections of work being accomplished aboard ship. In-process inspections of work accomplished off-ship will be accomplished as deemed necessary by the EXRAV PM.

(6) Providing ship-specific operating and design system parameters to aid in determining actual testing requirements. Reporting specified test results on appropriate QA forms to the EXRAV PM or designated representative prior to the end of the EXRAV period.

(7) Providing all Material Identification and Control LEVEL I material required to the EXRAV PM or designated representative. Material will not be accepted unless properly controlled by ship's force. A face-to-face turnover

by a designated Controlled Material Petty Officer to the EXRAV PM or designated representative is required.

j. Unsatisfactory Work or Work Practices. Any unsatisfactory work accomplished, or work practice conducted by any maintenance activity must be promptly reported to the activity involved and the applicable Maintenance Manager or NSA PM. Reports should include sufficient detail to ensure timely and proper corrective action may be taken. Prior to informing the Maintenance Manager or NSA PM, direct liaison between customer and repair activity in identifying and clarifying deficiencies is required.

k. Outbrief. The EXRAV PM will provide to ship's force all appropriate documentation, including OQE, to verify that the EXRAV work was satisfactorily completed. As necessary, technical justification will be provided when a DFS request is required to be submitted.

l. The NSA shall generate an After-Action Report (AAR), similar to a fleet maintenance availability departure report (refer to SWARM, chapter 8 Appendix A of this volume as template), that will include:

(1) Summary table of jobs accepted, added, canceled, and completed by each repair activity, along with total manhours executed by each activity.

(2) Listing of all jobs completed.

(3) Successes, challenges, and lessons learned.

(4) This report will be issued with 10 days of completion of the SWARM Exercises and routed to the cognizant fleet. Prior to final release, review signature required by NSA PM and CNRMC, AAR approval signatures are required NSA Commanding Officer or designated representative for release.

7.4 VOYAGE REPAIR RESTRICTION. EXRAVs are executed by U.S. Navy personnel, primarily active duty enlisted sailors. Therefore, the restriction to Voyage Repair on non-forward deployed naval force ships does not apply.

APPENDIX A

EXRAV PLANNING MILESTONES

MILESTONES	RESPONSIBLE ACTIVITY	TIMELINE (Days)
1. Issue Naval Message execution order for EXRAV event	Fleet	A-65
2. Assign PM	NSA and Supporting RMC or Activity	A-60
3. Update CSMP and provide to TYCOM representative and ISIC	Ship or TYCOM	A-60
4. Validate and review CSMP	NSA and Supporting RMC or Activity	A-55
5. Conduct ERMC Movement and laydown planning	Supporting RMC	A-55
6. Build EXRAV Team	NSA and Supporting RMC	A-55
7. Conduct CSMP review or work candidates	All	A-50
8. Prepare tentative EXRAV work package	NSA and Supporting RMC/ or Activity	A-50
9. Issue additional source of support request to RMC	NSA and Supporting RMC	A-50
10. Issue additional source of support request to outside supporting activities	NSA and Supporting RMC	A-50
11. Develop all source of support roster	NSA and Supporting RMC	A-50
12. Finalize EXRAV team roster	All	A-45
13. Validate EXRAV work package	NSA and Supporting RMC	A-45
14. Screen EXRAV tasks to outside supporting activities	TYCOM reps and ISIC (CNRMC)	A-45
15. Conduct OCONUS travel, ERMC laydown, OCONUS training requirements, and other logistical planning	NSA and Supporting RMC	A-45
16. Validate all material, tools, and parts for EXRAV work package	NSA and Supporting RMC	A-30
17. Finalize EXRAV work package	All	A-20
18. Execute preliminary EXRAV lead(s) meeting with OCONUS Husbanding agent	Ship, NSA and Supporting RMC	A-20
19. Finalize EXRAV team travel and logistics	All	A-15
20. Accept receipt of ERMC at EXRAV location	NSA or Supporting RMC	A-10

MILESTONES	RESPONSIBLE ACTIVITY	TIMELINE (Days)
21. Execute travel for EXRAV lead(s) meeting with OCONUS Husbanding agent	Ship, NSA and Supporting RMC	A-7
22. Execute EXRAV	All	A-0
23. Execute daily production meeting	All	Daily
24. Validate growth and new work	NSA or Supporting RMC	Daily
25. Complete EXRAV	All	C
26. Issue summary EXRAV report	NSA	C+10
27. Issue EXRAV AAR report	NSA	C+30

APPENDIX B

RMC EXRAV CAPABILITY MATRIX

CATEGORY	CAPABILITY	FDSRT
I	EXECUTION OF ASSIGNED SHIP REPAIR AND MAINTENANCE	X
I-A	Perform structural repairs (Shipfitter)	
I-B	Perform pipe repairs (Pipefitter)	
I-C	Perform insulation and lagging services	X
I-D	Perform repair and maintenance of ship's RHIBs	X
I-E	Perform (Inside Machinist) machining services	
I-F	Perform diesel engine governor and injector repairs and maintenance	
I-G	Perform valve repair and maintenance	X
I-H	Perform diesel engine repair and maintenance	
I-I	Perform hydraulics system repair and maintenance	X
I-J	Perform pump repairs and maintenance	X
I-K	Perform gas turbine repairs and maintenance	
I-L	Perform (Outside Machinist) machinery repairs and maintenance	X
I-M	Perform air conditioning and refrigeration repair and maintenance	X
I-N	Perform flex hose fabrication and testing	X
I-O	Provide mechanical and photo engraving services	
I-P	Provide key and lock repair services	
I-Q	Perform repairs and maintenance to heat exchangers	X
I-R	Perform inside electrical repair and maintenance, including motor troubleshooting	X
I-S	Provide sound vibration analysis of rotating equipment (both in place and in shop)	
I-T	Perform outside electrical repair and maintenance	X
I-U	Perform cableway inspections	X
I-V	Perform repair and maintenance of interior communication systems	X
I-W	Perform test, repair and maintenance of electronic modules (2M) and provide qualification services for shipboard site reviews and personnel certification of (2M) technicians	
I-X	Perform repair and maintenance of electronics systems	X
I-Y	Perform repair and maintenance of sonar systems	

CATEGORY	CAPABILITY	FDSRT
I-Z	Perform repair and maintenance of fire control and weapons systems	X
I-AA	Perform repair and maintenance of antennas	X
I-AB	Provide corrosion control services (also as part of all NAMTS NECs)	X
I-AC	Perform repair and maintenance of HLS and RAST systems	
I-AD	Perform repair and maintenance of life rafts	X
I-AE	Repair and overhaul CIWS and 25mm chain guns	X
I-AF	Perform repair and maintenance of Mine Warfare specific systems	X
I-AG	Provide diving services, including hyperbaric chamber	
I-AH	Perform rigging, weight testing and manufacture of weight handling devices	X
I-AI	Provide oil analysis, spectral analysis, fluid contamination and particle contamination services	
I-AJ	Perform non-destructive testing	
I-AK	Provide weld qualification services	
I-AL	Provide the services of a certified Marine Gas Turbine Inspector	
I-AM	Provide various calibration services not provided by regional calibration centers	
I-AN	Provide SISCAL Level II services	
I-AO	Provide shipboard welding and brazing services	X
I-AP	Provide SCBA Cylinder testing and mask flow testing	
I-AQ	Provide services of a qualified Gas Free Engineering (GFE)	
I-AR	Provide prescriptive safety equipment fittings or issuance i.e. respirator(s), aloft safety harness	

VOLUME III

CHAPTER 8

SHIP WARTIME REPAIR AND MAINTENANCE (SURFACE FORCE ONLY)

LISTING OF APPENDICES.

A After-Action Report Template
B Ships Mission Area Status Template

8.1 PURPOSE. To implement the policies and guidance of references (a) through (h) when performing Ship Wartime Repair and Maintenance (SWARM) to provide additional capability to execute afloat maintenance, sustainment, and Battle Damage Assessment and Repair (BDAR) to support returning surface ships to mission capable or enable surface ships to transit to a permanent repair location.

8.2 SHIP WARTIME REPAIR AND MAINTENANCE ESTABLISHMENT. A SWARM event occurs when the operational command directs the establishment of a forward maintenance and sustainment in the form of a Forward Deployed Ship Repair Team from reference (a) in a designated location.

8.2.1 Maintenance Availability. This event will support maintenance availabilities on one or more ships for the period of time designated. The duration of the Forward Deployed Ship Repair Team will cover the total duration of all maintenance availabilities utilizing those resources. Each assigned ship may have a Continuous Maintenance Availability (CMAV), an Expeditionary Repair Availability (EXRAV), or both.

a. A SWARM CMAV is a contracted maintenance availability using maritime repair and overhaul companies available in the port. The Naval Supporting Activity (NSA) will be as designated in this volume: Forward Deployed Regional Maintenance Center or Ship Repair Facility (SRF). CMAV planning will be per the CMAV milestones contained in chapter 4 of this volume. The NSA will provide a qualified Project Manager (PM) for the CMAV.

b. A SWARM EXRAV will be executed in accordance with chapter 7 of this volume. Fleet and Commander, Navy Regional Maintenance Center (CNRMC) will coordinate movement of Expeditionary Maintenance and Repair Containers (EMRC)

as required to establish an Expeditionary Maintenance and Repair Facility (EMRF) for the EXRAV. The RMC providing the majority of the EXRAV workforce will provide a qualified PM and will ensure the team includes adequate military leadership.

8.2.2 Battle Damage Assessment Team. When warranted, a Battle Damage Assessment Team (BDAT) will be assigned to the SWARM event, as discussed in the following section.

8.2.3 Project Officer. The NSA will assign a Project Officer to be in charge of the overall SWARM event. All PMs will report to the NSA Project Officer.

a. The Project Officer will oversee the conduct of a daily morning production meeting with all executing activities, as well as a mid-day production meeting. The notional meeting times will be 0805 and 1300, local.

b. The Project Officer will issue a daily Plan of the Day report with contents and distribution specified by CNRMC. This report will include information on total jobs inducted, in-progress, cancelled, and completed, segregated by each executing activity.

8.3 BATTLE DAMAGE ASSESSMENT AND REPAIR.

a. Damage from sources other than battle, or conflict, may be addressed with the procedures in this section as determined by CNRMC, in coordination with the cognizant fleet.

b. Battle Damage Assessment (BDA) is the necessary first step of BDAR and starts the moment a ship receives any damage within a combat environment or naval operations other than combat. BDA is accomplished per reference (b) and is intended to prioritize mission critical systems. The objective of BDA is to ascertain which actions need to be performed to quickly restore system(s) without injury to personnel and without causing further damage to the equipment. The assessment determines the extent of damage, to include which systems or subsystems and components were damaged, the level of repair, and associated risk. The assessment will also include an estimate of personnel, time, and material(s) required to perform expedient repairs.

(1) Ship's Force is the Battle Damage Initial Response Team conducting immediate damage control actions and efforts after ship withstands damage. Immediate communications of initial survey and assessment shall be transmitted via naval message, email, or voice, based on availability. Communication will include mission warfare areas, stability, personnel casualties, and known needs.

(2) Ship's Force initial damage control response is vital to ship survivability and self-recoverability efforts to navigate to safer seas or safer harbor.

(3) Per reference (a), NAVSEA Force Packages encompassing a BDAT are typically prepositioned in theater so that BDA can begin afloat or ashore at the first safe harbor. The BDAT will receive verbal and written damage reports from the Battle Damage Initial Response Team via applicable Immediate Superior In Command (ISIC), Type Commander (TYCOM), NAVSEA, or upon arrival to damaged vessel. Primary objective of the BDAT is to assist

ship's force with detailed assessments that will inform the Operational Commander's repair decision making process.

c. The BDAT member composition is per reference (b) and referred to in Table 8-1 of this chapter.

Project Manager
Mobile Diving and Salvage Unit Diver
Ship Building Specialist
Ship Supervisor
Naval Architect or Structural Engineer
HM&E Mechanical Engineer or Technician
HM&E Electrical Engineer or Technician
HM&E Main Propulsion (Ship Specific) Engineer or Technician
Ship Controls and Auxiliaries Engineer or Technician
Command, Control, Communications, Computers, and Intelligence Systems Engineer or Technician
Combat Systems Weapons Engineer or Technician
Additional composition as required:
Project Support Engineer
Safety Personnel (can issue specific Personal Protective Equipment, e.g. respirators, aloft harness, etc.)
Lifting, Handling, or Rigger
Engineering Limited Duty Officer or Chief Warrant Officer

Table 8-1 BDAT Member Composition

8.4 BATTLE DAMAGE ASSESSMENT AND REPAIR EXECUTION. BDAR consists of assessing damage and performing temporary repairs to facilitate the movement of a unit from a hostile environment to a safe environment where permanent repairs can be performed. Alternatively, may be used to rapidly return a disabled unit to the operational commander or ISIC by applying field-expedient repairs and restoring minimum essential combat capabilities necessary to support the mission.

a. Initial system restoration priorities shall be set by the ship Commanding Officer (CO) by direction of area Combatant Commander.

b. A notional sequence of events is shown below. Further details are contained in reference (b):

(1) Initial damage. Ship sends initial Operational Report (OPREP) 3.

(2) Ship's force damage control efforts. Ship sends OPREP 3 updates as required. Ship's force requests Ship Salvage support, if required.

(3) BDAT stand up and travel to designated port.

(a) The cognizant fleet, numbered fleet, TYCOM, or logistics task force requests NAVSEA support in accordance with reference (c), either by direct communication, or by naval message, depending on operational situation.

(b) NAVSEA and CNRMC designate a lead RMC and required support from other RMCs, either by direct communication, or by naval message, depending on operational situation.

(c) Ship transition to designated port, with salvage assistance if required. Ship's force sends OPREP 3 updates as required.

(4) Ship communication of mission impacts, using a format similar to Appendix A. This communication can be by direct communication to the ship's ISIC, by email, by naval message, or by some combination depending on operational situation as determined by the ship's CO.

(5) Ship arrival in port. Ship's force sends an OPREP 3 update to document arrival. Recovery operations commence if required.

(6) BDAT commences assessment, with daily progress reports to CO.

(a) Priority given to areas that will obviously be critical path for repairs.

(b) Scope of assessments determined by CO, but should be very broad and cover all mission areas, and not restricted to areas of obvious damage. This is to reduce the risk of hidden damage or inoperability that would be discovered once the ship is back underway.

(c) Assessments should include the execution of standard cold checks and hot checks per Planned Maintenance System, Engineering Operational Sequencing System, and Combat Systems Operational Sequencing System.

(d) The BDAT should document the completion of all assessment checks and provide the ship's CO a copy.

(e) The BDAT will give priority to recovery operations. In non-battle related situations, the BDAT will coordinate around any investigative bodies.

(f) The primary variable is time. The BDAT should maximize the use of temporary repairs, and associated temporary Departure from Specifications, to minimize time. Any contracted work should assume multiple shifts and extended shifts. (i.e. non-stop execution of the critical path).

(g) When available, the repair plan should maximize the use of any on-site EXRAV team where that may reduce repair timeline.

(h) Once the critical path is identified to achieve CO's priorities, the BDAT should develop and execute repair plans that restore the maximum redundancy to the CO across all mission areas. However, care should be taken to ensure these additional repair plans do not introduce unnecessary risk of becoming the critical path.

(i) The BDAT should look at all available options for sourcing material, with a focus on lead time.

(7) Development of repair Courses of Action (COA) occurs concurrent with completion of assessments.

(a) Presentation and selection of COA can occur prior to completion of all assessments if agreed upon by BDAT Officer, CO, and Local Technical Authority representative.

(b) COAs are tailored to the ship's mission impact assessment and aligned with the CO's priorities as communicated to the BDAT.

(c) All proposed COAs shall have an adequate risk assessment performed, and any recommended or required mitigating actions shall be identified to support an informed COA selection. The need for Temporary Standing Orders shall be clearly communicated to the CO by the BDAT.

(8) Selection of COA and development of repair plan.

(a) The repair plan will reflect expected change to the mission impact assessment.

(b) The repair plan consists of a phased repair schedule documented in a Program Evaluation and Review Technique (PERT) chart. A Gantt chart may be used to communicate the daily work plan and progress.

(c) The repair plan will include all required material and sourcing.

(d) Required cannibalization will be coordinated through the cognizant TYCOM or logistics Task Force, depending on operational situation.

(9) Commencement of repairs. Required contracting actions should occur as soon as technically possible and not wait until all elements of the repair plan are completed.

(10) Completion of repairs and ship modified dock trials. The CO will determine what element of the Dock Trial requirements of volume II, part II, chapter 2 Appendix O of this manual will be required, in consultation with the Local Technical Authority representative and Project Officer.

(11) The BDAT will complete documentation of all repairs completed, temporary or permanent, to include generation of required Departure from Specifications prior to departing the area.

(12) The ship will conduct a modified Fast Cruise prior to getting underway.

c. Per reference (a), Naval Sea Systems Command (NAVSEA) BDAT assessment reports are standardized, address operational redlines and provide a repair COA aligning with reference (b) Operational Decision Framework:

(1) Re-deploy the vessel as a serviceable unit upon completion of the BDA and BDAT services and completion of temporary repairs necessary for the vessel to be fully or partially mission capable.

(2) Continue repairs at the vessel's current location utilizing reference (a) Force Package.

(3) Move the asset to a location or repair facility upon completion of BDA or afloat salvage services for repair or for cannibalization:

(a) Under own power, with or without a salvage and towing capable escort ship.

(b) Under tow from a United States Navy, United States Naval Ship, or commercial vessel.

(c) As float-on and float-off cargo onboard a submersible transport ship or barge (i.e. heavy lift vessel)

(4) Scuttle the damaged asset.

d. BDAR COA development process.

(1) Ship develop and provide mission area impact(s).

(2) BDAR Team develop PERT chart. Identify production risk and repair plan assessment.

(3) Ship and BDAR Team consolidate and provide Ship's CO and Task Force Commander consolidated mission area impact and repair plan report (see Appendix B of this chapter). BDAR Team makes reports to Task Force Commander via message release, email or voice.

(4) BDAR Team develop a repair plan that is technically accurate to restore required systems.

(5) BDAR Team develop material repair list to support repair plan.

(a) Document material that can be sourced locally.

(b) Document all material estimated delivery dates.

(c) Evaluate suitability of non-Military Specification commercial material alternatives.

(6) BDAR Team contract local vendor(s) repair capabilities, as required.

(7) BDAR Team document all temporary repairs in accordance with volume V, part I, chapter 8 of this manual.

(8) Ship's force and BDAR Team determine Environmental, Safety, and Health regulations, as required for local country compliance.

8.5 SHIP WARTIME REPAIR AND MAINTENANCE EXERCISES. SWARM Exercises (SWARM-EX) are designed to exercise and mature the SWARM process, develop lessons learned, and validate contractor capability. A SWARM-EX consists of three maintenance components:

a. EXRAV

(1) Executed per chapter 7 of this volume

(2) 14 to 21 days in duration.

b. CMAV

(1) Planned in accordance with the Firm Fixed Price CMAV milestones shown in chapter 4 Appendix H of this volume.

(2) Executed in accordance with section 8.4 of this chapter.

(3) Normally, 14 to 21 days in duration.

c. BDAR Table-Top Exercise (TTX)

(1) Executed as part of a SWARM-EX.

(2) Typically 5 days in duration, inside the overall SWARM-EX duration.

(3) Execute the timeline of section 8.3, up to and including development of the repair plan. The repair plan must include:

(a) The PERT chart showing all work and identifying the critical path.

(b) A full, detailed material list, including verified source information for all material.

(c) A draft Test and Inspection Record (QA form 17) form for each temporary repair.

(4) The cognizant fleets develop the scenario with CNRMC and the cognizant TYCOM. The associated Battle Damage Card is developed by Naval Surface Warfare Center Carderock Division.

(5) The BDAT will generate a summary report to include in the After-Action Report (AAR), discussed below. Elements of the BDAT report include roster, summary of scenario, COAs presented and selected COA, PERT chart, material list, estimated completion date of repairs, and lessons learned.

d. The NSA shall generate an AAR, similar to a fleet maintenance availability departure report (see Appendix A of this chapter), that will include:

(1) Summary table of jobs accepted, added, canceled, and completed by each repair activity, along with total manhours executed by each activity.

(2) For CMAV work, the table shall include the dollar value of the contract.

(3) Input from the Battle Damage event as described above.

(4) Listing of all jobs completed.

(5) Successes, challenges, and lessons learned.

(6) This report will be issued within 10 days of completion of the SWARM-EX and routed to the cognizant fleet. Prior to final release, review signature required by NSA PM and CNRMC, AAR approval signatures required by NSA CO or designated representative for release.

APPENDIX A

AFTER-ACTION REPORT TEMPLATE

A. Executive Summary.

1. Exercise Overview:

   a. SWARM-EX Designation (e.g., 2X-XX)

   b. Dates and Location

   c. Participating Units and Organizations

   d. Overall Mission and Objectives (briefly stated)

   e. Brief exercise overview

      (1) Key successes

      (2) Key challenges

      (3) Recommendations

2. Work Package Summary Table:

Work Package	Description (Concise)	Key Accomplishments	Key Shortcomings	Recommendations
CMAV	Number of jobs awarded, number of jobs completed, overall cost of contract	Critical path job completed, or any critical job completed	Any negative impacts to work or schedule	
EXRAV	Number of jobs planned, number of jobs completed, number of growth work jobs received and completed, total MDs achieved for all jobs completed	Critical path job completed, or any critical job completed	Any negative impacts to work or schedule	
BDAR TTX	BDAT location i.e. SRF, SWRMC, etc. Conduct a comprehensive damage assessment and develop a repair plan to recover from a simulated missile strike.	Met all objectives or deliverables? Comms with SF adequate and routine?	Any negative impacts to event or TTX	
Other Specify	Any other items of interest to capture			

B. Concise Narrative.

1. CMAV: (1-3 paragraphs)
    a. What went well in the CMAV execution?
    b. What challenges were encountered?
    c. Briefly describe specific instances that highlight successes or failures.
2. EXRAV: (1-3 paragraphs)
    a. What went well in the EXRAV execution?
    b. What challenges were encountered?
    c. Briefly describe specific instances that highlight successes or failures.
3. BDAR TTX:
    a. Process Description: (1 paragraph) Describe the BDAR TTX process followed during the exercise. Focus on the steps taken, tools used, and team interaction.
    b. Challenges Encountered: (1 paragraph) Describe any challenges the team faced during the exercise.
    c. Successes Encountered: (1 paragraph) Describe any successes the team had during the exercise.
4. Other (as applicable): Follow the same format as above for any other work packages or significant activities.

C. BDAR TTX COA Discussion & Assessment.

1. BDAR TTX Expectations: (1-2 sentences) State the specific expectations for the BDAR TTX within the context of SWARM-EX. For example: "The expectation for the BDAR TTX is to rapidly assess simulated damage, develop repair COAs and associated risks, and recommend the most operationally effective COA to the CO or Fleet within a limited timeframe."
2. COA Development and Recommendation:
    a. Briefly describe the COAs developed by the BDAR team.
    b. State the recommended COA.
    c. Summarize the rationale for selecting the recommended COA. What factors were considered? What were the pros and cons of each COA? Why was the recommended COA chosen as the best option?
3. Assessment of BDAR TTX Performance:
    a. Strengths: (Bullet points) What did the BDAR team do well?
    b. Areas for Improvement: (Bullet points) Where could the BDAR team improve?
    c. Standardization Needs: (Bullet points) What aspects of the BDAR process need to be standardized (e.g., report formats, communication protocols)?

D. Lessons Learned & Recommendations Matrix. This is a separate living document (e.g., spreadsheet) that feeds into the AAR. This is the tracking system outside the AAR. Not all lessons learned shall be entered into the AAR. The spreadsheet is available and populated by SWARM personnel during the event.

Example spreadsheet:

Lesson ID	Category (e.g., CMAV, EXRAV, Logistics, Communication)	Detailed Lesson Learned (Concise)	Recommendation (Specific & Actionable)	Assigned To	Target Completion Date	Status (Open, In Progress, Complete)	Notes - Updates
251-LL-001	CMAV	Slow comms between MDS and ship	Establish dedicated comms channel	Comms Officer	6/30/2024	In progress	Testing new equipment
251-LL-002	EXRAV	EMRF pre-positioning incomplete	Standardize EMRF packing list and process	Logistics Officer	7/15/2024	Open	Awaiting parts list

1. Lesson ID: Unique identifier for each lesson.
2. Category: Categorize lessons for easier filtering and analysis.
3. Detailed Lesson Learned: A concise statement of the problem or observation.
4. Recommendation: A specific, actionable step to address the lesson learned.
5. Assigned To: Individual responsible for implementing the recommendation.
6. Target Completion Date: Desired completion date.
7. Status: Track the progress of the recommendation.
8. Notes and Updates: Any relevant information about the recommendation's progress.

Provide detailed description of repeated or critical lessons learned and recommendations. (3-4 lessons learned max; 1-2 concise paragraphs)

E. Goal Assessment.

This section directly addresses "goals" for the SWARM-EX program.

Goal #	Goal Description	Met or Not Met	Quantitative Results (if applicable)	Notes and Explanation
1	CMAV: Execute 80% of CONUS 3wk CMAV in MDs (1000 MDs total, 50 MDs/day)		[Specific MDs Achieved]	EX: Achieved [number] MDs. Delays due to [reason]. Need to improve [area].
2	EXRAV: Ability to execute full spectrum of codified capabilities. EMRFs pre-positioned.			EX: All codified capabilities were successfully demonstrated. EMRFs pre-positioned at [location].

3	Other agencies: Inclusion of NSWC PH and NAVWAR, and others.			EX: Initial contact made with NSWC PH. NAVWAR participation not achieved due to. Continue to pursue inter-agency collaboration.
4	BDAR TTX: BDAT can promptly execute full assessment program, present options to CO, and develop repair plan.			EX: BDAT successfully completed assessment and presented repair options within [timeframe].
5	7 SWARM-EX in PACFLT per year. Each 14d to 21d duration, with average of at least 17d for all 7.			EX: This is a program-level goal. Tracked separately.
6	Incorporation of partner Navy I-level activity in EXRAV team.			EX: Partner Navy I-level activity not incorporated due to [reason]. Explore opportunities for future collaboration.
7	Increase responsiveness and reduce required planning timeline to meet real-world requirements. A-60 as baseline.			EX: Fleet identified ship, dates, and port at A-[number] days. Goal is A-60. Continue to work towards reducing planning timeline.

F. Appendices. (As Needed)

1. Certification Letter.
2. Supporting Job Documents (if applicable).
3. BDAR Supporting Documents (COAs, PERT Chart, Gantt Chart, etc.).
4. Glossary of Terms.

B Non-Nuclear Test Rig Determination and Inspection Check List....IV-9B-1
C Nuclear and Non-Nuclear Pre-Test Inspection Check List IV-9C-1
D Nuclear and Non-Nuclear Performance of Test Check List....IV-9D-1

CHAPTER 10 - WORK AUTHORIZATION AND CONTROL

10.1 Purpose....IV-10-2

10.2 Work Authorization IV-10-2

10.3 Work Authorization Control....IV-10-2

10.4 Work Authorization System IV-10-2

10.4.1 Administration IV-10-3
10.4.2 Work Authorization Procedure IV-10-4
10.4.3 Transfer of Non-Nuclear Systems and Nuclear Systems That Do Not Affect Reactor Plant Safety Or Operations (Depot availabilities only) IV-10-6
10.4.4 Work Authorization Form Revisions IV-10-8
10.4.5 Centralized Work Control Procedures IV-10-10
10.4.6 Equipment Tagout Procedures IV-10-10
10.4.7 Barrier Criteria IV-10-10
10.4.8 Safety of Ship Maintenance Item Identification, Listing and Control IV-10-10
10.4.9 Prevention, Detection, and Response Items IV-10-14
10.4.10 Ship in Dry Dock (Submarines Under Joint Fleet Maintenance Manual Controls IV-10-15

10.5 Final Certification, Close-Out and Re-entry of Submarine Spaces, Tanks and Voids IV-10-16
10.5.1 Purpose IV-10-16
10.5.2 Discussion IV-10-16
10.5.3 Action IV-10-16
10.5.4 Applicability IV-10-17

Appendices
A_1 Work Authorization Form IV-10A-1
A_2 Work Authorization Index IV-10A-4
B Technical Work Document Record Sheet IV-10B-1
C Work Authorization Form Continuation and Revision Sheets IV-10C-1
D Barrier Criteria for Hull Penetrations IV-10D-1
E Safety of Ship Maintenance Item List Example IV-10E-1
F Safety of Ship Maintenance Item List IV-10F-1
G Procedures and Safety Precautions for Entering Submarine Spaces, Tanks and Voids IV-10G-1
H Close-Out Inspection Check-Off List IV-10H-1

CHAPTER 11 - TECHNICAL DATA AND INFORMATION MANAGEMENT

11.1 Purpose IV-11-1

11.2 Shipboard Technical Document Management IV-11-1

11.3 Technical Libraries IV-11-2
11.3.1 Technical Library Supervisor IV-11-3
11.3.2 Technical Library Non-Supervisory Personnel IV-11-5
11.3.3 Technical Library Materials IV-11-6

11.4 Technical Manual Applicability Report and Ship's Drawing Index IV-11-8
11.4.1 Technical Manual Applicability Report IV-11-8
11.4.2 Ship's Drawing Index IV-11-8

11.5 Maintenance Support Centers (Aircraft Carriers only) IV-11-8

CHAPTER 12 - HULL INSPECTION OF SHIPS AND CRAFT

12.1 Purpose IV-12-1

12.1.1 Scope....IV-12-1
12.1.2 Discussion....IV-12-1
12.2 Action....IV-12-3
12.3 Reports....IV-12-3
Appendices
A Sample Layout of Inspection Areas....IV-12A-1
B Hull Reporting Format....IV-12B-1
CHAPTER 13 - WEIGHT HANDLING EQUIPMENT TESTING AND INSPECTION
13.1 Purpose....IV-13-2
13.2 Naval Sea Systems Command Afloat Requirements....IV-13-2
13.2.1 Definitions....IV-13-2
13.2.2 Procedure....IV-13-3
13.2.3 Load Test Types and Duration....IV-13-5
13.2.4 Load Test Periodicity....IV-13-5
13.2.5 Crane Certification Program....IV-13-6
13.2.6 Daily Inspections....IV-13-6
13.2.7 Use of Synthetic Straps....IV-13-7
13.2.8 Weight Test Procedure Matrix....IV-13-7
13.2.9 Identification of Equipment....IV-13-8
13.2.10 Record Keeping....IV-13-8
13.2.11 Crane Material Condition Assessments....IV-13-8
13.3 Naval Facilities Engineering Command Ashore Requirements....IV-13-9
13.3.1 Certification Program....IV-13-9
13.3.2 Operator Licensing Program....IV-13-9
13.3.3 Inspections....IV-13-10
13.3.4 Test Procedures....IV-13-10
13.3.5 Special Purpose Service....IV-13-10
13.4 Slings....IV-13-10
13.5 Crane Rigging Gear and Miscellaneous Equipment....IV-13-10
CHAPTER 14 - MAGAZINE SPRINKLER INSPECTION REQUIREMENTS
14.1 Purpose....IV-14-1
14.2 Responsibilities....IV-14-1
14.2.1 Commanding Officers....IV-14-1
14.2.2 Verification Activity....IV-14-2
14.2.3 Immediate Superior In Command....IV-14-2
CHAPTER 15 - CIRCUIT BREAKERS
15.1 Purpose....IV-15-1
15.2 Circuit Breaker Function and Acquisition on Navy Ships....IV-15-1

15.3 Circuit Breaker Types and Applicable Specifications IV-15-1
15.4 Circuit Breaker Repairability and Parts Procurement IV-15-1
15.5 Circuit Breaker Maintenance Facilities/Activities (Non-Nuclear) IV-15-2
15.6 NAVSEA 08 Cognizant Circuit Breakers (Nuclear) IV-15-3

CHAPTER 16 - AIRCRAFT LAUNCH AND RECOVERY SYSTEMS FOR AIRCRAFT CARRIERS ONLY

16.1 Purpose IV-16-1
16.2 Aircraft Launch and Recovery Equipment Maintenance Program IV-16-1
16.2.1 Applicability IV-16-1
16.2.2 Objectives IV-16-1
16.2.3 Responsibilities IV-16-1
16.2.4 ALRE Management Team IV-16-2
16.2.5 AMMT Assist Visits IV-16-2
16.2.6 Audits IV-16-2
16.3 Aviation Certification IV-16-3
16.4 Carrier And Field Service Unit IV-16-3
16.5 Responsibilities IV-16-3
16.5.1 Aircraft Carrier Commanding Officer IV-16-3
16.5.2 Industrial or Repair Activity IV-16-4
16.6 Fleet Readiness Center IV-16-4
16.7 Fleet Readiness Center Voyage Repair Team IV-16-5

CHAPTER 17 - STEAM CATAPULT INSPECTION

17.1 Purpose IV-17-1
17.2 Policy IV-17-2
17.3 Types of Inspections IV-17-2
17.4 Responsibilities IV-17-2
17.4.1 Naval Sea Systems Command IV-17-2
17.4.2 Naval Surface Warfare Center, Philadelphia Division IV-17-3
17.4.3 Type Commander Maintenance Program Manager IV-17-4
17.4.4 SRF or RMC Commanding Officers IV-17-5
17.4.5 Ship Commanding Officer IV-17-5
17.4.6 SRF or RMC Senior SGPI IV-17-5
17.4.7 SRF or RMC Steam Systems SME IV-17-6
17.4.8 SRF or RMC SGPI IV-17-6
17.5 Inspection Scheduling IV-17-7
17.6 Safety IV-17-7
17.7 Inspections Requirements IV-17-8

17.7.1 Routine Inspection IV-17-8
17.7.2 Five-Year Strength and Integrity (5YR-SI) Inspection Cycle IV-17-9
17.7.3 Special Inspections IV-17-10
17.7.4 Operational Assessment IV-17-11
17.7.5 Inactivation Inspection IV-17-11
17.7.6 Reactivation Inspections IV-17-11

17.8 Additional Inspection and Reporting Guidelines IV-17-11

17.9 Catapult Accumulator System Inspection Preparation IV-17-13

17.10 Catapult Accumulator Inspection IV-17-14
17.10.1 Catapult Accumulator Inspection Forms IV-17-14
17.10.2 Completion of Inspection IV-17-14
17.10.3 Operating Procedures IV-17-14

Appendices
A Sample Catapult Accumulator Inspection Request Message IV-17A-1
B Sample Inspection Confirmation Letter IV-17B-1
C Sample Catapult Accumulator Inspection RBO and Severely Degraded Discrepancies Message IV-17C-1
D Sample Catapult Accumulator RBO Rescission Message IV-17D-1
E Sample 30-Day Update Message IV-17E-1
F Summary of Catapult Accumulator Inspection Scheduling and Responsibilities IV-17F-1
G Sample Routine Catapult Accumulator Inspection Report Cover Letter IV-17G-1
H Sample Five-Year Strength and Integrity Catapult Accumulator Inspection Report Cover Letter IV-17H-1
I Sample Other Catapult Accumulator Inspection Report Cover Letter IV-17I-1

CHAPTER 18 - SUBMARINE SALVAGE INSPECTION

18.1 Purpose IV-18-1

18.2 Inspections IV-18-1
18.2.1 Periodicity IV-18-1
18.2.2 Procedures and Reports IV-18-1
18.2.3 Inspection Resources IV-18-2

18.3 Responsibilities IV-18-2
18.3.1 Immediate Superior In Command IV-18-2
18.3.2 Commanding Officer or Officer In Charge IV-18-2
18.3.3 Senior Inspecting Officer IV-18-3

Appendices
A SSN 21 Class DISSUB and Salvage Inspection Check-Off List IV-18A-1
B SSN 688 Class DISSUB and Salvage Inspection Check-Off List IV-18B-1
C SSBN/SSGN 726 Class DISSUB and Salvage Inspection Check-Off List IV-18C-1
D SSN 774 Class DISSUB and Salvage Inspection Check-Off List IV-18D-1
E Sample Pre-Inspection Information or Certification IV-18E-1
F Sample Report of DISSUB and Salvage Inspection Forwarding Letter IV-18F-1

CHAPTER 19 - RETENTION OF MATERIAL DEFICIENCY REPORTS AND RECORDS OF EQUIPMENT CHARACTERISTICS AND TESTS

19.1 Purpose....IV-19-1

19.2 Inspection Reports....IV-19-1

19.3 Retention of Records of Equipment Characteristics and Tests....IV-19-1

Appendices
A Bearing Log (Submarines Only)....IV-19A-1

CHAPTER 20 - DIVER LIFE SUPPORT SYSTEMS, SUBMARINE RESCUE CHAMBER AND DRY DECK SHELTER MAINTENANCE AND CERTIFICATION

20.1 Purpose....IV-20-1

20.2 Diver Life Support System Maintenance and Certification....IV-20-1
20.2.1 General....IV-20-1
20.2.2 Objective....IV-20-1
20.2.3 United States Navy Diving and Manned Hyperbaric Systems Safety Certification....IV-20-1

Appendices
A System Safety Certification Verses Authorized for Navy Use Requirements Matrix....IV-20A-1

CHAPTER 21 - SUBMARINE OXYGEN GENERATING PLANTS

21.1 Purpose....IV-21-1
21.1.1 Policy....IV-21-1
21.1.2 Background....IV-21-2

21.2 Responsibilities....IV-21-2
21.2.1 Immediate Superior In Command....IV-21-2
21.2.2 Performance Monitoring Team....IV-21-2
21.2.3 Commanding Officer....IV-21-3

21.3 Requirements for Shipboard Personnel Qualification....IV-21-4
21.3.1 Training....IV-21-4
21.3.2 Watchstanding Prerequisites....IV-21-5

CHAPTER 22 - SUBMARINE ANTENNA TESTING

22.1 Purpose....IV-22-1

22.2 Background....IV-22-1

22.3 Policy....IV-22-1
22.3.1 Hydrostatic Pressure Testing....IV-22-1
22.3.2 Fleet Maintenance....IV-22-2

22.4 Procedure....IV-22-2

CHAPTER 23 - GAS TURBINE ENGINE INSPECTION FOR SURFACE FORCE SHIPS

23.1 Purpose....IV-23-1
23.2 Discussion....IV-23-1
23.3 Marine Gas Turbine Inspector....IV-23-1
23.3.1 Certification....IV-23-1
23.3.2 Authorized Functions and Responsibilities....IV-23-2
23.4 Gas Turbine Inspections and Requirements....IV-23-5
23.4.1 Applicability....IV-23-5
23.4.2 Pre-Planned Major Maintenance Availability....IV-23-5
23.4.3 Pre-Deployment....IV-23-5
23.4.4 Gas Turbine Bulletin Inspections....IV-23-5
23.4.5 Casualties....IV-23-6
23.5 Requesting Procedures....IV-23-6
23.6 Preparation for Inspection....IV-23-6
23.7 Inspection Procedures....IV-23-6
23.7.1 Post Casualty Inspections....IV-23-6
23.7.2 Pre-Availability Inspections....IV-23-6
23.8 Inspection Criteria....IV-23-6
23.8.1 Repair Before Operating....IV-23-6
23.8.2 Severely Degraded....IV-23-7
23.8.3 Major Deficiencies....IV-23-7
23.8.4 Minor Deficiencies....IV-23-8
23.9 Inspection Results....IV-23-8

CHAPTER 24 - WOOD HULLED SHIPS AND CRAFT

24.1 Purpose....IV-24-1
24.2 Wood Decay....IV-24-1
24.2.1 Primary Causes....IV-24-1
24.2.2 Recognition....IV-24-1
24.2.3 Preventive Measures....IV-24-2
24.3 Class Specific Maintenance....IV-24-2
24.3.1 Mine Countermeasure Class Vessels....IV-24-2
24.3.2 Yard Patrol Class Vessels....IV-24-3
24.3.3 USS Constitution....IV-24-3

CHAPTER 25 - GAS FREE ENGINEERING INSPECTIONS

25.1 Purpose....IV-25-1
25.2 Scope....IV-25-1

25.3 Discussion....IV-25-1

25.4 Oversight....IV-25-9

Appendices
A Gas Free Engineering Program Assessment Sheet....IV-25A-1

CHAPTER 26 - BOARD OF INSPECTION AND SURVEY INSPECTIONS POLICY

26.1 Purpose....IV-26-1
26.1.1 Scope....IV-26-1
26.1.2 Background....IV-26-1
26.1.3 Discussion....IV-26-1
26.1.4 Policy… IV-26-2

26.2 Responsibilities....IV-26-2
26.2.1 Type Commander....IV-26-2
26.2.2 Immediate Superior In Command....IV-26-2
26.2.3 Ship Commanding Officer....IV-26-3
26.2.4 INSURV Coordinator IV-26-3
26.2.5 Regional Maintenance Centers IV-26-4

26.3 Inspection Scheduling....IV-26-4
26.3.1 Combined Trial or Acceptance Trial Inspections....IV-26-4
26.3.2 Guarantee Material Inspection or Final Contract Trials....IV-26-4
26.3.3 Material Inspections....IV-26-4

26.4 Preparation for INSURV Inspection....IV-26-5
26.4.1 Active Preparation IV-26-5
26.4.2 Ship's Internal Organization....IV-26-5
26.4.3 Updating the Current Ship's Maintenance Project....IV-26-5

26.5 Board of Inspection and Survey Inspection Conduct and Documentation....IV-26-6
26.5.1 Inspection Conduct IV-26-6
26.5.2 Deficiency Documentation IV-26-6

26.6 Post Board of Inspection and Survey Inspection Actions IV-26-6
26.6.1 Deficiency Processing and Resolution....IV-26-6
26.6.2 Post INSURV Inspection Reports IV-26-7

Appendices
A INSURV Material Inspection Plan of Action and Milestones....IV-26A-1

CHAPTER 27 - REBOILER INSPECTION

27.1 Purpose....IV-27-1

27.2 Policy IV-27-2

27.3 Types of Inspections IV-27-2

27.4 Responsibilities....IV-27-2
27.4.1 Naval Sea Systems Command....IV-27-2
27.4.2 NSWCPD or ISEA IV-27-3

27.4.3 TYCOM Maintenance Program Manager IV-27-4
27.4.4 SRF or RMC Commanding Officers IV-27-5
27.4.5 Ship Commanding Officer IV-27-5
24.4.6 SRF or RMC Senior SGPI IV-27-5
27.4.7 SRF or RMC Steam Systems SME IV-27-6
27.4.8 SRF or RMC SGPI IV-27-6

27.5 Inspection Scheduling IV-27-7

27.6 Safety IV-27-7

27.7 Inspections Requirements IV-27-8
27.7.1 Routine Inspection IV-27-8
27.7.2 Five-Year Strength and Integrity (5YR-SI) Inspection Cycle IV-27-9
27.7.3 Special Inspection IV-27-10
27.7.4 Operational Assessments IV-27-11
27.7.5 Inactivation Inspection IV-27-11
27.7.6 Reactivation Inspection IV-27-11

27.8 Additional Inspection and Reporting Guidelines IV-27-11

27.9 Steam Reboiler Inspection Preparation IV-27-13

27.10 Boiler Inspection IV-27-14
27.10.1 Reboiler Inspection Forms IV-27-14
27.10.2 Completion of Inspection IV-27-14
27.10.3 Operating Procedures IV-27-14
27.10.4 Eddy Current Inspection IV-27-14

Appendices
A Sample Reboiler Inspection Request Message IV-27A-1
B Sample Reboiler Inspection Confirmation Message IV-27B-1
C Sample Routine Reboiler Inspection Report Cover Letter IV-27C-1
D Sample Five Year Strength and Integrity Reboiler Inspection Report Cover Letter IV-27D-1
E Sample Other Reboiler Inspection Report Cover Letter IV-27E-1
F Sample Reboiler Inspection RBO and Severely Degraded Discrepancies Message IV-27F-1
G Sample Reboiler Inspection RBO - Discrepancies 30 Day Update Message IV-27G-1

I Sample Reboiler Inspection RBO Discrepancies Rescission Message IV-27I-1

VOLUME IV
CHAPTER 1
INTRODUCTION

REFERENCES.

(a) OPNAVINST 3120.32 - Standard Organization and Regulations of the U.S. Navy
(b) OPNAVINST 4700.7 - Maintenance Policy for U.S. Naval Ships
(c) COMLANTFLTINST 5400.2 - U.S. Atlantic Fleet Regulations
(d) COMPACFLTINST 5400.3 - U.S. Pacific Fleet Regulations
(e) NAVSEAINST 4790.8 - Ships' Maintenance and Material Management (3-M) Manual

1.1 PURPOSE. To provide guidance in the execution and management for tests, inspections and assessments applicable to units of the Navy.

a. The Foreword of this manual contains a master listing of all references used throughout the Joint Fleet Maintenance Manual. These references are arranged in alphanumeric order to facilitate their procurement for use with this manual. References used in specific chapters of this volume are listed at the beginning of each chapter in the order in which they appear in the chapter text.

b. Acronyms are identified when they are initially used in this volume. Appendix C of the Foreword of the manual contains a master listing of acronyms used throughout this manual.

c. References (a) through (e) must be used in conjunction with this manual, however, the requirements of this manual must **not** take precedence over these higher authority directives, or technical directives from applicable Systems Commands. Where conflicts exist with previously issued Fleet Commander, Commander, Naval Reserve Forces (COMNAVRESFOR), Type Commander (TYCOM) letters, transmittals and instructions, other than references (c) and (d), this manual must take precedence. Conflicts must be reported to the cognizant TYCOM for resolution.

1.2 SCOPE. This volume applies to all ships and shore activities under the cognizance of Commander, United States Fleet Forces Command (COMUSFLTFORCOM), Commander, Pacific Fleet (COMPACFLT) and COMNAVRESFOR. This volume is not intended to be all encompassing, since the guidance for many elements of the maintenance programs and their execution are issued by higher or technical authority (e.g., Naval Ships' Technical Manuals (NSTM), Office of the Chief of Naval Operations Instruction (OPNAVINST)).

a. This volume contains general topics, applicable to all ships and units under the cognizance of COMUSFLTFORCOM or COMPACFLT. In those cases where chapters, sections or paragraphs of chapters are not applicable to certain Forces, an applicability statement has been used for clarification.

b. Equipment under the cognizance of the Strategic Systems Programs and Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) is maintained following Strategic Systems Programs and NAVSEA 08 directives, respectively.

1.3 CHANGES AND CORRECTIONS. Changes and corrections will be issued as required. Comments and suggestions for improving or changing this volume are invited. Address comments, recommendations and requested changes to Submarine Maintenance Engineering, Planning and Procurement Activity utilizing the change request form located in the front of this manual. If changes are submitted in electronic format, facsimile or E-mail, each change request must contain the information required on the change request form.

LISTING OF APPENDICES.

A Typical Core Capability Assessment Areas
B Typical Core Capability Assessment Projects
C Sample FMA Assessment Report
D FMA Assessment Deficiency Format

2.1 PURPOSE. The purpose of this chapter is to provide guidance for conducting a Fleet Maintenance Activity (FMA) Assessment, including areas to be assessed, responsibilities for conducting the assessment and deficiency correction and reporting requirements.

2.1.1 Scope. Fleet Maintenance Activity assessments will be conducted by the Type Commander (TYCOM) or Fleet Commander with cognizance over the FMA. For assessments conducted by the cognizant TYCOM, the assessment team will be comprised of members from each TYCOM that the FMA performs repairs for, with the senior member from the cognizant TYCOM. For assessments conducted by the cognizant Fleet Commander, the assessment team will be comprised of members from each TYCOM that the FMA performs repairs for, with the Fleet Commander, or Fleet Commander assigned TYCOM representative as the senior member of the assessment team. Assessments will be conducted per references (a) through (g) using the Quality Assurance assessment areas prescribed by volume V, part I, chapter 9 of this manual.

a. Assessments of Afloat FMAs will be performed annually, not to exceed 18 months.

b. Assessments of shore based FMAs will be performed every 18 months, not to exceed 24 months. (TYCOM Quality Assurance assessments, explained in volume V, part I, chapter 9 of this manual, will be accomplished concurrently with FMA assessments when scheduled in the same calendar year.)

c. (Regional Maintenance Centers only) The following Regional Maintenance Centers (RMC) will be assessed every 18 months not to exceed 24 months. Areas may be assessed more frequently based upon results of previous assessments. These assessments encompass all functions of the RMC standard departments as listed in Commander, Naval Regional Maintenance Center Ship Organization and Regulation Manual:

Mid-Atlantic Regional Maintenance Center (MARMC)
Southeast Regional Maintenance Center (SERMC)
Southwest Regional Maintenance Center (SWRMC)
Pearl Harbor Naval Shipyard and Intermediate Maintenance Facility
Puget Sound Naval Shipyard and Intermediate Maintenance Facility
Forward Deployed Regional Maintenance Center (FDRMC)

d. Assessments are to evaluate the ability of the FMA to execute maintenance following applicable technical directives and specifications. The assessment of FMAs encompasses Repair Department Work Centers (WC) and the direct repair WC support functions performed by other departments.

2.1.2 Applicability. The assessments described in this chapter are applicable for non-nuclear work only. This chapter does not apply to nuclear work and systems; they are addressed separately in volume V, part I, chapter 9 of this manual.

2.2 ASSESSMENT AREAS.

a. FMAs are expected to maintain a broad spectrum of capabilities at full readiness. The FMA can expect that many of these capabilities will be observed and evaluated during the course of the assessment. The Assessment Team will place primary emphasis on the essential core capabilities, utilizing the guidelines of references (a) and (b).

b. Core capability craftsman demonstration areas are shown in Appendices A and B of this chapter. These represent the typical areas to be assessed and, as time permits, the team leader may observe other areas or projects. Observation of "in process work" is preferred to the assignment of projects or mockups in core capability areas. The team leader will make all decisions regarding the assignment of projects.

2.3 ASSESSMENT RESULTS. An overall grade of satisfactory or unsatisfactory will be assigned based on the FMA's compliance with higher-level requirements and governing technical documents.

2.4 RESPONSIBILITIES.

2.4.1 Type Commander.

a. Promulgate an assessment schedule by 30 November for the following calendar year.

b. Forward a precepts letter, or a message, to the FMA's Commanding Officer at least two weeks prior to the assessment. This letter should include:

(1) The date of the assessment.

(2) Assessment Team member's security clearance information.

(3) Core capability areas for the observation of in process work.

(4) Logistic support requirements.

(5) Additional information as appropriate.

c. Conduct an inbrief and outbrief with the Immediate Superior in Command (ISIC) (if assigned), FMA's Commanding Officer and designated personnel. A preliminary copy of the Assessment Report will be provided to the FMA at the outbrief.

d. Issue the Assessment Report (Appendix C of this chapter) to the FMA via the ISIC within 15 calendar days following completion of the assessment.

2.4.2 Fleet Maintenance Activity.

a. Forward team security clearance information to the local base security office and to all units who are or will be in availability during the period of the assessment.

b. Designate an Assessment Coordinator to act as the point of contact between the Assessment Team and the command. Notify the appropriate TYCOM of the name and phone number of the Assessment Coordinator upon receipt of the assessment precepts letter.

c. Ensure the following assessment support is provided:

(1) Access to all industrial areas within the FMA.

(2) An adequate and dedicated administrative work area to allow the Assessment Team to assemble.

(3) Parking for the Assessment Team.

(4) A telephone with off-ship and long distance capability.

(5) Access to Maintenance Resource Management System.

(6) Clerical personnel to assist. These personnel will report to the Assessment Team Leader for assignment of working hours and duties.

(7) Copying services.

(8) Access to all Controlled Work Packages (CWP) and standard Formal Work Packages (FWP), including the index of FWPs.

(9) Access to selected Repair Department training records and the departmental weekly training schedule for the week of the assessment.

(10) A list of all non-nuclear Technical Work Documents performed since the last assessment.

(11) A list of key personnel and telephone numbers.

(12) A list of capabilities required per references (a) and (b), but not held.

(13) A list of all critical path jobs scheduled during the assessment.

(14) A list of all production or management meetings scheduled during the assessment.

(15) In the Assessment Team work area, provide:

(a) One desk top computer and a laser printer.

(b) A copy of the following reference documents:

1 The previous TYCOM or Fleet Assessment report with corrective actions.

2 Equipment out of commission lists.

3 All FMA instructions and notices, including those pertaining to safety, production and repair functions, and the Command Availability Guide (if applicable).

4 Activity manpower documents.

5 Navy Afloat Maintenance Training Strategy-Training Reports.

6 FMA Capabilities (currently titled IMA Capabilities) and WC Validation Reports for all applicable WCs.

7 Joint Fleet Maintenance Manual.

8 TYCOM Training Manual.

9 Repair Department Equipment Status Log.

10 FMA Audit and Surveillance Program records.

11 FMA self-assessments.

12 Departure from Specification files.

d. Initiate action to systematically correct each assessment deficiency finding (see Appendix D) per paragraph 2.5.1 and 2.5.2.

2.5 ASSESSMENT FINDINGS AND CORRECTIVE ACTION.

a. For each noted deficiency in an assessment area, a finding will be written and classified as either “Immediate Corrective Action Required” or “Corrective Action Required”.

b. Audit cards must clearly “stand on their own” and indicate if certification is or is not impacted by the finding when the audit card deals with SUBSAFE, Deep Submergence Systems or Fly-By-Wire deficiencies. All audit cards annotating a certification issue will be classified as “Immediate Corrective Action Required”.

c. The FMA will annotate in the corresponding assessment report enclosure, the corrective actions taken for each finding.

d. The Commanding Officer will also submit a findings status report to the TYCOM via the administrative chain of command within 60 days following receipt of the official assessment report.

e. Unless a delay is specifically authorized by the TYCOM, all findings will be corrected within the time limits specified in paragraphs 2.5.1 and 2.5.2.

2.5.1 Immediate Corrective Action Required. A deficiency that poses a significant safety hazard or results in a total loss or extreme degradation of the FMA’s readiness to perform work or

provide a service within an area of required capability. Findings classified as "Immediate Corrective Action Required" require the immediate attention of the Commanding Officer and must be corrected within 15 days following the date of the assessment out-brief. Additionally, the TYCOM may direct the immediate suspension of work in any area(s) pending resolution of critical deficiencies.

2.5.2 Corrective Action Required. A deficiency which poses a potential hazard to personnel safety or has a significant impact on the FMA's readiness to perform work or provide a service within an area of required capability. Findings classified as "Corrective Action Required" require the prompt attention of the Commanding Officer to preclude them from developing into "Immediate Corrective Action Required" deficiencies and must be corrected within 60 days following receipt of the official assessment report.

APPENDIX A

TYPICAL CORE CAPABILITY ASSESSMENT AREAS

1. Safety or Navy Occupational Safety and Health.
2. Repair Training Effectiveness.
3. Maintenance Management.
4. Maintenance Data System Management.
5. Calibration - Production or WC Management.
6. FWPs (Volume V, Part I, Chapter 2 of this manual).
7. Tool or Equipment Control Programs.
8. Corrosion Control Program (as applicable).
9. Welding and Brazing Programs.
10. Quality Assurance Organization (Volume V of this manual).
11. Nondestructive Testing and Nondestructive Inspection (volume V, part I, chapter 3 of this manual).
12. Technical Work Documents (volume V, part I, chapter 2 of this manual).
13. Planning & Estimating.
14. Technical Library.
15. Hull Repair.
16. Machinery Repair.
17. Electrical Repair.
18. Electronics Repair.
19. Ordnance Repair (as applicable).
20. Weapon System Repair.
21. Weight Handling or Rigging.
22. Diving or Diver Life Support Systems (as applicable).
23. Regional Repair Center Capabilities (as applicable).

APPENDIX B

TYPICAL CORE CAPABILITY ASSESSMENT PROJECTS

1. Butt Weld (pipe).
2. HY-80 Weld Process.
3. Weld Hard-face.
4. Silver Braze.
5. Tube Bend.
6. Flex Hose Manufacture & Testing.
7. Electroplating.
8. Hydraulic Control Valve Repair.
9. Weight Handling Sling Manufacture and Weight Test.
10. Valve Lap and Hydrostatic Test.
11. Other projects as necessary.

APPENDIX C

SAMPLE FMA ASSESSMENT REPORT

From: TYCOM (as appropriate)
To: Commanding Officer, FMA
Via: ISIC (as appropriate)

Subj: FMA ASSESSMENT

Ref: (a) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual
(b) Precepts letter

Encl: (1) FMA Assessment Findings
(2) FMA Assessment Project Summary

1. Per Volume IV, Chapter 2 of reference (a) and reference (b), an FMA Assessment was conducted onboard FMA (Name of assessed command), during the period (Dates of Assessment).

2. The Assessment Team reviewed selected areas as prescribed in reference (a) and their findings and comments are contained in enclosures (1) and (2). Any required corrective actions should be initiated per Volume IV, Chapter 2, paragraph 2.5.1 and 2.5.2 of reference (a).

3. Overall Observation: (A brief summary of the results of the assessment including an overall evaluation of satisfactory or unsatisfactory).

4. (Subsequent paragraphs should briefly comment on major areas of concern found during the assessment).

LISTING OF APPENDICES.

A Sample Boiler Inspection Request Message
B Sample Inspection Confirmation Message
C Summary of Boiler Inspection Scheduling and Responsibilities
D Sample Boiler Inspection Report Cover Letter
E Sample Boiler Inspection – RBO and Severely Degraded Deficiencies Message
F Sample RBO Rescission Message
G Sample 30 Day Update Message

3.1 PURPOSE. To establish policy and provide procedures and inspection requirements for the inspection of all conventional steam generating plants in surface force ships and training sites including schedules, preparations for inspection, inspection guidelines and reporting. Periodic standardized inspections are required of all non-nuclear propulsion, auxiliary, waste heat and training site boilers by a certified Steam Generating Plant Inspector (SGPI) or Naval Surface Warfare Center, Philadelphia Division (NAVSURFWARCEN PD), as applicable. The maximum interval between boiler inspections and other occasions requiring boiler inspections, including responsibilities for continuation and standardization of the boiler inspection program, are formally assigned in reference (a).

3.2 TYPES OF BOILER INSPECTIONS.

a. Routine Inspection.

b. Pre-start of Availability Inspection (PSAI).

c. Start of Availability Inspection (SAI).

d. Strength and Integrity Inspection.

e. Industrial Support Visit (ISV).

f. Completion of Availability Inspection (CAI).

g. Inactivation or Reactivation Inspection.

h. Engineer Officer Inspection.

i. Major Repair Inspection.

j. Special Inspection.

k. Operational Assessments.

3.3 RESPONSIBILITIES.

3.3.1 Naval Sea Systems Command. NAVSEA must provide technical authority oversight over all main, auxiliary, waste heat and training site boiler systems and associated equipment. The designated NAVSEA Technical Warrant Holder must:

a. Assure safe and reliable system operation.

b. Set and enforce all technical requirements.

c. Approve all major Departure from Specifications (DFS).

d. Provide technical oversight and management of the SGPI and NSWCPD programs:

(1) Establish and enforce requirements for SGPI certification and recertification.

(2) Ensure periodic SGPI seminars are conducted.

(3) Ensure periodic technical audits of all Integrated Logistics Support documentation and Training.

(4) Maintain the Boiler Inspection and Repair Management Information System (BIRMIS).

(5) Routinely evaluate and ensure state of the art inspection, maintenance and repair tools and techniques are used.

3.3.2 Naval Surface Warfare Center, Carderock Division. NSWCCD must:

a. Provide support to NAVSEA for the SGPI and NSWCPD programs. Ensure that the required technical documentation to support the SGPI or NSWCPD Inspector programs is maintained current.

b. Establish and monitor the requirements and standards for routine and industrial inspections of steam generating plants.

c. Develop, implement and maintain a program to train and certify NSWCPD Inspectors per reference (a).

d. Ensure that inspections of newly constructed ships and ships undergoing major overhaul or conversion are conducted per this instruction.

e. Conduct periodic technical audits of the SGPI Training Course per reference (a).

f. Provide management of technical data, boiler history and the associated repair management information database system.

g. Provide technical support to the semi-annual seminars.

h. Maintain a roster of all certified SGPIs by name, rating, duty station, date of certification and expiration date of certification. Revoke inspector certification and initiate action to decertify inspectors who fail to comply with requirements of reference (a).

i. Ensure that the requirements for SGPI certification, recertification and certification extensions are met prior to final approval.

3.3.3 Fleet Commander. The Fleet Commander must:

a. Identify and designate those fleet activities which have inspection responsibilities and maintain a base of certified SGPIs within those activities.

b. Ensure the availability of "school ships" to support SGPI or NSWCPD Inspector training. Student certification must be conducted on "D" type boilers.

c. Host the semi-annual SGPI seminars on an alternating coast basis.

3.3.4 Regional Maintenance Center. The Regional Maintenance Center (RMC) must:

a. Provide certified SGPIs to perform inspections per section 3.6.

b. Review the guidelines and inspection requirements for all boiler inspections required by this instruction and ensure that each inspection report is recorded and updated into BIRMIS.

c. Schedule and coordinate inspections of all steam generating plants required by this instruction with the appropriate technical activities to avoid the unnecessary opening of boilers.

d. Provide a qualified SGPI when requested by the ship, Immediate Superior in Command (ISIC) or Type Commander (TYCOM).

3.3.5 Regional Maintenance Center Commanding Officers. RMC Commanding Officers must:

a. Coordinate inspections in cognizant maintenance areas.

b. Maintain an up-to-date status of required steam generating plant inspections which must include the latest inspection for all ships assigned to RMCs in their respective area of responsibility.

3.3.6 Immediate Superior In Command. The ISIC must:

a. Maintain overall cognizance of the Steam Generating Plant Inspection Program within their area of responsibility to ensure requirements and standards are met.

b. Schedule routine steam generating plant inspections in coordination with the cognizant RMC.

c. Arrange for the availability of an SGPI during the SAI and CAI in coordination with NSWCPD and the cognizant RMC.

d. Monitor the follow-up action required to correct noted discrepancies by randomly sampling the ship's deferred maintenance action file and most recent boiler inspection report.

e. Assist Commanding Officers in arranging for the corrective action of items beyond the capability of Ship's Force, when requested.

3.3.7 Ship Commanding Officer, Officer In Charge or Maintenance Team. Ship Commanding Officers, Officers In Charge or Maintenance Team must:

a. Request boiler inspections via Naval Message using the format in Appendix A of this chapter.

b. Prepare for scheduled inspections to include required operational testing per references (b) and (c).

c. Review inspection results and initiate corrective action for those items within Ship's Force capability. Initiate requests for the correction of items beyond Ship's Force capability. If any of the discrepancies of paragraph 3.9.2 of this chapter cannot be corrected within 72 hours following completion of the inspection, or if said discrepancies will impact the ship's operational schedule, initiate a Casualty Report (CASREP) for the affected boiler(s) per reference (d).

d. Assess the impact (if any) of corrective action on operating schedules and advise the operational commanders. Decide (with repair activities) the optimum timing of repair actions to minimize impact on operating schedules.

e. Submit reports per paragraph 3.7.2.

f. Schedule boiler inspections as required by appropriate Planned Maintenance System (PMS) or Class Maintenance Plan item.

3.3.8 Regional Maintenance Center Senior Inspector. RMC Senior Inspectors must:

a. Ensure all assigned SGPIs maintain current certifications per reference (a).

b. Perform steam generating plant inspections per section 3.9, when directed.

c. Review and submit reports per paragraph 3.7.2.

d. Send inspection confirmation messages using Appendix B.

e. Administer an SGPI pre-test for SGPI training school candidates per reference (a).

3.3.9 Steam Generating Plant Inspector. The SGPI must:

a. Maintain SGPI certifications per reference (a).

b. Perform steam generating plant inspections per section 3.9, when directed.

c. SGPIs are part of the technical authority chain-of-command and are accountable to the NAVSEA Technical Warrant Holder for the performance of their inspection duties.

d. The shipboard SGPI must:

(1) Monitor all repairs conducted on the boilers, such as tube replacements, casing or refractory work, burner settings, hydrostatic test, etc., and annotate findings in Boiler Water or Feedwater log.

(2) Observe PMS performed on the boilers to include MLOCs (burner front checks), greasing of sliding feet, setting safety valves, high and low static checks, flex tests and auxiliary support equipment safety and governor settings.

(3) Accomplish special inspections and repairs on boilers after boiler casualties while underway and report in BIRMIS. Also, accomplish operational assessments on ship's boiler auxiliary support equipment prior to upcoming availabilities and report in BIRMIS and in ships Current Ship's Maintenance Project (CSMP), if repairs are required.

e. It is recommended that the shipboard SGPI be assigned as the LCPO of the Oil Lab in order to monitor the boiler water chemistry, boiler lay-ups and the Boiler Water or Feedwater Program (not to be assigned as Ships Oil King).

NOTE: THE SHIP'S FORCE SGPI CAN ONLY ACCOMPLISH SPECIAL INSPECTIONS AND OPERATIONAL ASSESSMENTS ON THEIR OWN SHIP, AS DESCRIBED IN PARAGRAPHS 3.6.9 AND 3.6.10. THE SHIP'S FORCE SGPI WILL ASSIST THE RMC SGPI OR NSWCPD INSPECTOR DURING ROUTINE AND AVAILABILITY RELATED INSPECTIONS. THE SHIP'S FORCE SGPI MAY NOT INDEPENDENTLY CONDUCT ROUTINE, STRENGTH AND INTEGRITY, PSAI, SAI, ISV, CAI INSPECTIONS ON THEIR OWN SHIP.

3.4 INSPECTION SCHEDULING. Commands will coordinate boiler inspections with the Maintenance Team or ISIC to include operational testing. Commands must ensure the inspection scheduling complies with the following:

a. Boiler inspections are actively managed by SURFMEPP utilizing the Class Maintenance Plan. All routine, Pre-Availability, Start of Availability, Completion of Availability, Strength, Integrity and Ultrasonic Test Inspections will be pushed by SURFMEPP into the maintenance screening and brokering system as part of the Baseline Availability Work Package. SURFMEPP will also push non-routine boiler inspections as requested by TYCOM or the Maintenance Team.

b. Once the Work Notification is available in the maintenance screening and brokering system, Ship's Force and the Maintenance Team may coordinate and execute the inspection.

c. Inspections should coincide with the required routine waterside and fireside maintenance.

d. Boiler inspection services must be coordinated by geographic areas for maximum utilization of SGPIs and NSWCPD Inspectors. ISICs will combine inspection requests and schedule inspections.

3.5 BOILER SAFETY PROCEDURES. The safety of personnel must be given the highest priority. Observance of good engineering practices and careful control of boiler water chemistry will reduce the frequency of pressure vessel entry.

a. Ensure "idle boiler condition" is accomplished per the provisions of the Engineering Operational Sequencing System (EOSS) and reference (b). Where conflicts occur, an EOSS feedback form should be submitted for resolution.

b. Do not enter any part of a boiler or De-Aerating Feed Tank (DFT) until it has been fully ventilated and certified by a Naval Maintenance Facility Gas Free Engineer or National Fire Protection Agency marine chemist as safe for entry per references (e) and (f), as applicable, and chapter 25 of this volume.

c. Ensure the idle boiler is tagged out (valves wired shut and danger tagged). Observe two-valve protection per reference (g) where applicable. Open to the atmosphere the drain connections on all dead interconnecting piping to observe drainage.

d. The use of unshielded or non-approved portable lighting in an open boiler is prohibited. Portable lighting must be watertight. (National Stock Number (NSN) 9S-6230-00-701-2947 applies.)

e. Ensure all precautions cited in reference (b), section 2.24 are followed before entering an idle boiler.

f. There must be a safety observer outside the boiler entrance to provide assistance whenever personnel are inside a boiler (steam drum, water drum, firebox or smoke pipe).

g. Maintain an inventory log for accountability of all items taken into a boiler. The pockets of all personnel working in a boiler must be emptied and all jewelry removed. The removal of all items from the boiler must be verified from the inventory log prior to the close-up inspection. The Chief Engineer or his designated representative must inspect the boiler prior to final closeout.

h. Cleaning of firesides or repairs conducted to the pressure vessel exterior of a boiler is acceptable with a steaming boiler in the same space provided the precautions cited in reference (b), section 2.7, are observed. Water washing of the firesides is not authorized without NAVSEA approval.

i. Requiring personnel to enter the steam or waterside of a boiler with an adjacent steaming boiler is considered an unnecessary risk and will be avoided unless operations dictate otherwise. The decision to override normal safety precautions will be made by the Commanding Officer or Officer In Charge and will be reported to the TYCOM by message.

j. Keep the area under the boiler clean and dry.

k. Place signs warning that personnel are working in the boiler at the Boiler Console Operating station in the boiler operating space. The sign must remain there until the work has been completed and personnel are clear of the secured boiler.

3.6 BOILER INSPECTIONS AND REQUIREMENTS. Main propulsion, auxiliary, waste heat and training site boiler inspections conducted per the requirements of this chapter must fulfill all other requirements for comprehensive inspections of propulsion, auxiliary and waste heat boilers. All boiler inspections, including pre- and post-operational assessments, should be scheduled for coincidental performance. Appendix C of this chapter is a summary of boiler inspection scheduling and responsibilities. Propulsion, auxiliary and waste heat boilers will be inspected by a certified SGPI at the following intervals:

3.6.1 Routine Inspection. Routine Inspections will be conducted at least once every Fleet Readiness Training Cycle. For newly constructed ships, the period will begin at the completion of the Board of Inspection and Survey (INSURV) Acceptance Trials. For LHD-1 Class ships, the normal interval between routine boiler inspections will be 24 months. For LCC-19 and CG-47 Class ships, the normal interval between routine boiler inspections will be every 18 months. To provide scheduling flexibility, boiler inspections may be performed as early as 6 months before or as late as 6 months after the required inspection date. However, extensions beyond 24 months for LHDs or 18 months for LCC-19 and CG-47 class ships, require Type Commander approval via minor DFS. Such extensions must not result in the inspection interval exceeding 30 months for LHDs or 24 months for LCC-19 and CG-47 class ships. Any boiler which exceeds the inspection interval may be placed out of commission until inspected by a certified SGPI. A major DFS submitted from the TYCOM to NAVSEA Boiler and Condenser Technical Warrant Holder for adjudication is required to operate a boiler beyond 30 months for LHD-1 Class ships and beyond 24 months for LCC-19 and CG-47 Class ships without a Routine Boiler Inspection. The Completion of Availability Inspection (CAI) or Strength and Integrity required inspections fulfill the requirements of a routine inspection.

a. A Safe-to-Steam Assessment will be performed when a DFS request for inspection periodicity extension is submitted for:

   1. LHD-1 Class - Minor and Major
   2. LCC-19 Class - Major
   3. CG-47 Class - Minor and Major

b. A Safe-to-Steam Assessment performed by an SGPI that is not part of Ships Company must be included with the periodicity extension request. Safe-to-Steam Assessments are scheduled by the TYCOM via the ISIC. Minimum requirements for a SGPI Safe-to-Steam Assessment are:

   1. Boiler-water and Feed-water program review per guidance provided in NAVSEA S9221-D2-MMA-010, Steam Generating Plant Inspection (Non-Nuclear) Manual: para 9.2 and Appendix F for LHD and LCC Classes; para 11.7 and Appendix F for CG-47 Class.
   2. Operational inspection per guidance provided by NAVSEA S9221-D2-MMA-010, Steam Generating Plant Inspection (Non-Nuclear) Manual: Appendix E and Figure E-6 for LHD and LCC Classes; Appendix E and Figure 11-2 for

CG-47 Class. Demonstration of PMS that will become due during the requested extension timeframe along with any other PMS that has already been complete may be requested by the SGPI conducting the Assessment.

3. All Safe-to-Steam Assessment results must be reported in BIRMIS.

c. The boiler inspection will be scheduled by the cognizant ISIC.

d. The boiler inspection will be performed by the RMC SGPI.

e. The TYCOM may utilize PSAIs, CAIs, and Strength and Integrity Inspections which are documented in BIRMIS, to satisfy the pressure vessel portion of a routine boiler inspection. This will reduce the number of boiler openings. A Routine Inspection will not be considered completed until an SGPI has certified all items required in NSTM 221-2.1.2.3 Ship's Pre-inspection Checklist For Up-coming Routine Boiler Inspection by U.S. Navy Steam Generating Plant Inspector and reference (c), Appendix E, F and Figure E-6 addressing Operational Assessments has been accomplished. Once completed, this resets the periodicity required for the next inspection to 24 months not to exceed 30 months for LHD-1 Class and 18 months not to exceed 24 months for LCC-19 and CG-47 Classes.

3.6.2 Pre-Start of Availability Inspection. The PSAI may be required at the discretion of the TYCOM to support early bid specification and work package development.

a. The PSAI will be scheduled by the ISIC, as approved by the cognizant TYCOM.

b. The PSAI will be performed by the NSWCPD Inspector and the RMC SGPI.

3.6.3 Start of Availability Inspection. The SAI may be required to be accomplished at the beginning of an overhaul or availability to better define or re-evaluate the boiler bid specifications or work items at the discretion of the ISIC with TYCOM concurrence.

a. The SAI will be scheduled by the ISIC, as approved by the cognizant TYCOM.

b. The SAI will be performed by the NSWCPD Inspector and the RMC SGPI.

3.6.4 Strength and Integrity Inspection. The normal interval between Strength and Integrity Inspections will be 60 months. Strength and Integrity Inspections may be performed as early as 48 months or as late as 72 months after the last Strength and Integrity Inspection to provide scheduling flexibility. Inspections that exceed the 60-month interval will require a minor DFS to the TYCOM with recommendation from NSWCPD. Strength and Integrity Inspections **may not** exceed 72 months since the last inspection. Any boiler which exceeds the inspection interval will be placed out of commission until inspected by an NSWCPD Inspector and a certified SGPI. A major DFS with NAVSEA Technical Warrant Holder approval is required to operate a boiler beyond 72 months without a Strength and Integrity Inspection.

a. The Strength and Integrity Inspection will be scheduled by the cognizant ISIC.

b. The Strength and Integrity Inspection will be performed by an NSWCPD Inspector and the cognizant RMC SGPI.

3.6.5 Industrial Support Visit Inspection. The ISV inspection should be scheduled during the availability, but may be waived by the TYCOM for availabilities of short duration.

a. The ISV inspection will be scheduled by the industrial activity or Supervising Authority as applicable.

b. The ISV inspection will be performed by an NSWCPD Inspector and the cognizant SGPI.

3.6.6 Completion of Availability Inspection. The CAI will be conducted before reinstallation of steam drum internals and de-superheater for the Strength and Integrity Inspection.

a. The CAI will be scheduled by the industrial activity or Supervising Authority, as applicable, and may be conducted in conjunction with a Routine Inspection.

b. The CAI will be performed by an NSWCPD Inspector and the cognizant SGPI.

3.6.7 Inactivation or Reactivation Inspection. The Inactivation or Reactivation Inspection must be conducted on all boilers prior to completion of the inactivation or reactivation.

a. The Inactivation or Reactivation Inspection will be scheduled by the industrial activity, Supervising Authority or Inactive Ship Facility as applicable.

b. The Inactivation or Reactivation Inspection will be performed by an NSWCPD Inspector and the cognizant SGPI.

3.6.8 Engineer Officer Inspection. The Engineer Officer Inspection will be conducted per PMS and situational requirements of references (b) and (c), but does not qualify as a Routine Inspection described in paragraph 3.6.1. This inspection will be scheduled and performed by the ship's Engineer Officer. All results are to be documented in the Boiler or Water Feedwater logs and the Engineering Logs.

3.6.9 Special Inspection.

a. A special inspection must be conducted whenever major repair work as defined by references (b) and (g) is accomplished. This inspection is arranged by the ISIC in coordination with the TYCOM and the RMC and performed by an SGPI.

b. Additionally, SGPIs are authorized to conduct special no-notice inspections at their discretion to assess operational, chemistry and maintenance related problems.

3.6.10 Operational Assessments. An operational assessment must be accomplished prior to and at the completion of all Chief of Naval Operations (CNO) scheduled maintenance availabilities. These assessments are part of the Routine and Strength and Integrity Inspection requirements. These assessments will include both cold and hot plant inport safety checks and an operational evaluation. Detailed assessment requirements and checklists are available in reference (c), Figure E-6.

3.7 BOILER INSPECTION GUIDELINES AND REPORTS.

3.7.1 Guidelines.

a. Routine Inspections of boilers will be conducted by certified SGPIs.

b. Only an SGPI with a current certification may issue a Repair Before Operating (RBO) deficiency. All RBO items must be corrected prior to boiler operation and reinspected by a certified SGPI or NSWCPD Inspector, as applicable, and preferably the same SGPI or NSWCPD Inspector who originally inspected the boiler. RBO discrepancies

include those for which continued unrestricted operation could endanger personnel. RBOs may not be departed via DFS. If there is not an immediate or near future danger to personnel, the discrepancy must be assigned as SEVERELY DEGRADED with major operational restrictions.

c. An SGPI-designated discrepancy discovered per reference (c) and paragraph 3.9.2 which is assigned as severely degraded with major operational restrictions, and is considered for a DFS submission, is a major DFS and must be brought forward to the attention of the NAVSEA Boiler and Condenser Technical Warrant. A Major DFS must be forwarded for NAVSEA review and approval with accompanying engineering analysis recommendations from the originator. A severely degraded discrepancy per this chapter must be corrected or repaired prior to boiler operation unless it has been properly approved as a Major DFS.

d. The status of a boiler related DFS will be verified by the SGPI during the inspection for conformance with the requirements of this manual prior to placing the boiler into operation.

3.7.2 Reports.

a. The SGPI must provide an oral critique and preliminary report to the ship's Commanding Officer or his designated representative. The report will contain the findings of the inspection, with special note of recurring discrepancies from previous inspections. The SGPI must ensure a maintenance ready Ship's Maintenance Action Form, OPNAVINST 4790/2K, (2-Kilo) for every discrepancy found during the inspection is entered into the Current Ship's Maintenance Project. Document the assessment finding of maintenance ready work notification (2-Kilo) per volume VI, chapter 42, paragraph 42.5.5 of this manual.

b. The Senior Inspector will forward a copy of the BIRMIS report with cover letter per the sample shown in Appendix D to the ship's Commanding Officer no later than ten days after satisfactory clearance of all discrepancies.

c. The SGPI must report deficiencies discovered during the inspection by message within 24 hours, using the message format of Appendix E. This message must contain both RBO and severely degraded deficiencies as described in paragraph 3.7.1.

d. The cognizant SGPI must report by message, using the format in Appendix F of this chapter, the correction and re-inspection of all RBO deficiencies prior to lighting off an inspected boiler.

e. The ship's Commanding Officer must submit a copy of the Current Ship's Maintenance Project to the SGPI for verification of downloaded 2 Kilos.

f. The ship's Commanding Officer must report corrected deficiencies, by message, to the ISIC and TYCOM using the format in Appendix G of this chapter, within 30 days of the completed inspection and at 30-day intervals thereafter until all deficiencies are corrected or deferred to a CNO Maintenance Availability. The TYCOM is the sole authority for deferral of deficiencies. Update messages must list the BIRMIS item number and 2-Kilo Job Sequence Number of those items which have been completed

since the last update message. A corrected BIRMIS report will be provided to the ship after BIRMIS status codes are updated.

g. The ship's Commanding Officer must notify the ISIC (as applicable) or TYCOM when a scheduled steam generating plant inspection cannot be conducted by submitting a DFS request. State the reason why the inspection cannot be conducted and recommend a revised date.

3.8 BOILER INSPECTION PREPARATION.

a. Conduct the operational assessment before disassembling the boiler for inspection. Detailed assessment requirements are reported in reference (c).

b. Prepare the boiler using the guidance provided in reference (b).

c. Keep air passages, including the air box beneath the boiler and uptake spaces, clean and dry.

d. Wire shut and danger tag all steam and water valves to the boiler per the ship's Tag Out User's Manual. Open to the atmosphere the drain connections on all dead interconnecting piping to observe drainage.

e. The ship's Engineer Officer must ensure all Ship's Force responsibilities are complete using the guidance provided in reference (c).

f. Open DFT for inspection.

3.9 BOILER INSPECTION.

3.9.1 Boiler Inspection Forms. Boiler inspections will be conducted using the appropriate BIRMIS forms. Include specific comments on the state of preservation and material condition of the boiler, hull structural members beneath the boiler and the effectiveness or ineffectiveness of the boiler water chemistry program.

3.9.2 Boiler Inspection Areas. A discrepancy is classified as an RBO when, if left uncorrected, it could endanger personnel safety. All RBO items must be corrected prior to boiler operation and re-inspected by a certified SGPI or NSWCCD LCEM Inspector as applicable, and preferably the same SGPI or NSWCPD Inspector who originally inspected the boiler. As inspected by an SGPI inspector, RBO discrepancies may include but are not limited to the following:

a. Active oxygen attacking the boiler watersides.

b. Hard scale or baked sludge.

c. Significant lube oil or fuel oil contamination of watersides.

d. Inoperative, misadjusted or missing safety devices.

e. Refractory deterioration which allows heat penetration to casings or causes incomplete combustion.

f. Ship's Force Boilerwater or Feedwater certifications, chemical inventory and shelf life not within requirements in reference (h).

g. Inability to maintain water chemistry within limits. Ineffective Boilerwater or Feedwater program based on log review which, if left uncorrected, may result in

severe degradation of the boiler watersides. Inoperative or degraded treatment, sampling and blow-down systems.

h. Excessively fouled or tacky firesides, fireside deposits built up on the crown of the water drum.

i. Sliding feet that do not accept grease or do not show indication of movement.

j. Lack of maintenance and preservation of the boiler, resulting in deterioration and weakening of boiler and hull structural members. This includes deterioration in the air casing which allows water and combustion air or gasses into the space.

k. Lube oil contamination of Automatic Boiler Control (ABC) Systems.

l. Fire hazards, safety hazards (fuel or lube oil in the machinery room), deteriorated or missing flange shields. Oil soaked lagging and insulation.

m. Inoperative or missing firefighting equipment.

n. ABC equipment inoperable or failed cold or hot checks.

o. Steam smothering system inoperative (plugged nozzles, deteriorated or improperly installed piping).

p. Deteriorated boiler smoke pipes which allow stack gas to escape. Clogged or deteriorated stack drains.

q. Incorrectly adjusted burners or inoperative air registers. Safety Shut-off Devices which do not meet the leakage criteria of reference (b). Insufficient amount of sprayer plates, burner barrels and go-no-go gages to meet main space requirements as specified in reference (b).

r. Boiler that does not pass design hydrostatic test.

s. Non-deferrable defects or indications in the pressure vessel and piping boundary.

t. Damaged or deteriorated internals.

u. Defective tubes such as blistered, excessively warped or married tubes which prevent proper gas passage. Cracked tube bells.

v. Ultrasonic test results on soot blower heads or pressure vessel piping that are currently or projected to be at or below minimum requirements, out of periodicity, or when visual inspection dictates replacement before the next scheduled ultrasonic inspection.

w. Out of periodicity, in-operative temperature or pressure measuring instruments.

x. In-operative, out of adjustment Forced Draft Blower counterweight shutters.

y. Non-functioning DFT components or defects in the pressure vessel.

z. In-operative fuel and steam systems remote isolation devices.

aa. Valve tightness integrity and operation, which limits its ability to perform its intended function and exceeds the criteria of reference (i).

ab. Non-conformance of electrical safety and deteriorated or damaged wiring or components.

ac. Any other discrepancy deemed by the SGPI which would cause injury to personnel.

NOTE: A SEVERELY DEGRADED DESIGNATION IS ASSIGNED TO A DEFICIENCY THAT IS NOT AN IMMEDIATE OR NEAR FUTURE DANGER TO PERSONNEL, BUT WILL HAVE MAJOR OPERATIONAL RESTRICTIONS. A SEVERELY DEGRADED DISCREPANCY PER THIS CHAPTER MUST BE CORRECTED OR REPAIRED PRIOR TO BOILER OPERATION UNLESS IT HAS BEEN PROPERLY APPROVED AS A MAJOR DFS.

3.9.3 Completion of Inspection. An oral critique and a preliminary inspection report, including a summary of restrictive deficiencies, will follow the inspection. Paragraph 3.7.2 identifies official reporting requirements.

3.10 AUTOMATIC BOILER CONTROL SYSTEMS AND ONLINE VERIFICATION GUIDELINES.

a. ABC Systems, which include Automatic Combustion Controls, Boiler Feedwater Level Controls, and Automatic Feed Pump Controls and DFT Level Controls have been designed and installed for the purpose of permitting steady and transient operation with the least variation possible. Proper utilization and maintenance of these systems will also allow a reduction of watch standers on station thereby enabling engineering personnel to devote more time to routine maintenance of machinery and upkeep of spaces, as well as providing the ship with instant response to signaled engine orders.

b. The following guidelines must be adhered to regarding any or all ABC Systems installed:

(1) Ships must use the controls at all times while steaming. Manual operation at the control panel or console (remote manual) must be used when lighting off or securing the boiler. ABCs should be cut out and the boiler controlled in local manual only when required for casualty control, maintenance of equipment, or training of personnel. When ABCs cannot be operated in automatic, this fact must be reported by a CASREP message.

(2) Installed multi-element feedwater regulators must be cut in and used at all times except for periods devoted to training operators in the manual operation of feed check valves. Prime reliance for the control of water level in the boiler steam drum must be placed on the automatic regulator. When any indicator, alarm or feedwater regulating valve is not functioning properly, or is out of commission, a qualified check man must be assigned. He or she must have no other duties as directed by temporary standing orders.

(3) Prior to boiler light off, all ABCs must be tested per EOSS.

(4) Maintenance and calibration of the ABC Systems must be accomplished by qualified technicians following the direction provided in applicable PMS, reference (j) and the manufacturer's technical manuals.

c. Online Alignment Verification procedures provide a set of checks to verify proper performance of each of the sub-systems or control loops within the automatic

combustion, feedwater and feed pump control systems. Online Alignment Verification must be accomplished using the periodicity and procedures in PMS and applicable ABC ship specific technical manuals.

3.11 BOILER FLEXIBILITY TESTS. PMS and Online Alignment Verification procedures contain the necessary procedures for a boiler flexibility test. The periodicity is provided by and included in the PMS scheduling. The applicable Maintenance Requirement Card contains the NAVSEA guidelines governing the performance level of the boiler flexibility tests. Level I is the desired boiler flexibility performance level. Boilers with performance levels of II and III are considered safe to steam and safe for the conduct of Engineering Casualty Control Exercises. Boilers which cannot achieve a minimum level III flexibility are unsafe to steam and the ABC System should be reported by CASREP per the requirements of reference (d).

3.12 CERTIFIED BOILER WATER AND FEEDWATER TESTER REQUIREMENTS. All personnel who are required in the course of their duties to test, treat or manage boiler water or feedwater programs must be certified as specified in reference (k).

3.13 OPERATING AND CASUALTY PROCEDURES. Each ship with steam generating plants will have approved Steam Generating Plant Operations Procedures in the format prescribed by their respective TYCOM. They must contain detailed procedures and precautions for:

a. Normal operations including startup and shutdown.

b. Infrequent operations such as initial steam generating plant light-off following an availability.

c. Operating parameters, limitations, alarms and set points.

d. Casualty conditions including indications, immediate and supplementary actions.

e. Propulsion fuel economy per references (l) and (m).

f. JP-5 for use as boiler fuel.

g. Management of boiler water and feedwater.

h. Quality Assurance (QA) requirements for boiler repairs.

i. Maintenance and storage of boiler burner atomizers.

APPENDIX C

SUMMARY OF BOILER INSPECTION SCHEDULING AND RESPONSIBILITIES

Type Inspection	Schedule Date	Scheduling Responsibility	Responsibility for Inspections
1. Routine	Every 24 months(LHD-1 Class) Every 18 months (LCC-19, CG-47)	ISIC or Ship	RMC SGPI
2. Pre-Start of Availability Inspection	Schedule PSAI and operational testing in conjunction with Routine boiler appraisal 3-12 months prior to availability	ISIC	NSWCPD INSPECTOR and RMC SGPI
3. Start of Availability Inspection	At start of overhaul, with strength and integrity inspection	Naval Shipyard RMC	NSWCPD INSPECTOR and RMC SGPI
4. Strength and Integrity Inspection	Once every 60 Months	ISIC or RMC	NSWCPD INSPECTOR and RMC SGPI
5. ISV*	During availability	Industrial Activity or Supervising Authority	NSWCPD INSPECTOR and RMC SGPI
6. CAI	To be conducted before reassembling boiler for final hydrostatic test	Industrial Activity or Supervising Authority	NSWCPD INSPECTOR and RMC SGPI
7. Inactivation or Reactivation	Prior to final action	Industrial Activity, Supervising Authority or Inactive Ship Facility	NSWCPD INSPECTOR and RMC SGPI
8. Engineer Officer	Per PMS and references (b) and (c)	Engineer Officer	Engineer Officer
9. Special	Subsequent to major repairs No-Notice at SGPI discretion	ISIC (Coordinate with Regional Maintenance Center)	NSWCPD INSPECTOR and RMC SGPI
10. Operational Inspection	Prior to and at completion of all CNO maintenance	TYCOM	RMC SGPI

*The ISV inspection may be waived by the TYCOM for availabilities of short duration.

LISTING OF APPENDICES.

A Diesel Maintenance Strategy for Surface Force Ships

4.1 PURPOSE. To provide guidance for the conduct of diesel engine inspections, timely correction of discrepancies and the general operation and maintenance of diesel engines.

4.2 DIESEL ENGINE INSPECTOR CERTIFICATION. Diesel Engine Inspector (DEI) candidates must complete all certification requirements as outlined in reference (b).

4.3 DIESEL INSPECTIONS.

NOTE: FOR THE ASSESSMENT OR INSPECTION OF MAIN PROPULSION DIESEL ENGINES (MPDE) AND SHIP SERVICE DIESEL GENERATORS SEE APPENDIX A.

4.3.1 Diesel Engines Requiring Inspections.

a. All diesel engines, including main propulsion, ship service and emergency diesel generators onboard ships and submarines must be inspected per references (a) and (b).

b. All small boat diesel engines, including main propulsion, ship service and emergency diesel generators that are 400 Brake Horsepower and above, unless otherwise determined by TYCOM, must be inspected per references (a) and (b). TYCOMs may exempt diesel engines on small boats and craft from inspection requirements where the engine or boat configuration provides insufficient access to accomplish the inspection.

4.3.2 Periodicity of Inspections. Diesel engines must be inspected per references (a) and (b) on the following events:

a. Routine and Pre-Availability Inspections.

(1) Once during the unit's cycle, not to exceed 24 months, not including periods of Inactive Equipment Maintenance as discussed in paragraph 4.3.2.e. The normal interval between routine diesel inspections is 18 months. Routine and Pre-Availability Inspections may be performed as early as 12 months or as late as 24 months to allow for maximum scheduling flexibility and utilization of assessment findings. The TYCOM, Immediate Superior in Command (ISIC) and other Fleet Maintenance Managers must ensure the Routine and Pre-Availability Inspection is scheduled to allow adequate time prior to availabilities to utilize the inspection and assessment results to plan work on the diesel. As per reference (a), in no case must the interval between Routine Inspections exceed 24 months. A Routine or Pre-Availability Inspection normally consists of all three phases as discussed in paragraph 4.3.4. For Emergency Diesel Generators (EDG) onboard nuclear powered vessels, industrial activity work on the diesel engine(s) or its support systems will not normally be approved except during a Chief of Naval Operations (CNO) Availability. The TYCOM or ISIC must ensure that adequate upkeep time is made available prior to the availability to ensure there are a sufficient number of diesel engines with no outstanding discrepancies to provide the required standby power during the availability.

(2) For Submarine CNO Availabilities greater than six months.

(a) The Pre-Availability Inspection must be integrated into the Shipyard's work definition period and must be considered the material health assessment for the EDG.

(b) SUBMEPP must enter this Pre-Availability Inspection in the applicable 000-Series SWLIN as a material health assessment assigned to Forces Afloat.

(c) The DEI must include the Executing Shipyard (Code 260) and the Supervisor of Shipbuilding or NAVSEA Shipyard Representative's Office, as applicable, on distribution for all DEI reports conducted as a Pre-Availability Inspection or during the availability.

(d) As Lead Maintenance Activity, the executing shipyard will work with

the TYCOM to assign all deferred inspection deficiencies to the appropriate repair activity for repair.

(e) The Shipyard's technical review of this inspection report may satisfy the Pre-Availability technical assessment requirement of reference (c).

b. Post Casualty or Pre-Overhaul. When major internal engine malfunctions have occurred or are suspected (e.g., crankcase explosion, major bearing, blower or crankshaft failure), or there are indications that the engine is in need for overhaul. Extent of disassembly or inspection is at the discretion of the DEI based on the casualty or observed indications. For Post Casualty Inspections, the DEI must determine the full extent of damage and the cause, along with recommendations for repairs. For Pre-Overhaul Inspections, the TYCOM may require the DEI confirm that an overhaul is required and determine the scope of the overhaul. Partial inspections do not satisfy the requirement for a complete Routine Inspection and this fact will be annotated in the DEI's written report.

c. Post Overhaul or Repair. When an engine has been overhauled or significant maintenance or repair has been completed. A Post Overhaul or Repair Inspection must be conducted by a DEI prior to continuous operation. The DEI will make the final determination of whether the overhaul or repair was extensive enough to warrant a Post Overhaul or Repair Inspection. The inspection must consist of a review of actions taken to complete the overhaul or repair, external visual inspection, tests of safety devices, review of required readings or clearances and a Phase III operational test. Unless there are indications of internal discrepancies, Phase II (internal inspection) is waived and the Routine Inspection periodicity requirement in paragraph 4.3.2.a will be considered complete and valid. The Post Overhaul or Repair inspection should be an integral part of the overhaul or repair vice a separate inspection. Specifically, the Phase III operational test should be part of the final operational testing of the overhaul or repair vice a separate operational test.

(1) For contractor accomplished work, the contractor specification will contain requirements for the contractor to document required readings or clearances on applicable forms and have appropriate check points made by a DEI or Industrial Subject Matter Expert (SME) during the overhaul or repair. If there is evidence of poor workmanship, use of improper parts, discrepancies in reassembly or test documentation or missing information as part of the repair process or during the inspection, the DEI or Industrial SME will advise the Repair Project Manager of the quality issues and required actions. The Repair Project Manager will coordinate required actions with the RMC Technical Authority and Maintenance Team. The RMC must liaise with the TYCOM and obtain TYCOM concurrence on all required actions and must advise the TYCOM of all potential cost and schedule impacts.

(2) For Ship's Force or Fleet Maintenance Activity accomplished engine overhauls, a Post Overhaul or Repair Inspection will be conducted by a DEI prior to starting the engine. The scope of the inspection will be as specified in paragraph 4.3.2.c. Commanding Officer (or designated representative)

permission is required to perform Phase II (internal inspection) when requested by the DEI.

d. New Construction (Acceptance Inspection).

(1) Prior to the delivery of a newly constructed ship, when requested by the Board of Inspection and Survey. An acceptance inspection will normally be conducted in conjunction with the open-and-inspect phase of Board of Inspection Survey acceptance trials. The acceptance inspection does not satisfy the requirements of a routine inspection.

(2) The initial Routine Inspection on a new construction unit must occur prior to initial startup by Ship's Force. The cognizant Supervisor of Shipbuilding should incorporate the DEI as part of the Government Test Plan or Acceptance Plan. The cognizant Supervisor of Shipbuilding must notify the DEI for new construction acceptance test prior to Ship's Force accepting responsibility of the diesel engine. This will ensure that an inspection baseline is established and construction discrepancies are identified and corrected early in the life of the unit.

(3) For submarine and CVN construction programs, the initial Routine Inspection on a new construction unit must occur prior to initial startup by Ship's Force. For ships with temporary systems in place or less than 95 percent load available, the Phase I (see paragraph 4.3.4.a) and Phase II (see paragraph 4.3.4.b) inspections must occur in conjunction with crew Operational Control Transfer including an operational test at available load. The operational phase of the inspection must be completed within 90 days of the start of the inspection. If the operational phase cannot be completed within these 90 days, the inspection will be terminated and rescheduled. The Phase III (see paragraph 4.3.4.c) inspection must occur prior to ship delivery when sufficient loading is available. Any as found conditions requiring corrections must be adjudicated via the normal shipyard Operational Control Transfer inspections adjudication process. The routine diesel inspection periodicity must commence upon completion of all three diesel engine inspection phases.

e. Reactivation of Engines in Inactive Equipment Maintenance. Prior to the first operation of engines which have been placed in Inactive Equipment Maintenance. The inspection consists of a complete review of the administrative records associated with the diesel engine including: actions taken to place the engine in and out of lay-up status, a review of repairs accomplished since the last inspection, visual inspection, test of safety devices and an engine performance test. If sufficient load cannot be attained, a 1-hour operational test at maximum available load must be accomplished. Based on the administrative review and visual inspection, further internal inspections may be accomplished at the discretion of the DEI. This inspection should be requested far enough in advance of the first key event requiring use of the diesel. This will ensure any significant discrepancies found can be corrected prior to the start of the key event. This inspection does not satisfy the requirements of a routine inspection as per paragraph 4.3.2.a unless a complete 3-phase inspection is accomplished. If a complete 3-phase inspection is not accomplished and

administrative, visual and operational inspections are satisfactory, the reactivation inspection report letter or cover letter should provide revised dates for the next required inspection that account for the time in Inactive Equipment Maintenance status. The revised date for the next routine inspection must be equal to the completion date of the previous routine diesel inspection plus the number of whole months the engine was in Inactive Equipment Maintenance status plus 12, 18 and 24 months respectively for the earliest, normal interval and latest dates.

4.3.3 Inspection Scheduling.

a. (Surface Force only) Diesel inspections are actively managed by SURFMEPP utilizing the Class Maintenance Plan. All routine diesel inspections will be pushed by SURFMEPP to the ship's Current Ships Maintenance Project as part of the ship's BAWP. SURFMEPP will also push non-routine inspections as requested by TYCOM or the Maintenance Team. As part of this process, the Maintenance Team must contact the local RMC or ISIC Diesel Inspector to coordinate the diesel inspection 120 days prior to the desired inspection date.

b. Diesel inspections are scheduled by the ship with RMC, via ISIC when appropriate, per reference (a) and the Planned Maintenance System (PMS). As part of this process, it is recommended that units contact the local RMC or ISIC Diesel Inspector to schedule the diesel inspection no later than 15 months after the previous inspection. Units must contact the local RMC or ISIC Diesel Inspector a minimum of 120 days prior to the desired inspection date and submit a Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), to the appropriate RMC a minimum of 90 days in advance of the desired dates to allow for DEI scheduling.

c. It is the responsibility of the Fleet Maintenance Managers (the ship, ISIC, and Ashore Ships Maintenance Managers, as appropriate) to schedule the diesel inspection with the RMC during a period where the inspection's condition assessment can be best utilized for repair planning. The inspection may require that each engine being inspected normally be placed out of commission for five to seven days at the minimum. This time frame may increase when significant Repair Before Operating (RBO) discrepancies are discovered that require extensive repairs. Sufficient time must be allowed for the performance of the operational phase of the inspection which requires specific load testing as defined by PMS. SSDGs normally have the operational phase performed inport, whereas operational assessment of MPDEs requires the ship to be underway for a minimum of one day. Units with MPDEs must allot underway time to allow the DEI to complete the operational phase. The operational phase of the inspection must be completed within 90 days of the start of the inspection. If the operational phase cannot be completed within these 90 days, a TYCOM approved Departure From Specification (DFS) per volume V, part I, chapter 8 of this manual is required. Without a DFS, the inspection will be terminated and rescheduled. Ships should integrate the operational phase of the inspection into the Fleet Response Training Plan underway schedule.

d. A Diesel Inspection must be accomplished by an ISIC or RMC DEI. It is encouraged that persons holding the DEI NEC that may be assigned to the ship being inspected be part of this inspection.

e. (Surface Force and Aircraft Carriers) Inspection deferrals must submit a minor DFS for approval by the respective TYCOM for diesel inspections in the 18 to 24 month window. When an inspection cannot be accomplished within 24 months, Surface, Carrier and Submarine units must submit a DFS request to the TYCOM no later than the 23rd month since the last inspection, that includes satisfactory operating trend data reviewed by a DEI confirming that the engine is in sound operating condition. For inspection deferrals of greater than 24 months, the TYCOM will forward endorsement to NAVSEA 05Z for approval of the DFS. The requirements of this paragraph are not applicable when the reason for exceeding the 18 month inspection window is due solely to the diesel being in Inactive Equipment Maintenance as discussed in paragraph 4.3.2.e.

4.3.4 Inspection Phases. The diesel inspection consists of a detailed records check, internal material condition inspection and observation of engine operating characteristics. During all phases of an inspection, all safety precautions with the engine and space must be strictly adhered to. The degree of the inspection must be decided by the DEI based on the results of reference (b) mandatory checkpoints, TYCOM directed check points, if any, operating data and other records maintained on the diesel engine. The inspection will include the following phases (See Appendix A):

a. Phase I - Administrative Inspection. This is a complete review of the administrative records associated with the diesel engine(s).

b. Phase II - Secured Inspection (partial disassembly). Based on the results of Phase I, the inspector will decide the degree of disassembly and will conduct a thorough evaluation of the internal condition of the engine as warranted by Phase I and Phase II findings. Per reference (b), disassembly of the engine will be minimized. Submarines must have a complete Phase II Inspection per reference (b).

c. Phase III - Operation Inspection. The DEI will observe and analyze operating data on all inspected engines per reference (b) and PMS Maintenance Requirement Card (MRC) for performance testing or troubleshooting the engine. If no PMS guidance exists, then 100 percent or maximum attainable load on all inspected engines should be achieved.

4.3.5 Preparation for Diesel Engine Inspection.

a. The DEI must meet with the inspected ship's Commanding Officer or his designated representative, Engineer Officer and a diesel system expert prior to the start of the inspection. Where appropriate, either the Reactor Officer or the Engineer Officer may fulfill this role. This visit will ensure that Ship's Force is aware of the extent of the inspection, what PMS is to be accomplished, required support to be provided to the DEI and interference to be removed to allow access to the diesel engine. Coordination between the ship and the DEI can significantly reduce the time the diesel will be out of commission for inspection purposes and maximize the training to Ship's Force. Ship's Force will perform diesel engine disassembly, reassembly and operation, as well as correcting Ship's Force capable discrepancies concurrent with the inspection. It is the responsibility of Ship's Force to order all software and repair parts for Ship's Force capable work, to include all gaskets, lockwire, etc., for engine reassembly.

Discrepancies beyond Ship's Force capability will be scheduled to be corrected through the Fleet Maintenance Managers, utilizing the Current Ship's Maintenance Project. At all times during the inspection, safety precautions with the engine and the space will be strictly adhered to. The DEI will meet with the Main Propulsion Assistant or Engineer Officer on a daily basis to ensure the unit's leadership is informed and produce optimal coordination efforts.

b. The ship will:

(1) Prepare the diesel engine for inspection.

(2) Provide the DEI with dedicated time and the appropriate personnel to conduct the inspection. The inspection will be structured to maximize training of shipboard personnel. The ship should ensure continuity of personnel is maintained during the inspection or assessment.

(3) Assign a Job Control Number for accomplishing the inspection and record all parts usage through the Maintenance and Material Management system.

(4) Ensure all equipment directly associated with the engine(s) is operable.

(5) Ensure all records are available and in good order.

(6) Ensure that the tools listed on the appropriate MRCs, technical manuals, and DEI check sheets are available for use during the inspection.

(7) Ensure that all applicable MRCs and technical manuals for the engine and related support systems are available.

(8) Test diesel engine lubricating oil following the applicable Lube Oil Quality Management program, as defined by PMS, prior to the inspection. In most cases, this requires Navy Oil Analysis Program results of recent oil sample be available.

(9) Test jacket water treatment following PMS prior to the inspection.

(10) For SSN, SSBN and SSGN Class Submarine EDGs, the unit should evaluate existing conditions of battery capacity, propulsion plant status and shore power reliability. Based upon this evaluation, if conditions warrant, the ship will submit a request for a stand-by generator for emergency power during the diesel inspection.

4.3.6 Inspection Findings. The inspection will report "as found" conditions. Discrepancies found will be noted on the Administrative Review Sheet and the Engine Discrepancy Sheet as required by reference (b). Categorize discrepancies as Repair Before Operate (RBO), Severely Degraded, Major and Minor.

4.3.6.1 Repair Before Operating. An RBO condition is any condition existing that, if left unattended, would pose an immediate or near term hazard to personnel safety. Only a DEI that is currently certified may issue an RBO. RBO deficiencies require re-inspection by a DEI that is currently certified after repairs and before the diesel engine is operated. A DFS will not be approved for RBOs. Discrepancies that may cause a finding of RBO include but are not limited to:

a. Any condition existing that if left unattended, would definitely pose an immediate or near term hazard to personnel safety.

b. Evidence of serious internal failure (bearing, connecting rod, crankshaft or piston failure).

c. Uncontrollable lube oil, fuel oil or exhaust leaks. Reference (g) provides guidance for defining leaks.

d. Malfunctioning overspeed governor or trip.

4.3.6.2 Severely Degraded. A finding of Severely Degraded will be assigned to a discrepancy which does not present an immediate or near term danger to personnel but does present risk to the equipment. A Severely Degraded finding will include specific operational restrictions. Severely degraded items must be corrected and re-inspected prior to operation or must have an approved major DFS. Discrepancies that may cause a finding of Severely Degraded include but are not limited to:

a. Inoperative alarms or safety devices.

b. Low lube oil pressure.

c. Readings that exceed the limits of PMS or manufacturer specifications that during unrestricted operation would present a hazard to equipment.

d. Lube oil fuel dilution above safe levels.

e. Controllable exhaust leaks as defined in reference (g).

4.3.6.3 Major Discrepancy. This finding is made when major problems exist, but the engine is still operable. operational restrictions must be approved by the TYCOM. Any deficiency that has been noted as major, which has not been corrected by the end of the inspection must have a JCN assigned. Discrepancies not corrected within 30 days must be reported by Naval message in accordance with paragraph 4.4.b(3). This requirement does not alter the normal Casualty Reporting or DFS reporting requirements. In accordance with references (a) and (b), major deficiencies include, but are not limited to:

a. Engine unable to maintain rated load.

b. Automatic equipment inoperative or not functioning properly.

c. Critical components exceed prescribed limits but do not meet the Severely Degraded criteria.

d. Temperature or pressure between cylinders are not within specification.

e. Either Remote or Local engine starting (one of two must be operational) or remote securing devices are inoperative.

f. Excessive blower clearance readings.

g. Air box exhaust belt or muffler is excessively dirty or oil laden.

h. Clogged valves or ports.

i. Malfunctioning fuel injection system.

j. Jacket water treatment out of specification.

4.3.6.4 Minor Discrepancy. Categorize all other deficiencies as minor.

4.3.6.5 Re-inspections. Discrepancies assigned a grade of RBO must be re-inspected by a DEI prior to operation. A Departure from Specification will not be approved in the case of an RBO discrepancy. Discrepancies assigned a category of Severely Degraded require correction and re-inspection prior to operation or an approved Major Departure from Specification. Repairs to Major and Minor discrepancies may be approved at the unit command level and do not require re-inspection.

4.3.6.6 Recurring Discrepancies. A recurring discrepancy from previous inspections will be specifically noted in the inspection report.

4.3.6.7 Component Certification. (Aircraft Carriers only). With the exception of RBOs, deficiencies identified in the course of diesel engine inspections performed prior to or during a CNO availability do not necessarily affect component certification to support readiness conditions identified in references (c) and (d). Evaluation of specific deficiencies by Ship's Force, Naval Supervisory Authority, and project team personnel is necessary to determine system readiness conditions are met. An emergency diesel generator is considered certified for operation per reference (c) and (d) provided the diesel inspection and all required PMS are within periodicity, including completion of a satisfactory performance test.

4.4 REPORTING REQUIREMENTS.

a. Casualty Reporting (Submarines Only).

(1) Purpose. To provide guidance for Casualty Reporting (CASREP) requirements for submarine diesel generators. CASREPs are in addition to, and do not replace the reporting requirements of other documents (e.g., Naval Reactors Technical Bulletins, Operational Orders, Mishap Reports, etc.).

(2) Background. The significance of a submarine's emergency and backup power supplies cannot be overstated. Reference (e) defines the CASREP types, requirements and format. CASREP requirements of Out of Commission power generating or storage equipment require additional clarification.

(3) SSBN and SSGN Class Submarine EDGs. Report EDG casualties by message as allowed by operational constraints.

b. The ship's Commanding Officer must:

(1) Ensure that each inspection or assessment is entered in the applicable machinery history with a brief description of any RBO conditions found at the conclusion of the assessment or inspection.

(2) All maintenance actions and parts usage as the result of the inspection or assessment are properly documented per reference (f).

(3) Report by Naval message 30 days after the conclusion of an engines inspection and each 30 days thereafter the status of any discrepancy assigned a category of Major or Minor that has not been corrected or brokered to a repair activity. Discrepancies not corrected or brokered will be identified by JCN. The

message will be sent action to NSWC Philadelphia and the servicing Regional Maintenance Center. Information addressees are the ISIC, TYCOM N43, the applicable TYCOM Readiness Code for the ship class, and NAVSEA 05Z. The message will include the engine number, date of inspection, the type of inspection and the name of the inspector.

c. The DEI must:

(1) The DEI must ensure a maintenance ready 2-Kilo for every discrepancy is entered into the ships CSMP by M0001 file upload using the software approved by the DEI Program Manager and in accordance with the file upload procedures defined in volume VI, chapter 42. The DEI will verbally report the findings of the inspection to the Commanding Officer or a designated representative upon completion of the inspection.

(2) Ensure the inspection report, prepared in accordance with reference (b), is signed, serialized and transmitted within 30 days of the inspection completion date. When applicable the inspector must include in the report the likely cause or condition that resulted in discrepancies rated Major or above and any actions taken during the inspection to correct any discrepancies. The Inspector must upload a copy of the signed, serialized cover letter as the final enclosure to the report in the Report Generator. The appropriate Supervisor should then approve the report in the Report Generator and upon approval, the inspection report is considered complete.

(3) Utilize the Diesel Inspection Management Information System using the DEI report generator for classes of ships that are currently in use. For classes of ships that are not yet in the system, use the current guidance that is in reference (b). This inspection must be reviewed by the RMC or parent command prior to forwarding the report to the Commanding Officer of the inspected ship, with information copies to the ISIC, TYCOM, Fleet Maintenance Managers, the cognizant Shipyard (Code 260) and Supervisors of Shipbuilding or NAVSEA Shipyard Representative's Office (Pre-Availability and during Availability Inspections only) and In Service Engineering Agent.

(4) Open the report in the Diesel Inspection Management Information System on the day of starting the inspection or assessment and will send an email to the DEI Program Manager that an inspection or assessment has started. Discrepancies found during the inspection or assessment must be entered into the open report on a daily or weekly basis and AWRs should be uploaded weekly.

4.5 OPERATION AND MAINTENANCE. This section does not supersede existing engine, ship or ship class specific guidance and is only meant to provide guidance where currently none exists.

NOTE: IN SITUATIONS WHERE LIGHT LOADING OF A DIESEL ENGINE IS UNAVOIDABLE, ARRANGEMENTS SHOULD BE MADE TO OPERATE THE ENGINE AT 60-80 PERCENT RATED LOAD CAPACITY FOR A MINIMUM OF THIRTY MINUTES, PREFERABLY THREE HOURS,

UNLESS OTHER GUIDANCE EXISTS SPECIFIC TO THE ENGINE'S APPLICATION. THIS CAN HELP OFFSET THE DETRIMENTAL EFFECTS OF LIGHT LOADING; HOWEVER, IT IS NOT TO BE CONSIDERED A SUITABLE ALTERNATIVE TO THE AVOIDANCE OF LIGHT LOADING. FURTHER DETAILS ARE PROVIDED IN APPENDIX A.

a. Per reference (g), the light loading of a diesel engine (less than 60 percent) should be avoided. Consistently light loading a diesel engine will cause one or more undesirable conditions, depending on specific engine design:

(1) A loss of cylinder compression due to glazed cylinder walls, leading to an unnecessary premature engine overhaul.

(2) Carryover of engine lube oil into the exhaust, causing excessive exhaust smoke and creating conditions for a possible exhaust stack fire.

(3) Fuel oil dilution of lube oil, leading to frequent oil changes.

(4) Carbon formation on exhaust valves, leading to valve failure.

b. Per reference (h), diesel engines that have online purification capability must operate the purifier continuously while the diesel engine is operating. On installations where multiple engines are serviced by one purifier, the purifier alignment should be shifted periodically within a 24-hour period to ensure all engines receive adequate oil purification and maintain satisfactory oil condition. Each engine's operating hours and oil condition should be considered when scheduling purification of several engines on a rotational basis.

c. Per reference (i) and PMS, diesel engine jacket water treatment must be tested and maintained to ensure proper corrosion control and freeze protection, as applicable.

d. Diesel engine operating hours since engine commissioning, engine overhaul and lifecycle maintenance requirement completions (PMS or Class Maintenance Plan requirements), at a minimum, must be maintained on all MPDEs, SSDGs, and EDGs. The hours must be documented and recorded in the appropriate machinery history records in order to assist with scheduling of overhauls and lifecycle maintenance requirements. An overhaul typically includes rebuilding or replacing, as complete sets to new criteria the following components: cylinder heads, piston rings, cylinder liners, main and connecting rod bearings. If one of these sets is not rebuilt or replaced, the repair is generally not considered an overhaul and engine operating hours since overhaul must not be zeroed, however, machinery history will be updated and lifecycle operating hours since the significant repairs must be tracked. A certified DEI must make the final determination if the extent of the work accomplished constitutes an engine overhaul for a particular engine or not during execution of the Post Overhaul or Repair Inspection detailed in paragraph 4.3.2(c).

e. For any corrective maintenance action accomplished on the engine, an entry should be made to the diesel maintenance history log including date, engine hours and a brief narrative that provides the reason for and description of maintenance. The maintenance history log should be reviewed periodically by the division officer and Department Head, as appropriate.

4.6 COMPLIANCE.

a. All ships, submarines and craft must comply with the procedures herein for the operation, maintenance and inspection of installed diesel engines.

b. Ship's Commanding Officers must ensure all diesel records are readily available for the inspector's review and Ship's Force use, including:

(1) Engine operating logs.

(2) Navy Oil Analysis Program test results, or, for submarines, the applicable oil analysis results.

(3) Onboard lube oil testing logs.

(4) Diesel Maintenance and history records to include all maintenance and significant items accomplished on the engine since last engine overhaul.

(5) Diesel operating and maintenance documents, including Engineering Operational Sequencing System, Steam Plant Manual, Ship System Manual (Submarines only), PMS, Engineering Standing Orders, etc., as appropriate.

(6) Engine hours' log.

(7) Diesel inspection reports since last overhaul and associated Naval message on the status of discrepancies.

(8) Fuel Oil Quality Management records.

(9) Diesel Engine Technical Manuals.

(10) References (g), (h) and (i).

(11) Appropriate diesel-related Training records.

(12) Jacket water logs.

c. The TYCOM or ISIC must ensure that assigned ships operate and maintain diesel engines following the procedures in references (a), (b), (g), (h), (i) and (j). Specifically, they must:

(1) Ensure ships are complying with all required instructions by observation of diesel engine operations during shipboard visits.

(2) Conduct follow-up action to ensure that any unsatisfactory conditions found are correct at the earliest possible date.

(3) Maintain a library of technical material and appropriate visual aids for use by assigned ships in training diesel operations.

d. (Submarines only) Ensure the induction and exhaust systems are inspected following the appropriate Maintenance Requirement, or Maintenance Requirements for continued Unrestricted Operation. For maintenance, operations, and trend analysis, comply with the requirements of reference (j).

e. The Diesel Inspection Program Manager must audit the diesel inspection programs of each Regional Maintenance Center and other DEI inspection activities annually. The

audit report will be debriefed to the highest level available at the conclusion and copy of report will be provided to the Commanding Officer and NAVSEA 05.

4.7 SUBJECT MATTER EXPERT IN THE REPAIR AND MAINTENANCE OF DIESEL ENGINES. The SME provides technical oversight on all scheduled and emergent work performed by the RMC personnel, and contractor, as required. The SME ensures work packages include proper repair procedures and are used with maintenance standards and appropriate technical documentation related to the diesel engine assessment or inspection. The SME must have direct communication with the RMC Engineering Department regarding resolutions of repairs that do not meet Original Equipment Manufacturer specifications.

APPENDIX A

DIESEL MAINTENANCE STRATEGY FOR SURFACE FORCES

1. OBJECTIVE. This document is applicable only to non-nuclear Surface Force ships and craft. The objective of the Diesel Maintenance Strategy (DMS) is to baseline the class maintenance plan by technically validating Life Cycle Maintenance requirements. This provides guidance for Long-Range Maintenance Schedule provisioning and supports the management of Engineering Core Maintenance documentation (e.g., CMP, Technical Foundation Paper, and Ship Sheets). DMS is designed to improve the accuracy of work specifications and provide a closed loop work product evaluation and improvement process. DMS supports the Surface Maintenance Engineering Planning Program (SURFMEPP) end-to-end maintenance philosophy throughout the Optimized Fleet Response Plan, reference (k), in accordance with the DMS Standard Operating Procedure, reference (l), through the following:

a. DRS continuous assessment process including engine performance and lube oil and jacket water data in accordance with reference (m).

b. Through direct engagement with ships force personnel.

c. By evaluating engine material history for the purpose of validating technical documentation.

d. Review of Integrated Condition Assessment System and Continuous Maintenance Assessment System data.

e. Diesel Inspection Reports.

2. DIESEL MAINTENANCE STRATEGY MANAGEMENT. DMS Management is the responsibility of the In-Service Engineering Agent (ISEA) located at Naval Surface Warfare Center Philadelphia PA. The ISEA will manage the maintenance strategy on a ship class and engine type basis. The ISEA will report to the technical warrant holder in NAVSEA 05 for all DMS related technical matters. The ISEA DMS Manager is responsible for providing SURFMEPP with all technical requirements for diesel propulsion or power generation plant maintenance. The Diesel Lifecycle Engineering Representative (DLER) performs the ISEA Waterfront Technical Support function under the DMS organization.

3. DIESEL MAINTENANCE STRATEGY CORE ELEMENTS.

a. Life Cycle Maintenance Branding Report. The Life Cycle Maintenance (LCM) Report aids the Maintenance Team in deconflicting maintenance plans by publishing major diesel maintenance for the upcoming O-FRP cycle and identifies long lead-time material requirements in accordance with references (n) and (o). Major maintenance is determined by the review of each class maintenance plan task against availability records, task history, and assessment reports. This report will also include routine maintenance based on ISEA LCM recommendations and the vessel's next availability date. This ensures critical life cycle maintenance tasks, mandatory assessment tasks, any active departures from specification and life-cycle impacting class advisories are identified early and incorporated into the availability work package. In addition to the LCM Branding Report an updated master Life Cycle Maintenance Matrix and 4790/2-Kilo Bulk Upload listing are provided via formal

letter to SURFMEPP, TYCOM, Maintenance Team, Ships Force, and the local Regional Maintenance Center regarding mandatory diesel time-directed maintenance requirements. Logistics support is integrated during this period through the identification of long lead time and high cost material requirements. Early coordination with the Defense Logistics Agency and Navy Inventory Control Point is designed to reduce the likelihood of delay during the availability.

b. Mid-Cycle Assessment Process and Branding Report. The Mid-Cycle Assessment (MCA) is the last opportunity to assess the condition of the engines prior to submission and approval of the final availability work package. Therefore the MCA is critical to ensuring that work is scheduled, scoped, planned, provisioned and executed in a successful manner. The MCA is an assessment, not an inspection or certification, and will be performed in accordance with volume VI, chapter 42. For any discrepancies that may be considered operationally limiting Volume V, Part I, Chapter 8, paragraph 8.2.b of this instruction regarding a Commanding Officers discretion at-sea applies. Deferral of the MCA requires the approval of the TYCOM.

(1) MCA Execution. The MCA is by design a non-intrusive assessment of the propulsion and power generation diesel engines overall condition including a detailed review of the Availability Work Package, Shipboard Automated Maintenance Modules (SAMM) or DRS data and a short (no more than 7 days notional) onboard assessment of engine condition and performance. High power (above 80%) tests of each main engine and Ship Service Diesel Generator with compression analysis may be performed based on the quality of existing DRS combustion analysis data. As this assessment is for the purpose of defining a work package, grooming of the engines prior to this testing is not required. This assessment may be tailored based on the completeness of the ships material history in SAMM and compliance with DRS compression testing and lube oil and jacket water test results. The assessment may even be performed virtually if there is sufficient data in SAMM to warrant that determination. The ISEA will provide a detailed schedule of events for this assessment no later than 30 days prior to the scheduled event with a complete listing of all Planned Maintenance System Maintenance Requirement Card’s to be performed during the visit. This schedule of events document will include an executive summary brief to the Commanding Officer detailing the execution of the visit, will include all points of contact. The schedule of events will define the team and will assign the team leader. The MCA should occur within the duration of the Availability Work Package Integrated Phase, prior to the 100% Package Lock milestone.

(2) MCA Reporting and Branding Report. Upon completion of the MCA the team lead must ensure maintenance ready 4790/2K's are provided to Ship's Force 3MC for upload in accordance with Volume IV Chapter 42 of this manual. The MCA Branding Report will include all branded 4790/2K's for the upcoming availability and must be submitted within 30 days of completion but in any case prior to the 100% lock date. Completion of the MCA will be reported to the TYCOM by the ship via naval message.

c. Package Lock Branding Report. The Package Lock Branding Report identifies CBM related work candidates that were not previously included in the LCM and MCA Branding reports. Condition Based Maintenance candidates are identified using DRS data analytics, knowledge of ship's condition and, when available and appropriate, onboard assessment, inspection results, or reports. The Package Lock Branding Report may be submitted at multiple milestones as required to document Condition Based Maintenance related tasks and the final report must be submitted no later than 30-days prior to the 100% Package Lock Milestone. The MCA Branded Tasks may be included with the Package Lock Report in lieu of a separate MCA Branding Report if the two report dates are within 60 days of each other.

d. Diesel Engine Inspection Branding Report. Periodic diesel inspections will be conducted by the Regional Maintenance in compliance with reference (b). Upon completion of the inspection, deferred maintenance requirements will be uploaded to OMMS-NG in the form of a 2-Kilo. The ISEA may choose to brand specific 2-Kilos for accomplishment during an upcoming or future Chief of Naval Operations availability or continuous maintenance period.

e. Industrial Support Visit Report. The objective of the Industrial Support Visit (ISV) is to document, measure and analyze the impact of growth and new work, the impact of collateral work, to assess the accuracy and timeliness of material to determine the impact on cost and schedule and seeks to determine if changes may be made in the ETE process to improve future work efforts.

f. Integrated Propulsion Plant Alignment Procedure (IPPAP). The IPPAP is a detailed alignment procedure accomplished in accordance with the Integrated Propulsion Plant Alignment Manual for the applicable ship class, reference (p). The purpose of the IPPAP is to groom and align the main propulsion plant and the associated control system after a major maintenance period to produce the optimal plant performance to support training and deployment. IPPAP notionally begins as part of the end of availability initial light off and continues through sea trials.

4. DIESEL LIFECYCLE ENGINEERING REPRESENTATIVE

a. Role of the Diesel Lifecycle Engineering Representative. The role of the Diesel Lifecycle Engineering Representative (DLER) is outlined in reference (b). The DLER acts as the waterfront point of contact for the execution of DMS. The DLER performs the following tasks in support of DMS.

(1) Maintains and updates the Lifecycle Maintenance Workbook.

(2) Attends IPTD meetings, Work Package Integration Conference, Work Package Execution Conference, Completion Conference, and the Interim Support Visits.

(3) Reviews and integrates condition based maintenance requirements into the availability planning process.

(4) Maintains and updates the DMS and DRS Workbooks for their assigned vessels.

(5) Submits all DMS Branding Reports required by reference (b) to support the SURFMEPP End-to-End Planning Process.

(6) Coordinates with logisticians to ensure proper ILS support for task scheduled in the Lifecycle Maintenance Matrix.

(7) Supports the technical evaluation of Departure from Specification requests on behalf of the In Service Engineering Agent.

b. Qualifications of the DLER Position. The DLER must be a senior engineering technician with a minimum requirement of 15 years of active duty U.S. Navy experience or a minimum of five years as a field service representative for a diesel engine original equipment manufacturer. Prior qualification as a Diesel Engine Inspector or prior assignment as a main engine room supervisor on a diesel ship is desired. U.S. Coast Guard Engineers license may substitute for experience.

VOLUME IV

CHAPTER 5

MARINE SANITATION DEVICES

REFERENCES.

(a) NAVSEAINST 9593.1 - Certification Program for Sewage Marine Sanitation Devices in U.S. Navy Surface Ships and Craft
(b) OPNAVINST 5090.1 - Environmental and Natural Resources Program Manual
(c) NAVSEA S9086-T8-STM-010 - NSTM Chapter 593 (Pollution Control)
(d) NAVSEA S9086-CH-STM-030 - NSTM Chapter 074 V3 (Gas Free Engineering)
(e) NTRP 1-03.1 - Navy Tactical Reference Publication, Operational Reports
(f) NAVEDTRA 10500 - Catalog of Navy Training Courses

5.1 PURPOSE. To provide guidance in the operation, maintenance and certification of surface ship Marine Sanitation Devices (MSD) and to specify the requirements, procedures and responsibilities applicable to those systems.

a. Sewage systems must be properly operated and maintained or serious health hazards can result. References (a) and (b) require that all MSD systems being installed on naval ships and craft be inspected and certified. The prevention of health, sanitation and safety problems associated with the various sewage handling and disposal systems must be a priority matter.

b. Environmental considerations have made the operation of shipboard sanitation systems more restrictive with regard to the discharge of sewage to navigable waters. Local and State environmental laws are generally more restrictive than the requirements of reference (b). Senior Officer Present Afloat regulations are continually reviewed and revised to comply with the laws under which the Senior Officer Present Afloat is licensed to operate sanitation systems.

c. This chapter is applicable to all surface ships, service craft and small boats on which pollution abatement sewage systems are installed, either during construction or by alteration. It includes all types of shipboard sewage handling and treatment systems or MSDs certified per reference (a) and described in Section 4 of reference (c). Reference (d) describes the procedures, equipment, and records to be used during maintenance of MSD system components where toxic or combustible gases may be present. The most common pollution abatement sewage system in use on ships and craft is the Collection, Holding and Transfer system. Other systems in use include the Pall Trinity, JERED, GATX MK1 and the Vacuum Collection, Holding and Transfer System.

5.2 CERTIFICATION. The purpose of MSD certification is to confirm that the system, as installed, meets established design requirements, that adequate logistic support is available onboard and that major installation deficiencies are corrected. A single level certification program has been implemented by Naval Sea Systems Command to supersede the older two

level system (provisional and full). Ships that presently hold a "Full" certification are considered to be certified and require no further certification inspections.

5.3 RESPONSIBILITIES. The cognizant Type Commander (TYCOM) will coordinate the operation, maintenance, and certification of MSD systems installed on all units following the procedures established by references (a) and (c).

5.3.1 Type Commander or Immediate Superior In Command. The TYCOM or Immediate Superior In Command must:

a. Ensure surface ships participate in the pollution abatement program to the maximum extent possible by utilizing their pollution control equipment when within U.S. territorial waters (three miles).

b. Ensure MSD systems are properly installed, operated and maintained and that shipboard personnel working with sewage systems are properly trained in health and sanitation procedures.

5.3.2 Commanding Officer or Officer In Charge. The Commanding Officer or Officer In Charge must:

a. Oversee the correction of discrepancies on MSD system installations per reference (a).

b. Prevent foodstuffs from being stored in areas adjacent to or below sanitation system valves, flanges or take down joints. Drip pans must be installed beneath all sanitation system valves, flanges and take down joints in health sensitive areas.

c. Log the time, duration and justification for each unavoidable discharge of prohibited sewage in restricted waters. Notify the TYCOM and Immediate Superior In Command of each occurrence. In a situation where holding sanitary wastes would present a health or safety hazard, the system must be reported by Casualty Report per reference (e) and secured.

5.4 SYSTEM MAINTENANCE AND INSPECTION.

a. Ship-to-Shop Work. All Fleet Maintenance Activities are capable of accomplishing repair and overhaul of all MSD components on a ship-to-shop basis. When components are delivered to the Fleet Maintenance Activity, their cleanliness will be certified in writing by the delivering ship's Medical Department representative.

NOTE: IF NONE OF THE METHODS IN SUB-PARAGRAPH (5.4.B) ARE AVAILABLE, AND AN EMERGENCY SITUATION EXISTS, REFER TO REFERENCE (B) FOR EMERGENCY DISPOSAL REQUIREMENTS.

b. MSD Cleaning. The only authorized MSD pipe cleaning processes are hydroblast cleaning and acid cleaning. Acid cleaning may only be performed by qualified activities using the procedures of reference (c). Request cleaning for the removal of hard deposits which cannot be removed by ordinary shipboard means.

(1) Due to the extreme hazards involved in cleaning MSD systems, a high level of supervisory attention must be applied to all evolutions. An agreement on the procedures to be used by the Fleet Maintenance Activity and Ship's Force

must be established by a locally prepared Memorandum Of Agreement which describes all aspects of the operation.

(2) Disposal of effluent must be accomplished in an environmentally safe manner. Depending on port availability, the following methods of disposal must be used in priority order:

(a) Discharge to pier side sewage system.

(b) Discharge to tank truck or barge.

(c) Discharge to sea (when hydroblasting while underway).

5.5 TECHNICAL SYSTEM ASSESSMENT.

a. Technical System Assessments may be requested for training or, when necessary, to develop a work package.

b. Technical assist visits and assessments are described in Volume VI, Chapter 42 of this manual.

5.6 TRAINING.

a. Training courses in the maintenance and operation of MSD systems are offered by Fleet Training Centers at various locations. Consult reference (f) for current course offerings and details.

b. On ships with Collection, Holding and Transfer and JERED systems installed, the following school graduates are required:

(1) An Officer responsible for the operation and maintenance of the system.

(2) Senior enlisted personnel assigned the responsibility for operation and maintenance of the system.

(3) Other maintenance personnel; at least one in each inport duty section.

VOLUME IV

CHAPTER 6

OXYGEN AND NITROGEN SYSTEMS

REFERENCES.

(a) NAVSEA S9086-SX-STM-010 - NSTM Chapter 550 (Industrial Gases; Generating, Handling, and Storage)
(b) MIL-STD-1330 - Standard Practice for Precision Cleaning and Testing of Shipboard Oxygen, Helium, Helium-Oxygen, Nitrogen and Hydrogen Systems
(c) NAVAIR A6-332AO-GYD-000 - Laboratory and Aviators Breathing Oxygen Field Guide

6.1 PURPOSE. Oxygen - Nitrogen (O_2-N_2) producing storage and transfer systems are installed onboard all Aircraft Carriers and other surface force ships and shore stations to provide liquid and gaseous oxygen and nitrogen for use by Ship's Force and embarked air wings. Guidance for the proper operation and maintenance of these systems is provided by this chapter and references (a) and (b).

6.2 PRECAUTIONS.

a. Oxygen is not flammable but supports and rapidly accelerates the combustion of all flammable materials. Any substance that burns in a normal atmosphere will burn much more rapidly in concentrated oxygen with a much higher flame temperature. Combustible material (e.g., dirt, dust, soap, oil, cloth, paper, wood, cork, carbon black and gasoline) should not be allowed to come in contact with an enriched oxygen environment. Oxygen can cause combustion of substances not normally considered burnable (notably steel wool, thin gauge metals and certain types of cloth).

b. Gaseous nitrogen is an almost totally inert gas, does not burn, and does not support combustion or respiration. It is not poisonous but can displace oxygen from the air and cause asphyxia.

c. Cryogenic fluids (liquid oxygen and liquid nitrogen) are extremely dangerous. They can cause severe burns or frostbite if they contact the skin. Prolonged exposure to the cold vapors can damage delicate tissues such as those of the eye, windpipe and lung. The cold surface of piping components and vessels containing cryogenic fluid can burn or freeze bare flesh and cause it to stick to the cold metal. At the temperature of cryogenic fluids, many metals and other materials become brittle. Ship structural steel can crack if contacted by cryogenic fluid. Liquid oxygen and nitrogen will produce a very large volume of gas when they vaporize. In a closed compartment with inadequate ventilation, vaporizing liquid can create a hazardously high concentration of oxygen or nitrogen. The cloudy vapor that appears from vaporizing liquid, or cold gas venting is condensed moisture, making the issuing gas visible. When handling liquid cryogenic products, personnel must utilize protective clothing per the requirements of reference (a) and comply with all safety rules.

6.3 AVIATORS BREATHING OXYGEN TESTING.

a. Because of the severe consequences of liquid oxygen failing to meet the standards for Aviators Breathing Oxygen (ABO), stringent requirements for testing and ABO certifications have been established. Liquid oxygen and nitrogen is to be sampled and tested for production and stowage per reference (a) and Planned Maintenance System procedures.

b. All Aircraft Carriers producing ABO have certified ABO test sites and are capable of certifying shipboard produced liquid oxygen. These ABO test sites are under the control of the shipboard Aviation Intermediate Maintenance Department. The testing and surveillance requirements of Aircraft Carrier shipboard O_2-N_2 plant oxygen and nitrogen products must be accomplished per reference (a) and meet the spectrographic analysis requirements of reference (c).

c. Aircraft Carrier O_2-N_2 producers are known to experience high levels of methane (i.e., aircraft exhaust fumes, Collection, Holding and Transfer system discharge and boiler or Emergency Diesel Generator exhaust gases) which exceed the current established maximum limit of 25 parts per million per reference (c). The following direction is established for aircraft carrier O_2-N_2 producer liquid samples as stated in reference (a).

(1) For shipboard produced liquid oxygen, the limit for methane, when sampled at the storage tank, is 75 parts per million. This limit must not be exceeded.

(2) Liquid oxygen samples drawn from the storage tank are “customer or user” samples, for issuance in compliance with the ABO surveillance program. Samples from the O_2-N_2 producer are Maintenance samples used for monitoring and contaminate analysis and correction.

d. If at any time a liquid oxygen test sample or test method is found unsatisfactory, Ship's Force O_2-N_2 Plant operators and Aviation Intermediate Maintenance Department ABO laboratory personnel must work together to identify and correct the problem. Guidelines to follow for this are outlined in references (a), (b) and (c).

e. Certification of high-pressure gaseous storage flasks must be performed per reference (a).

6.4 OPERATIONS AND MAINTENANCE.

a. Per reference (a), only qualified personnel with full knowledge and understanding of the applicable safety requirements and hazards associated with oxygen production and handling must be permitted to handle gaseous and liquid oxygen aboard ship. Equipment such as O_2-N_2 producing plants, storage tanks, and pump-vaporizer units must be operated only under the supervision of a Fleet Cryogenics School graduate that holds a current Navy Enlisted Classification (NEC)-4283 qualification. Ideally, all operating personnel, as well as supervisory personnel, will be graduates of the Cryogenics School; however, there may be cases where sufficient personnel with this formal training are not available. In this event, operators trained by a currently qualified NEC-4283 supervisor may be used if they have successfully completed the required Personnel Qualification Standard and are designated in writing by the Commanding Officer.

b. Only qualified personnel will be authorized to perform oxygen clean maintenance and repairs to shipboard oxygen or nitrogen system components. The procedures and guidelines, as stated in reference (b), must be followed.

c. High-Pressure O_2-N_2 Producers onboard Aircraft Carriers are equipped with R-22 Refrigeration Units. When maintenance or repairs are being conducted on this equipment strict guidance must be followed to prevent the release of any ozone depleting substances (i.e., CFCs and HCFCs) to the atmosphere as mandated by the Environmental Protection Agency Clean Air Act. The Environmental Protection Agency Clean Air Act, Section 608 prohibits individuals from knowingly venting ozone-depleting compounds, used as refrigerants, into the atmosphere while maintaining, servicing, repairing, or disposing of air-conditioning or refrigeration equipment. Only the following four types of ozone-depleting substance venting releases are permitted under this section of the act.

(1) Absolute minimum quantities of refrigerant released in the course of making good faith attempts to recapture and recycle or safely dispose of refrigerants.

(2) Refrigerants emitted in the course of normal operation of air-conditioning and refrigeration equipment, (i.e., purging of air and non-condensable gases), as opposed to during the maintenance, servicing, repair or disposal of the equipment.

(3) Mixtures of nitrogen and R-22 that are used as holding charges or as leak test gases, because in these cases, the ozone-depleting compound is not used as a refrigerant. However, a technician may not avoid recovering refrigerant by adding nitrogen to a charged system.

(4) Small releases of refrigerant which result from purging hoses or from connecting or disconnecting hoses to charge or service appliances. Additionally, refrigerant recovery and recycling equipment must be equipped with low-loss fittings.

d. Personnel who perform maintenance or repairs to equipment that utilize ozone depleting substances, are required to successfully pass an Environmental Protection Agency approved technician certification test and be licensed before any commencement of work begins.

VOLUME IV

CHAPTER 7

ACCOUNTABILITY AND CERTIFICATION OF NUCLEAR PROPULSION PLANT TEST AND SUPPORT EQUIPMENT

REFERENCES.

(a) NAVSEA 0989-031-4000 - Reactor Plant Instrumentation and Control Equipment Maintenance
(b) NAVSEA 0989-064-3000 - Cleanliness Requirements for Nuclear Propulsion Plant Maintenance and Construction

LISTING OF APPENDICES.

A Nuclear Test Equipment Check-Out and Check-In Form
B Nuclear Support and Test Equipment Certification Record

7.1 PURPOSE. To issue requirements for the certification and accountability of Nuclear Propulsion Plant Test and Support Equipment as required by the applicable Reactor Plant Manual (RPM) and reference (a). Nuclear Propulsion Plant Test and Support Equipment is commonly referred to as Nuclear Test Equipment (NTE).

a. NTE specified by the applicable RPM and reference (a) to support planned and corrective maintenance of Nuclear Propulsion Plant systems must be carefully controlled. Maintaining accountability and certifying accuracy, operability, and reliability per the most current Field Changes and technical specifications is an essential element of reactor safety. The basic elements of the NTE program are certification and verification.

b. Certification is the detailed technical evaluation of the equipment to conclude that the item conforms to the required specification. Certification is conducted prior to initial issue and after any event that invalidates the certification, such as repair, Field Change installation or a revision to the equipment reference drawing or figure and is recorded on a NTE Certification Record. Equipment will normally be maintained in a Ready for Issue, certified condition, requiring verification prior to each issue.

c. Verification is the validation that the equipment is certified based on a review of records and is in a physically acceptable condition for issue and use. Verification is conducted prior to each issue and is recorded on a NTE Check-out and Check-in Form contained in Appendix A of this chapter.

7.2 NUCLEAR TEST EQUIPMENT CATEGORIES. For purposes of this chapter, NTE is divided into three categories.

a. General Purpose Electronic Test Equipment.

b. Electronic and Electrical Test Equipment, non-General Purpose Electronic Test Equipment (e.g., switchboard test equipment, scram breaker time response equipment, etc.).

c. Mechanical Test Equipment.

7.3 ACTION. The Repair Officer must implement the requirements of this chapter. The Nuclear Repair Officer is designated as the custodian of NTE and must ensure that assigned personnel carry out the requirements of this chapter.

7.4 PROCUREMENT. Only test equipment meeting the specifications of the applicable RPM and reference (a) may be used to conduct testing on Nuclear Propulsion Plant Systems. Requisitions for new equipment must contain sufficient detail to ensure the correct item is purchased. Allowance Equipage Lists for required NTE are provided in the tender Coordinated Shipboard Allowance List or Q-Coordinated Shipboard Allowance List. The requirements for General Purpose Electronic Test Equipment to support nuclear electrical and electronic testing are contained in the applicable Ship's Portable Electronic Test Equipment Requirements List.

7.5 NUCLEAR TEST EQUIPMENT CERTIFICATION. NTE must be certified using a Formal Work Package (FWP) for Electronic, Electrical and Mechanical Test Equipment. Certification is required for new equipment prior to initial issue and following repairs or modifications which could impact performance. Periodic recertification is not required. The FWP should be as simple as possible. As a minimum, the FWP must provide the exact equipment reference and indicate the attributes that must be verified and the required testing. Recertification following repair must be a step in the repair FWP. Certification must be documented on NTE Certification Records and is discussed in detail in paragraph 7.5.4. Certification must be accomplished per paragraph 7.5.1 or 7.5.2. The ultimate objective is to demonstrate that the NTE available for Nuclear Propulsion Plant application is technically correct.

7.5.1 Electronic and Electrical Test Equipment. The FWP must require completing and retaining an NTE Certification Record.

a. To certify new or existing measuring and recording equipment, such as a Visicorder or strip chart recorder, verify that the specifications given in the equipment technical manual match the specifications required by the applicable RPM, reference (a), or applicable test reference.

b. To certify repaired or re-calibrated measuring and recording equipment, the repair or calibration activity must certify that the item still conforms to the original technical specifications and is properly calibrated (as evidenced by a calibration sticker). The Fleet Maintenance Activity Work Center performing the repair or calibration must complete the NTE Certification Record. If the repair or calibration was not performed by the Fleet Maintenance Activity, Nuclear Repair must certify the equipment. Work orders for repair must require conformance to referenced drawings and figures.

c. To certify other existing electrical test equipment not previously certified, such as switch boxes, jumper boxes, cables, Under Voltage and Under Frequency test boxes, etc., each component and the wiring configuration must be compared to the referenced drawing for correctness.

d. To certify other new electrical test equipment verify the test equipment as correct with respect to what was ordered and the nameplate data or other markings compared to the equipment requirements of the RPM, reference (a), or referenced test procedure.

7.5.2 Mechanical Test Equipment.

a. To certify existing or newly manufactured mechanical test equipment, the FWP that manufactures the test equipment must include steps to verify that the material specifications and configuration match the equipment reference. The FWP must also include all required testing.

b. To certify purchased mechanical test equipment, the FWP must include steps to verify the equipment as correct with respect to what was ordered, compare the equipment to the requirements of the RPM, reference (a) and or referenced test procedure and must also specify any testing that may be required prior to use.

7.5.3 Recertification Following Reference Revision. To certify existing equipment after a revision to the equipment configuration reference, take the actions necessary for the NTE to conform to the revision and complete an NTE Certification Record for recertification. The FWP for Electronic, Electrical and Mechanical Test Equipment used to accomplish the equipment changes will specify recertification. A new NTE Certification Record will be generated regardless of whether or not the equipment required modification. The new certification record will serve to update the applicable revision and will provide evidence that the NTE was in fact validated to the correct revision.

7.5.4 Certification Documentation. The FWP must contain a NTE Certification Record. The minimum attributes are shown in Appendix B.

a. The Certification Record page (current and superseded) must be retained by the Nuclear Repair Officer for the life of the equipment. This record must be available for review by personnel checking out equipment.

b. The active revision or advance change notice level of the reference to which the equipment was built must be specific enough to allow verification of the effects of future reference revisions. For example, while the RPM or reference (a) may be at revision 480, a figure showing test equipment details may be revision 453. The reference should be stated as the exact figure number and 453 should be recorded as the revision level.

c. Existing records that contain proper certification data are acceptable and need not be replaced.

7.6 ACCOUNTABILITY.

a. Electrical and electronic test equipment must be fitted with tamper resistant seals where unauthorized access to calibration settings or internal components may invalidate certification.

b. Requests for test equipment are normally made using an Supplemental Form, OPNAV 4790/2L, and identifying the appropriate Master Job Catalog routine Job Sequence Number. The OPNAV 4790/2L requesting the test equipment must be specific with respect to the fittings or other associated components required in addition to the specific piece of test equipment. For hydrostatic test equipment, sufficient information must be provided to complete the checklist requirements of chapter 9 of this volume.

c. Equipment should be issued for a specified period and delinquent equipment recovered as soon as possible.

d. Activities receiving NTE must be briefed that only the issuing activity is authorized to repair NTE and that tampering will invalidate certification.

e. Equipment Check-out and Check-in Forms will, as a minimum, contain the attributes contained in Appendix A of this chapter.

f. Verification that the equipment is following the latest revision of the controlling reference must be accomplished by:

(1) Review of the NTE Certification Record prepared per section 7.5 to demonstrate that the item has been certified.

(2) Compare the revision level stated on the NTE Certification Record to the latest revision of the reference.

g. When equipment is returned, those items of the issue and receipt procedure necessary to determine the condition of the equipment must be repeated. This will ensure that equipment requiring repair is identified in a timely manner. A check-in operational test need not be performed in every case, but would be appropriate if visible physical conditions indicate possible damage affecting operability.

h. Prior to issue by the repair facility, mechanical NTE which is expected to be subjected to pressure greater than 10 pounds per square inch will be operationally pressure tested to the highest pressure expected during use in the propulsion plant. Individual gages are excluded provided they are issued as individual components without adapters or hoses (for normal installation in a system) and are properly calibrated.

i. The activity requesting mechanical NTE will be specific when requesting NTE. The following data (at a minimum) will be specified as applicable:

(1) Maintenance for which the NTE is required.

(2) Gage range and required tolerance.

(3) Set-points of protective devices.

(4) Length of hose.

(5) Size and style of fittings for attachment to ships system (e.g., Swagelok SS 1/8" inverted 37 Degrees SAE flare fitting).

(6) Maximum temperature the NTE is expected to be subjected to during use.

(7) Date required.

(8) Any special requirements.

7.6.1 Lost or Damaged Test Equipment. Lost or damaged test equipment must be repaired or replaced in a timely manner. Equipment requiring repair will be entered in the Equipment Deficiency Log, assigned a Job Sequence Number and entered in the Current Ship's Maintenance Project. Out-Of-Commission equipment that results in an inability to provide necessary test equipment for reactor plant testing must be given high repair priority. Maintenance of NTE will only be accomplished by the issuing activity.

7.6.2 Cleanliness and Foreign Material Exclusion. Mechanical Test Equipment and Assemblies attached to Nuclear Propulsion Plant Systems must meet the requirements for cleanliness control

and foreign material exclusion specified by reference (b). Verification of cleanliness will be incorporated into check-out and check-in forms and into FWPs and Technical Work Documents.

7.6.3 Stowage. NTE must be stowed in a location segregated from non-NTE. Ready For Issue equipment will be stowed apart from non-Ready For Issue equipment. Segregated stowage must be such that it precludes inadvertent mixing of equipment.

7.6.4 Inventory. NTE will be inventoried at least annually. A record of the most recent inventory will be retained by the Nuclear Repair Officer.

APPENDIX A

NUCLEAR TEST EQUIPMENT CHECK-OUT AND CHECK-IN FORM

Receiving Activity: _____Date _____

Lending Activity: _____

1. Equipment description and serial numbers. Include all individual components. _____

_____
_____
_____
_____
_____
_____
_____
_____

2. Required return date:

ATTRIBUTE	CHECK-OUT			CHECK-IN		
	SAT	UNSAT	N/A	SAT	UNSAT	N/A
Physical condition of assembly or item						
Calibration current						
Tamper resistant seals intact						
Level of cleanliness is as required						
Operational test. Protective feature set point _____. For hydro rigs, complete Test Rig Determination and Inspection Check List (see Chapter 9 of this volume) and provide with hydro rig.						
Equipment previously certified. Review Certification Record Card						
Equipment verified correct to latest revision or advance change notice of referenced drawing or manual.						

3. Equipment found to be unsatisfactory has been segregated from satisfactory equipment and repair request submitted. CHECK-OUT YES (☐) CHECK-IN YES (☐)

CHECK-OUT and CHECK-IN signatures on reverse.

CHECK-OUT

Prepared and Issued By:

Signature _____

Printed Name _____

Received By:

Signature _____

Printed Name _____

NOTE: RECEIPT SIGNATURE ACKNOWLEDGES THAT ONLY THE ISSUING ACTIVITY IS AUTHORIZED TO REPAIR NTE AND THAT TAMPERING WILL INVALIDATE CERTIFICATION. THIS SIGNATURE ALSO ACKNOWLEDGES THAT A REVIEW OF CERTIFICATION RECORDS CONFIRMS THAT THE EQUIPMENT CONFORMS TO THE REQUIRED TEST REFERENCE REQUIREMENTS.

CHECK-IN

Returned by:

Signature _____

Printed Name _____

Received by:

Signature _____

Printed Name _____

APPENDIX B

NUCLEAR SUPPORT AND TEST EQUIPMENT CERTIFICATION RECORD

<table>
<tr><td>1. SHIP/ACTIVITY</td><td>2. FWP NUMBER</td><td>3. DATE CERTIFIED (circle one)
INITIAL CERTIFICATION
RECERTIFICATION</td></tr>
<tr><td colspan="3">4. EQUIPMENT IDENTIFICATION (Noun Name and Assigned Serial Number)</td></tr>
<tr><td colspan="3">5. MATERIAL AND CLEANLINESS CERTIFCATION: Identify equipment configuration reference (e.g., NAVSEA manual, drawing, figure, FMRSD Quality Note), including exact revision and ACN to which the equipment was built. If built to locally generated sketch, attach sketch to this document. Identify final cleanliness condition as applicable.</td></tr>
<tr><td colspan="3">6. CERTIFICATION TEST(S)/CHECK(S) PERFORMED AND RESULTS (e.g., testing and inspections performed in FWP)</td></tr>
<tr><td colspan="3">7. REASON FOR RECERTIFICATION (not applicable to initial certification)</td></tr>
<tr><td colspan="2">8. CERTIFIED BY LWC Supervisor (Note 1):
DATE:_____
SIGNATURE:_____
PRINTED NAME:_____</td><td>9. CERTIFIED BY NRO (Note 2):
DATE:_____
SIGNATURE:_____
PRINTED NAME:_____</td></tr>
</table>

Note 1: The LWC Division Supervisor will sign, legibly print, and enter the date certifying that the production work and testing specific in the FWP listed block 2 for test equipment manufacture has been accomplished per the specified instructions and has been completed, reviewed, visually inspected and is correct per ship's request and equipment configuration references.

Note 2: The NRO will sign, legibly print, and enter the date, certifying that all production work and testing specified in the FWP listed in block 2 has been reviewed for accuracy and is complete and accurate.

VOLUME IV

CHAPTER 8

WEAPONS AND CARGO ELEVATOR ASSESSMENTS

8.1 PURPOSE. To provide guidance in the preparation for and execution of shipboard weapons and cargo elevator assessments and assist visits by the Elevator Support Unit (ESU). Shipboard weapons and cargo handling elevators are supported through the elevator assessment and repair program, which is executed by the ESU. The ESU program, formerly the Program to Assess and Repair Shipboard Elevators for the Atlantic Fleet, and Weapons Elevator Support Unit for the Pacific and Atlantic Fleets, provides direct fleet support for the maintenance and modernization of shipboard elevators. The program is executed by the ESU on a per ship cycle, as dictated by the individual ship's deployment and maintenance schedules. Although ESU scheduled milestones are based on the maintenance cycle, the primary focus of the program is to achieve peak system readiness at the time of deployment by evaluating and repairing elevators throughout the ship's cycle.

8.2 ELEVATOR SUPPORT UNIT. The Regional Maintenance Center ESU is composed of skilled technicians qualified in the operation, repair, testing and training of weapons and cargo elevator systems. The ESUs are responsible for periodic material assessments, repair, technical assistance, on board operator maintenance training, and verification of Integrated Logistics Support (ILS) elements under this program.

8.3 SHIP'S FORCE ASSESSMENT RESPONSIBILITIES.

a. Ensure that the Current Ship's Maintenance Project (CSMP) is up to date.

b. Ensure operators and maintenance personnel are available to assist the Assessment Team.

c. Require operators and maintenance personnel to accompany the Assessment Team for on the job training to increase self-sufficiency.

d. Prepare and submit a Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), for each deficiency not corrected prior to completion of the assessment. Provide a listing of Job Control Numbers to the ESU.

8.4 ELEVATOR SUPPORT UNIT EVOLUTIONS. The specific components of each ESU evolution are defined in sub-paragraphs 8.4.a. through 8.4.d. These evolutions are designed to ensure deficiencies are identified and repaired in a timely manner. Prior to commencement of any ESU evolution, a pre-brief will be conducted by the ESU representative and attended by the ship's Maintenance Manager and all applicable departmental representatives. The pre-brief will cover, but is not limited to, the following topics:

a. Key evolution elements.

b. Roles and responsibilities of:

(1) ESU technical personnel.

(2) Ship's Force personnel.

c. Working relationship between ESU technical personnel and Ship's Force.

d. Overall safety practices and precautions applicable to the evolution.

8.4.1 Material Condition Assessment Visit. A Material Condition Assessment visit will be used to determine a baseline and establish the scope of follow-on actions. This visit is accomplished once per Fleet Readiness Training Plan. The ESU uses assessment guidelines to determine the system's material condition, while ensuring the following is accomplished:

a. The CSMP is validated to avoid redundancies during the assessment.

b. The elevator system is assessed by certified governmental elevator inspectors with assistance by the ESU to repair, groom and operationally test. The ESU will make every effort to correct all deficiencies prior to the end of the visit.

c. On the Job Training (OJT) is conducted with Ship's Force to promote self-sufficiency.

d. Working with the ship's cognizant Department(s) Maintenance Manager, and TYCOM coordinators, determine the preliminary level of effort required to correct the discrepancies.

e. All discrepancies and corrected items have been documented in the ship's CSMP using the appropriate IT System.

f. The Commanding Officer, or an officer designated by the Commanding Officer, is briefed on the elevator system material condition.

g. A final report is issued to the ship, ISIC and TYCOM following the Material Condition Assessment visit. The report must address the following:

(1) Safety of systems, including "safe to operate" conditions.

(2) Major discrepancies found during the visit.

(3) System Operability Test results.

(4) Training status of Ship's Force with respect to Personnel Qualification Standards (PQS) and practical elevator system maintenance and operation.

(5) Status of authorized, completed, or programmed Ship Alterations.

(6) Recommendations to the In-Service Engineering Agent for system changes.

(7) In-Service Engineering Agent.

8.4.2 Repair Visit. The Repair Visit is designed to correct discrepancies identified in the ship's CSMP that could not be repaired during the assessment visit.

a. Conduct multiple visits, as receipt of material permits, to repair as-found conditions.

b. Provide logistics assistance as necessary.

c. Conduct OJT with Ship's Force.

8.4.3 In Process Review. This review will be conducted on a case-by-case basis, contingent on the scope of repairs programmed for the maintenance availability. When tasked, the ESU will review the elevator system work package prior to the start of an availability. During the availability the ESU will:

a. Monitor the progress and Quality Assurance of the ESU, coordinating with Supervisor of Shipbuilding and industrial activity representatives, Naval Surface Warfare Center, Philadelphia Division, and TYCOM Maintenance Manager, as applicable.

b. Provide technical and logistic support to Ship's Force.

c. Monitor the CSMP status.

d. Witness elevator tests, as tasked.

8.4.4 On-Board Maintenance Training. On-board maintenance training will be conducted at least once per Fleet Readiness Training Plan with each ship receiving training as a host ship or by having their personnel participate in training on another ship of the same class. It consists of operator and maintenance classroom instruction followed by hands-on training. The ship class on-board maintenance training documentation is tailored to be ship specific, giving the ship the most accurate and coherent training possible.

8.4.5 Integrated Logistics Support.

a. A one-time ILS validation of elevator configuration, Allowance Parts Lists (APL), Coordinated Shipboard Allowance Lists (COSAL) and technical manuals will be conducted.

b. Follow-on ILS visits will be accomplished at the TYCOM's request.

8.5 VISIT SCHEDULING. The ISIC will schedule all ESU visits through the TYCOM sponsored Quarterly Scheduling Conference. Visits will not be authorized without prior approval by the cognizant TYCOM.

8.6 REPORTS. Before departing the ship, the ESU will debrief the Commanding Officer, or designated officer, on the material condition of the elevator system. The ESU must provide the ISIC and TYCOM a report, outlining the results, not later than 30 days following the visit.

CHAPTER 9

SYSTEM TEST CHECK LIST

REFERENCES.

(a) NAVSEA 0387-046-8000 - System Hydrostatic Test Requirements
(b) NAVSEA S9086-RJ-STM-010 - NSTM Chapter 504 (Pressure, Temperature and Other Mechanical and Electromechanical Measuring Instruments)
(c) NAVSEA S9505-AF-MMA-010 - Submarine Non-Nuclear Piping Systems Test Manual
(d) NAVSEA S9086-RK-STM-010 - NSTM Chapter 505 (Piping Systems)

LISTING OF APPENDICES.

A Nuclear Test Rig Determination and Inspection Check List
B Non-Nuclear Test Rig Determination and Inspection Check List
C Nuclear and Non-Nuclear Pre-Test Inspection Check List
D Nuclear and Non-Nuclear Performance of Test Check List

9.1 PURPOSE. To provide standard check lists for the proper preparation for the conduct of and recovery from nuclear and non-nuclear tests. Appendices A through D of this chapter are applicable to installed ship systems, individual components and support equipment tested in conjunction with Formal Work Packages (FWP) and Technical Work Documents (TWD).

a. Appendices A through D of this chapter are similar to a standard FWP that will require entries, prior to each use, to detail the specifics of the test to be performed. When TWDs are utilized, the locally developed FWP should direct execution of the checklists and need only direct other actions that are not included in the checklists. For example, since Forces Afloat rarely perform hydrostatic tests on hot systems, the checklists are prepared based on system temperatures less than 200 degrees F. In the event that a hydrostatic test is performed with temperatures greater than 200 degrees F, the locally developed FWP must contain additional requirements for the test from the referenced test manual.

b. These lists are developed from references (a) through (d) and **are not inclusive of all requirements**. All applicable test references must be reviewed in preparation for the test to ensure no requirement or precaution is overlooked. Other references such as the Reactor Plant Manual (RPM), Propulsion Plant Manual, Steam Plant Manual, Steam and Electric Plant Manuals, Ship Systems Manuals, Ships Information Books, Test Pressure Drawings, component technical manuals, etc., provide additional guidance and requirements that must be included in the locally developed FWP for the test.

9.2 GENERAL INSTRUCTIONS.

a. Blank spaces are provided throughout the checklists so that requirements for the specific test to be performed may be added. These specifics must be entered during FWP preparation.

b. Portions that are not applicable must be marked "N/A" prior to FWP approval.

c. Multiple "Completed by" signature blanks are provided at the end of each checklist since one individual may not be able to fully complete a particular checklist. Additional signature blanks may be added if required.

d. The Test Rig Determination and Inspection Check List, Appendices A and B of this chapter, must be completed by the activity issuing the test equipment. It is the responsibility of both the issuing and receiving activity to ensure that the correct test gear is used. Local exceptions to gages specified in reference (b) Table 504-6-1 will be approved by an individual with a technical warrant. When gage exceptions are invoked, the approved exception must be included with associated test form. This may be accomplished by requesting the correct test equipment, and the issuing activity completing the check list and providing it with the test equipment for review. To satisfy the scope of this chapter, the activity requesting the test equipment must include in their request (OPNAV 4790/2L) the information necessary for the issuing activity to complete Item 1 of Appendices A or B of this chapter, as applicable.

e. These check lists may also be used when a maximum operating pressure test is specified and an external pressure source is required to obtain this pressure. Installed system equipment must be used whenever possible to perform operating pressure tests.

f. Appendices B, C, and D of this chapter may contain classified information when filled in (i.e., the nuclear information or classified test pressures). It will be the responsibility of the requesting activity to ensure the proper classification is annotated on the document when applicable.

9.3 RECORD RETENTION. System Check Lists do not require retention after the test has been satisfactorily completed, documented in the FWP or TWD, and the FWP or TWD is closed. Additional reviews of testing information are provided in sub-paragraphs "a" and "b":

a. For Ship's Force testing to recertify TWD work performed by the Fleet Maintenance Activity (FMA), the completed checklists, or copies must be provided with the test documentation provided to the FMA. When the FMA Quality Assurance Officer accepts the completed retest, the checklist may be discarded.

b. For FMA shop testing of controlled work, the completed checklists, or copies, must be provided with the test documentation required by the Controlled Work Package until the FMA Quality Assurance Officer or Quality Assurance Supervisor accepts the testing objective quality evidence. Once the tests are accepted, the checklist may be discarded.

APPENDIX A

NUCLEAR
TEST RIG DETERMINATION AND INSPECTION CHECK LIST

References: (a) NAVSEA 0387-046-8000 - System Hydrostatic Test Requirements

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
1. Complete the following based on the information provided by the requesting activity.		
a.	System or component to be tested	
b.	Test Pressure _____ Reference_____	
c.	Number of test gages required: Total_____ Primary _____ (per reference (a) Appendix D). Backup _____ Indicate zero if multiple primary gages are required, one of which will also serve as a backup or if an installed system gage will be used.	
d.	Level of cleanliness required	
e.	Planned method of over pressure protection (e.g., manual using installed system valve plus one automatic relief included with test rig, or other combination). Unless otherwise specified, the rig will be provided with one manual and one automatic relief.	
2. GAGES: Normally installed instrumentation may be used as backup pressure indication. If an installed gage is not available and the backup gage will be a temporary gage, then complete Items a-f for both primary and backup gages. Otherwise, a-f apply to primary gage(s) only.		
a.	Complete and attach reference (a), Figure 8-2 for selection of test gages.	
b.	Reference (a), Figure 8-2, Item 8 (maximum gage error at test pressure) must not exceed 2% of test pressure.	
c.	Nominal indicated test pressure must be no less than 25% of the primary gage's range. Nominal indicated test pressure must be no less than 10% of the backup gage's range, if the backup gage is a temporary gage.	
d.	The gage range must be capable of indicating the manual over pressure protection pressure at no greater than 90% of full range and the potential maximum overpressure (when using a relief valve) at no greater than 98% of full range.	
e.	Temporary gages must be single scale analog gages or digital pressure instruments calibrated in psig.	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
f.	RECORD GAGE DATA: Primary gage range _____ psi Cal due date_____ Ser Number_____ Backup gage range _____ psi Cal due date_____ Ser Number_____	
g.	Gages have been calibrated within the required periodicity. Circle applicable item: (1) Normal metrology requirements list calibration frequency (This is the frequency unless specified otherwise for the specific test). (2) Special frequency _____ Required by _____(Indicate required frequency and reference).	
3. OVERPRESSURE PROTECTION:		
a.	The manual release of pressure is the primary method of protection.	
b.	Automatic backup relief valve will be provided.	
c.	If the temporary relief valves provided are to be installed in the system, installation must be such that it does not cause damage to the system or system components.	
d.	The over-capacity of relief valves should not cause excessive thermal and pressure shock. (Relief valve capacity should not be grossly higher than pressure source capacity).	
e.	The blow down characteristics must be compatible with the system being tested. (The reseating characteristics of automatic reliefs should be consistent with the requirements of the system being tested. For example, a relief that does not reseat until pressure is reduced to zero would not be acceptable for a primary hydro). (Review manufacturer's data).	
f.	Valve accumulation at the flow of the test pressure source must not exceed 10% of the relief valve set point.	
g.	Temporary automatic relief valves which have more than one inlet and therefore provide different relief valve performance characteristics (e.g., set pressure) must not be used.	
h.	Temporary automatic reliefs which require no tools for set point adjustment (e.g., employ hand adjustment knob) must:	
	(1) Have some means to positively lock the setting once it has been made or (2) Must be designed to prevent ready access to the adjustment knob.	
4. OVERPRESSURE PROTECTION SETPOINT DETERMINATION:		
a.	Record required hydrostatic test pressure _____ psi.	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
b.	Record required overpressure protection set point _____ psi. Circle applicable determination method: (1) As specified in the applicable RPM. (2) Other Naval Sea Systems Command (NAVSEA) approved document (identify reference). (3) Using Reference (a), Figure 8-2 (attach).	
c.	Potential maximum overpressure (Reference (a), Figure 8-2, item 29) conforms to the requirements of reference (a) Section E.3.3.	
5. TEMPORARY EQUIPMENT REQUIREMENTS:		
a.	Temporary connections and equipment (cap, spool pieces, jumpers, blank flanges, etc.) must be verified to be capable of withstanding hydrostatic test pressure.	
b.	Verify that within the last year and subsequent to disassembly or replacement of any test rig equipment, the assembled test rig (pump, hoses, gages, connecting tubing) has been satisfactorily tested to a pressure at least equal to the maximum pressure which might be encountered during this hydrostatic test. (Hydro is not required to test pressure gage and relief valve replacement or fittings between subassemblies designed to be broken for portability. Set point testing of the test rig relief valve while on the test rig meets this requirement).	
c.	Verify the rig has been cleaned to meet the system cleanliness requirements of the system being tested. If the rig is not maintained clean, comply with the cleanliness boundary requirements of reference (a), Section E.4.	
d.	No quick-disconnects with check features are to be used in the hydro rig.	
6. OPERATIONAL TEST:		
INSTRUCTIONS: The following checks must be performed with the test rig isolated from the system being tested. This may be done by blanking the hose prior to connecting the rig to the system. Equipment provided by an FMA will be tested at the FMA prior to being issued to a tended ship. The operational test need not be repeated by the tended ship receiving the test gear. **NOTE: FOR SHOP TEST FACILITIES (I.E., INTERMEDIATE MAINTENANCE ACTIVITIES, NAVAL SHIPYARDS AND TENDERS) WHERE HYDROSTATIC TESTS ARE CONDUCTED AT LEAST ONCE EVERY TWO WEEKS AND WHERE THE TEST GAGES (BACKUP AND MASTER) ARE COVERED UNDER THE NAVY METROLOGY AND CALIBRATION (METCAL) SYSTEM, CROSS CHECKING THE GAGES BEFORE TEST IS NOT REQUIRED.**		
a.	Mark hydro gages with a red pointer at the required relief set point.	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
b.	Raise rig pressure to the specified test pressure. If the backup gage is included with the test rig, (vice an installed system gage) verify primary and backup gages are in agreement. (Maximum difference after height correction is no more than the sum of the specified accuracies plus a readability error of one-half the smallest graduation of each gage). Required accuracy + or - _____ psig. If not in agreement, replace or re-calibrate and repeat this step until satisfied.	
c.	Record required overpressure protection set point _____ psig. Continue to raise pressure to the specified overpressure protection set point. If the manual relief is installed on the rig, with the pressure source operating at the specified manual relief set point, verify that the **manual** relief and associated piping relieve the capacity of the pressure source.	
d.	Set or confirm set point of the automatic relief valve. With the pressure source operating and at the relief set point, verify that the **automatic** relief and associated piping relieve the full capacity of the pressure source.	
e.	Vent the rig to reduce pressure to reseat the automatic relief valve. Slowly raise pressure again to recheck the automatic relief set point.	
f.	With the rig vented, verify that pressure gages that will be installed as primary or backup pressure indication, which are not equipped with a dial adjustment device read zero (within the gage accuracy plus the readability of one half of the smallest graduation on the dial face).	
g.	With the rig completely assembled, verify cleanliness by operating the pump to flush the pump and any attached piping or equipment.	
h.	Ensure cleanliness controls are established on the rig such that cleanliness is not lost in the interim period between flushing and the operational test and connection to the system being tested.

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
1. Complete the following based on information provided by the requesting activity.		
a.	System or component to be tested.	
b.	Test Pressure _____ Reference _____ (If Item Number)	
c.	Number of test gages required: Total_____ Primary_____ Backup __**_____** Indicate zero if an installed system gage will be used.	
d.	Level of cleanliness required_____	
e.	Planned method of overpressure protection (e.g., manual using installed system valve plus one automatic relief included with test rig, or other combination). Unless otherwise specified, the rig will be provided with one manual and one automatic relief.	
2. GAGES:		
NOTE: TYPICAL GAGES FOR MOST NON-NUCLEAR TESTS ARE LISTED IN REFERENCE (a), TABLE 504-6-1.		

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
CAUTION:	**REFERENCE (a) TABLE 504-6-1 ALLOWS EXCEPTIONS TO THE GAGES LISTED IN THE TABLE. IF USING A GAGE NOT LISTED ON THE TABLE, IT MUST STILL COMPLY WITH THE CRITERIA SPECIFIED IN THIS APPENDIX.**	
a.	ANALOG GAGES The pressure gage range based on the maximum test pressure up to and including the relief valve setting must be: - greater than the test pressure **and** - not more than 200% of the maximum test pressure.	
	For tests 0-60 psi and below, the range may exceed 200% of the test pressure but will be as low as practical.	
	Test gage pressure graduations are equal to or smaller than those specified by reference (a) Table 504-6-1.	
	Gage accuracy must be at least + or - 1.0 % of the gage span.	
	Primary gage accuracy must be at least + or - 1.0% of the gage span.	
b.	DIGITAL GAGES Digital gages are authorized for use by reference (b). Digital gages of any range may be used as long as the gage accuracy is equal to or better than + or - 1.0% of the gage span. Gage range may exceed 200 % of the test pressure as long as the gage accuracy is equal to or better than + or - 1.0% of the test pressure. Gage accuracy must be equal to or better than + or - 1.0% of the test pressure.	
c.	RECORD GAGE DATA: Primary gage range _____ psi Cal due date_____ Ser Number_____ Backup gage range _____ psi Cal due date_____ Ser Number_____	
d.	Gages have been calibrated within the required periodicity. Circle applicable item: (1) Normal metrology requirements list calibration frequency (This is the frequency unless specified otherwise for the specific test). (2) Special frequency _____ required by ___ (Indicate required frequency and applicable reference).	
3. OVERPRESSURE PROTECTION:		
a.	The manual release of pressure is the primary method of protection.	
b.	Backup relief valve, automatic or manual, will be provided. (Automatic preferred unless otherwise specified).	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
c.	If the temporary relief valves provided are to be installed into the system, installation must be such that it does not damage the system or system components. Review reference (b) or (c), as applicable.	
d.	The over-capacity of relief valves should not cause excessive thermal and pressure shock. (Relief valve capacity should not be grossly higher than pressure source capacity).	
e.	The blow down characteristics must be compatible with the system being tested. (The reseating characteristics of automatic reliefs should be consistent with the requirements of the system being tested). (Review manufacturer's data).	
f.	Valve accumulation at the flow of the test pressure source must not exceed 10% of the relief valve set point.	
g.	Temporary automatic relief valves which have more than one inlet and therefore provide different relief valve performance characteristics (e.g., set pressure) must not be used.	
h.	Temporary automatic reliefs which have a rapid adjustment feature by which the set point may be inadvertently changed must not be used.	
4. OVERPRESSURE PROTECTION SETPOINT DETERMINATION:		
a.	If performing a maximum operating pressure test, verify that installed system relief valves are unisolated and not blocked or gagged. The set point for the manual release of pressure must be based on installed system relief set points.	
CAUTION: WHEN PERFORMING MAXIMUM OPERATING PRESSURE TESTS, INSTALLED RELIEF VALVES PROVIDE SYSTEM PROTECTION. SYSTEM RELIEF VALVES MUST NOT BE REMOVED FROM SERVICE.		
b.	Record required hydrostatic test pressure _____ psi.	
c.	Record required overpressure protection set point _____ psi. Circle applicable determination method: the lesser of: (1) 100 psi over test pressure. (2) 10% above test pressure.	
5. TEMPORARY EQUIPMENT REQUIREMENTS:		
a.	Temporary connections and equipment (cap, spool pieces, jumpers, blank flanges, hoses, etc.) must be verified to be capable of withstanding the test pressure.	
b.	Verify that within the last year and subsequent to disassembly or replacement of any test rig equipment the assembled test rig has been satisfactorily tested to a pressure approximately 15% above the maximum pressure it will witness during the system hydrostatic test. (Hydro is not required to test pressure gage and relief valve replacement or fittings between subassemblies designed to be broken for portability. Set point testing of the test rig relief valve while on the test rig meets this requirement).	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
c.	Verify the rig has been cleaned to meet the system cleanliness requirements of the system being tested.	
d.	No quick-disconnects with check features are to be used in the test rig.	
6. OPERATIONAL TEST:		
INSTRUCTIONS: The following checks must be performed with the test rig isolated from the system being tested. This may be done by blanking the hose prior to connecting the rig to the system. References (b) and (c) provide a sample step-by-step procedure for these checks. Equipment provided by an FMA or Industrial Activity must be tested prior to being issued to a tended ship. If documentation is provided by the issuing FMA or Industrial Activity that the assembled test rig has been verified to meet all of the requirements of this appendix, the operational test need not be repeated by the end user. **NOTE: FOR SHOP TEST FACILITIES (I.E., INTERMEDIATE MAINTENANCE ACTIVITIES, NAVAL SHIPYARDS AND TENDERS) WHERE HYDROSTATIC TESTS ARE CONDUCTED AT LEAST ONCE EVERY TWO WEEKS AND WHERE THE TEST GAGES (BACKUP AND MASTER) ARE COVERED UNDER THE NAVY METROLOGY AND CALIBRATION (METCAL) SYSTEM, CROSS CHECKING THE GAGES BEFORE TEST IS NOT REQUIRED.**		
a.	ANALOG GAGES: Mark all test gages with either a red grease pencil, red tape, or the use of an integral red hand or other suitable mark at the required relief over pressure protection set point, half way between the test pressure and the relief valve set point.	
	DIGITAL GAGES: Digital gages must have the manual over-pressure value (red hand setting) posted in the immediate vicinity of the display with red digits approximately the same size as the digits in the instrument display. For example, red hand settings may be marked on a blank label plate of "Whiteboard" material affixed to the test rig and the setting entered using a non-permanent red marker (dry erase).	
b.	Raise rig pressure to the specified test pressure. Verify primary and backup gages are in agreement. Maximum difference between the two gage readings after height correction is no more than 2%. Calculate 2% for each gage using the full-scale pressure measured by each gage (i.e., a 0-100 psi gage, 2% = 2 psig, the maximum difference between two gages with a 0-100 psi scale at a given pressure is 2 psig). Required accuracy + or - _____ psig. If not in agreement, replace or re-calibrate and repeat this step until satisfied.	
c.	Continue to raise pressure to the specified overpressure protection set point. If the manual relief is installed on the rig (vice using an installed system valve), with the pressure source operating and at the specified manual relief set point, verify that the **manual** relief and associated piping relieve the capacity of the pressure source.	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
d.	Set or confirm setting of the automatic relief valve. With the pressure source operating and at the relief set point, verify that the **automatic** relief and associated piping relieve the capacity of the pressure source.	
e.	Vent the rig to reduce pressure to reseat the automatic relief. Slowly raise pressure again to recheck the automatic relief set point.

APPENDIX C

NUCLEAR AND NON-NUCLEAR PRE-TEST INSPECTION CHECK LIST

References: (a) NAVSEA S9505-AF-MMA-010 - Piping Systems/Submarine Non-Nuclear Piping Systems Test Manual
(b) NAVSEA 0387-LP-046-8000 - System Hydrostatic Test Requirements

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
1. REVIEW TEST PREPARATIONS: The following attributes are necessary for proper test accomplishment and may be included in the test procedure, indicated on the Quality Assurance (QA) form 26 or covered in the pre-test briefing.		
a.	Test equipment installation location and method of installation is clearly indicated in sketch on the QA form 26, or is clearly defined. Test accomplishment will be per reference (a) or (b) as appropriate.	
b.	Specific jumpers, gagging devices, blanks etc. are indicated for both installation and removal. These items must be danger or caution tagged.	
c.	Boundaries of test and specific inspection points are clearly identified.	
d.	Instructions are provided for returning the system to normal or to a specifically stated condition upon completion of the test.	
e.	Procedure minimizes the amount of system to be pressurized to accomplish the test.	
f.	All components within the test boundary are capable of withstanding the test pressure (gages not over-ranged, etc.).	
g.	Necessary precautions as identified on the test pressure drawing have been taken (List or none). Use reverse if additional space required.	
h.	Applicable chapter (maintenance section) or maintenance instruction of the RPM reviewed for test or flush requirements (List or none). Use reverse if additional space required. (Not applicable to non-nuclear tests).	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
i.	Specific actions and precautions taken are included in the test procedure as a result of a review of reference (b), sections 7.2.3, 7.2.4 and 7.2.5 to preclude damage to installed system components due to pressure or temperature conditions that may occur during the test (List or none). Use reverse if additional space required (Not applicable to non-nuclear tests).	
2. WALKTHROUGH OF THE TEST AREA: The attributes listed in Section 2 of this appendix are basic quality control checks that should be conducted or supervised by the Petty Officer in charge of the test.		
a.	Piping in the test boundary is free from dents, gouges, arc strikes and other external defects (Removal of additional lagging or other interference is not required to perform this check).	
b.	Conditions for detecting leaks are satisfactory (e.g., joints being tested are not covered or lagged).	
c.	Hot piping or equipment that could result in a safety hazard to personnel has been insulated or precautions have been taken to minimize the hazard.	
d.	The hydrostatic test will not be a hazard to other evolutions adjacent to the test area (e.g., Work on an open oxygen system adjacent to a seawater hydro).	
e.	Adequate measures have been taken to prevent spray damage to electrical equipment in the event of a leak during pressure testing.	
f.	Pipe hangers removed for work have been reinstalled.	
g.	All mechanical joints are re-made; system integrity established.	
h.	No obvious loose fasteners.	
i.	No obvious instances of missing fasteners or improper fastener material or material mismatch (e.g., no carbon steel fasteners in seawater systems, no improper use of black oxide coated fasteners).

APPENDIX D

NUCLEAR AND NON-NUCLEAR PERFORMANCE OF TEST CHECK LIST

NOTE: DO NOT PRESSURIZE TEST PUMP WITH AIR AND WATER SUPPLY UNTIL READY TO ACTUALLY START THE TEST. DO NOT LEAVE TEST PUMP UNATTENDED DURING ANY PORTION OF THE TEST.

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
1. VERIFY SYSTEM LINE-UP:		
a.	Verify the system to be tested is aligned for the test by performing valve lineup checks or by aligning valves via procedural steps in the test procedure or by steps in an operating instruction.	
b.	Verify that required plant conditions have been established.	
c.	All valves are **DANGER TAGGED OPEN** that:	
	Could block either the primary or backup pressure relief point from the pressure source unless they are to be used during the test to isolate the pressure source from the portion of the system being tested.	
	Could block discharge from the pressure relieving point.	
	Could block either the primary or the back up pressure gage from the pressure source. (To ensure pressure indication, a clear pressure path between the applied pressure source and at least one pressure gage must be confirmed by danger tagging any isolation valve in this path. Confirmation that the other pressure gage is not isolated will be made by comparison with the tagged open gage).	
	Would isolate the test pressure gages and the portion of the system being tested.	
	Are vent paths in adjacent systems when the design or test pressure of the adjacent system is less than that of the system being tested?	
d.	If a section of pipe will be pressurized downstream of a check valve and no provisions are available for measuring the pressure in that section of piping, ensure that: (1) Pressure sources in that portion of the system are isolated or inoperative as discussed in item 1.e of this appendix. (2) Provisions are included to manually depressurize any section of pipe isolated by a check valve as soon as possible after test completion.	
e.	Potential pressure sources within the test area boundaries that are not required for testing are isolated or rendered inoperative by danger tagging out fuses, danger tagging shut appropriate valves, etc.	
f.	There must be no valves in the pressure-relieving path which could shut as a	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
	result of depressurization and thereby block the relief path from relieving the applied test pressure.	
g.	System relief valves within the test boundary are rendered inoperable to permit reaching elevated test pressure.	
h.	Systems susceptible to chloride stress corrosion are isolated to protect in-leakage of chlorides from adjacent systems being tested to an elevated pressure. This isolation may be accomplished either by using double valve isolation with leak off in between or by pressurizing the system susceptible to chloride stress corrosion to prevent in-leakage.	
	If such isolation cannot be attained by practical means or is not assured, then the system susceptible to chloride stress corrosion must be flushed outwardly before and after the elevated pressure test and appropriate samples taken to confirm the absence of contaminants. (Not applicable to non-nuclear tests).	
i.	Verify test equipment: (1) Installation is as specified on the QA form 26. (2) Test gages are within required calibration periodicity. (3) Automatic relief valves set point have been checked within 30 days prior to the test.	
j.	If test gages are provided with a dial adjustment which does not affect calibration, the dial should be adjusted to zero after the gage is installed for the test and prior to opening the valve that isolates the gage from the system being tested.	
k.	Verify calibration and dial adjustment devices, if readily accessible, are protected from inadvertent movement or adjustment during the test.	
l.	The discharge of test medium for overpressure protection is directed into areas where the discharge will not cause damage to equipment, create personnel hazards or radioactive problems.	
m.	Pressure gages must be clearly visible and readable by test personnel.	
n.	The location of gages is such that no path exists whereby pressure could be applied to any portion of the system undergoing test without a pressure gage (primary or backup) indicating this pressure.	
o.	The primary and backup pressure gages must be located on different branch lines (where this can be done without extending the test boundaries).	
2. VERIFY PERSONNEL ARE READY TO CONDUCT TEST:		
a.	Brief personnel, ensuring that the following attributes are understood: (1) Personnel assignments. (2) Maintaining communications.	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
	(3) Test gage requirements: - Gage locations. - Calibration cross checks. - Gage indication and pressure readings. - Primary pressure indications. - Back up pressure indications. (4) Overpressure set point. (5) Type and location of primary overpressure protection. (6) Type and location of back up overpressure protection. (7) Duties of test pressure source operator. (8) Duties of system inspector(s) and required inspection points. (9) Duties of manual overpressure relief operators. (10) Immediate action must be taken to secure the test pressure source and investigate the problem should any of the following occur: - Pressure gages fail to respond to changes in test pressure. - A rupture of a test gage occurs. - Pressure gage readings do not agree with the sums of their accuracies plus readability errors + or - _____ psig. - Changes in test pressures are erratic or operation of the test pumps after the system is filled solid does not produce a corresponding increase in pressure. (11) Immediate action must be taken to secure the test pressure source and relieve system pressure if the pressure at which manual overpressure protection is to be initiated is exceeded on any primary or backup pressure gage. (12) Plant and system status. (13) Preliminary leak checks. (14) Valve packing leak checks (if applicable). (15) Criteria for an acceptable elevated pressure test. (16) Pressurizing to elevated test pressure. (17) Depressurization following completion of test.	
b.	Manual overpressure protection relief valve operators have no other responsibilities assigned. **NOTE: WHEN PRESSURE IS BEING APPLIED BY A HAND-OPERATED TEST PUMP OR WHEN THE PRIMARY AND BACKUP TEST GAGES AND THE MANUAL OVERPRESSURE PROTECTION VALVE(S) ARE ALL INSTALLED ON THE HYDROSTATIC TEST RIG, THE TEST PUMP OPERATOR MAY ALSO SERVE AS THE PRIMARY OVERPRESSURE PROTECTION WATCH, PROVIDED THAT:** **(1) THE MANUAL OVERPRESSURE PROTECTION VALVE IS**	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
	WITHIN EASY REACH. **(2) PROPERLY SET AND TESTED BACKUP RELIEF VALVE PROTECTION IS PROVIDED (FOR OTHER THAN HAND-OPERATED TEST PUMPS, EITHER AN AUDIBLE OVERPRESSURE ALARM IS PROVIDED OR A SECOND BACKUP RELIEF VALVE IS INSTALLED ON THE TEST RIG).** **(3) THE USE OF THIS EXCEPTION DOES NOT RESULT IN ONE INDIVIDUAL BEING SOLELY RESPONSIBLE FOR SATISFACTORY TEST PERFORMANCE.**	
c.	Adequate communications have been established between testing personnel.	
d.	Rate of pressurization and depressurization is specified at 100 psi per minute maximum. If testing a small component or small volume system such that 100 psi per minute is not practicable, control rate as low as possible.	
3. PERFORM ELEVATED PRESSURE TEST:		
a.	Obtain permission to conduct test.	
b.	Verify that the water purity of the test medium will not degrade system cleanliness or the required purity of water already in the system.	
c.	Note depressurized gage readings of all primary gages for comparison later, at test completion. Location _____ ____ psig Location _____ ____ psig	
	Mark all test gages with a red mark at the overpressure protection set point, half way between the test pressure and the relief valve set point.	
d.	Raise rig pressure to the specified test pressure. Verify primary and backup gages are in agreement. Maximum difference between the two gage readings after height correction is no more than 2%. Calculate 2% for each gage using the full-scale pressure measured by each gage (i.e., a 0-100 psi gage, 2% = 2 psig, the maximum difference between two gages with a 0-100 psi scale at a given pressure is 2 psig). Required accuracy + or - _____ psig. If not in agreement, replace or re-calibrate and repeat this step until satisfied.	
e.	If a less accurate gage is used for backup and is indicating higher than the primary gage during gage cross checks, increase the overpressure set point mark on the backup gage by the indication differential after the second crosscheck.	
f.	Increase pressure in increments and perform preliminary leak checks.	
g.	Unless required to be positioned differently (e.g., throttle valves), backseat all valves that were aligned for packing leak checks prior to increasing pressure	

ITEM NO.	ATTRIBUTE	CHECK OFF or N/A
	above normal operating pressure.	
h.	Hold test pressure for 30 minutes prior to commencing final inspection unless otherwise specified.	
i.	Primary and backup gages are in agreement at test pressure. (Same criteria as in Section 3.d of this appendix) + or - _____ psig.	
j.	Results of inspection _____. Also record data on QA form 26. Remarks:	
k.	Slowly depressurize the test area at less than 100 psi per minute. If testing a small component or small volume system such that 100 psi per minute is not practicable, control rate as low as possible.	
	For nuclear tests only: When depressurizing systems which are adjacent to systems potentially contaminated with chlorides, ensure that the potentially contaminated systems are depressurized before depressurizing the system susceptible to chloride stress corrosion to prevent in-leakage. Ensure that the depressurization path is selected such that any fluid flow produced by depressurization will tend to keep chlorides away from the system of concern.	
l.	Note the depressurized gage readings of all primary gages. Location _____ _____ psig Location _____ _____ psig Compare to pre-test depressurized readings. Gages must agree within the gage accuracy and readability error. Disagreement is not cause for rendering the elevated pressure test unsatisfactory, provided gage crosschecks in items 3.d and 3.i of this appendix are satisfactory. However, disagreement should be considered unusual and warrant further investigation.	
m.	Remove temporary equipment.	
n.	Perform system restoration as directed by the FWP.

H Close-out Inspection Check-off List

10.1 PURPOSE. To provide the procedures for authorization and control of shipboard work.

10.2 WORK AUTHORIZATION. Work on ship's systems and components, as defined in volume I, chapter 1, appendix C of this manual, must be properly authorized and controlled in order to ensure rigorous personnel and ship safety standards are met at all times. All outside activity work on ship's systems and components, regardless of who performs the work, requires formal authorization through a Work Authorization Form (WAF) for the specific work to be accomplished. This applies to all U.S. Naval ships in all types of maintenance availabilities, public and private. The Work Authorization System and preparation of the WAF are discussed paragraphs 10.3 and 10.4. For the purpose of this chapter, the term "Repair Activity" is any activity other than Ship's Force involved in the construction, testing, inspection, repair, overhaul, refueling or maintenance of the ship.

10.3 WORK AUTHORIZATION CONTROL. Work on the Fleet's ships is conducted under positive Work Authorization Control in order to ensure rigorous personnel and ship safety standards are met at all times. The following considerations apply in meeting these standards:

a. Work requiring formal authorization may include Planned Maintenance System (PMS), troubleshooting, corrective maintenance (repair) or alterations. It may also include removal of system components for repairs.

b. As many ship systems, such as hydraulics and high-pressure air, are operationally interrelated, caution must be exercised in planning work so that other systems are not unintentionally disabled when setting work boundaries for the system to be worked.

10.4 WORK AUTHORIZATION SYSTEM. Work Authorization must be controlled.

a. Designation of Work Requiring Formal Control. The WAF is the vehicle by which work requiring formal control is authorized for accomplishment and tracked to completion or otherwise no longer requiring isolation or authorization.

b. A WAF, shown in Appendix A_1, is required to authorize the start of work on all ship systems and equipment by activities other than Ship's Force. Work includes all maintenance, repairs or modifications and installation or removal of temporary support systems and equipment. Repair activity non-intrusive work (e.g., painting, lagging, sheet metal work, deck plate, structural foundation) that does not affect ship or personnel safety does not normally require a WAF.

c. For Ship's Force maintenance conducted in nuclear propulsion plants, the Engineering Department Manual contains the requirements regarding when a WAF is needed. For Ship's Force work conducted outside the nuclear propulsion plant, the cognizant department head must determine the necessity for a WAF.

d. For availabilities where a repair activity is assigned responsibilities for work authorization control by Memorandum of Agreement (MOA), the requirement regarding when Ship's Force must submit a WAF must be specified in the MOA.

e. For Surface Force ships and Aegis Ashore only, the use of an electronic WAF (eWAF) program can be utilized if Ship's Force has an eWAF program on the unit that fully updates and links directly to the shore database and the repair activity has access to the eWAF program or via Memorandum of Agreement per volume II, part II, chapter 2 of this manual.

f. A WAF for individual Hot Work evolutions, as defined in reference (a), is not required when the work is a part of a Technical Work Document (TWD) already authorized by an existing WAF. The notification and authorization process to perform Hot Work, required by reference (a) will be executed independent of any approved WAF.

10.4.1 Administration. The following administrative process is to be used in executing Work Authorization Control:

10.4.1.1 Work Authorization Form. The WAF, shown in Appendix A_1, must be filled out by the organization conducting the work, or Ship's Force, as determined by the MOA signed for the availability per volume II, part I, chapters 2 and 3 for aircraft carriers, volume II, part II, chapters 2 and 3 for surface force ships, or volume II, part III, chapters 2 and 3 for submarines of this manual.

10.4.1.2 Work Authorization Log or Index. The Work Authorization Log(s) or Index for Surface Force ships only, shown in Appendix A_2 must be maintained at the same location and administered by the same individuals as the ship's tagout logs or indices or, when the repair activity is assigned responsibilities for work authorization control by MOA, the repair activity must retain original WAFs with a copy of all WAFs (or as specified by local MOA) and the WAF index must be provided to Ship's Force either by hard copy or electronically via a database that can be easily accessed by the Ship's Duty Officers per Appendix A_2.

NOTE: FOR SHIP'S FORCE GENERATED WAFS, THE SERIAL NUMBER MUST USE THE SAME PREFIXES USED FOR THE TAGOUTS THAT SET THE SYSTEM ISOLATION FOR THE WORK. WHEN A REPAIR ACTIVITY IS ASSIGNED RESPONSIBILITIES FOR WORK AUTHORIZATION CONTROL, THAT ACTIVITY WILL SPECIFY THE SERIALIZATION PROCESS USED BY ALL ACTIVITIES INCLUDING SHIP'S FORCE FOR THE AVAILABILITY.

NOTE: FOR SURFACE FORCE SHIPS AND AEGIS ASHORE ONLY:

A. APPENDIX A_2 MUST BE ESTABLISHED AS EITHER A HARD BINDER OR BY ELECTRONIC MEANS SEPARATED BY THE CATEGORIES PROPOSED, ACTIVE, TESTING AND CLOSED.

B. THE ISIC MUST CONDUCT AN AUDIT OF APPENDIX A_2 PER THIS MANUAL DURING THE FIRST 15 DAYS OF A NUMBERED AVAILABILITY (CMAV, SRA, CNO TYPE AVAILABILITIES) AND EVERY 90 DAYS THEREAFTER OF MAINTENANCE PERIOD AND FINAL AUDIT POST TYPE COMMMANDER SEA TRIAL EVENTS.

C. SHIP'S FORCE QUALITY ASSURANCE OFFICER MUST CONDUCT WEEKLY WAF AUDIT WORKING IN CONJUNCTION WITH COMMAND TAG OUT LOG AUDITING.

D. CLOSED WAFS MUST BE RETAINED FOR 30 DAYS THEN TRANSFERRED TO ELECTRONIC MEANS FOR A MINIMUM OF 1 YEAR AFTER CLOSURE.

10.4.1.3 Technical Work Document Record Sheet. When the job description on the WAF covers multiple components and their associated TWD, a TWD Record Sheet (Appendix B) in addition to the WAF may be used to document this work.

10.4.1.4 Work Authorization Form Continuation and Revision Sheets. If necessary, a WAF Continuation Sheet similar to the one shown in Appendix C may be used when information on the initial original WAF will not fit in the blocks provided in the WAF form in Appendix A_1. The WAF Continuation Sheet shown in Appendix C depicts the minimum blocks that must be filled out. Additional blocks may be utilized as deemed appropriate. Any changes necessary to the information on the WAF form after Block 14 is signed will be on the WAF Revision Sheet or changes to the existing WAF as described in paragraph 10.4.4 of this chapter. Existing WAF Continuation Sheets may be used until exhausted if desired. The WAF Revision Sheet, similar to the one shown in Appendix C, may be used to accomplish WAF revisions as permitted by paragraph 10.4.4 of this chapter. The WAF Revision Sheet shown in Appendix C depicts the minimum blocks that must be filled out. Additional blocks may be utilized as deemed appropriate.

10.4.1.5 Numbering Work Authorization Form Continuation and Revision Sheets. Revisions and continuation sheets generated by computer software may be numbered as determined by the software programming. Paper WAF continuation and revision sheets are to be numbered using the conventions of sub-paragraphs "a" through "c" of this paragraph:

a. The WAF (Appendix A_1) will be identified as "Sheet 1".

b. Continuation sheets will be identified as "Sheet 1A, Sheet 1B", etc.

c. Revision sheets will be identified as "Sheet 2, Sheet 3", etc.

10.4.2 Work Authorization Procedure. The following procedure is to be followed for properly authorizing work:

a. The WAF is presented to the Watch or Duty Officer by the division or repair activity tasked with the work.

b. For Safety of Ship items, as defined in paragraph 10.4.8 of this chapter and reference (b), the Watch or Duty Officer must obtain the Commanding Officer's permission prior to authorizing work. When assigned, the Repair Activity's Ship Safety Officer and, or Fire Safety Officer signature is required.

c. The Watch or Duty Officer will then determine if adequate isolation and plant or system conditions exist to safely and properly conduct the work including that the system is drained, de-energized and depressurized. The tagout is then established per reference (c). The work is not to be authorized if doubt exists on either of these points. For high energy systems (i.e., >200°F, >1000 psi) that could have the potential for trapped energies, the repair activity after consulting with Ship's Force, may provide a written plan (i.e., valve lineup, procedure, marked up drawings) to Ship's Force to ensure all parties are satisfied the system is properly drained and depressurized.

d. When system isolation and plant conditions are satisfactory to conduct the work (e.g., tagout complete, system depressurized, drained and de-energized), the Watch or Duty Officer authorizes the work and signs the WAF. For repair activity generated WAFs,

the Repair Activity Representative (RAR) also signs the WAF. The Watch or Duty Officer and RAR signature indicates that, based on personal observation, certified records or direct report from watch standers or divisional personnel, that system isolation and plant or ship conditions are set and the division or repair activity is authorized to start work.

NOTE: ELECTRICAL SAFETY CHECKS (E.G., VOLTAGE CHECKS TO ENSURE CIRCUITS ARE DE-ENERGIZED) ARE PART OF THE WORK PROCESS, NOT PART OF THE TAGOUT PROCESS, AND THEREFORE SHOULD BE PERFORMED AFTER BLOCK 14 OF THE WAF IS SIGNED.

e. Some component contractor personnel who perform work on ships are not knowledgeable of ship systems and are not qualified to determine if plant or ship conditions are satisfactory to conduct work. For such cases, the contractor's signature will be based on a direct report or briefing they receive from Ship's Force or the Naval Supervisory Authority, unless another method of providing the information to the contractor is specified in a MOA. The contractor's signature represents confirmation that the contractor understands the hazards presented by the ship's systems on which they will be working, and they have received assurances the work area has been appropriately isolated, depressurized, de-energized or drained. As an alternative, the contractor may specifically agree via their contract that all repair activity responsibilities as defined in this chapter will be assigned to the Naval Supervisory Authority per paragraph 10.4.5 of this chapter. In all cases, appropriate information should be provided to the contractor prior to initiating work to ensure the contractor understands the hazards involved. A Regional Maintenance Center representative must sign MOA(s) only after ensuring all civilian contractor requirements detailed in any MOA(s) are contained within the applicable contracts.

f. The original WAF is placed in the Work Authorization Log and a copy must be maintained with the TWD until the work is completed.

g. Once the work is completed, the WAF is signed by the repair activity as work complete and forwarded to Ship's Force for clearing of Tagout Record Sheet line items per reference (c).

h. Following completion of testing (if there is no formal test program) and setting of appropriate system status (e.g., clear tags and perform valve line-ups as appropriate for the situation), the WAF is signed as closed and forwarded to the cognizant department head for review.

i. For fire prevention, detection, and response items, as defined in paragraph 10.4.9 of this chapter, the Watch or Duty Officer must, when assigned, obtain the NSA's Fire Safety Officer permission and signature.

j. Some personnel may perform work on ships that are not assigned to Ship's Force, do not fall under the Naval Supervisory Authority, and are not contractors. Examples include (but are not limited to) inspections performed within the Hazardous Energy Control boundaries by personnel assigned to an Immediate Superior in Command (ISIC), Type Commander, Performance Monitoring Team (submarines only), and Naval Reactors Representative's Office. For these situations, Ship's Force personnel

are responsible for generating all work controls and tagouts associated with the work to be performed. In these cases, Block 7 of the WAF must include the organization(s) performing the work /inspection. Signing as "Repair Activity" is not required on the WAF, line item record sheet, or tag-out line item. Ship's Force will establish appropriate isolations and open the WAF then inform the external personnel when all administrative requirements have been completed and the work area is ready. Prior to entering the Hazardous Energy Control, external personnel will review and verify the work controls are open. External personnel may request to review the isolations and may request to witness a voltage check (as applicable) prior to entering the boundary of the isolated area. Upon completion of the work, the external personnel will inform Ship's Force and Ship's Force will process the WAF for closeout.

10.4.3 Transfer of Non-Nuclear Systems and Nuclear Systems That Do Not Affect Reactor Plant Safety Or Operations (Depot Availabilities Only). During depot availabilities, large amounts of work will be performed on ship's systems. Formal work control practices in place by a shipyard enable Ship's Force to transfer non-nuclear systems and Nuclear systems not required for maintaining reactor plant conditions to the shipyard (example nuclear systems include Nuclear Instrumentation and Control systems and non-operation impacting reactor support systems). Transfer of systems is the process by which Ship's Force transfers the authority to approve all actions within a system or portion of a system to a shipyard and subsequent return of systems back to Ship's Force prior to major events. Systems, or portions of systems, are transferred with or without transferring the ability to operate ship's equipment. By transferring a system or portion of a system to the shipyard, the shipyard is responsible for authorizing all work, testing and equipment operation within the boundary transferred. Transfer of systems does not diminish a Commanding Officer's overall responsibility for the safety of personnel, equipment and the ship. Although other activities may perform work within the boundaries and Ship's Force normally retains responsibility for operating ship's equipment, all actions (i.e., work, testing, equipment operations, etc.) within the boundary must be approved by the shipyard.

a. The MOA between the shipyard and ship for the availability must include the following minimum attributes regarding transfers:

   (1) Clearly state that all actions performed within the boundary being transferred must be approved by the shipyard.

   (2) Normally, Ship's Force retains responsibility for operating ship's equipment. If any transfers with operations are planned, the MOA must define the extent to which the shipyard will operate ship's equipment within the boundaries.

   (3) Normally, Ship's Force retains responsibility for PMS, unless otherwise specified in the MOA.

   (4) Delineate who is responsible to maintain system status within the boundary.

   (5) Identify the process (e.g., Joint Fleet Maintenance Manual Volume IV, Chapter 10, paragraphs 10.2 through 10.4.5) by which work control must be administered, including interface between the shipyard, Ship's Force and other applicable activities.

b. A WAF must be used to transfer a system or portion of a system to the shipyard. Block 7 of the WAF must clearly state this intent (i.e., specify "transfer" or "transfer

including operations"). Ship's Force formally transfers a system or portion of a system to the shipyard by signing Block 14 of the WAF. Unless Block 7 of the WAF states the transfer is "including operations", the shipyard is not authorized to operate ship's equipment within the transferred boundary.

c. The shipyard returns a system or portion of a system back to Ship's Force by completing all authorized work and testing specified on the WAF and signing Blocks 16, 17 and 18 of the WAF. Ship's Force indicates acceptance of the work and testing and, if applicable, operation by signing Block 18 of the WAF. For nuclear powered ships, the Engineering Department Manual contains requirements for accepting operational control from the shipyard.

d. When the shipyard is responsible for operating ship's equipment as specified in the transfer MOA, operation of ship's equipment must be following shipyard or Naval Sea Systems Command (NAVSEA) procedures (e.g., test procedures, ship's operating instructions, Steam and Electric Plant Manual, Reactor Plant Manual, Propulsion Plant Manual, etc.).

e. When waterborne, Ship's Force must retain operation of hull and back-up valves.

f. When portions of a system are required to be operational to support propulsion plant key events per NAVSEA Instruction 4730.1 and 4730.2 series, those portions of the system must be transferred back to Ship's Force.

g. Ship's Force must have the capability to isolate the transferred area from components and systems under Ship's Force control. The valves, switches, breakers, fuses, blanks, etc., that provide this capability must remain under Ship's Force control.

h. Any ship system which could directly affect the reactor plant or conduct of reactor plant testing must not be transferred to a shipyard until required nuclear temporary support systems are installed and the system is isolated from the reactor plant. Nuclear systems or portions of nuclear systems may be transferred to support shipyard work and testing, including equipment operation, provided there is no impact to operations required for maintaining reactor plant conditions and reactor safeguards. Refer to reference (d) to ensure all requirements associated with nuclear system transfers are met, including but not limited to obtaining the nuclear Joint Test Group concurrence for systems being transferred from ship's force to the shipyard.

i. Within the boundaries transferred to the shipyard, Ship's Force must be notified prior to commencing testing and when testing is interrupted and completed.

j. All transfers on submarines must be consistent with ship's safety requirements and reference (b).

k. In order to minimize subsequent changes to the WAF and ensure that Ship's Force is aware of the work scope, the WAF which transfers systems or portions of systems should include all known customer authorized work within the specified job description.

l. This authority applies to all work performed by or sub-contracted by the shipyard.

m. Within the boundaries approved by the WAF, the shipyard can add additional work to the WAF without Ship's Force approval by adding additional TWDs to a TWD Record Sheet (Appendix B) provided the additional work is within the original description of work and tagout boundaries (i.e., no additional tags are required). This method is applicable only when two independent reviews of the additional work by the shipyard confirms that the existing WAF and its associated tagout(s) provide adequate isolation and conditions for the work (see paragraph 10.4.5 of this chapter). TWDs (Task Group Instructions (TGI), Deficiency Logs, Deficiency Reports, etc.) that meet this criteria and require work control per paragraph 10.3 of this chapter will be added to the TWD Record Sheet. To ensure Ship's Force remains informed of all work being performed on ship's systems, the shipyard must verbally notify Ship's Force at the time work is added to the TWD Record Sheet and subsequently provide a hard copy of the changed TWD Record Sheet if it cannot be printed by the Ship's Duty Officer from an electronic database. Work added to the TWD Record Sheet does not need to be added to the associated Tagout Record Sheet.

n. When other activities perform work and testing within boundaries transferred to a shipyard and the shipyard is acting as their RAR, the shipyard may add the other repair activity's work to the TWD Record Sheet. Otherwise, a separate WAF must be generated and a new line item must be added to the existing Tagout Record Sheet.

o. In cases where Ship's Force will perform work, testing or equipment operations within boundaries transferred to a shipyard, the following two options for authorizing this work are allowed:

(1) Ship's Force must prepare a separate WAF processed as described in paragraph 10.4.2 of this chapter, add a new line item to the existing Tagout Record Sheet and obtain shipyard concurrence in Block 12 of the WAF. RAR signature is not required on the Tagout Record Sheet.

(2) In lieu of generating a separate WAF, Ship's force may add these items to the Shipyard TWD Record Sheet provided that the process is documented in a specific MOA concurred on by the respective Type Commander.

p. For small depot availabilities (e.g., conventional surface ship availabilities less than six months in duration, submarine Selected Restricted Availabilities and Extended Refit Periods, Aircraft Carrier upkeeps), the provisions of this paragraph may be applied on a case basis where the amount of work on a system is extensive and warrants transferring a portion of a system. These exceptions require Type Commander approval.

10.4.4 Work Authorization Form Revisions. Changes to the scope of the existing job description or system transfer boundary must be authorized by a formal revision to the existing WAF. Except as noted for minor administrative changes, changes to conditions (i.e., Blocks 7, 8, 11, 13 or 14) established by an authorized WAF, including the associated tagout(s), also require a formal revision to the existing WAF. A formal revision to a WAF can be accomplished by either preparing a new WAF with the same number or revising the existing WAF.

a. Prepare a new WAF. A new WAF with the same number will be used primarily for major changes to Block 7, Job Description or other major changes which warrant reverification of all aspects of the work authorization.

(1) A new WAF with the same number will be generated with changes included.

(2) In Block 9, enter revision (REV A, REV B, REV C, etc.) the reason for, and description of the change.

(3) Authorize the new WAF per the requirements of this chapter.

(4) Mark superseded WAF(s) "SUPERSEDED" and retain with the new WAF.

b. Revise Existing WAF. The revised existing WAF will be used primarily for tag shifts or other minor changes.

(1) Enter all required changes. Include initials, date and revision with each entry.

(2) Line-out all changed or invalidated information. Include initials, date and revision with each line-out.

(3) Remake all affected signatures.

(4) In Block 9, enter reason for and description of the change. Sign and date the entry.

(5) Obtain authorization including verification of "Plant or Ship Conditions Set" by resigning Blocks 13 and 14 of the WAF.

c. Revise existing WAF using the WAF Revision Sheet.

(1) Fill in the information required by the WAF Revision Sheet, including the revision (REV A, REV B, REV C, etc.). Add additional blocks as deemed appropriate.

(2) Enter the reason for and description of the change. Sign and date the entry.

(3) Obtain all required signatures.

(4) Once the WAF Revision Sheet has been completed, it must be maintained with the original WAF in the WAF log.

d. Minor Administrative Changes to Existing WAFs. The Watch or Duty Officer or the RAR may make pen and ink changes that are editorial or administrative in nature to the original WAF without processing a new or revised WAF. These changes must not affect the scope or sequence of shipboard work, and include items such as obvious typographical errors, erroneous job order numbers or spelling errors. Either the Watch or Duty Officer or Repair Activity may make these changes on the original WAF without resigning Blocks 13 and 14. The changes must be initialed and dated by the person entering the changes.

e. Iterative Tagouts. When using the reference (c) Iterative Tagout procedure, a revision to the WAF is not required provided the specific tests or maintenance evolutions are controlled by a formal process. This process is to be defined and concurred with by a MOA established between Ship's Force and the Lead Maintenance Activity. The

process must ensure that isolation is re-established and system conditions verified prior to recommencing work.

10.4.5 Centralized Work Control Procedures. It is the responsibility of the Lead Maintenance Activity to determine the need for centralized work control and to assign the responsibility for work authorization control. During depot availabilities, a centralized work control team will be established. For other availabilities, this decision is based on the number of repair activities performing work during the availability and the complexity of the work. When centralized work control procedures are invoked, the following process must be used:

a. Work by all repair activities is processed by the centralized work control team including work covered by paragraph 10.4.3 of this chapter. Ship's Force involvement will be defined by MOA.

b. The Lead Maintenance Activity will specify participation and supervision of the centralized work control team by MOA. Ship's Force is an integral part of the centralized work control team and should man the team with experienced officers or senior petty officers.

c. The repair activity performing the work must prepare the WAF, sign as RAR on the Tagout Record Sheet and sign the WAF blocks 10, 14, 16 and 17 if applicable, unless specified otherwise by MOA (e.g., repair activity does not maintain qualified personnel). The Lead Maintenance Activity assigned responsibility for centralized work control is responsible for processing the WAF and signing all other repair activity blocks on the WAF.

d. For work covered by paragraph 10.4.3 of this chapter, the Ship's Force member(s) of the centralized work control team would notify the responsible Division or Work Center Supervisor and Duty Officer of added work to a TWD Record Sheet to ensure that Ship's Force remains informed of all work being performed on ship's systems.

10.4.6 Equipment Tagout Procedures. Tagouts must be accomplished per the requirements of reference (c).

10.4.7 Barrier Criteria.

a. Barrier criteria for maintenance is located in reference (c) and applicable Reactor Plant and Steam and Electric Plant manuals.

NOTE: BARRIER CRITERIA REQUIRED BY REACTOR PLANT AND STEAM AND ELECTRIC PLANT MANUALS HAVE PRECEDENCE OVER REFERENCE (C) CRITERIA.

b. (Submarines only) Specific guidance for hull penetrations is located in Appendix D.

10.4.8 Safety of Ship Maintenance Item Identification, Listing and Control.

a. Safety of Ship Maintenance Item List (SOSMIL). Safety of Ship maintenance items are those evolutions having significant potential to impact the ship's watertight integrity, damage control capability or which require special attention to ensure ship safety.

NOTE: DESIGNATION OF SAFETY OF SHIP MAINTENANCE ITEMS FOR BOTH

SHIP'S FORCE AND ANY OUTSIDE ORGANIZATION IS REQUIRED WHEN FLEET MAINTENANCE ACTIVITY (FMA), INDUSTRIAL ACTIVITIES AND CONTRACTOR PRODUCTION WORK IS IN PROGRESS. REQUIREMENTS OF PARAGRAPH 10.4.8 OF THIS CHAPTER OR A SHIP'S PLAN OF THE DAY, IF REFERENCE (B) IS IN EFFECT, WILL BE IMPLEMENTED ANY TIME WORK AFFECTING SAFETY OF SHIP ITEMS IS PERFORMED REGARDLESS OF AVAILABILITY STATUS.

NOTE: ENSURE PROTECTION REQUIREMENTS OF REFERENCE (E) ARE MET BEFORE RELAXING THE SAFETY OF SHIP REQUIREMENTS FOR ITEMS LISTED AS "(NOT SAFETY OF SHIP IN DRYDOCK)".

b. Safety of Ship Maintenance Items. The ship's Commanding Officer's permission is required prior to authorizing the maintenance evolution. The following, as a minimum, must be scheduled on the SOSMIL:

(1) All maintenance involving single closure isolation from sea. (Not Safety of Ship in drydock.)

(2) All maintenance which removes a means of blowing main ballast tanks. (Not Safety of Ship in drydock.)

(3) All maintenance requiring the use of flat patches, hull blanks or cofferdams, with specific entries identifying the actual installation and removal of these items.

(4) All maintenance which removes the capability to dewater the ship using either the trim or the main drain systems.

(5) All maintenance which removes the ship's installed firefighting capability (e.g., maintenance which prevents pressurization of the trim system).

(6) Bleeding or charging oxygen banks.

(7) Handling or loading of explosives or weapons.

(8) All maintenance which removes portions of, or the entire Emergency Air Breathing system.

(9) Fueling or defueling.

(10) Diver operations. (Not Safety of Ship in drydock when dock is drained.)

(11) Pumping or flooding the sonar dome.

(12) Per references (f) or (g), constant-voltage or constant-current charges (elevated charge) where total battery voltage reaches or exceeds 2.45 volts per cell (VPC) and battery temperature meets or exceeds 65 degrees °F.

(13) Nitrogen load.

(14) Refrigerant on or off load.

(15) Evolutions with an expected draft change of >3 inches (e.g., ballasting, lead load, etc.). (Not Safety of Ship in drydock when dock is drained.)

(16) Securing the Emergency Diesel Generator.

(17) Other maintenance or evolutions which require special coordination between Ship's Force and maintenance providers to ensure safe accomplishment of authorized work (e.g., Loading Vertical Launch System Platform).

(18) All maintenance that violates the integrity of the pressure hull, watertight bulkhead or watertight doors, excluding the routine operations of access hatches. (Not Safety of Ship in drydock when dock is drained.)

(19) All maintenance that disables any bilge alarm or any portion of an emergency announcing circuit when temporary alarms or indications are not installed.

(20) All maintenance that secures normal or emergency lighting circuits in a compartment or space such that damage control response would be significantly impacted.

NOTE: USE OF TEMPORARY SYSTEMS TO REPLACE FUNCTIONS OF SHIP'S INSTALLED SYSTEMS SHOULD BE CONSIDERED WHEN DEEMED NECESSARY. CLASS SUBMARINE ORGANIZATION AND REGULATIONS MANUALS AND SHIP SYSTEM MANUALS MAY PROVIDE FURTHER GUIDANCE.

c. SOSMIL Preparation. The SOSMIL will be prepared by a person designated by the ship's Commanding Officer using written input provided by Ship's Force divisions and the FMA representative. A new SOSMIL will be prepared prior to the FMA Daily Production Meeting per ~~volume II, part I, chapters 2 and 3 for aircraft carriers, volume II, part II, chapters 2 and 3 for Surface Force ships, or~~ volume II, part III, chapters 2 and 3 for submarines of this manual. Appendix E of this chapter is provided as an example and depicts the minimum attributes that must be documented on the SOSMIL. Appendix F of this chapter may be reproduced locally for use. The requirements to prepare the SOSMIL are:

(1) Indicate ship's name, hull number, upkeep number, calculated maximum expected draft, actual morning draft and date prepared.

(2) For each job, list the Job Control Number or WAF number (as applicable) (operating instruction, PMS item, operating procedure), job description, scheduled end date and any remarks.

(3) The SOSMIL should indicate planned work for the next seven days. A thick black line must be used on the left side of the current day to indicate the current days' work.

(4) In the job description block, indicate in parentheses a number that corresponds to the list at the bottom of the sheet as to why the job requires a SOSMIL entry.

(5) Items must remain listed on the SOSMIL until work has been verified complete and associated WAF has been completed or Block 11 of the WAF revised as no longer affects Safety of Ship. SOSMIL items that are waterborne specific can be evaluated for a Ship in a Drydock condition. The requirements

to maintain these items on the SOSMIL can be relaxed when all approving parties of the SOSMIL agree. Associated WAF block 11's should have an evaluation of NO before the item has been removed from the SOSMIL. Prior to relaxing the waterborne requirements on the SOSMIL, ensure the drydock is maintained in accordance with reference (e).

d. Maximum Expected Draft. For those items which will have an effect on ship's draft, expected draft changes greater than three (3) inches will be calculated fore and aft for that evolution and indicated in the remarks section. Draft calculations will be made by a Diving Officer of the Watch qualified individual. Additionally, for all ballasting evolutions, a second independent calculation will be performed and provided by a second Diving Officer of the Watch qualified individual. The worst-case draft change for each item will be totaled to arrive at a "maximum draft" and a maximum one foot buffer added to arrive at the "maximum expected draft". (The ship's Commanding Officer can decide to reduce the buffer as they desire. If Safety Draft Marks are in use, the bottom edge of the mark must match the "maximum expected draft".) The "maximum expected draft" is listed at the top of the SOSMIL. Calculation sheets will be retained until the job is no longer carried on the SOSMIL. If the ship exceeds the "maximum expected draft", the Duty Officer will stop the evolution, place the ship in a safe condition and notify all parties who signed the SOSMIL and the ship's Commanding Officer.

NOTE: THIS MUST IN NO WAY BE CONSTRUED AS LIMITING ACTIONS BY THE DUTY OFFICER OR NOTIFICATION OF THE SHIP'S COMMANDING OFFICER OF SMALLER DRAFT CHANGES. ANY UNEXPECTED DRAFT CHANGE SHOULD BE THOROUGHLY INVESTIGATED AND UNDERSTOOD.

e. Morning Actual Draft. The actual ship's draft recorded each morning prior to the Daily Production Meeting. This draft will serve as a baseline value for draft changes that occur throughout the day.

f. The Ship's Force Availability Coordinator will present the SOSMIL at the FMA daily production meeting for review and signatures. The SOSMIL will be signed by:

(1) Ship's Force (signed by a department head). Signature indicates that all evolutions that affect ballast have been identified, the form has been completed per this instruction and the correct drafts have been calculated and at least four feet of freeboard is available to all hull openings.

(2) ISIC (signed by an ISIC representative). Signature indicates that all maintenance has been identified, the form has been completed per this instruction and the draft measurements are noted.

(3) Maintenance Organization (signed by appropriate senior level person of the repair activity, normally the Production Officer, as they lead the FMA Daily Production Meeting). Signature indicates all authorized Safety of Ship work items are listed. If any additional items are to be worked, a formal change to the SOSMIL will be required.

g. Following review and signature, the Ship's Force Availability Coordinator will provide the original copy to the ship's Duty Officer. Reproduced copies for distribution must be made from the "original document" only. Copies will be provided to:

(1) Each Production Meeting attendee listed:

(a) FMA Division Officers

(b) FMA Repair Duty Officer or Repair Duty Chief Petty Officer

(c) FMA Regional Maintenance Team Leader. They must receive enough copies to make further distribution to the FMA Duty Officers and each FMA Division Officer having work listed on the SOSMIL.

(d) Supply Repair Other Vessel Officer

(e) Ship's Force Availability Coordinator

(f) ISIC Material or Squadron Representative

(g) FMA Availability Coordinator

(2) The ship's Engineering Duty Officer.

(3) The ship's Below Decks Watch.

(4) The ship's Petty Officer of the Deck.

(5) Naval Submarine Support Center Representative.

h. SOSMIL Use and Pre-Job Briefs. None of the evolutions or maintenance specified in paragraph 10.4.8.b of this chapter must commence unless it is scheduled on the current SOSMIL. The activity performing any maintenance or evolutions listed on the SOSMIL is responsible for a pre-job brief prior to commencing work. A pre-job brief is required for all items listed on the SOSMIL and will be attended by all parties involved as desired by the Ship's Duty Officer.

10.4.9 Fire Prevention, Detection, and Response Items. Fire prevention, detection, and response are Safety of Ship maintenance items. When reference (a) is invoked, the Fire Safety Officer's permission is required, per Appendix A_1 or Appendix C, prior to authorizing the maintenance evolution. The following, as a minimum, must be concurred with by the Fire Safety Officer:

a. All maintenance which removes the capability to dewater the ship.

b. All maintenance which disables the ship's installed firefighting capability.

c. All maintenance which disables Emergency Air Breathing system.

d. All maintenance which disables general alarm and announcing systems.

e. All maintenance which disables heat and smoke sensors and other detectors.

f. All maintenance which disables internal radio communication systems.

g. Securing the Emergency Diesel Generator.

h. All maintenance which violates the integrity of the fire zone boundaries.

i. All maintenance which secures normal or emergency lighting circuits in a compartment or space.

10.4.10 Ship in Dry Dock (Submarines Under Joint Fleet Maintenance Manual Controls).

a. When the ship is in dry dock, Chapter 0872 of Navy Regulations requires the closing of all valves and other openings in the ship at the end of working hours when such closing is practical. In situations where there is extensive disruption of watertight integrity, making daily closing impracticable, it is prudent to protect the dry dock, rather than the ship, from inadvertent flooding. To this end, shipyards must maintain dry docks per reference (e).

b. Temporary fluid systems must be considered a controlled constant fluid supply provided the following conditions exist:

(1) The temporary fluid supply contains two in-line isolation valves external to the ship between the source and the ship.

(2) The two isolation valves must be located to facilitate rapid isolation (e.g., close to the ship).

(3) The temporary fluid system, including both off hull isolations, must be formally transferred to, including operation of, Ship's Force.

(4) The supplied ship system must be tested to the temporary system operating pressure.

c. Dry dock simulated waterborne conditions exist when water is introduced to the dry dock and kept at a level below that necessary to lift the vessel off the blocks. During this condition, the following minimum requirements must apply:

(1) The event must be authorized on the SOSMIL, contained in section 10.4.8 of this chapter (Submarines only).

(2) Hull openings must be maintained per reference (b).

(3) Seawater valves should normally be operated using ship's systems. A temporary system may be used to operate seawater valves after obtaining Commanding Officer's permission.

(4) Ship's dewatering capability meets the requirements of reference (h). Prior to undocking or a simulated waterborne condition, items that would be required to be on the SOSMIL when waterborne that had been removed while in Drydock must be reevaluated and a new entry on the SOSMIL made. Associated WAF block 11's should have a subsequent evaluation of YES when the item has been added on the SOSMIL.

d. Dewatering capability. Each compartment must be capable of being dewatered at a rate of at least 200 GPM with pumping started within three minutes of the flooding being called away. Ship's Force will demonstrate adequate dewatering capability by planning and scheduling flooding drills to be observed by the ISIC and Lead Maintenance Activity Representative at the following times:

(1) Within seven days of docking and temporary systems being delivered.

(2) Just prior to undocking, normally within 30 days.

10.5 FINAL CERTIFICATION, CLOSEOUT AND RE-ENTRY OF SUBMARINE SPACES, TANKS AND VOIDS.

10.5.1 Purpose. To establish procedures for the final certification, closeout and re-entry of submarine spaces, tanks and voids.

10.5.2 Discussion. Historically during space, tank or void closeout, a large number of diverse and inconspicuous items have been overlooked. These items have, at times, seriously degraded both material readiness and acoustic signature of submarines. This section establishes a procedure to ensure a thorough certification of all spaces prior to final closeout and provides a check-off list when re-entry is required. The check-off list or sheet is not all-inclusive. Common sense and effective use of personnel experience and knowledge must be used to ensure complete and thorough inspections. A review of references (i), (j) and (k) should be performed to determine if a formal report of unscheduled visual inspection is required to be submitted for tank and voids being entered or closed. Non-steel damping and acoustic restraining covers are not required to be painted. Accidental overspray is acceptable. Full paint out of damping restraining covers and acoustic tile covers is not the intent. If damping and acoustic tiles are painted, they must be checked to ensure that the paint will not bridge the gap between the rubber and the restraining cover more than 75% over an area. Degradation of the performance of tiles is possible. A suggested way to repair the area is to score the gap between the restraining cover and the damping tile and between the acoustic tile covers and the rubber. Previously painted serviceable tiles may remain in service. Reference (i) allows paint on piping.

NOTE APPENDIX G MAY BE USED AS AN AID FOR ENTERING SUBMARINE SPACES, TANKS AND VOIDS.

10.5.3 Action.

a. The Damage Control Assistant (DCA) is designated the coordinator for the closeout of all spaces. As such, the DCA is responsible for the following:

(1) Assigning responsible personnel to closeout or assist in closing out specific spaces, tanks and voids.

(2) Providing personnel designated to conduct tank, void, or space closeouts with a copy of Appendices G or H as applicable.

(3) Ensuring personnel performing closeouts are aware of their responsibilities and are adequately trained. DCA must provide, by periodic notice, a list of personnel qualified to perform closeout inspections.

(4) Maintaining a folder for completed copies of Appendix H. This folder will serve as a space, tank and void closeout certification record. Only the most recent copies of these Appendices are required to be retained. This folder should also include an index of all spaces, tanks and voids applicable to closeout certification and their status.

(5) Keeping the Commanding Officer and the Engineer Officer informed as to the status of closeouts and significant deficiencies noted.

b. Personnel performing tank, void and space closeout or entry are responsible for:

(1) Obtaining a copy of Appendix G and Appendix H.

(2) Forwarding to the DCA completed copies of Appendix H.

NOTE A REVIEW OF REFERENCES (I), (J) AND (K) SHOULD BE PERFORMED TO DETERMINE IF A FORMAL REPORT OF UNSCHEDULED VISUAL INSPECTION IS REQUIRED TO BE SUBMITTED FOR TANKS AND VOIDS BEING ENTERED OR CLOSED.

c. Responsibility for Re-Entry Controls (REC) and final certification are:

(1) In cases where entry is required to be made for production work by both Ship's Force and FMA personnel, the FMA will be responsible for REC and Ship's Force will be responsible for final certification closeout.

(2) For cases where only FMA work is anticipated, the FMA will be responsible for REC and Ship's Force will be responsible for final certification closeout. For the cases in which only the maintenance activity has access (e.g., waterborne entry into mud tanks or ballast tanks by divers) the maintenance activity will be responsible for final certification closeout.

(3) For cases where only Ship's Force work is anticipated, Ship's Force will be responsible for REC and final certification closeout.

10.5.4 Applicability. All SSN, SSBN and SSGN Class submarines and FMAs.

APPENDIX A_1

WORK AUTHORIZATION FORM

INSTRUCTIONS FOR COMPLETING WORK AUTHORIZATION FORM

Block 1. USS: Enter name or the hull number.

Block 2. SYSTEM: Enter the system noun name, abbreviation or identification number.

Block 3. WAF NO.: Enter the WAF serial number.

Block 4. JSN: Enter the Job Sequence Number or job order.

Block 5. DIVISION, Lead Work Center (LWC) or REPAIR ACTIVITY (RA): Enter ship's Division, LWC or repair activity Point of Contact responsible for conducting the maintenance.

Block 6. TECHNICAL WORK DOCUMENT: Enter the TWD (e.g., Controlled Work Package (CWP) or Formal Work Package (FWP), Task Group Instruction (TGI)) number(s) or enter "see attached TWD Record Sheet". If a TWD Record Sheet is used, it must be referenced in Block 6.

Block 7. JOB DESCRIPTION: Enter a description of work to be performed detailed enough for the Authorizing Officer or RAR to understand the scope of the work boundary and prepare or concur in the isolation established for this work. If necessary, use of an additional Continuation Sheet per Appendix C is authorized. Description of work can contain either a description of work boundaries or a description of components (see paragraph 10.4.3a of this chapter).

Block 8. POST WORK TESTING IS AS SPECIFIED: Check BELOW and identify test requirements when retest is not contained in a TWD or formal test program. Check FORMAL TEST PROGRAM if retesting will be tracked or completed in a program administered by the repair activity. If FORMAL TEST PROGRAM or NO TEST REQUIRED is checked, Block 17 is N/A.

Block 9. RESTRICTIONS, PRECAUTIONS AND REMARKS (OPENING): Enter any restrictions or precautions associated with the work item. If any information is entered in this block, the person making the entry must enter name, organization and date. If necessary, use of an additional Continuation Sheet per Appendix C is authorized.

Block 10. DIVISION OR REPAIR ACTIVITY READY TO COMMENCE WORK: Signature by Leading Petty Officer or Division Officer for Ship's Force work or repair activity indicates that sufficient prerequisites are met to commence isolation for production work.

Block 11. SAFETY OF SHIP: When required by paragraph 10.4.8 of this chapter, reference (a) or reference (b), check the "YES" block. For Surface Force Ships, the Watch Officer signature is required.

(1) If the SPOD is used, the Repair Activity's Ships Safety Officer (SSO) or the Fire Safety Officer (FSO) will sign concurrence.

(2) If the SOSMIL is used, the qualified Watch or Duty Officer (RA SSO/FSO if assigned) will verify that work is listed on the SOSMIL for that day and sign the block. NON-SAFETY OF SHIP WORK CONTROLS. Check NO. When safety of ship qualified RA or Ship's Force work control personnel process their respective WAFs, they may sign concurrence for non-safety of ship maintenance.

Block 12. CONCURRENCES: Concurrence signatures may be entered as necessary (e.g., nuclear or non-nuclear interface, assist work center(s), two cognizant department heads). The Authorizing Officer or RAR should define any needed concurrences by noting the concurring organization beneath the signature line in Block 12 and obtain the concurrences. Enter N/A if no concurrences are required. For Surface Force Ships, DCA or CHENG signature is required.

Block 13. TAGOUT REQUIRED: If tagout is required, mark YES. When tagout is hung, enter tagout number(s) (Log Serial Number or Shift Operations Management System line item number) and Watch or Duty Officer will sign block. If no tagout is required, mark NO. Enter N/A in TAGOUT NO., and Watch or Duty Officer will sign block.

Block 14. PLANT OR SHIP CONDITIONS (e.g., drained, de-pressurized, de-energized, restrained) SET, FMA, DIVISION OR REPAIR ACTIVITY ARE AUTHORIZED TO START WORK: The Watch or Duty Officer signs in all cases for authorizing the start of all work. Note any restrictions, precautions, or both, in Block 9. If Block 11 is checked YES, the Watch or Duty Officer must ensure the work of the WAF is listed on the SOSMIL or Ship's Plan of the Day prior to authorization of the WAF. RAR signs for authorizing the start of work when the WAF is for repair activity work.

Block 15. RESTRICTIONS, PRECAUTIONS OR REMARKS: Enter any general conditions (e.g., outstanding work) that may affect system restoration. If any information is entered in this block, the person making the entry must enter name, organization and date. If necessary, use of an additional Continuation Sheet per Appendix C is authorized.

Block 16. WORK IS COMPLETE: A signature by Ship's Force or the repair activity is entered when the work described in Block 7 is verified complete and tags may be cleared with any exceptions listed in Block 15.

Block 17. TESTING IS COMPLETE: A signature by the activity performing the retest is entered when testing of Block 8 is completed. Block 17 is marked N/A if Formal Test Program is in effect or no test required.

Block 18. WAF CLOSED OUT: When work specified in Block 7 and testing as specified in Block 8 is completed, including all exceptions listed in Block 15, repair activity signature is entered to indicate the WAF is closed out. Ship's Force signature indicates acceptance of the work and testing and that appropriate system status has been set (e.g., clear tags and perform valve lineups as appropriate for the situation). Block 18 may be signed prior to completion of testing covered by a formal test program. A copy of the closed out WAF must be provided to Ship's Force if the repair activity is maintaining the original WAF.

TECHNICAL WORK DOCUMENT RECORD SHEET

TWD RECORD SHEET								
SYSTEM/COMPONENT:			WAF SERIAL NO.:					
TWD LINE ITEM NO.	TWD (TGI, DL, DR, CWP, FWP)	BRIEF DESCRIPTION	TWD AUTHORIZATION			STATUS C-COMPLETED, T-TRANSFERRED X-CANCELED		REMARKS
			1ST CHECK (INI)	2ND CHECK & AUTH (INI)	DATE AUTH	C/T/X	INI & DATE	

☐ CHECK BOX IF CONTINUED ON ADDITIONAL SHEET PAGE_____

TECHNICAL WORK DOCUMENT RECORD SHEET COMPLETION INSTRUCTIONS

NOTE: THE ACTIVITY USING THE TWD RECORD SHEET MUST FILL IN ALL BLOCKS.

BLOCK	INFORMATION REQUIRED
SYSTEM OR COMPONENT	Enter system or component.
WAF SERIAL NO.	Enter WAF serial number.
TWD LINE ITEM NO.	Enter next sequential number (1, 2, 3, etc.).
TWD (TGI, DEFICIENCY LOG, DEFICIENCY REPORT, CWP, FWP)	Enter TWD (e.g., TGI, Deficiency Log, Deficiency Report or other unique document identification.)
BRIEF DESCRIPTION	Enter brief description.
1ST CHECK	Initials of 1st person who reviews and ensures the line item is within the WAF work description and tagout boundaries. (NOTES 1 and 2)
2ND CHECK AND AUTHORIZATION	Initials of 2nd person (independent from 1st) who reviews and ensures work is within the WAF work description, tagout boundaries, that the WAF is in an authorized status and authorizes the line item. (NOTES 1 and 2)
DATE AUTH	Date line item was authorized. (NOTE 1)
STATUS LINE ITEM BLOCK (C/T/X)	Status of line item.
(INI) & DATE	Initials and date of person that verifies a line item is complete, transferred to another WAF or canceled.
REMARKS	Write any pertinent information (may be left blank).

NOTE 1: 1ST AND 2ND CHECKS OF TWD RECORD SHEET WILL BE BASED ON A REVIEW OF THE ISSUED TWD. ALL TWDS NOT REVIEWED (I.E., LEFT BLANK) AT TIME OF WAF AUTHORIZATION ARE NOT AUTHORIZED UNTIL REVIEWS ARE COMPLETED.

NOTE 2: ACTIVITIES WHICH CHOOSE TO USE THE TWD RECORD SHEET MUST TRACK AND STATUS ONLY THE TWDS APPROVED AND EXECUTED BY THEIR ACTIVITY.

APPENDIX D

BARRIER CRITERIA FOR HULL PENETRATIONS

1. SYSTEMS WHICH PENETRATE THE HULL. Commanding Officers will review tag-outs and work procedures for systems which penetrate the hull to the detail considered necessary for safety. Any required work or testing which violates the requirements of this appendix should not commence without prior specific approval of the Commanding Officer.

2. HULL PENETRATIONS BELOW THE WATERLINE. The principle of double closure applies to all hull penetrations except for those mechanical and electrical penetrations (such as the secondary propulsion motor shaft and cable penetrations) which are designed for single closure. Double closure is accomplished by using installed valves, blank flanges, outside closure plates, shaft seal inflatable boots, or shaft seals. Positive control must be exercised by Ship's Force to maintain closure through the use of danger tags and interlocks, gagging devices, chains, mechanical locks, hydraulic locks, blanks etc., until the work, including the required testing, on the associated system has been completed.

a. Single closure can be used only with the specific permission of the Commanding Officer. If single closure is approved, the barrier must be verified by a satisfactory leak check of the single closure before opening the system for maintenance as listed in sub-paragraphs (1) through (3):

(1) The system should be isolated using the single closure barrier.

(2) If the system has not been drained, open the closest system high-point vent to conduct a controlled leak check of the single closure.

(3) If the system has been drained, open the closest low-point drain to conduct a controlled leak check of the single closure.

b. Prior to undocking:

(1) If undocking becomes necessary prior to completing all sea connected system maintenance and testing, obtain double closure through reassembly, then satisfactorily hydrostatic test all pressure boundary joints outboard of the backup valve seat and verify the integrity of the hull and backup valve seats by performing a hydrostatic seat leakage check of both valves.

(2) Where schedule, resources or other constraints prevent accomplishment of the requirements of sub-paragraph b(2) at the time of undocking, a blank flange(s) must be installed, tested and identified external to the hull penetration to provide double closure. This condition must be identified both internally and externally to prevent inadvertent removal. The installation of the blank flange must be approved by the Commanding Officer. Removal of these blank flange(s) must not commence until the required valve(s) and associated local Valve Position Indicator(s) have been reinstalled and tested to support removal of the blank and blank removal has been approved by the Commanding Officer.

3. HULL PENETRATIONS ABOVE THE WATERLINE. These penetrations or openings will also be protected by double closure or as listed in sub-paragraphs "a" and "b":

NOTE: THE DETERMINATION OF LESS THAN OR GREATER THAN FOUR FEET FROM THE WATERLINE WILL BE DETERMINED BY A MEASUREMENT FROM THE LOWEST LIP OF OPENINGS IN A PENETRATION TO THE ACTUAL WATERLINE.

a. Hull penetrations less than four feet above the waterline.

(1) Cofferdams must be installed around all open hull access openings, including temporary hull cuts, which have less than four feet of freeboard at the opening. Cofferdams must be constructed and tested per reference (b) to maintain watertight integrity to at least four feet above the waterline. A hull opening such as an electrical cable penetration need not have a cofferdam installed if it is adequately blanked or plugged while the system is under repair. Cofferdams will be designed to permit personnel access, temporary services and equipment shipping, as applicable, without violating the required watertight integrity. The ship's topside freeflood structure may be used to achieve the four-foot requirement, however, the opening must be controlled in the same manner as a cofferdam. Positive control to maintain closure through the use of danger tags, and gagging devices, mechanical locks or blanks must be exercised for all hull access openings not in an as-built condition. Removal or changes in status must be approved by the Commanding Officer.

(2) Other penetrations or openings which do not meet this criteria or which cannot be isolated by some type of single closure will be attended at all times by personnel with access to equipment capable of securing flooding, should it ever occur. Exceptions require specific permission of the Commanding Officer. Single closure may be affected by any suitable temporary watertight closure.

b. Hull penetrations greater than four feet above the waterline. Penetrations or openings not in their normal as-built condition are not required to be watertight but should be provided with protection against unwanted fluid entry.

4. INADVERTENT OPERATION OF HYDRAULIC ACTUATORS. For those conditions when the ship is waterborne with a hull or backup valve below the waterline installed but the associated inboard piping is not complete and the hull or backup valve hydraulic actuator lines are disconnected, the following guidance is provided for reconnecting the hydraulic actuators (which may cause valve movement):

a. If an external blank flange is installed, any additional precautions should be determined by the Commanding Officer.

b. If an external blank flange is not installed, then the hull and backup valves should be installed, hydrostatically tested and local valve position indication proven correct and reliable. Additional safety precautions such as not working the actuators for a particular hull and backup combination concurrently, shutting and danger tagging both valves at all times, isolating and danger tagging the hydraulic pressure source to the control valve for the specific actuator being worked and not pressurizing or operationally testing the actuators until the seawater system integrity has been

reestablished, should be employed to provide the additional assurance required to preclude the need for an external blank.

5. INSTALLATION OF HULL FITTINGS OR FLANGES. When maintenance is to be performed which requires a hull fitting or flange to be installed, the following actions will be taken:

a. Ship's Force will identity the hull opening by noun name, docking plan number, frame number, side and distance off centerline and item number (as obtained from the ship's docking plan) and provide this information to the FMA.

b. The FMA planning division will verify the data provided by Ship's Force and calculate the circumferential distance from the centerline.

c. The FMA LWC will provide the verified data and the fitting or flange, including the required installation hardware, to the diving supervisor.

d. Ship's Force must mark the fitting location using a weighted and marked line, referenced from frame marks topside.

e. The Ship's Duty Officer must authorize the installation of the fitting or flange and coordinate the pre-brief for the installation evolution. As a minimum, the brief must be attended by the Ship's Duty Officer, LWC Supervisor and Diving Supervisor. The mechanism for authorizing the hull blank installation must be the Work Authorization Form (Appendix A_1), per this chapter.

f. The divers, in conjunction with Ship's Force and the LWC Supervisor must verify the location of the hull opening and weighted or marked line prior to the divers entering the water.

g. A diver accompanied by Ship's Force must tap on the internal hull opening until the in-water diver acknowledges the location by returning the signal except where permanent markings identifiable by a diver uniquely identify a specific hull fitting or penetration (markings such as a fitting name or number welded as raised characters on or adjacent to the fitting or penetration).

h. After installation, the hull fitting or flange location and installation must be independently verified by a second diver.

i. Divers, assisted by the LWC and Ship's Force, must verify the hull fitting or flange integrity with a 100-psig air test.

j. Divers and the LWC Supervisor must mark the hull fitting or flange by attaching a tether from the fitting or flange to topside. At the topside attachment point, the tether must be labeled "Hull Fitting (Noun Name) Installed".

k. Positive verification from inboard of the hull fitting or flange placement and integrity must be achieved for each installed fitting or flange prior to proceeding with any maintenance. The verification must be accomplished using the method for testing a single closure described in paragraph 2.a of this Appendix. If either of the leak check methods of paragraphs 2.a.(2) or (3) of this Appendix are not possible, the Commanding Officer must be notified and give specific permission for continuing or conducting the maintenance.

l. If internal verification of hull fitting or flange integrity is not possible due to system configuration, the fasteners must not be fully removed from the pressure boundary being disassembled until the system is fully drained and hull fitting or flange integrity has been verified.

m. If a hull fitting or flange is left installed for system or at sea operations, the guidance of volume V, part I, chapter 8 of this manual concerning Departure From Specification must be followed.

6. REMOVAL OF HULL FITTINGS OR FLANGES. Prior to removal, divers, in conjunction with Ship's Force, must verify the label of the tether of the fitting or flange to be removed and check for the presence of danger or caution tags. The divers must then follow the tether to the fitting or flange to ensure the removal of the correct fitting or flange.

7. BULKHEAD VENTILATION VALVES. Bulkhead ventilation valves must either be operational and capable of being shut or made watertight with a blank. Bulkhead penetrations must either be in their normal condition or be rendered watertight if unattended. Temporary closures are permitted.

8. FABRICATION OF NON-NUCLEAR PIPING BLANKS. For fabrication of non-nuclear piping blanks to be used during hydrostatic testing and maintenance on submarine piping systems, the following general guidelines apply:

a. The material must be the identical type, level and pedigree required for the system application per reference (l) or as required by NAVSEA drawings.

b. Blanks must be constructed such that the design sealing surface dimensions and fit-up characteristics of the system are maintained.

c. Dimensions of blanks will be per reference (l).

d. Applicable hydrostatic strength and porosity testing will be performed as required by system test pressure drawings.

e. All blanks must be marked per reference (l). Maximum allowable pressure will be the hydrostatic test pressure (e.g. 6750 psi for a 4500-psi application, 4500 psi for a 3000-psi application, etc.). Additionally, mark piece with nominal operating pressure and material used. Ensure pressure markings are annotated "MAX" and "NOM" as appropriate.

f. Blanks installed for maintenance or testing will be identified by a plain tag stating the purpose of the blank. This tag will be in addition to any danger tags used.

APPENDIX E

SAFETY OF SHIP MAINTENANCE ITEM LIST EXAMPLE

Ship name: USS Bigcity Hull #: SSN-799	Upkeep #: 802	Maximum expected draft: Fore: 32'0" aft: 34'6"	Actual Morning Draft: Fore: 32'0" aft: 32'0"	Date prepared: Wednesday 23 SEP 98

NOTE: THE MAXIMUM EXPECTED DRAFT MUST IN NO WAY BE CONSTRUED AS LIMITING ACTIONS BY THE DUTY OFFICER OR NOTIFICATION OF THE SHIP'S CO OF SMALLER DRAFT CHANGES. ANY UNEXPECTED DRAFT CHANGE SHOULD BE THOROUGHLY INVESTIGATED AND UNDERSTOOD.

JCN/ WAF #	Job Description Reason on SOSMIL	Days work planned 28 Mon	29 Tue	23 Wed	24 Thurs	25 Fri	26 Sat	27 Sun	Scheduled end date	Remarks
EA01-2345/ WAF #	TD-101 repair (1,3)			testing	Remove flange				24SEP98	Restoration in progress
EM01-3456/ WAF #	Divers: inspect screw for fouling (2,10)			Brief 0830					23SEP98	
WQ01-1986/ WAF #	Inspect sonar dome/ (11)			Pump down dome, brief 0830					23SEP98	Draft change expected: 1' up fore 1.5' down aft
EA01-3509/ WAF #	TD-1 ball/seat repair (4,5)	Trim system restored					Stage temp firefightin g	Testing	28SEP98	Valve worked in place; temporary firefighting capability staged
WK01-4568/ WAF #	Off-loading countermeasures (7)					Off-load			25SEP98	through weapons shipping hatch
EA01-3525/ WAF #	LP Blower MRC M-2, change oil on LP Blower (2)	Down for 1 hour at 1300							28SEP98	

The following items are Safety of Ship:

1. Single closure from sea
2. MBT blow removed
3. Belly bands, hull blanks, cofferdams
4. Dewatering ability removed
5. Firefighting capability removed
6. Bleeding charging Oxygen banks
7. Weapons handling
8. EAB system maintenance
9. Fueling or defueling
10. Diver operations
11. Pumping or flooding sonar dome
12. Per references (f) or (g), constant-voltage or constant-current charges (elevated charge) where total battery voltage reaches or exceeds 2.45 VPC and battery temperature meets or exceeds 65 degrees °F.
13. Nitrogen load
14. Refrigerant on/off load
15. Evolutions with an expected draft change of >3 inches (e.g., ballasting, lead load, etc.)
16. Securing the Emergency Diesel Generator
17. Special coordination between S/F and FMA
18. Pressure hull watertight bulkhead/doors maintenance
19. Bilge alarm/emergency announcing circuit maintenance
20. Normal/emergency lighting maintenance

Review and approval (all parties must sign):

APPENDIX G

PROCEDURES AND SAFETY PRECAUTIONS FOR ENTERING SUBMARINE SPACES, TANKS AND VOIDS

NOTE: IN ADDITION TO THE PRECAUTIONS NOTED IN THE STEPS OF THIS APPENDIX, SHIP'S FORCE MUST COMPLY WITH SAFETY PRECAUTIONS IDENTIFIED IN REFERENCES (M) THROUGH (R).

1. Prior to entry into any free-flood area or main ballast tank, check with the Engineering Duty Officer to ensure radiological surveys have been conducted to determine the radiological controls, if required.
2. Verify REC requirements, if any.
3. Obtain permission from the Duty Officer prior to entering any tank.
4. Ensure atmosphere surveys have been completed and adequate ventilation is available prior to entering the tank.
5. Obtain the necessary tools and equipment (i.e., rubber mallet, explosion proof flashlight or drop light, hardhat, wrenches, screwdrivers, etc.) required to enter or close out the space, tank or void.
6. Wear a hard hat when entering any Main Ballast Tank or free-flood area.
7. Use the buddy system with one man external to the tank or void at all times.
8. No smoking in any tanks or voids. Do not carry any naked lights or sparking electrical apparatus. Ensure all droplights are inspected and approved by the Electrical Division.
9. While inside the tank, make maximum use of ladders and walkways provided. Do not step on valves and piping.
10. Ensure positive measures are taken to identify the access to the tank or void to be opened (ship's plans, two-man check, label plate identification).
11. Ensure all system penetrations to the tank or void are isolated and all sources of potential pressurization danger tagged out per reference (c), to include gravity drain funnels, and the tank or void is vented to the atmosphere.
12. Ensure the tank or void fasteners are loosened to permit breaking the gasket seal. Remove fasteners only after the seal has been broken.
13. Use lanyards on tools and tethered sealable parts pouches.
14. Prior to entering a tank or void, remove all unnecessary items from your person (i.e., combs, lighters, wallets, etc.).
15. Take an inventory of all tools and materials which entered the tank or void. Have a second person verify the inventory before and after each entry.
16. A rubber mallet should be used to investigate for sound shorts, rattles, etc.

APPENDIX H

CLOSE-OUT INSPECTION CHECK-OFF LIST

Name of tank, void, or space _____

	DESCRIPTION	PETTY OFFICER & OFFICER INITIAL
1.	PAINT	
	a. Area does not have evidence of gross preservation system failure. (Note 1)	
	b. Zincs, transducers and hydrophones are not painted.	
2.	FRAMEWORK AND FOUNDATIONS	
	a. Inspect space framing and shell welds for visual defects.	
	b. Ensure nuts are lock-tight type or lock wired and screw engagement allows for at least one thread protrusion.	
3.	PIPING	
	a. Inspect all pipes for visual weld or sil-brazed joint defects. Ensure pipe walls have not been cut by grinding, denting, or struck or burned by welding equipment.	
	b. Check pipe penetrations for properly installed sleeves and weld fillets.	
	c. Pipe hangers should:	
	- prevent vibration when pipe is struck with mallet.	
	- have studs and nuts painted.	
	- have proper insulation between pipe and hanger.	
	- have stud nuts lock wired or locking cabled or have self-locking nuts used as required.	
	d. If blanks have been installed and will remain in-place following a preliminary closeout inspection, ensure the configuration has been evaluated for impact on ship conditions, system operation and are properly tracked to ensure removal during the final closeout inspection.	
4.	TRANSDUCERS, HYDROPHONES, CABLES AND CABLE WAYS	
	a. Ensure all rubber elements are not gouged, cut, or scraped. Ensure rubber elements are not painted in the following areas: submarine reserve feed water tanks and hangers on nuclear piping.	
	b. Ensure all sonar transducers and hydrophones and corresponding cables are installed per ship's plans.	

	DESCRIPTION	PETTY OFFICER & OFFICER INITIAL
	c. Ensure only CRES banding and rubber channel insulation is used on cableways.	
	d. Ensure cableways and cable are properly supported.	
	e. Ensure electrical coamings are made and tight.	
	f. Ensure cable loop boxing covers (at hull fittings) are installed with appropriate plastic spacers such that vibration does not occur when struck with a mallet.	
	g. Ensure electrical hull penetrations are properly labeled.	
5.	BAFFLE PLATES AND SOUND DAMPENING TILES	
	a. Sound dampening tiles are the proper type per reference (n).	
	b. Tiles are not cut, gouged or loosely secured.	
	c. Baffle plates are properly bolted such that they are free from vibration when struck with a mallet.	
6.	MECHANISMS	
	a. Dynamic mechanisms are installed, hooked up and unpainted, with no evidence of damage or scraping of components.	
	b. Tank level floats, if applicable, are free to operate and have no visual defects.	
	c. Grease lines, if applicable, are installed properly with mechanical fittings tight and no evidence of leakage.	
7.	VENTS AND DRAINS	
	a. Adequate draining exists from each bay.	
	b. Vents are clear of loose gear and rags.	
	c. Ensure that vents or drains have no installed blanks.	
8.	GALVANIC PROTECTION	
	a. Zincs are properly located and installed such that vibration does not occur when struck with a rubber mallet.	
	b. (Galvanic protection) Mounting straps and bolts are not required to be painted.	
	c. Surfaces behind zincs are properly painted. Sacrificial anode surfaces must not be painted. Sacrificial anode surfaces must not have any coatings, sealants or fairing compounds added to the backside unless approved by	

	DESCRIPTION	PETTY OFFICER & OFFICER INITIAL
	NAVSEA. Painting of anode straps and hardware is recommended for all sacrificial anode applications. Coatings for zinc anode straps and hardware may be omitted due to galvanizing of the strap. Painting of aluminum anode straps and hardware is required for all alternate immersion applications (e.g., Main Ballast Tanks or bilges).	
9.	CLEANLINESS	
	a. Check space clear of loose gear and rags.	
	b. Check space clean and free of dirt.	
10.	COMPLETION	
	a. All interior inspection items are clear of any discrepancies.	
	b. Take an inventory of all tools and materials that entered the tank or void. Verify all items carried into the tank or void have been removed.	
	c. All personnel are clear of the tank or void.	
	d. Tank or void cover gasket and gasket seat areas are in acceptable condition.	
	e. Tank or void cover studs and nuts are torqued to the specified values required and the lock tabs are properly engaged or spot-welded.	
	f. Inspect the exterior for incomplete work that would require a reinspection.	
	g. Ensure that all temporary services are removed from tank.	

NOTE 1: If evidence of gross preservation system failure exists, then a qualified preservation system inspector must be contacted to confirm that the preservation system meets the requirements.

11.1 PURPOSE. This chapter defines the responsibilities with respect to the management of technical documentation and data and requires the establishment and operation of technical libraries. Unless otherwise noted, Aircraft Carriers are governed by references (a) and (b). Technical data and information are critical for the proper operation, maintenance, troubleshooting and repair of all plant equipment. Improper maintenance or equipment remaining not repaired and inoperative can result from a lack of proper documentation in the form of technical manuals, ship's drawings and blueprints, Military Specifications and standards, etc.

11.2 SHIPBOARD TECHNICAL DOCUMENT MANAGEMENT. Ships must maintain the Advanced Technical Information Support (ATIS) System up to date. ATIS updates are mailed out to the ship on Compact Disks (CD or DVD). Ship technical document distribution is based on configuration and therefore relies upon the Configuration Data Managers Database - Open Architecture being maintained up to date to accurately assign documents to the ship. To ensure ships maintain up to date technical documents, the following requirements must be met:

a. The ship must assign a senior Petty Officer (E-5 or above with minimum of 5 years of service) as the Technical Librarian to maintain the ATIS systems up to date under the supervision of the 3-M Coordinator (3MC) for submarines, or Systems Test Officer (STO) or Electronics Material Officer (EMO) for surface ships. Assignments as a

Technical Librarian should be for a minimum of 12 months. Technical Librarians on Aircraft Carriers are assigned for a minimum of 18 months per reference (b). For Aircraft Carriers, the point of contact is the Maintenance Support Center (MSC) Officer and the Maintenance Officer per reference (b). At Submarine Fleet Maintenance Activities (FMA), ashore and afloat, the Technical Librarian will work under the supervision of the Planning and Estimating Officer for ATIS and other databases maintained for FMA use.

b. The Technical Librarian must promptly apply ATIS changes within one week of being received on board.

c. 3MC, STO, or EMO must report completion of ATIS updates to the Executive Officer. For Aircraft Carriers, the point of contact is the MSC Officer and the Maintenance Officer.

11.3 TECHNICAL LIBRARIES. Technical Library personnel must maintain a complete master technical library including either digital or hard copies of selected record drawings, equipment technical manuals, drawings, Coordinated Shipboard Allowance Lists, provisioning Allowance Parts Lists (APL), computerized databases (i.e. ATIS and technical shipboard library system (TSLS)) and any other technical reference aids necessary to support operation and maintenance. The appropriate IT system computer programs will be used to maintain the library. In general, the technical library serves the following basic functions:

a. Acquisition of new documents and data which includes updating of existent technical information.

b. Cataloging, indexing and filing all documents, data and information materials to allow for effective use of library technical information.

c. Accountability and control to ensure continuous integrity of the library collection and to enhance periodic inventories.

d. Central control point for all technical documents received, held, used, transferred or disposed of by the repair department (FMA only) or command. For FMAs having a Nuclear Support Facility (NSF), all Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) controlled documents must be controlled by the NSF. For MSCs aboard aircraft carriers, all NAVSEA 08 controlled documents must be controlled by the Reactor Department Technical Publication Library. All aircraft maintenance related documents must be controlled by the Aircraft Intermediate Maintenance Department.

e. Maintain access to the following computer networks and web sites whenever possible.

(1) Model Based Product Support (MBPS). https://mbps.navseaplm.navy.mil/Windchill/app/

(2) Military Engineering Drawing Asset Locator System. https://public.logisticsinformationservice.dla.mil/PublicHome/MEDALS/default.aspx

(3) Naval Surface Forces, Atlantic Planning and Execution of Alterations and Repair (FMA and COMNAVSURFLANT and COMNAVSURFPAC commands only) https://www.spear.navy.mil click on SPEAR info.

(4) Maintenance and Modernization IT Systems.

(5) Technical Manual Feedbacks in MBPS utilizing system Search tools. https://mbps.navseaplm.navy.mil/Windchill/app/

(6) ASSIST Quick Search http://quicksearch.dla.mil

(7) Haystack™ Gold by S7P Global https://login.ihserc.com/intelligence

11.3.1 Technical Library Supervisor. The Technical Library Supervisor is responsible for keeping current plans, prints, specifications, manuals and all other technical documents and information needed by ship and FMA departments and for managing the daily operation of the library. The Technical Library Supervisor must:

a. Have a sufficient understanding of technical library organization requirements in references (a) through (l) (as applicable) to supply the necessary technical information.

b. Have **a minimum** security clearance equal to the highest security classification of any document held within the library.

c. Supervise personnel assigned to library.

d. Operate the technical library in the following manner:

(1) Schedule and carry out a frequent and recurring on the job training program for all personnel assigned to the technical library staff or to satellite librarian positions. As a minimum, training must include topics that provide guidance for performing each library or satellite library function. Satellite librarian training may be tailored to cover only those areas applicable to satellite libraries. Lesson plans must be developed for each topic.

(2) Maintain and provide applicable and current plans, prints, specification, manuals and all other technical documents and information needed by the cognizant department. FMAs will also provide technical documents to tended units, other FMAs, non-FMA government activities or qualified Department of Defense contractor personnel.

(3) Maintain an inventory of technical publications, manuals and manufacturer instruction books and other technical and repair documents available in the technical library or any satellite libraries (Work Centers and division offices, etc.).

(4) Develop a system for checking out or in and recall of library technical publications issued to individuals in order to maintain the integrity of the library and ensure revisions or changes are made as received and also to minimize lost materials due to unaccountability. The system should include a recall capability that would allow for the location and recall or reissue of materials after 90 days. FMAs issuing technical publications and documents to

tended units should establish a 90-day or end of fleet maintenance availability recall whichever comes first.

(5) Requisition technical documentation needed for maintenance and repair procedures but not already available on board. Maintain a separate file of material on order. Track the status of requisitioned documents until received. Initiate follow-up action for those documents where supply status has not been received for a 14-day period, unless previous supply status indicates no follow-up is required per reference (a).

(6) Ensure proper security for the contents of the technical library.

(7) Maintain written procedures which describe how to perform each function carried out by the technical library (i.e., checkout or check-in of technical documents, updating library document files, operating reproduction equipment, performing updates, requisitioning, inventories and audits of library documents, etc.).

(8) Ensure maintenance calls or contracts are made for all viewing, reproduction, computer and powered document retrieval systems or equipment used to carry out library functions. The program must include devices associated with this equipment.

(9) Perform an inventory of technical publications and manuals and manufacturer's instruction books.

(a) Ships are to perform an annual inventory of technical publications and manuals and manufacturer's instruction books and other maintenance and repair documents available in the technical library and satellite libraries (work center and division offices).

(b) Shore facilities and submarine tenders are to perform an inventory of technical publications and manuals and manufacturer's instruction books and other maintenance and repair documents available in the technical library and satellite libraries (work center and division offices) every 12 months.

(10) Ensure manuals within library's inventory contain applicable Advance Change Notices (ACN), or Interim Rapid Action Changes (IRAC). Verify each manual against the ACN report available from Naval Systems Data Support Activity (NSDSA), Port Hueneme, CA, and the Naval Air Technical Data and Engineering Service Center (NATEC) IRAC Tracker Report.

(11) Perform an annual data verification (configuration audit) of technical manuals and other repair documents available in the technical library and satellite libraries. Afloat libraries should perform verifications as often as operational constraints permit, within 6 months of major deployments, is recommended if verifications are not conducted annually.

(a) Verify each NAVSEA and Naval Information Warfare Systems Command technical manual held with the data listed in MBPS using Library Management Data (LMD) for manual or automated

verification. Verify Naval Supply Systems Command (NAVSUP) manuals with the modem Internet access.

(b) Verify NAVSUP manuals against https://my.navsup.navy.mil/apps/ops$nll.home (i.e., NAVSUP 600 CD) or by performing a process verification file with LMD or MBPS.

(c) Compare each technical manual held with the ACN Report provided from Naval System Support Data System Activity, Port Hueneme, CA. This should be performed monthly.

(d) Compare each technical manual held with MBPS (TM Applicability Report) to the unit is scheduled to receive all applicable TMs.

(e) Make sure each technical manual is in good material condition (i.e., does not have loose or unrepaired torn pages, is readable and has an outside cover).

(f) For Naval Air Systems Command manuals, submit an Automatic Distribution Requirements List annually to NATEC to update distribution and verify manuals per reference (a).

(12) Keep a record of annual inventories for 24 months. The annual inventories should include an assessment of recorded deficiencies in the technical data management program to determine areas that require improvement.

(13) Establish procedures to incorporate changes or revisions to technical documents held within library or satellite libraries as soon as practical after receipt. Updates involving the safety of personnel or equipment (ACNs) must be entered within 48 hours of receipt. Routine changes must be installed before publication use or within 30 days of receipt, whichever occurs first.

(14) Establish procedures that assure positive control of all technical documents held by the library. If Process Instructions or documents listed in ASSIST Quick Search http://quicksearch.dla.mil or any alteration text documents are held in Satellite library inventories, verify that these documents are up to date at least semiannually.

(15) Establish procedures for issuing technical documents to Department of Defense contractor personnel using guidance provided in references (c) (FMA only).

(16) Be the department point-of-contact for the Integrated Logistics Overhaul team with respect to technical documentation.

(17) Ensure all superseded technical documentation is removed and disposed of following local procedures.

11.3.2 Technical Library Non-Supervisory Personnel. The Technical Library non-supervisory personnel will carry out the daily operations of the technical library as directed by the Technical Library Supervisor. The Technical Library non-supervisory personnel must:

a. Be a reliable and motivated petty officer (E5 or above for FMA or MSC or full-time civilian equivalent).

b. Military should be assigned for at least 12 months. On Aircraft Carriers, they are assigned for a minimum of 18 months per reference (b).

c. Personnel assigned as satellite librarians will be reliable and motivated petty officers appointed in writing and resubmit designation letters every 6 months. Satellite librarians will have **a minimum** security clearance equal to the highest security classification of any document held within the library per reference (d).

11.3.3 Technical Library Materials. The technical library has a wide variety of technical information and data in many different forms and formats. For FMA Technical Libraries eight broad categories of information exist which are described in reference (e).

11.3.3.1 Indices. Indices serve as reference or information sources that name systems, supplies and other information sources. Examples of indices include:

a. Ships Drawing Index (SDI).

b. Tech Manual Applicability Report (TMAR).

c. Model Based Product Support (MBPS). https://mbps.navseaplm.navy.mil/Windchill/app/

d. Navy publications, forms and instructions. https://my.navsup.navy.mil/apps/ops$nll.home

e. ASSIST Quick Search http://quicksearch.dla.mil

f. ATIS Systems

11.3.3.2 Technical Manuals. Technical manuals outline inspection and repair procedures for shipboard systems. Examples of technical manuals include:

a. Ship's Information Books.

b. General Information Books.

c. Naval Ships' Technical Manual (NSTM).

d. Propulsion Operating Guide.

e. General Specifications for Overhaul.

f. Equipment Technical Manuals.

g. Organizational Maintenance and Management System - Next Generation (OMMS-NG).

h. Ordnance Publications.

i. Ordnance Data.

11.3.3.3 Drawings. Drawings have engineering and design requirements needed to repair equipment to original specifications. Drawings are also used to find the location of shipboard systems and system equipment and components. Drawings stored in technical libraries include:

a. Ship's construction drawings.

b. Ship Alteration installation drawings.

c. Selected Record Drawings.

d. Ship's Equipment Drawings.

e. Vendor and Manufacturer's Drawings.

f. Booklet of General Drawings.

11.3.3.4 Handbooks and Cataloging. Handbooks have detailed information about specific systems or equipment and may also list equipment repair procedures. Examples of handbooks include the following:

a. Micro-Electronic Device Date Handbook.

b. Identification Markings for Fasteners.

c. Gasket Material (Non-metallic).

d. Guide for Sampling Inspections.

e. Shipyard welding procedures.

11.3.3.5 Military Specifications and Standards. Military specifications and standards are specific, detailed requirements for equipment or material. ASSIST Quick Search http://quicksearch.dla.mil

11.3.3.6 Documents and Lists. Documents and lists are catalogs of parts, equipment or publications and alteration records. The following are examples of documents and lists typically found in technical libraries:

a. Navy Management Data List (NAVSUP Publication 4100).

b. Navy Directive List.

c. Introduction to Federal Supply Catalogs and Related Publications (NAVSUP Publication 4400).

d. Ship Changes.

e. Planning Yard Work Instructions.

11.3.3.7 Instructions, Technical Publications and Bulletins. These publications give guidelines for the operation of equipment, introduce new equipment and may have lists of available items. Instructions, technical publications and bulletins commonly stocked in technical libraries include:

a. General Services Administration Supply Catalog.

b. Electronics Information Bulletins.

c. Field Change Bulletins.

d. NAVSEA Instructions.

e. Type Commander Instructions.

f. Technical Directives.

11.3.3.8 Repair Standards. These standards are detailed repair procedures for the troubleshooting and overhaul of specific equipment and guidance for standard processes. Examples of repair standards include:

a. Technical Repair Standard.

b. Maintenance Standard.

c. Intermediate Maintenance Standard.

d. Unified Industrial Process Instruction.

11.4 TECHNICAL MANUAL APPLICABILITY REPORT AND SHIP'S DRAWING INDEX. Due to the wide variety of types of materials that may be included in a technical library, it may be confusing as to what are the minimum titles and requirements needed for a particular ship. The TMAR and SDI have been developed for each ship and list the titles and drawings applicable to the ship.

11.4.1 Technical Manual Applicability Report. The TMAR identifies all Final Issue technical manuals used on board a ship. The TMAR is tailored to the configuration of a specific ship and lists technical manuals needed to operate, maintain and repair ship systems and equipment. This report will exclude Depot (except Carriers) and Intermediate Level TMs. It also lists any other general and ship related manuals needed by Ship's Force. The TMAR will:

a. Contain a list of the technical manuals needed on board a ship.

b. Identify technical manuals for specific systems and equipment.

c. List the systems and equipment supported by a specific technical manual.

d. Include information (i.e. Title, Revision Level, Applicable Changes if any, Publication Date) about each technical manual about each technical manual.

11.4.2 Ship's Drawing Index. The SDI is a list of ship drawings and related design reference information that shows the actual current configuration of the ship. SDIs are required by General Specifications for Shipbuilding for all ships over 200 feet in length.

a. The original SDI is prepared by the shipbuilder and approved by Supervisor of Shipbuilding. After acceptance of the ship by the Navy, the SDI is sent to the selected planning yard which is assigned as custodian of the index.

b. Corrections to the SDI are submitted by the industrial activity to reflect work performed during Chief of Naval Operations maintenance availabilities and Fleet maintenance availabilities. Original SDIs are to be corrected by the planning yard to reflect changes reported by the ship or other activities when changes are made between regular overhauls.

c. SDI information includes:

(1) Drawing title.

(2) NAVSEA drawing number and revision.

(3) Builder or contractor drawing numbers of Hull Mechanical and Electrical drawings applicable to the individual ship.

11.5 MAINTENANCE SUPPORT CENTERS. (Aircraft Carriers only)

a. MSCs provide a centralized support facility to aid work center technicians in Integrated Logistics Support processing and problem resolution services. The MSC provides shipboard management of technical documentation and libraries in support of ship's maintenance and material requirements. The MSC will function within the policy and procedural guidelines of references (a) and (b).

b. The MSC manages and maintains an accurate equipment or component configuration database, identification of required technical support (e.g., repair part APLs, drawings, technical manuals, test equipment, Planned Maintenance System, etc.), and facilitates resolution of repair part support problems.

(b) ABS Guide for Building and Classing High Speed Naval Craft (2007)
(c) NAVSEA T9074-AS-GIB-010/271 - Requirements for Nondestructive Testing Methods

LISTING OF APPENDICES.

A Sample Layout of Inspection Areas
B Hull Reporting Format

12.1 PURPOSE. To provide general guidance for the inspection of ship's hulls to detect structural defects or hull thickness degradation and to establish supplemental procedures and periodicities for the conduct of hull inspections of thin hulled ships and craft for the timely detection of corrosion or erosion.

12.1.1 Scope. Thin hull ships are defined as those ships and craft with hull plating less than 1/2-inch design thickness at any location below the waterline. Hull Inspections and repair for wooden hulled ships and craft are addressed in chapter 24 of this volume. Guidance contained in this chapter applies to all thin steel hull ships and craft.

a. Detailed direction for thin hull assessment can be found in reference (a) for the following classes of surface force ships:

(1) DDG 51

(2) FFG 62

(3) CG 47

(4) LPD 17

b. The following classes of Surface Force ships were built to reference (b), therefore reference (a) does not apply:

(1) LCS 1

(2) LCS 2

12.1.2 Discussion.

a. All ship's hulls must be inspected per Planned Maintenance System (PMS). Reference (a) contains additional guidance and checklists for conducting a thorough internal and external visual hull inspection. Should visual hull inspections reveal suspect areas, these areas should be ultrasonically tested to determine the need for repairs.

b. Hull inspections will reveal the ship's hull condition through self-inspection of inner shell structure by Forces Afloat. These inspections will permit detection of structural defects and hull thickness degradation resulting from the cumulative effects of unarrested corrosion, and identify any areas in need of repair or preservation. Shell plating areas which are inaccessible can be measured ultrasonically by divers from outside the hull.

c. Besides verbal descriptions of damage, graphical layouts of hull structure for some ship classes are available for use in the inspection. These schematics are for the purpose of plotting damage locations, as well as assisting the inspector in orientation and report analysis in assessing damage effects.

d. Main machinery spaces are most prone to corrosion due to the severe environmental extremes of temperature and humidity arising from continuous operation of the propulsion machinery and supporting systems. This alternate wetting and drying of the interior hull surfaces resulting from normal ship's operations and shutdowns over a long period produces oxidation cycles which lead to corrosion.

e. Inspections must take place inport during a period when the machinery plant will be secured for at least one week. During the work definition period, prior to a scheduled dry-dock availability, an inspection must be scheduled so that it precedes the availability in enough time to permit the identification of all hull structure in need of repair (i.e., approximately nine to ten months prior to the scheduled availability). The ISIC or TYCOM will coordinate and schedule the inspections as requested by the ship's Commanding Officer.

f. The inspection is primarily intended for areas which are subject to both high stress and heavy corrosion, namely, bottom shell structure in the main machinery spaces of the ship. Accordingly, all fire rooms, engine rooms, and gas turbine enclosures must be surveyed for structural deterioration, with emphasis on the following areas:

(1) Under boilers and turbines, where access is difficult and environmental extremes are most severe.

(2) Around boiler feedwater tanks, which are continuously wet from "sweating".

(3) Around the various overboard intakes and discharges, where external turbulence often produces erosion.

(4) Along the interior of the side shell in way of the exterior waterline. Here the design thickness of the shell plating is thinnest, and exterior corrosion from wave action is always present.

(5) Around "wet" equipment, which continuously operate with steam or water emission (e.g., pumps, condensers, evaporator, etc.).

(6) Areas of the bottom shell which are subject to the corrosive action of bilge water.

g. Items such as deck plating in way of uptake spaces, pump rooms, refrigeration spaces, heads, etc., are omitted from this inspection. These "wet" areas are considered to be "housekeeping" items and will be surveyed during the pre-overhaul hull inspection.

All tank and void spaces, which are in proximity to the machinery spaces being surveyed, are also omitted from this inspection, as these compartments do not meet the criteria in sub-paragraph "f". The interiors of these spaces are inspected during industrial availabilities.

h. Procedures regarding hull inspections which are associated with Pre-CNO Maintenance Availability planning are issued separately for each availability as determined by the requirements for each ship.

12.2 ACTION. Both internal and external hull inspections must be accomplished per reference (a) and (c) on all ships and craft identified in paragraph 12.1.1 of this chapter. Periodicities must be as specified by the TYCOM or as required by PMS.

a. At the beginning of any dry-docking period, (regular overhaul, Docking Selected Restricted Availability, interim dry-docking, etc.) an extensive hull survey will be conducted using the ship's plans and a sampling plan similar to that shown in Appendix A of this chapter. The inspection must be conducted using ultrasonic techniques, drill testing or caliper method as appropriate.

b. A pre-overhaul inspection of the hull should be conducted prior to a dry-docking availability to ensure known hull repairs are included in the planned work package and to ensure unexpected costs are kept to a minimum. Dry-docking is not required for a pre-overhaul inspection; however, maximum use should be made of available tools and techniques to accurately determine the condition of the hull.

c. A minimum of one hull reading every other frame, and every other strake (as shown in Appendix A of this chapter) up to the waterline, must be taken and the results recorded in the inspection report of Appendix B of this chapter. Suspect areas, as determined by visual inspection, must have several readings taken and the least thickness recorded. Any area showing a reading less than the minimum allowable must have additional readings taken in an expanding fashion to determine the actual extent of the excessive deterioration.

d. In locations where there is an inner hull, such as bilge area tank tops, inside readings must be taken in addition to those readings taken on the hull. These readings must be taken every other frame, port and starboard, recorded in the format of Appendix B of this chapter, and submitted with the hull inspection report.

e. In general, hull sections and structures which have suffered 25 percent or greater reduction in cross-sectional area from their original thickness should be cut out and replaced. Scattered pits of depth at least 25 percent, but not greater than 45 percent of the original thickness, may be repaired by clad welding.

f. An engineering analysis considering current and probable future corrosion may be performed to determine if the corroded structure is within allowable stress levels, rather than performing an automatic repair when corrosion has resulted in a 25 percent or greater reduction of cross sectional area. The repair criteria must be based on the applicable General Specifications for Overhaul.

12.3 REPORTS. The results of all hull inspections must be forwarded to the ship, with an information copy to the TYCOM or ISIC, using the format of Appendix B of this chapter. Areas

having unsatisfactory results must be superficially noted in the report cover letter. Unsatisfactory areas must be defined by size in feet and inches and location in relation to strake and frames.

APPENDIX A

SAMPLE LAYOUT OF INSPECTION AREAS

13.1 PURPOSE. To ensure Weight Handling Equipment (WHE) is capable of continued reliable and safe operation.

a. WHE must be of sufficient rated capacity to safely handle the calculated load; including, all slings, shackles, turnbuckles, strongbacks and chain hoists.

b. The WHE selected must be inspected before each use for obvious material deficiencies, equipment capacity markings, and load test expiration date (as applicable).

c. The following guidance has been utilized to incorporate both Naval Sea Systems Command (NAVSEA) and Naval Facilities Engineering Command (NAVFACSYSCOM) requirements:

(1) For shipboard WHE used both afloat and ashore, including Floating Drydocks, NAVSEA technical requirements are cited and invoked as the top-level guidance.

(2) For shore based WHE used only ashore, NAVFACSYSCOM and the Code of Federal Regulations technical requirements are cited and invoked as the top-level guidance.

(3) For general purpose lifting and rigging, shore based rigging gear and portable hoists meeting the requirements of reference (a) may be used aboard ship when the ship is pierside.

(4) For Reactor Plant Lifting and Handling Equipment and lifts of major reactor plant components, additional guidance is provided in Section 9400-0 of reference (b) and in reference (c). Reference (d) provides guidance for lifting radioactive material or reactor plant components when NAVSEA approved lifting equipment is not available (i.e., use of the B & M crane to lift portable effluent tanks or radioactive waste). These requirements apply to all commissioned ships, shipyards and Naval shore-based activities.

13.2 NAVAL SEA SYSTEMS COMMAND AFLOAT REQUIREMENTS.

13.2.1 Definitions.

a. Dynamic Load Test. An operational overload test conducted to verify the ability of the lifting equipment to operate with rated load while being subjected to dynamic conditions associated with ship motions.

b. Load Bearing Members. Those components or structural support members of the lifting and handling equipment which support the load; a failure of which could cause dropping, uncontrolled shifting or movement of the load.

c. No-Load Test. A test which verifies equipment functional performance without a load.

d. Rated Load. The maximum permissible load carried during use (also called "Safe Working Load"). The weights of handling gear; such as slings, strongbacks, handling dolly, which are not an integral part of the equipment being tested, must be considered as part of the rated load.

e. Rated Load Test. A load test at 100 percent of the rated load, conducted at rated speed through the complete range of operating limits. The test is performed to determine the proper operation of the equipment, repeatability of functions and heat dissipation ability.

f. Safe Working Load (SWL). See Rated Load.

g. Factor of Safety. The ratio of the yield strength of a structure to the required strength (based on estimated maximum load in ordinary use).

$$\text{Factor of Safety} = \frac{\text{Actual Yield Strength}}{\text{Required Strength}}$$

h. Static Load Test. A stationary overload test conducted to verify the structural and mechanical integrity of the lifting equipment. In this test, the lifting equipment holds the test load for a short period of time while the test inspector checks the equipment for signs of brake slippage or damage.

13.2.2 Procedure. Fabrication, repair and testing of Shipboard Weight Handling Equipment will be conducted using a Controlled Work Package developed per volume V, part I, chapter 2 of this manual.

NOTE: THIS REQUIREMENT DOES NOT APPLY TO PERIODIC WEIGHT TEST OF SHIPBOARD WEIGHT HANDLING EQUIPMENT. SHIPBOARD WEIGHT HANDLING EQUIPMENT REQUIRING A WEIGHT TEST BASED ON PLANNED MAINTENANCE SYSTEM (PMS) OR OTHER PERIODIC TESTING REQUIREMENTS, EXCLUDING TESTS IN CONJUNCTION WITH REPAIR OR MANUFACTURE, WILL BE INSPECTED AND TESTED USING TECHNICAL WORK DOCUMENTS, SUCH AS A PRE-EXISTING MAINTENANCE PROCEDURE, TEST LOAD METHODS DRAWING, TECHNICAL MANUAL OR FORMAL WORK PACKAGE. PERIODIC WEIGHT TESTING MUST BE WITNESSED BY A QUALIFIED INSPECTOR.

a. Testing Sequence. Newly installed or overhauled equipment must be tested in the following order:

(1) No-load Test.

(2) Static Load Test.

(3) Dynamic Load Test.

(4) Rated Load Test.

b. Results of completed weight tests will be documented on QA form 17W, using the procedures of volume V, part I, chapter 11 of this manual. The serial number (if known) of the equipment must be recorded on the weight test record.

c. Weight Handling Equipment that has satisfactorily passed the required inspections and load testing must be so marked by the activity conducting the tests. As a minimum, this marking must include the name of the testing activity, the date (year and month) tested, date of re-inspection due date, the rated load and a unique serial number that will allow it to be traced to its test and inspection documentation.

(1) Where there is little available space for surface marking, such as on wire rope slings, the item may be marked with a Periodic Load Test Record Strap as shown in reference (e).

(2) Synthetic webbing slings must have etched leather tags sewn to each sling leg to identify the leg and indicate test results as described in reference (f).

(3) Stamped, etched or engraved metal tags, which are attached to the tested item with mechanical fasteners or adhesives, may also be used.

(4) Color coding, for local control only, may be used in addition to, but not as an alternate to, one of the authorized marking methods.

(5) Wire rope (1/32” through 3/16” diameter) may be used to attach metal tags to WHE provided that the wire rope is secured using mechanical fasteners designed to secure wire rope such as swedges. Metal tags attached using lockwire style twisted wires are prohibited.

d. A permanent log, written or electronic, must be maintained to record the following information:

(1) Equipment identification.

(2) Date of the test or inspection.

(3) Description of the test or inspection.

(4) Weight used for the test, in pounds.

(5) Testing activity.

e. New hooks, blocks, sheaves, wire rope, fiber rope, and other loose hardware or gear need not be load tested after installation if it has not been modified and has been purchased to Military Specifications (MILSPEC) or NAVSEA standard drawings through the Naval Supply System. Any load carrying loose gear procured otherwise must be tested prior to placing in-service to 200% of the SWL of the part in question. If any sheave, block or hook assembly is received that does not bear the manufacturer’s test stamp, it must be tested to 200% of the SWL.

f. Unless otherwise specified, all load test capacity tolerance must be +5%, -0%.

13.2.3 Load Test Types and Duration. For each test type, the equipment must withstand the required load for the specified amount of time, per the applicable reference(s) listed in paragraph 13.2.8.

13.2.3.1 No-Load Test. As a prerequisite to any load testing, a no-load test must be performed. During the test, the equipment or system must be operated through full ranges and directions of motions and in all operating modes. All safety devices and travel limits must be demonstrated during the test.

13.2.3.2 Static Load Test.

a. Unless otherwise specified, all arrangements for handling and supporting weights (including weights of personnel), all arrangements for taking heavy strains, and all parts upon which the safety of the ship or life depend, must be given a static load test equal to twice the rated load. In cases in which the rated load is not specified, the test load must be based on the expected duty of the equipment or system. For hoisting arrangements, the static test load must be suspended clear of all supports and held suspended for a sufficient period of time to allow for the inspection of welds and other fastenings, but need not be lifted or moved by the system under test. After relieving the static test load, there must be no evidence of permanent deformation of structure.

b. The equipment or system to be tested must not be used to lift the total static test load. Static load tests must be completed prior to performance of operational tests. Where static test loads exceed 40% of rope breaking strength, the ship's rope must not be used for the static test.

13.2.3.3 Dynamic Load Test. Weight handling arrangements must be tested to demonstrate capacity to withstand additional loads imposed on a system when operating under unfavorable sea conditions at reduced speed. The dynamic load test must be conducted to demonstrate handling equipment load capabilities throughout the complete operating range, but the load need not be lifted or moved at rated speeds. As far as practicable, test loads must be moved completely through the equipment operating range, within the limits of all operating modes.

NOTE: IF THE EQUIPMENT USES HYDRAULIC POWER, THE SYSTEM RELIEF VALVES MUST BE CHECKED FOR PROPER SETTINGS BEFORE PERFORMING A DYNAMIC LOAD TEST.

13.2.3.4 Rated Load Test. Following satisfactory completion of the dynamic load test, the rated load test must be conducted to demonstrate capability to operate with a full load, at rated speed, through the complete range of operating limits. As far as practicable, test loads must be moved completely through the equipment operating range, within the limits of all operating modes. Proper operational functions must be demonstrated at each speed in all operating modes. The mechanical safety devices must be tested for their ability to stop and hold when carrying rated load at rated speed.

13.2.4 Load Test Periodicity.

a. In the interest of personnel safety and equipment protection, inspection and testing of all WHE not covered by PMS or other directives will be performed at intervals not to exceed four years.

NOTE: PER NAVSEA DIRECTION, STATIC, DYNAMIC AND RATED LOAD TESTING OF MAIN STORAGE BATTERY LIFTING GEAR INSTALLED IN SUBMARINE BATTERY COMPARTMENTS IS NOT REQUIRED UNLESS REPAIRS TO STRUCTURAL OR WEIGHT SUPPORTING COMPONENTS HAVE BEEN ACCOMPLISHED. FOLLOWING REPAIRS, LOAD TESTING WILL BE ACCOMPLISHED DURING BATTERY REPLACEMENT AFTER THE BATTERY CELLS HAVE BEEN REMOVED.

b. Testing of the following components is required when newly installed or after major structure repair or modification.

(1) Accommodation ladders.

(2) Cleats.

(3) Gangplanks.

(4) Leadsman platform.

NOTE: SSN 688 CLASS LIFELINE STANCHIONS DO NOT REQUIRE WEIGHT TESTING FOLLOWING MANUFACTURE OR REPAIR.

(5) Life rails or stanchions.

(6) Lifelines.

(7) Padeyes.

(8) Portable davits.

(9) Reversible eyebolts.

(10) Slings.

(11) Safety nets (including deck edge safety nets).

(12) Vertical ladders.

13.2.5 Shipboard Crane Program.

a. A Shipboard Crane Program must be implemented on each ship with a crane installed or assigned, per reference (g).

b. Guidelines for training and qualification of personnel responsible for shipboard crane operation and maintenance are contained in reference (g).

13.2.6 Daily Inspections. Daily, before use visual inspections must be conducted:

a. For Weight Handling Equipment:

(1) A daily, before use visual inspection must be performed following PMS for the assigned equipment before any load handling operations.

(2) A no-load operational test must be conducted by each shift prior to handling ammunition.

b. All handling equipment selected (including slings, shackles, turnbuckles, strongbacks, chain hoists and taglines) must be visually inspected before use for obvious material

deficiencies, equipment capacity markings and load test expiration date (as applicable).

c. Before beginning crane operations for each new day, a qualified crane operator must perform an inspection of each crane to check for discrepancies in the crane's structure or operating controls using the crane Operator's Daily Check List provided in reference (g).

13.2.7 Use of Synthetic Straps.

a. The use of knotted synthetic strapping as handling equipment is prohibited.

b. Rigging with synthetic straps is permitted only when nylon strapping is equipped with sewn (lifting) eyes and the strapping has been static load tested to 200 percent of rated load.

c. When available handling equipment (for example, wire rope slings) cannot be properly attached, or load surface damage may occur, 6,000-pound (rated breaking strength) synthetic strapping is permitted only for loads up to 1,000 pounds.

d. Webbing slings must be inspected for abrasions and fraying of the webbing and stitching, and for broken stitches. Slings must not be used if signs of deterioration are visible.

NOTE: REFERENCE (A) IS TO BE USED ONLY WHEN THE SHIP IS ACTUALLY PIERSIDE.

13.2.8 Weight Test Procedure Matrix. Table 13-1 provides sources of load test procedures for shipboard equipment or systems that may require periodic load testing or testing following fabrication or repair:

EQUIPMENT OR SYSTEM INSPECTIONS AND TESTING	GOVERNING DOCUMENT(S) FOR MAINTENANCE
Aircraft Elevators	Reference (h), PMS
Aircraft Tie-downs	References (i)
Anchoring	Reference (j), PMS
Ammunition Handling	References (e), (l) through (o), PMS
Boats & Boat Davits	Reference (f), PMS
Booms	Reference (p), PMS
Cargo & Weapons Elevators	Reference (q), PMS
Cleats	Reference (r)
Cranes	Reference (g), PMS
Deck Edge Safety Nets	References (s) and (t)
Deck Screw Reversible Eyebolts	Reference (u)
Hoists	Reference (v), PMS

EQUIPMENT OR SYSTEM INSPECTIONS AND TESTING	GOVERNING DOCUMENT(S) FOR MAINTENANCE
Hull Fittings	Reference (w), PMS

Weapons Stowage and Handling Equipment - *Virginia* Class	Reference (ai)
Shipboard Crane and Miscellaneous Rigging Gear	Reference (g)

TABLE 13-1 – Load Test Procedures

13.2.9 Identification of Equipment. Following the weight test, ensure the Weapons Handling Equipment is properly marked as detailed per reference (e) section 4.

13.2.10 Record Keeping. QA form 17W must be used to document Shipboard Weight Handling Equipment weight testing. The Weight Handling Test Inspector must sign the Quality Assurance blocks of QA form 17W. The signed QA form 17W or a copy must be provided to the activity who maintains the Shipboard Weight Handling Equipment in all cases. QA form 17W must be retained by the end user or maintaining activity until superseded by successive testing for each piece of Shipboard Weight Handling Equipment. QA form 17W used to document Shipboard Weight Handling Equipment testing in a Controlled Work Package will be retained with the Controlled Work Package as prescribed by Volume V of this manual.

13.2.11 Crane Material Condition Assessments. This section provides guidance in the preparation for and execution of shipboard crane assessments by qualified crane assessors per reference (g). A crane assessment is used to determine a baseline condition and establish the scope of any follow-on actions. The assessment is designed to evaluate the material condition of the crane and all safety features and ensure all repairs, maintenance actions and design changes conform to the applicable standards and specifications.

13.2.11.1 Ship's Force Assessment Responsibilities.

a. Ensure that the crane's PMS is up to date.

b. Provide qualified operators as necessary to safely perform all crane operations.

c. Provide qualified maintainers as necessary to assist and learn from assessor.

d. Ensure all members of the assessment team comply with shipboard safety requirements.

e. Ensure all necessary tag-out procedures are accomplished following shipboard instructions.

13.2.11.2 Assessor Responsibilities.

a. Conduct crane assessments based on assessment procedures and reference (g).

b. Ensure the crane has been assessed, adjusted, repaired (where feasible) and operationally tested.

c. Ensure all discrepancies and corrected items have been documented via a Ship's Maintenance Action Form, OPNAV 4790/2K, in the Current Ship's Maintenance Project.

d. Ensure before leaving the ship that the Commanding Officer, or an officer designated by the Commanding Officer, is briefed on the crane material condition, to include all completed and outstanding maintenance and repair actions.

e. Issue a dedicated final report to the ship, SURFMEPP, ISEA, ISIC and TYCOM within 30 days following the assessment visit. The report must address the following:

(1) All discrepancies found during the assessment, specifically calling out any "In-Service Envelope" discrepancies (refer to reference (g)).

(2) Operational testing results.

(3) Any recommendations to the In-Service Engineering Agent for system changes.

13.3 NAVAL FACILITIES ENGINEERING COMMAND ASHORE REQUIREMENTS. WHE assigned to naval shore activities and utilized only in ashore operations or aboard ships when the ship is pierside must be certified, tested, inspected and operated in compliance with reference (a). For general purpose lifting and rigging, shore based rigging gear and portable hoists meeting the requirements of reference (a) may be used aboard ship when the ship is pierside (this does not apply to ordnance or radiological lifting and handling). Reference (a) covers line-handling mechanisms on floating cranes, hoists and chain falls which are used in multiple locations, and portable and adjustable gantry cranes and floor cranes. Material handling equipment is covered by Naval Supply Systems Command criteria.

13.3.1 Certification Program. The Commanding Officer is responsible for ensuring safety within the activity and must designate a WHE certifying official who must ensure the activity's WHE is inspected, tested and certified per reference (a).

13.3.2 Operator Licensing Program. All Navy civilian and military personnel assigned duties involving the operation of Navy shore-based Category 1, Category 2, Cab Operated Category 3 or Category 4 WHE must be qualified and licensed per the provisions of reference (a).

13.3.2.1 Operator Qualification and Testing. All applicants for Crane Operation Licenses must meet the requirements of reference (a).

13.3.2.2 Licensing Procedures and Documentation. Reference (a) contains the necessary procedural requirements for licensing and documentation.

13.3.3 Inspections.

a. Pre-Use Check (Category 1, 2, Cab Operated Category 3 and Category 4 Cranes). The operator must perform an inspection of their assigned crane using a Crane Operator's Daily Checklist as required by reference (a).

b. Specific instructions in reference (a) must be used for conducting and reporting the following inspections:

(1) Walk Around Check.

(2) Machinery House or Machinery Area Check.

(3) Operator Cab Check.

(4) Operational Check.

c. Pre-Use Check (Non-Cab Operated Category 3 Cranes) must be performed per reference (a).

13.3.4 Test Procedures. Reference (a) contains instructions for performing crane test procedures.

13.3.5 Special Purpose Service. Activities using special purpose service cranes must follow the requirements of reference (ah) in addition to criteria contained in reference (a).

13.4 SLINGS. Slings used in conjunction with other material handling equipment for the movement of material ashore by hoisting are covered by references (a) and (g).

a. A sling is an assembly which connects the load to the material handling equipment.

b. Slings include those made from alloy steel chain, wire rope, metal mesh, natural or synthetic fiber rope (conventional three strand construction), and synthetic web (nylon, polyester, and polypropylene).

13.5 CRANE RIGGING GEAR AND MISCELLANEOUS EQUIPMENT. Reference (a) contains maintenance, inspection and test requirements for the following common rigging gear used ashore and reference (g) contains maintenance, inspection and test requirements for the following common rigging gear used shipboard. Reference (g) allows shore based rigging gear and portable hoists meeting the requirements of reference (a) to be used aboard ship with shipboard cranes when the ship is pierside.

a. Slings.

b. Shackles, links, rings, swivels, eyebolts, turnbuckles, hooks and swivel hoist rings.

c. Tackle blocks.

d. Portable load indicating devices (dynamometers, load cells, crane scales, etc.).

e. Lashing (e.g., wire rope, synthetic rope, synthetic webbing).

CHAPTER 14

MAGAZINE SPRINKLING SYSTEM INSPECTION REQUIREMENTS

REFERENCES.

(a) NAVSEA S9522-AA-HBK-010 – Description, Operation and Maintenance Handbook for Magazine Sprinkling Systems
(b) NAVSEA S9040-AA-GTP-010/SSCR – Shipboard Systems Certification Requirements for Surface Ships Manual
(c) NAVSEAINST 4790.8 – Ships' Maintenance and Material Management (3-M) Manual
(d) NOSSAINST 8023.12 – Shipboard Explosives Safety Inspection Program

14.1 PURPOSE. To provide guidance for the performance of magazine sprinkling system inspections.

14.2 RESPONSIBILITIES.

14.2.1 Commanding Officers.

a. Ensure that magazine sprinkling systems are maintained, inspected, and tested in accordance with the planned maintenance system.

b. Ensure that magazine temperatures are checked and recorded daily.

c. Ensure that magazines are properly maintained.

d. Ensure that prior to acceptance of a sprinkling system in new construction or when design changes (Ship Changes) are made to a sprinkling system during construction or overhaul, the cognizant industrial activity provides written verification that each system is completely operational. A certified magazine sprinkling system inspector will perform the verification of system operability per references (a) and (b).

e. Ensure that magazine sprinkling system inspection requirements are conducted by a certification agent per references (a) and (b) and when directed by planned maintenance system. These inspection requirements apply to thermo-pneumatic, electronic, and hydraulic control systems. All tests will be per references (a) and (b) and will be completed by using the appropriate maintenance requirement card(s). A certified magazine sprinkling system inspector will conduct all magazine sprinkling system tests.

f. Ensure that a Magazine Sprinkling System Verification (MSSV) is scheduled prior to ammunition and explosives on-load (if required by section 14.2.1.d or 14.2.1.e above). A certified magazine sprinkling system inspector shall conduct the verification.

g. Schedule a MSSV during a Total Ship Readiness Assessment. A certified magazine sprinkling system inspector shall conduct the verification.

h. Take necessary action to correct all discrepancies noted during MSSV. Within 30 days following receipt of the magazine sprinkling system discrepancy list, report the

status to the Immediate Superior In Command (ISIC) with an informational copy to the Type Commander and the original verification activity via message or official correspondence, identifying corrective action(s) taken or applicable Plan of Action and Milestones.

i. Ensure that design and operational discrepancies are reported to the Type Commander and submitted into the Current Ships' Maintenance Project. Procedures for reporting discrepancies are included in reference (c) and Type Commander instructions.

j. Ensure that associated magazine sprinkling systems are certified by the certification authority in accordance with reference (b) prior to stowage, service, assembly, or temporary holding of ammunition and explosives.

k. Ensure that magazine sprinkling system certification messages and official correspondence are retained in the ships Combat Systems Smooth Log.

14.2.2 Verification Activity.

a. Verification activities are activities authorized to conduct MSSVs per references (a) and (b), and as detailed below:

(1) Regional Maintenance Centers and Supervisor of Shipbuilding:

(a) For legacy style thermo-pneumatic and hydraulic magazine sprinkling systems, ensure Magazine Sprinkling System Inspector has completed the classroom based, instructor led Magazine Sprinkler Systems Inspector Course (Course Number: K-041-2137), is attached to a Regional Maintenance Center or Supervisor of Shipbuilding, has conducted an MSSV within the last 6 months, and has attended the magazine sprinkling systems inspector course of instruction within five years.

(b) For electronic type magazine sprinkling systems, the inspector shall meet the requirements of section 14.2.2.a.(1)(a), and the inspector shall also be designated to conduct MSSVs by the Naval Surface Warfare Center Philadelphia Division (NSWCPD) magazine sprinkling system In Service Engineering Agent (ISEA) or the Naval Sea Systems Command 05P5 Technical Warrant Holder for Fire Protection Systems – Ships.

(2) NSWCPD Code 336 ISEA: The magazine sprinkling system ISEA shall establish inspection criteria and standards for all magazine sprinkling systems and variants, including all legacy systems and all new electronic systems. The ISEA shall perform MSSVs in accordance with reference (b).

b. Provide written recommendations to the Ship's Commanding Officer and ISIC to continue or discontinue magazine sprinkling system certification until correction of all safety, major, or preponderance-related (minor or installation) discrepancies. When magazine sprinkling system certifications fall outside the scope of the ISIC certification authority, such as in new construction or new designs, those certifications shall comply with the requirements outlined in reference (a), with certification contingent upon correction of all safety, major, or preponderance-related (minor or installation) discrepancies. The written recommendation shall provide a magazine

sprinkling system discrepancy list utilizing the categories defined below and further expanded upon in reference (a):

(1) SAFETY - The equipment may harm personnel during normal operations even if installed by contract or approved design. The magazine sprinkling system will not work as intended or creates additional safety risk for ship or ship's force, even if installed following contract documents or approved design. Safety discrepancies shall be corrected immediately and shall preclude a certification or certification recommendation.

(2) MAJOR - The equipment is inoperable or severely compromised, broken, missing, or not installed; and by the nature of it being a MAJOR discrepancy, may also be a safety risk. Missing critical operational placards, labels, or valve information may render the system inoperable by limiting capability for manual operations of system. Equipment critical for manual operation of the magazine sprinkling system that is out of reach or inaccessible in accordance with Human Systems Integration standards. Major discrepancies shall be corrected immediately and shall preclude a certification or certification recommendation.

(3) MINOR - The equipment does not work as intended, or does not meet all installation standards, but the overall magazine sprinkling system will still function to provide cooling for ammunition and explosives; carries additional risk. Minor discrepancies shall be corrected at next available opportunity but should not preclude a certification or certification recommendation unless in preponderance.

(4) INSTALLATION - Equipment will work, but was not installed in accordance with specifications, standards, or drawings. Discrepancy may be a new issue that arose post-installation that was not originally identified. Installation discrepancies shall be corrected at next available opportunity, but should not preclude a certification or certification recommendation unless in preponderance, or identified as a SAFETY or MAJOR discrepancy. If an INSTALLATION discrepancy exists that is also a SAFETY or MAJOR discrepancy, then a major Departure from Specification (DFS) or Hazard Assessment Report (HAR) shall be generated and approved prior to certification or certification recommendation for the associated magazine sprinkling system.

14.2.3 Immediate Superior In Command (Certification Authority).

a. Ensure that Shipboard Explosive Safety Inspection is scheduled per reference (d).

b. Follow-up on and verify correction of all discrepancies reported by the verification activity. Those items that are discrepancies because of design problems shall be reviewed by the cognizant Naval Engineering Technical Authority and recommended corrective actions shall be performed at the earliest convenient availability.

c. Shall act as sole grantor of all magazine sprinkling systems re-certifications via Naval message or official correspondence. Re-certification is based on verification activity's recommendation.

d. Certification of a magazine sprinkling system shall not be granted until all discrepancies categorized as safety, major, minor if in preponderance, or installation if in preponderance, are repaired and subsequently verified by the ISIC or verification activity. If a DFS or HAR were generated, the DFS or HAR shall be fully approved and accepted prior to certification of a magazine sprinkling system.

VOLUME IV

CHAPTER 15

CIRCUIT BREAKERS

REFERENCES.

(a) NAVSEA LTR 9570, Ser 05Z/179 - NAVSEA policy letter for AQB and ACB circuit breakers
(b) NAVSEA LTR 9570, Ser 05Z/180 - NAVSEA policy letter for COTS molded case and power circuit breakers
(c) NAVSEA LTR 9570, Ser 05Z/194 - NAVSEA policy letter for COTS, militarized, and MIL-SPEC vacuum circuit breakers

15.1 PURPOSE. To issue the Naval Sea Systems Command (NAVSEA) policy on maintenance and overhaul of Navy shipboard circuit breakers of Commercial-Off-The-Shelf (COTS). militarized, and mil-spec types specified in references (a), (b) and (c) as applicable.

15.2 CIRCUIT BREAKER FUNCTION AND ACQUISITION ON NAVY SHIPS. Circuit breakers onboard Navy ships and submarines are used primarily to provide electrical system protection against disruptive and sometimes destructive abnormal currents. This protection is so precise that it selectively removes only the cause of the abnormal current (such as electrical system damage acquired in battle) while continuing to power other unaffected weapons, electronics and electrical systems. This continuous supply of electrical power is also ensured by the unique ability of these circuit breakers to maintain proper position during severe impacts produced by missiles, bombs, mines, torpedoes and other detonation sources. Due to the unique nature and critical function of Navy shock-hardened circuit breakers, their acquisition is controlled by requirements set forth in appropriate military and COTS specifications.

15.3 CIRCUIT BREAKER TYPES AND APPLICABLE SPECIFICATIONS. Although many mil-spec low voltage circuit breakers continue to be used in the fleet, the trend in recent surface shipbuilding programs has been to use low voltage COTS and medium voltage vacuum circuit breakers. Table 15-1 provides details on all types of circuit breakers currently in the fleet.

15.4 CIRCUIT BREAKER REPAIRABILITY AND PARTS PROCUREMENT. In accordance with references (a), (b) and (c) and as summarized in Table 15-1, not all circuit breaker types are repairable. To maintain the integrity of repairable circuit breakers as a qualified product, NAVSEA prohibits the local manufacture or fabrication of certain (restricted) parts during repair or overhaul. Specifically, all replacement parts for circuit breakers, except fasteners and general hardware items, are restricted parts. The restricted replacement parts must be obtained from the Federal Stock System, the Original Equipment Manufacturer (OEM), or approved material diversion. Additional details on restricted and non-restricted parts can be found in references (a), (b) and (c).

Circuit Breaker Type	Specification	Circuit Breaker Examples (See Note)	Repairability	Applicable References
AQB molded case	MIL-DTL-17361	AQB-A252 (SPD) AQB-L403 (Eaton)	Repairable – frame sizes 250 amps and greater Non-repairable - 100 amp frame sizes and smaller	reference (a)
ACB power	MIL-DTL-17587	ACB-4012 (SPD) ACB-2020 (DRS)	Repairable	reference (a)
MSVCB vacuum	MIL-DTL-32485	MSVCB-4.76KV-1600 (DRS)	Repairable	reference (c)
Militarized vacuum	Purchase specification for particular program	VCB-15KV (DRS)	Repairable	reference (c)
COTS molded case	UL 489 UL 489D IEC 60947-2	LDC (Eaton) Tmax (ABB) NSX (Schneider Electric)	Not repairable	reference (b)
COTS power	UL 1066 UL 1066A IEC 60947-2	Magnum (Eaton) Masterpact (Schneider Electric)	Repairable	reference (b)
COTS vacuum	UL 2831 Purchase specification for particular program	VCP-W (Eaton)	Repairable	reference (c)

TABLE 15-1 Fleet Circuit Breakers

NOTE: CIRCUIT BREAKERS SHOWN ARE ONLY EXAMPLES OF EACH TYPE AND NOT A COMPREHENSIVE LIST OF ALL CIRCUIT BREAKERS IN THE FLEET. SEE MIL-SPEC SPECIFICATION SHEETS AND PROGRAM-SPECIFIC SWITCHGEAR TECHNICAL MANUALS FOR INFORMATION ON ADDITIONAL CIRCUIT BREAKERS NOT SHOWN IN TABLE 15-1.

15.5 CIRCUIT BREAKER MAINTENANCE FACILITIES/ACTIVITIES (NON-NUCLEAR). References (a), (b) and (c) address the following types of maintenance facilities/activities:

a. Designated Overhaul Points (DOPs) - NAVSEA has designated Puget Sound Naval Shipyard as the Navy organic DOP for selected mil-spec circuit breaker types and has designated the OEMs as DOP for their own products. See References (a), (b) and (c) for additional details.

b. Approved Non-OEM Maintenance Facilities/Activities – NAVSEA or OEMs have authorized selected commercial and Navy facilities/activities to perform repair of selected circuit breaker types as specified in References (a), (b) and (c).

c. Naval Shipyards. References (a), (b) and (c) provide details on capabilities and scope of Naval shipyard circuit breaker repair work.

d. Navy Intermediate Level and Organizational Level. References (a), (b) and (c) provide details on capabilities and scope of Navy Intermediate Level and Organizational Level circuit breaker repair work.

e. Performance Monitoring Teams. Reference (a) provides details on capabilities and scope of PMT circuit breaker repair work (submarines only).

15.6 NAVSEA 08 COGNIZANT CIRCUIT BREAKERS (NUCLEAR). If questions or technical issues arise regarding NAVSEA 08 cognizant circuit breakers which cannot be resolved by consulting the applicable technical manual, prepare a Trouble Record or Liaison Action Request and submit to Assistant NAVSEA Technical Representative, Schenectady, NY following the Commissioned Submarine and Surface Ship General Reactor Plant Overhaul and Repair Specification.

VOLUME IV

CHAPTER 16

AIRCRAFT LAUNCH AND RECOVERY SYSTEMS FOR AIRCRAFT CARRIERS ONLY

REFERENCES.

(a) NAVSEAINST 4790.8 - Ships' Maintenance and Material Management (3-M) Manual
(b) OPNAVINST 4790.15 - Aircraft Launch and Recovery Equipment Maintenance Program (ALREMP)
(c) COMNAVAIRLANTINST 4790.40/COMNAVAIRPACINST 4790.39 - Aircraft Launch and Recovery Equipment Maintenance Program (ALREMP) Management Teams
(d) OPNAVINST 3120.28 - Certification of the Aviation Capability of Naval Ships Operating Aircraft
(e) COMLANTFLTINST 3500.18 - Certification and Readiness of Aviation Facilities in Naval Ships Operating Aircraft
(f) NAVAIRINST 3120.1 - Lead Systems Command Procedures and Responsibilities for Certification of Aviation Facilities and Equipment in Naval Ships Operating Aircraft
(g) COMFRCINST 13800.2 – Procedures for Fleet Readiness Centers Voyage Repair Teams

16.1 PURPOSE. To provide guidance concerning the maintenance policies, procedures and responsibilities for Aircraft Launch and Recovery Equipment (ALRE) throughout the ship's operating cycle. The Aircraft Launch and Recovery Equipment Maintenance Program (ALREMP) is sponsored and directed by the Chief of Naval Operations, and is administered through the chain of command to provide material and technical support by the cognizant Systems Command. The ALREMP provides an integrated system for performing maintenance and related support functions on ship's installed aircraft launching and recovery systems and associated peripheral support systems and equipment.

16.2 AIRCRAFT LAUNCH AND RECOVERY EQUIPMENT MAINTENANCE PROGRAM.

16.2.1 Applicability. The ALREMP encompasses all Navy activities concerned with the operation, rework, repair, production and support of Aircraft Carrier ALRE, including catapults, arresting gear, Visual Landing Aids (VLA), and associated deck gear and accessories.

16.2.2 Objectives. The ALREMP establishes standard procedures to control maintenance, provide quality assurance performance verification and provide for a more effective ship's Maintenance and Material Management system in compliance with reference (a).

16.2.3 Responsibilities.

a. Naval Air Systems Command (NAVAIR) must provide overall ALREMP management through the ALRE Program Manager (PMA 251).

b. The ALRE Program Manager, or his direct representative, must establish and chair the ALREMP Working Committee.

c. The Naval Air Warfare Center Aircraft Division (NAWCAD), Lakehurst will provide technical services and act as the technical manager for the ALREMP.

d. The Type Commanders (TYCOM) must provide ALRE Maintenance Management Teams to conduct assist visits and annual audits of all units, per the requirements of reference (b). These assist visits and annual audits will ensure operation and maintenance of ALRE is conducted within the guidelines of the ALREMP as directed by reference (b).

16.2.4 ALRE Management Team. The ALREMP Maintenance Management Team (AMMT) serves as the link between the OPNAV program sponsor, systems commands, fleet commands, CVNs and shore activities, ensuring adherence to ALREMP policy and procedures. TYCOM AMMTs will consist of one ship installation officer, one Aircraft Launch and Recovery Equipment Maintenance Officer and one Aviation Boatswains Master Chief or Aviation Boatswains Senior Chief capable of providing guidance in all facets of the ALREMP. The ALREMP Management Team provides the following services.

a. Pre-implementation training for the ALREMP.

b. Assistance to ships during the ALREMP implementation phase.

c. Assist visits during industrial availabilities.

d. Assist visits following an industrial availability or during a ship's work-up cycle.

e. Formal audits, per references (c), prior to or during mid-deployment.

f. Analyzing Navy Enlisted Classification (NEC) assignment, Billet Based Distribution (BBD) management and Ship Manpower Document (SMD) requirements.

g. Advising personnel regarding compliance with Quality Assurance program policy, maintenance and material control techniques.

h. Reviewing and recommending changes to procedures, instructions and publications.

i. Conducting spot checks of the CVN (including supply department) ALRE repair parts inventory to verify logistics policy compliance.

16.2.5 AMMT Assist Visits.

a. Assist visits will be advisory in nature and will normally be scheduled to follow a CVN selected restricted availability or during the work-up cycle.

b. Units visited are encouraged to discuss maintenance and material quality assurance problems with team members.

c. Upon completion of the visit, the team will debrief the air department officer and designated air department personnel. An informal report of noted problems and recommendations will be provided during the debrief. The host installation CO will be debriefed at the discretion of the team leader.

d. The AMMT may be requested for additional assist visits at the CVN CO's discretion via the applicable TYCOM.

16.2.6 Audits. Formal audits will be conducted upon completion of a CVN Chief of Naval Operations availability, annually or prior to deployment, and will evaluate the overall ALREMP and quality assurance management procedures, including compliance with current OPNAV and TYCOM instructions. Audits must also be conducted on ALRE test facilities annually.

a, The Commanding Officer must be debriefed by the ALREMP Team Leader at the completion of the audit.

b. The AMMT must notify the command being audited and PEO (T), PMA-251 by naval message no less than 2 weeks prior to the start date of scheduled audit.

16.3 AVIATION CERTIFICATION. Aviation Certification, including ALRE certification, responsibilities, procedures, and waiver guidance are provided in references (d), (e) and (f).

16.4 CARRIER AND FIELD SERVICE UNIT.

a. Carrier And Field Service Unit (CAFSU) East and West are branches within NAWCAD Lakehurst, ALRE Fleet Technical Services Division. The organization is comprised of civilian technicians highly skilled and thoroughly qualified in the operation, maintenance, repair, installation, and testing of both shipboard and shore based ALRE and VLA systems. They are geographically located in field offices to provide instant technical assistance to Fleet personnel and industrial activities throughout the Fleet operating areas. CAFSU Field Offices are located at:

Fleet Readiness Center Mid Atlantic Voyage Repair Team, Norfolk, VA
Fleet Readiness Center Southwest Voyage Repair Team, North Island, CA
Puget Sound Naval Shipyard Bremerton, WA
Ship Repair Facility Yokosuka, Japan
Supervisor of Shipbuilding Newport News, VA
Norfolk Naval Shipyard Portsmouth, VA

b. The CAFSU East or West Branch Head is located at TYCOM headquarters. T The Branch Heads are on staff to the to the Ship Installation Officer, TYCOM (N433). CAFSU functions as the technical representatives of NAVAIR, the TYCOM and NAWCAD in all matters which concern launch, recovery, and VLA equipment. CAFSU is required to maintain technical liaison with the commands listed in sub-paragraph 16.4 a of this chapter and is responsible for the completion of work to the satisfaction of these commands and for providing all interested parties with timely information as required. CAFSU will provide technical assistance during Chief of Naval Operations Maintenance Availabilities and other availabilities, and to ships not in a repair status. All industrial activity repairs, modifications, and operational tests of shipboard, launching, recovery and VLAs will be monitored by a CAFSU representative. All technical questions concerning the equipment may be directed to the local CAFSU representative. CAFSU must recommend approval or disapproval of work after consultation with the TYCOM. CAFSU representatives will submit timely written reports concerning repairs, alterations and work accomplished to the Head, Fleet Technical Services Division for appropriate action and distribution.

16.5 RESPONSIBILITIES.

16.5.1 Aircraft Carrier Commanding Officer.

a. Request CAFSU technical assistance when required, by message, letter, or informal means from the TYCOM to the CAFSU Branch Head. In the case of a formal request, direct an information copy to the local CAFSU field office.

b. Provide appropriate berthing and messing facilities for CAFSU representatives when embarked.

c. Pass to the TYCOM (N433) any comments concerning meritorious or substandard performance of CAFSU representatives.

d. Upon completion of the CAFSU assignment at sea, ensure timely departure from the ship.

16.5.2 Industrial or Repair Activity.

a. Provide support to the CAFSU representative, as appropriate to allow for accomplishment of the objectives set forth in paragraph 16.2.2.

b. Refer technical questions concerning the launching, recovery and VLA equipment to the local CAFSU representative for timely resolution.

16.6 FLEET READINESS CENTER.

a. The Fleet Readiness Centers maintain and operate facilities to perform:

(1) A complete range of industrial level rework operations on designated weapon systems, accessories and equipment.

(2) Manufacturing of parts and assemblies as required.

(3) Engineering services in the development of change hardware design.

(4) Technical and other professional services for Aircraft Carrier maintenance and logistic problems.

(5) Other levels of Aircraft Carrier maintenance for eligible activities upon specific request or assignment.

(6) Other functions as directed by NAVAIR.

b. In order to meet the material support needs of the operating forces, by accomplishment of the mission, the following specific functions are assigned:

(1) Perform depot maintenance functions for aircraft, engines and their components and accessories. Ground Support Equipment trainers and training equipment as specified in appropriate Aircraft Maintenance Program directives.

(2) Provide engineering, technical and professional services in support of rework of specific aircraft, engines, aeronautical components, Peculiar Ground Support Equipment, trainers and training equipment.

(3) Perform shipwork designated as Ship Installations Equipment and systems with the same priority as aircraft rework.

(4) Serve as the major maintenance, repair and modification point for assigned missiles.

(5) Provide calibration services as assigned by higher authority.

(6) Perform as the NAVAIR Weapons System Support Officer for the overall management of the NAVAIR Engineering Support Office, Weapon Systems Management Office for assigned weapons, and Integrated Logistic Support Office.

(7) Perform as a Cognizant Field Activity for assigned aircraft, equipment, and Peculiar Ground Support Equipment.

16.7 FLEET READINESS CENTER VOYAGE REPAIR TEAM.

a. Reference (g) denotes organizational relationships between the TYCOM and the Voyage Repair Team (VRT) and defines the TYCOM's responsibility, authority for workloading, and operational control of the VRT. Control is exercised through the TYCOM (N433).

b. To provide industrial level support for Ship Installation Equipment (ALRE) the VRT is used to support the following:

(1) Casualty Reports.

(2) Enroute maintenance or underway repairs.

(3) Miscellaneous repairs beyond Ship's Force capability.

(4) Rotatable spare overhaul.

(5) Special reports.

(6) Preparation for Overseas Movement repairs.

(7) Service Change installations.

(8) Modernization or repair of components in conjunction with Chief of Naval Operations Maintenance Availabilities and Planned Maintenance System availabilities.

c. The capabilities of the VRT are such that almost any task related to launch and recovery equipment is feasible, assuming adequate support from Ship's Force is available. The following ship's support for the VRT is required:

(1) Timely Current Ship's Maintenance Project deferral submission for the Maintenance Manager and TYCOM screening and programming.

(2) Providing sufficient V-2 Division personnel to assist the team, in such areas as providing forklifts, obtaining necessary parts, gaining machine shop assist and space access, etc.

I Sample Other Catapult Accumulator Inspection Report Cover Letter

17.1 PURPOSE. To provide policy, procedures, requirements and responsibilities for Catapult Accumulator Systems Inspections including:

a. Scheduling

b. Industrial Preparations

c. Naval Sea Systems Command (NAVSEA) Technical Warrant Holder (TWH)

d. Naval Surface Warfare Center Philadelphia Division (NSWCPD) In-Service Engineering Agent (ISEA)

e. Type Commander (TYCOM)

f. Ship’s Force

g. Ship Repair Facility (SRF) or Regional Maintenance Center (RMC)

h. ISEA Inspector

i. SRF or RMC Steam Systems Subject Matter Expert (SME)

j. Steam Generating Plant Inspector (SGPI)

k. Documenting and Reporting Inspection Results

17.2 POLICY. Periodic inspections of catapult accumulators are required and include the following support systems: steam and feed water fill and blowdown piping; control and indicating components associated with the fill, pressurization and blowdown, and trough heating steam supply and drain piping. Inspections must be conducted by a SGPI or NSWCPD ISEA Inspector as applicable per the requirements of references (a), (b) and (c). Responsibilities for the technical and programmatic stewardship and continuation of the SGPI and ISEA Inspection programs are formally assigned in references (a) and (d). Specific inspection criteria and specific periodicity intervals are detailed in references (a) through (d).

17.3 TYPES OF INSPECTIONS. Table 17-1 provides the various types of steam catapult accumulator inspections and the associated inspector.

INSPECTION:	**INSPECTOR:**
Routine (RTE) Inspection	SGPI
Five-Year Strength and Integrity (5YR-SI): Pre-Start of Availability Inspection (PSAI) Start of Availability Inspection (SAI) Industrial Support Visit (ISV) Inspection Completion of Availability Inspection (CAI)	ISEA Inspector accompanied by a local SRF or RMC SGPI and a Steam Systems SME
Inactivation Inspection	ISEA Inspector
Reactivation Inspection	ISEA Inspector
Special Inspection	SGPI, Steam Systems SME, or ISEA Inspector
Pre or Post Repair Operational Assessments Inspection	SGPI

Table 17-1 Inspections and Inspectors

17.4 RESPONSIBILITIES.

17.4.1 Naval Sea Systems Command. Provide NAVSEA TWH for catapult accumulator systems and inspections.

a. Review and provide technical adjudication of Major Departure from Specifications (DFS) Requests.

b. Ensure Integrated Logistics Support products for inspections and inspected components and systems are fully codified and updated regularly.

c. Ensure SGPI and SRF or RMC Steam System SME Refresher Training is held semi-annually at a TWH directed location, alternating between TYCOM Areas of Responsibility (AORs) and NSWCPD.

d. Obtain annual funding for ISEA management of the Steam Catapult Inspection and Repair Management Information System (SCIRMIS).

e. Ensure funding for state-of-the-art inspection tools, techniques, and associated training courses is available and tools/training are being utilized by SGPI's, SME's and ISEA Inspectors.

f. Provide oversight of SRF or RMC SGPI and Steam Systems SME programs as follows:

(1) Ensure periodic audits of SGPI and Steam Systems SME training curriculums are conducted.

(2) Enforce requirements for SGPI and Steam Systems SME certification and recertification.

(3) Enforce requirements for SRF or RMC Steam Systems SME oversight and status of AOR's catapult accumulator systems inspection preparations, repair planning, repair execution, contractor Condition Report (CR) review as required, repair testing and assisting SGPI's with system and component operational testing.

(4) Authorize by NAVSEA letter, SGPI and SME certification and recertification per references (a) and (d).

17.4.2 Naval Surface Warfare Center, Philadelphia Division.

a. ISEAs are part of the TWH's Technical Pyramid and are accountable for the enforcement of associated technical requirements.

b. The ISEA is responsible for:

(1) Providing technical support to SGPI's, ISEA Inspectors, and Steam Systems SME's as required.

(2) Verifying SGPIs and Steam Systems SMEs meet certification and re-certification requirements per reference (a).

(3) Ensuring ISEA inspectors are qualified and trained.

(4) Maintaining sufficient ISEA Inspector staffing.

(5) Obtaining Fleet funding to conduct the 5YR-SI Inspection Cycle.

c. ISEA Inspectors conduct the 5YR-SI Inspection Cycle (PSAI, SAI, ISV, or CAI) and other inspections specified in paragraph 17.7, references (b) and (c). ISEA Inspectors do not conduct routine inspections, but can assist if requested.

d. The Lead ISEA Inspector(s) are responsible for:

(1) Providing technical and programmatic support to the NAVSEA TWH for the Routine Inspection and 5YR-SI Inspection Cycle Programs.

(2) Ensuring technical and administrative documentation supporting the SGPI and ISEA Inspection programs are current and updated.

(3) Monitoring and updating NAVSEA and Fleet requirements and execution standards for Routing Inspection and 5YR-SI Inspections.

(4) Developing, implementing and maintain a program to train and certify NSWCPD Inspectors per references (a) through (d).

(5) Ensuring inspections on reactivated and deactivated ships are conducted as required per reference (c).

(6) Conduct periodic audits of the SGPI Training Course curriculums per references (a) and (d).

(7) Provide management of steam catapult accumulator system technical data, inspection and repair history, and the associated SCIRMIS.

(8) Coordinate and provide technical presentations to support the semi-annual SGPI and SRF or RMC Steam Systems SME Refresher Training.

(9) Maintain the roster of certified SGPI's and SRF or RMC Steam Systems SME's by name, rating, duty station, date of certification, and expiration date of certification. Recommend individual SGPI certification and provide awareness that actions to decertify inspectors who fail to comply with the requirements of references (a) and (d) will be initiated.

(10) Ensure that the requirements for SGPI and SRF or RMC Steam Systems SME certification and recertification are met (includes certification extensions).

e. The designated ISEA Inspector will notify the cognizant Lead SRF or RMC SGPI and SRF or RMC Steam Systems SME a minimum of 1 week prior to any 5YR-SI Inspection Cycle PSAI, SAI, ISV, or CAI occurring in the SGPI's and SME's AOR. If not possible due to reasons such as emergent tasking, the assigned ISEA Inspector will notify the Lead SRF or RMC SGPI or Steam Systems SME within one working day of tasking.

17.4.3 Type Commander Maintenance Program Manager.

a. Fund catapult accumulator system inspections required by references (a) through (c).

b. Assist with coordination of inspections with the Naval Supervisory Authority (NSA) and local Repair Activities.

c. Provide mission tasking and funding for SGPIs and ISEA Inspectors as applicable to travel to and from inspection sites, perform inspections, resolve inspection technical issues, and document and report findings per the requirements of references (a) through (c).

d. Assist ship's Commanding Officers in ensuring inspection repair actions beyond the capability of Ship's Force are satisfactorily accomplished using other resources as required.

e. Review SCIRMIS and inspection summary naval messages and ensure deferred inspection discrepancies are entered into the Current Ship's Maintenance Project (CSMP) and are programmed for repair.

f. Review inspection summary naval message major discrepancies and recommended repairs, Repair Before Operate (RBO) actions, and safety concerns and take appropriate actions.

g. Attend or direct staff to attend all SGPI RTE Inspection and ISEA Inspector 5YR-SI Inspection Cycle In-Briefs and Out-Briefs as required. Assist SGPI's and ISEA Inspectors with In- and Out-Brief scheduling.

17.4.4 SRF or RMC Commanding Officers.

a. Provide a SGPI when requested by a ship or TYCOM to conduct inspections.

b. Ensure SRF or RMC SGPI and Steam System SME's attend semi-annual SGPI and SME Refresher Training to maintain their certification.

c. Provide resources to ensure SRF or RMC SGPI and Steam System SME's meet all requirements to maintain certification per reference (a) and (d).

17.4.5 Ship Commanding Officer.

a. Request inspections via naval message with primary and alternate dates to the TYCOM. Include information copies to the cognizant SRF or RMC and NSWCPD Code 412 for accomplishment using the format in Appendix A.

b. Schedule catapult accumulator system inspections as required by appropriate Planned Maintenance System (PMS), Class Maintenance Plan items, and reference (a).

c. Prepare for scheduled inspections and operational tests per references (b) and (c).

d. Conduct inspections that are the responsibility of Ship's Force and provide reports required by references (b) and (c).

e. Review inspection results and initiate corrective actions for discrepancies within Ship's Force capability.

f. Initiate requests for assistance on repair actions beyond Ship's Force capabilities. Any severely degraded discrepancy as outline in paragraph 17.8.c of this chapter, which cannot be corrected prior to the end of the maintenance availability or if inspection occurs during an operational state (i.e. safe-to-steam), a Major Temporary DFS for the affected catapult accumulator, system or specific system components will be submitted per references (b) and (c) and the ISEA Inspector and local SRF or RMC Steam Systems SME will be contacted.

g. Assess the impact of repairs and associated corrective actions on the ship's operating schedule. Advise the TYCOM of any adverse effects.

h. Submit reports per paragraph 17.8.d of this chapter.

17.4.6 SRF or RMC Senior SGPI.

a. Ensure all assigned SGPIs complete training, attend at least one SGPI Training Refresher annually, and maintain current SGPI certifications per references (a) and (d).

b. Perform catapult accumulator system inspections per references (a) through (d) and paragraph 17.7.

c. Review and submit reports per paragraph 17.8.d.

d. Coordinate inspections in cognizant maintenance areas.

e. Send inspection messages prepared in accordance with Appendices A, B, C, D and E.

f. Maintain an updated list of upcoming catapult accumulator system inspections. The list must include the next required inspection date for all ships assigned to the SRF or RMC AOR.

17.4.7 SRF or RMC Steam Systems SME.

a. SRF or RMC Steam Systems SMEs are part of the TWH's Technical Pyramid and are accountable for the enforcement of associated NAVSEA technical requirements.

b. Review NSA and Ship's Force maintenance and repair industrial work packages to ensure specifications and special instructions are included. Adhere to current technical requirements, mandate proper material(s) selection, repair procedures are applicable and correct. Quality Assurance (QA) inspections and test procedures are correct and being accomplished in accordance with applicable requirements.

c. Provide solutions to help resolve technical or scheduling issues that negatively impacts a maintenance availability or operational ship repairs occurring in the applicable RMC AOR.

d. Provide direct technical support and oversight for repairs performed by Ship's Force, contractors, and naval or private shipyards. This work includes assessment, disassembly, repair, reassembly and testing of steam systems equipment.

e. Provide direct technical support and oversite for mandatory industrial preparations for 5YR-SI Inspection Cycle PSAI, SAI, ISV, and CAI in the SRF or RMC AOR. Provide status of industrial preparations for inspections to the designated ISEA Inspector and local RMC Lead SGPI upon immediate request.

f. Attend ship maintenance availability production meetings as required. Assist with scheduling of catapult accumulator maintenance availabilities, critical repairs, inspection preparation, inspection and test events, and help resolve associated technical issues.

g. Respond to requests for, and attend, onsite shipboard or repair shop industrial repair in-process inspections or "call-outs" and "check points" and function as the NSA government representative as applicable.

17.4.8 SRF or RMC SGPI.

a. SGPI's are part of the TWH's Technical Pyramid and are accountable for the enforcement of associated NAVSEA technical requirements.

b. Maintain SGPI certification by completing periodic requirements described in references (a) and (d).

c. Perform inspections per the requirements of references (a) through (d) and paragraph section 17.7 of this chapter.

d. Participate in the coordination of critical operational assessments and test events with Ship's Force, AOR SRF or RMC Steam System SME, and repair contractor to support in-port and underway events.

e. The assigned SGPI will notify the AOR's SRF or RMC Steam Systems SME a minimum of 1 week prior to any RTE or Special Inspection occurring in the applicable AOR. If not possible (emergent tasking), the assigned SGPI will notify the Lead RMC SGPI within one working day of tasking.

17.5 INSPECTION SCHEDULING.

a. Commanding Officers of ships request RTE Inspections and initiation of the 5YR-SI Inspection Cycle SAI by naval message per Appendix A. An OPNAV 4790/2-Kilo must be submitted requesting a SGPI and ISEA Inspector to conduct inspections.

b. Commands, NSAs and Ships can initiate requests for SGPI and ISEA inspections, requests for SRF or RMC Steam Systems SMEs and SGPIs to witness operational tests, and requests for SRF or RMC Steam Systems SMEs to perform ISV's in a timely manner to ensure successful coordination of scheduling. Commands and Ships must ensure inspection scheduling complies with references (b) and (c), and Appendix F.

c. RTE Inspections, 5YR-SI Cycle Inspections, and other inspection services must be coordinated by specific AORs for optimum utilization of SGPI, SRF or RMC Steam Systems SME and ISEA Inspector resources.

d. TYCOM may utilize 5YR-S&I Cycle SAI and CAI inspection results documented in SCIRMIS to satisfy the pressure vessel and piping portion of a RTE inspection.

e. Appendix F of this chapter provides a summary of inspection scheduling responsibilities.

17.6 SAFETY.

a. The safety of civilian and military Inspectors, SRF or RMC Steam Systems SME's, Ship's Force, Industrial Activity personnel, and other support contractors involved in inspection, industrial preparations, accumulator system component disassembly, and reassembly must be given the highest priority throughout the preparation and inspection process.

b. There must be a safety observer outside the accumulator entrance to provide assistance when personnel are working inside the accumulator.

c. Ensure the "Idle Accumulator Condition" is set and maintained per the requirements of the Catapult Engineering Operational Sequencing System (CATOSS) and references (b) and (c) in preparation for inspections. Contact the ISEA Inspector or cognizant SRF or RMC Steam Systems SME for requirements if clarification is required.

d. Do not enter any part of the idle accumulator until it has been fully ventilated and certified as "gas free" and safe for entry by a Naval Maintenance Facility Gas Free Engineer, Ship's Force Gas Free Engineer, or National Fire Protection Agency Marine Chemist.

e. Ensure the idle catapult accumulator is tagged out per reference (c). This includes setting and maintaining two-valve protection per chapter 10 of this volume.

f. Ensure all safety precautions associated with entry into sealed tanks, voids or pressure vessels, including gas-free certification procedures, are followed per the requirements of references (e), (f), (g), and chapter 25 of this volume.

g. Ensure all precautions cited in section 5.3 of reference (c) are followed before entering an accumulator.

h. Post warning signs that indicate personnel are working in the accumulator in all catapult control consoles and central charging panels in conspicuous places in the accumulator room, and in rooms containing fill and blowdown isolation valves. The signs must remain posted until the work has been completed.

i. Drain connections on all interconnecting catapult accumulator and steam or feed system piping should be opened to the atmosphere and monitored to observe potential instances of valve leak-by.

j. Portable lighting used inside the accumulator must be watertight. The use of unshielded or non-approved lighting in an open accumulator is prohibited. Portable lighting can be obtained from the National Stock Number 9G-6230-00-701-2947.

k. Maintain an inventory log for accountability of all items taken into an accumulator. Foreign Material Exclusion (FME) closures will be used to the maximum extent practical to prevent tools or other foreign materials from being inadvertently left in the accumulator or associated systems.

l. Personnel entering accumulators will remove all jewelry and empty their pockets of all unnecessary items.

m. Removal of all items and FME closures from the accumulator must be verified and accounted for from the inventory log prior to conducting a final closeout inspection. Final closeout inspection must be accomplished by the Chief Engineer or his designated representative.

17.7 INSPECTION REQUIREMENTS. All catapult system inspections, including pre and post inspection operational assessments should be scheduled concurrently. Appendix F of this chapter provides a summary of inspection scheduling responsibilities.

17.7.1 Routine Inspection. RTE Inspections will be conducted at least every 30 months. To provide flexibility to accommodate mission requirements, inspections may be performed as early as 24 months but shall not exceed 36 months after the previous RTE Inspection. The 30 months period begins with the first warm-up of the catapult accumulator to normal operating pressure and temperature following the previous inspection. Inspections that exceed the 30 months interval require a Minor Temporary DFS approved by the TYCOM, normally with concurrence from the ISEA. A Major Temporary DFS approved by the TWH and cognizant Ship Design

Manager (SDM) is required to operate beyond 36 months. Exceeding any RTE Inspection interval without a DFS requires that the accumulator system be placed Out of Commission (OOC) until inspected by a SGPI. Additional requirements are:

a. RTE Inspections are scheduled by the Carrier Planning Activity (CPA).

b. RTE Inspections are conducted by a SGPI. ISEA can assist if requested by SGPI.

c. The TYCOM may utilize 5YR-SI Inspection Cycle SAI and CAI results documented in SCIRMIS to satisfy the pressure vessel portion of a RTE Inspection.

d. RTE Inspections will not be considered complete until a SGPI has updated SCIRMIS and completed a satisfactory post availability operational assessment.

e. A Safe-to-Steam (STS) Inspection conducted by an SGPI in accordance with reference (c), Figure 5-5, is required as a condition of approval for both Minor (exceed 30 months but within 36 months) and Major (beyond 36 months) Temporary DFS's. The STS Inspection results will be documented in SCIRMIS by the inspecting SGPI and attached to the Request for DFS.

17.7.2 Five-Year Strength and Integrity (5YR-SI) Inspection Cycle. The 5YR-SI Inspection Cycle will be conducted every 60 months. To provide flexibility to accommodate mission requirements, 5YR-SI Inspection Cycle may be performed as early as 48 months but not exceed 72 months after the previous 5YR-SI Inspection. The 60 months period begins with the first warm-up of the catapult accumulator to normal operating pressure and temperature following the previous inspection. Inspections that exceed the 60 months interval require a Minor Temporary DFS approved by the TYCOM, normally with concurrence from the ISEA. A Major Temporary DFS approved by the TWH and cognizant SDM is required to operate beyond 72 months. Exceeding any 5YR-SI Inspection Cycle interval without a DFS requires that the accumulator system be placed OOC until inspected by ISEA Inspector. A STS Inspection conducted by an SGPI in accordance with reference (c), Figure 5-5, is required as a condition of approval for both Minor (exceed 60M but within 72 months) and Major (beyond 72 months) Temporary DFS's. The STS Inspection results will be documented in SCIRMIS by an SGPI and attached to the Request for DFS. Additional requirements and details are as follows:

a. Pre-Start of Availability Inspection.

   (1) PSAIs are scheduled at TYCOM discretion in coordination with the ISEA Inspector to support Advanced Planning.

   (2) PSAIs can only be conducted by an ISEA Inspector accompanied by a local SRF or RMC SGPI and a Steam Systems SME.

   (3) PSAI results will be documented in SCIRMIS by the ISEA Inspector, major findings and ISEA repair recommendations will be reported by naval message.

b. Start of Availability Inspection.

   (1) SAIs are scheduled by the CPA in coordination with the NSA.

   (2) SAIs can only be conducted by an ISEA Inspector, accompanied by a local SRF or RMC SGPI and a Steam Systems SME.

   (3) SAI results will be documented in SCIRMIS by the ISEA Inspector.

(4) Major findings and repair recommendations will be reported by naval message by ISEA.

c. Industrial Support Visit.

(1) ISVs are coordinated with the Industrial Activity or NSA to assess status of critical repairs and provide ISEA onsite technical support.

(2) ISVs can only be conducted by an ISEA Inspector, accompanied by a local SRF or RMC SGPI and a Steam Systems Subject Matter Expert (SME).

(3) ISV results will be documented in SCIRMIS by the ISEA Inspector, major findings and status of repairs will be reported by naval message.

d. Completion of Availability Inspection.

(1) CAIs are scheduled by NSA.

(2) CAIs certify all repairs identified at SAI's and subsequent ISV's are accomplished in accordance with requirements.

(3) CAIs can only be conducted by an ISEA Inspector, accompanied by a local SRF or RMC SGPI and a SME.

(4) CAI results will be documented in SCIRMIS by the ISEA Inspector. The status of repairs will be reported by naval message.

17.7.3 Special Inspections. Additional catapult accumulator inspections requested by the TYCOM in coordination with Ship's Force are performed by an SGPI, SRF or RMC Steam Systems SME per the requirements of references (a) through (d). ISEA Inspectors participate in Special Inspections if requested by the TYCOM or cognizant SRF or RMC for specific conditions. Special Inspections are conducted whenever the following conditions exist:

a. Variations in catapult end speed exist. At TYCOM request, ISEA Inspector accompanied by the local SRF or RMC SGPI, in coordination with the Naval Air Systems Command, will perform this inspection.

b. Internal steam charging manifold gasket is replaced. Whenever the flanged joint gasket is replaced, it must be re-inspected on a "not to interfere with operations basis", upon the first cool down following initial operations. This inspection is accomplished by the ship's Engineering Officer or designated representative using the guidance provided in reference (c).

c. Major repairs defined by reference (c) are accomplished. This inspection is requested by the TYCOM in coordination with Ship's Force. An ISEA Inspector and local SRF or RMC SGPI is required to perform this inspection. This includes:

(1) Repair or adjustments to safety devices or remote isolation devices.

(2) Repairs to the accumulator pressure vessel, including nozzles, circumferential welds, shell and head plates, manhole plate and attachment hinge welds which exceed reference (c), section 5.8 criteria.

(3) Repairs to or replacement of pressure vessel piping and valves.

(4) Repairs to the internal charging manifold.

d. When the TYCOM desires to assess a specific or unique material condition. This inspection is requested by the TYCOM in coordination with Ship's Force. An ISEA Inspector is required to perform this inspection.

e. Readiness to Deploy Inspection (RDI) is to be conducted 2 to 4 months prior to deployment. If an RDI cannot be accomplished, the ship must schedule a Mid-Cycle Inspection (MCI) with the cognizant SGPI, to occur 15-21 months after the last RTE Inspection or 5YR-SI Cycle CAI. RDI's and MCI's must be accomplished in accordance with reference (c), Figure 5-5, and documented in SCIRMIS and reported by naval message by the cognizant SGPI.

17.7.4 Operational Assessment.

a. Operational assessments shall be accomplished prior to and at the completion of all Chief of Navy Operations maintenance availability's. These assessments include both cold and hot (steaming) safety device and safety feature operational tests per the requirements of reference (c).

b. Operational assessments will be conducted by an SGPI normally accompanied by a SRF or RMC Steam Systems SME with Ship's Force.

c. Results will be documented in a Special Inspection SCIRMIS report by the SGPI.

17.7.5 Inactivation Inspection.

a. Inactivation Inspections are conducted prior to final component and system official inactivation in general accordance with 5YR-SI Inspection Cycle requirements as applicable per direction of the TYCOM.

b. Inactivation Inspections are conducted by an ISEA Inspector, accompanied by a local SRF or RMC SGPI and a Steam Systems SME.

c. If a RTE Inspection or 5YR-SI Inspection Cycle CAI has been conducted in the last 18 months, applicable results from the last inspection SCIRMIS report may be used to document final inactivation conditions (including lay-up).

d. Inspection results will be documented in SCIRMIS by the ISEA Inspector.

17.7.6 Reactivation Inspections.

a. Depending on the dates of the last CAI, reactivation may require a full 5YR-SI Cycle of Inspections (PSAI, SAI, ISV and CAI).

b. This inspection is conducted by an ISEA Inspector, accompanied by a local SRF or RMC SGPI and a Steam Systems SME.

c. Inspection results will be documented in SCIRMIS by the ISEA Inspector.

17.8 ADDITIONAL INSPECTION AND REPORTING GUIDELINES.

a. Repair Before Operate Discrepancies:

(1) RBOs are issued for discrepancies that, if not corrected prior to continued operation, could endanger personnel and equipment.

(2) Discrepancies that require a RBO to be issued are defined by paragraph 17.8.b of this chapter.

(3) Only an SGPI can issue or clear a RBO for a discrepancy. ISEA Inspectors and SRF or RMC Steam Systems SME's may recommend to an SGPI that a RBO be issued or cleared.

(4) The SGPI that issues the RBO must notify the TYCOM by naval message within 24 hours using the format in Appendix C of this chapter.

(5) RBO discrepancies and associated repairs are tracked and re-inspected by the SGPI and SRF or RMC Steam Systems SME's or ISEA Inspectors.

(6) RBO's cannot be rescinded by a DFS.

(7) The SGPI that issues the RBO must notify the TYCOM of the correction and re-inspection of all RBO discrepancies by naval message using the format in Appendix D of this chapter, prior to closeout and operation (including warm-up) of the accumulator system.

b. RBO Criteria:

(1) Inoperative or degraded safety devices.

(2) Fire or Safety hazards, oil soaked lagging, oil leaks or other fire hazards.

(3) Steam smothering system inoperative, plugged nozzles, and deteriorated piping.

(4) Inoperative electronic controls (controllers, transmitters, uninterruptible power source).

(5) Non-deferrable defects within the pressure vessel boundary.

(6) Ultrasonic test inspection results of piping that are below the minimum requirements of reference (b) or when visual inspection dictates replacement.

(7) Improperly assembled internal steam charging flanged joint.

(8) Improperly assembled flanged joints (mixed fasteners, undersized Flexitallic gaskets, non-level in Level I systems).

(9) Out of periodicity, in-operative critical temperature or pressure measuring instruments.

(10) Valve tightness integrity which limits its ability to perform intended function and exceeds the criteria of reference (h).

(11) Non-conformance of electrical safety and deteriorated or damaged wiring or components.

(12) Any other discrepancy deemed by the SGPI which would cause injury to personnel and damage to equipment.

NOTE: A SEVERELY DEGRADED DESIGNATION IS ASSIGNED TO A DEFICIENCY THAT IS NOT AN IMMEDIATE OR NEAR FUTURE DANGER TO PERSONNEL, BUT WILL HAVE MAJOR OPERATIONAL RESTRICTIONS. A SEVERELY DEGRADED DISCREPANCY PER THIS

CHAPTER MUST BE CORRECTED OR REPAIRED PRIOR TO CATAPULT OPERATION UNLESS IT HAS BEEN PROPERLY APPROVED AS A MAJOR DFS.

c. Severely Degraded.

(1) If there is not an immediate or near future danger to personnel, the discrepancy must be assigned as SEVERELY DEGRADED with major operational restrictions.

(2) An SGPI-designated discrepancy discovered in accordance with paragraph 17.8 of this chapter which is assigned as severely degraded with major operational restrictions, and is considered for a DFS submission, is a major DFS and must be brought forward to the attention of the NAVSEA Boiler and Condenser Technical Warrant. A Major DFS must be forwarded for NAVSEA review and approval with accompanying engineering analysis recommendations from the originator. A severely degraded discrepancy in accordance with this chapter must be corrected or repaired prior to catapult operation unless it has been properly approved as a Major DFS.

(3) The status of a catapult related DFS will be verified by the SGPI during the inspection for conformance with the requirements of this manual prior to placing the catapult into operation.

d. Reporting Inspection Results.

(1) The Lead Inspector must personally debrief inspection results and provide a preliminary SCIRMIS report to the ship's Commanding Officer or his designated representative and TYCOM prior to departure.

(2) Inspection results must be entered into SCIRMIS immediately after the completing the inspection by the cognizant Lead Inspector. SCIRMIS must be finalized no later than 7 days after the completion of all final repairs identified during inspections.

(3) Inspection results must be reported by naval letter by the Lead Inspector not later than 14 days after the completing the inspection using the guidance provided in Appendices G, H or I.

(4) The ship’s Engineering Officer must report repair status and corrected discrepancies by naval message within 30 days of inspection completion and update at 30-day intervals thereafter using the format in Appendix E of this chapter. Update messages shall list the SCIRMIS Item Number/2K Job Sequence Number of discrepancy items which have been completed since the last update message. Update messages must continue until all discrepancies are corrected or appropriately deferred to the next CNO-maintenance availabilities. The TYCOM is the sole authority for deferral of discrepancies.

17.9 CATAPULT ACCUMULATOR SYSTEM INSPECTION PREPARATION.

a. Depending on ship operational commitments or posture, an operational assessment should be conducted by a SGPI or designated Ship’s Force representative prior to

disassembling the catapult for inspection. Detailed assessment requirements are provided in references (b) and (c).

b. Prepare the accumulator system for inspection per references (b) and (c).

c. The cognizant SRF or RMC Steam Systems SME is responsible for reviewing the Repair Activity and NSA planning documents, tracking progress and providing assistance as required, reporting the status of industrial work and inspection preparations (including lagging removal and ultra-sonic test inspection of pressure vessel components and piping) for 5YR-SI Inspections. When 5YR-SI Inspection preparation industrial work and ultrasonic inspections are completed, the TYCOM and ISEA Inspector shall be notified immediately that the catapult accumulator system is ready for ISEA Inspection.

d. Wire shut and danger tag all steam and water valves to the catapult accumulator per the reference (c). Post warning signs, "PERSONNEL WORKING IN ACCUMULATOR", per reference (c) and paragraph 17.6.

e. The ship's Engineering Officer must ensure all Ship's Force responsibilities are complete using guidance provided in reference (c) and provide applicable reports to the cognizant SGPI, SRF or RMC Steam Systems SME or ISEA Inspector.

17.10 CATAPULT ACCUMULATOR INSPECTION.

17.10.1 Catapult Accumulator Inspection Forms. Catapult accumulator inspections will be documented using SCIRMIS.

17.10.2 Completion of Inspection. A debrief and a preliminary inspection report, including a summary of restrictive discrepancies, will follow the CAI. Paragraph 17.8.d identifies official reporting requirements.

17.10.3 Operating Procedures. Each ship with steam catapults will have approved CATOSS for:

a. Normal operations including startup and shutdown.

b. Operating parameters, limitations, alarms and set points.

c. Systems diagrams.

VOLUME IV
CHAPTER 18
DISTRESSED SUBMARINE AND SALVAGE INSPECTION

REFERENCES.

(a) NAVSEA S9086-T9-STM-010 - NSTM 594 Submarine Escape and Rescue
(b) NTRP 1-03.1 – Navy Tactical Reference Publication, Operational Reports

LISTING OF APPENDICES.

A SSN 21 Class DISSUB and Salvage Inspection Check-Off List
B SSN 688 Class DISSUB and Salvage Inspection Check-Off List
C SSBN/SSGN 726 Class DISSUB and Salvage Inspection Check-Off List
D SSN 774 Class DISSUB and Salvage Inspection Check-Off List
E Sample Pre-Inspection Information or Certification
F Sample Report of DISSUB and Salvage Inspection Forwarding Letter

18.1 PURPOSE. To ensure the continued readiness and quality of maintenance performed on distressed submarine (DISSUB) and salvage equipment per reference (a).

18.2 INSPECTIONS.

18.2.1 Periodicity. The readiness of DISSUB survival, escape and rescue equipment and salvage equipment is determined by periodic inspections. DISSUB and Salvage Inspections will be conducted within a 72-month interval, or:

a. Whenever requested by the submarine.

b. Prior to initial builder's trials for new construction ships, prior to initial sea trials for ships in Chief of Naval Operations (CNO) Maintenance Availabilities, and prior to initial sea trials for ships in Interim Dry Docking.

c. A partial DISSUB and Salvage Inspection will be completed for all items worked during an availability (i.e., hatches, salvage air valves, DISSUB stowage alterations, etc.)

d. Once every five years for SSBNs and SSGNs.

e. Prior to Sea Trials for repairs of damage from collision or grounding where deformation is observed to be in the hull integrity envelope or supporting structure.

18.2.2 Procedures and Reports. The specific DISSUB and salvage items to be inspected and the type of submarines to which they are applicable are identified in Appendices A through D of this chapter. Appendix E of this chapter is a sample pre-inspection form to be completed by the submarine prior to the DISSUB and Salvage Inspection. Appendix F of this chapter is a sample DISSUB and Salvage Inspection forwarding letter. Inspection attributes or elements of Appendices A through D may not be locally waived or have equipment substituted. Temporary changes to the attributes or elements of Appendices A through D will only be revised by the Type Commander (TYCOM) and the revision must be documented in formal correspondence. Any attributes or elements of Appendices A through D as applicable to the respective ship class not met or which fails inspection is underway limiting until corrected or waived by the TYCOM.

NOTE: IF NO QUALIFIED INSPECTORS ARE AVAILABLE, CONTACT THE TYPE COMMANDER FOR DIRECTION.

18.2.3 Inspection Resources. The hatch and watertight door portion of this inspection will be conducted by members of the local Ship's Maintenance Monitoring Support Performance Monitoring Team (PMT) (i.e., personnel who have successfully completed Submarine Structural Closure Inspection course or personnel designated by NAVSEA). Other portions of the inspection should be conducted by personnel who, by their rate and experience, are qualified in that particular section. Inspection teams are to be assembled, as required, from the following sources in order of the priority shown:

a. Undersea Rescue Commands.

b. Submarine Fleet Maintenance Activities.

c. Immediate Superior in Command (ISIC) Staffs.

d. Submarines of the same class.

e. Other submarines.

18.3 RESPONSIBILITIES. The responsibility for the preparation, conduct, and completion reporting for a DISSUB and Salvage Inspection is listed in the remainder of Section 18.3.

18.3.1 Immediate Superior in Command.

a. Schedule DISSUB and Salvage Inspections for assigned submarines as specified in paragraph 18.2.1 of this chapter. The inspection should be conducted early enough in the availability to allow for the correction of deficiencies prior to Fast Cruise.

b. Designate the Senior Inspecting Officer and inspecting team using the guidance provided in paragraph 18.2.3 to conduct the DISSUB and Salvage Inspection.

18.3.2 Commanding Officer or Officer in Charge.

a. Request the ISIC to conduct a DISSUB and Salvage Inspection per the periodicity set forth in paragraph 18.2.1.

b. Coordinate support requirements as may be needed by the inspecting team to fulfill the requirements of the applicable appendix of this chapter.

NOTE: HATCHES THAT ARE FOULED WILL PREVENT THE SATISFACTORY COMPLETION OF THIS INSPECTION. COORDINATION BETWEEN THE SHIP, INSPECTING TEAM AND MAINTENANCE ACTIVITY IS THE RESPONSIBILITY OF THE COMMANDING OFFICER OR OFFICER IN CHARGE.

c. Complete and forward a pre-inspection information letter to the Senior Inspecting Officer using the sample provided in Appendix E of this chapter as a guideline. Modify Appendix E as necessary to align required attributes with the applicable class-specific checklist.

d. Assemble all ship’s data indicated in the applicable appendix of this chapter prior to the inspection for ease of reference by the inspecting team.

e. Upon receipt of the Senior Inspecting Officer's report, take action to correct the discrepancies found and report by letter or message their corrections to the ISIC with a copy to the TYCOM and Supervising Authority (when assigned) prior to commencement of Fast Cruise.

f. Submit a Casualty Report (CASREP), if applicable, per reference (b) for each item which degrades submarine rescue mating capability.

g. Departure from Specification (DFS) may need to be submitted following Volume V, Part I, Chapter 8 of this manual for deficiencies noted with the submarine rescue seat.

18.3.3 Senior Inspecting Officer.

a. Assemble the inspecting team designated by the ISIC.

b. Conduct the DISSUB and Salvage Inspection per the applicable appendix of this chapter. Ensure Appendix E of this chapter is received prior to commencement of the inspection. The inspection should be completed at least 14 days prior to commencement of Fast Cruise, or for new construction ships and ships in a CNO Maintenance Availability, at least 28 days and no sooner than 60 days, prior to the scheduled commencement of Sea Trials. This examination should normally be performed close to Phase I crew certification, if possible.

(1) If the scheduled date for Sea Trials shifts to a later date AFTER the DISSUB and Salvage Inspection has begun, continue and complete the inspection to include submitting a report to ALCON. Evaluate work accomplished after the inspection performed by the Ship and or Shipyard. If any work conducted impacts attributes of the inspection, re-inspect and determine if a revised inspection report is required, and if so, issue a revised report.

(2) If the scheduled date for Sea Trials shifts to a later date and the DISSUB and Salvage Inspection HAS NOT begun, reschedule the inspection date per the normal scheduling guidance.

c. At the completion of the DISSUB and Salvage Inspection, report the following to the Commanding Officer or Officer in Charge of the inspected ship:

(1) Completion of the inspection. When ships are in a CNO availability, the shipyard and the Project Team must be formally notified of the scheduled date of the DISSUB and Salvage Inspection and any deficiencies identified.

(2) Which, if any, systems or equipment have not been restored to normal operating conditions (due to maintenance or required repairs, etc.).

(3) That an advance copy of the inspection results has been provided to the ship to facilitate early correction of deficiencies found.

d. Submit the inspection report to the Commanding Officer or Officer in Charge of the inspected ship in the format of Appendix F of this chapter within three working days following the completion of the inspection, with a copy to the cognizant ISIC and NAVSEA PMS390RE.

APPENDIX A

SSN 21 CLASS DISSUB AND SALVAGE INSPECTION CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces require substantial support equipment and are designated for industrial activity accomplishment.
2. Configuration differences are noted as comments in the reference column.
3. Portions of this inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as "pre-availability inspections" to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship's Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC and the Senior Inspecting Officer.
4. The user is directed to use the latest revision of the Planned Maintenance System (PMS) maintenance requirement.
5. An asterisk (*) will be used in addition to a check mark (✓) in the Unsat column to identify any exceptions or discrepancies. An explanation of the exception or discrepancy will be included in the DISSUB and Salvage Inspection Report, Appendix F of this chapter.

PART I: SALVAGE

INSPECTION TEAM (SSN 21 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
1. Salvage Drawings:					
a. Verify salvage drawings: (1) Have been updated during ship's new construction period or last CNO Maintenance Availability. or (2) Latest revision is identified in ship's plan index.	Navy Modernization Process Management and Operations Manual NAVSEA SL720-AA-MAN-030 Ship Dwg. Consolidated Index Number 594 or 845				
(3) Have correct distribution.					
(4) Are identified as Selected Record Drawings					
2. High and Low Salvage Connections:					
a. Verify deck touch plate markings are installed and per plan.	Ship's Plans				
b. Check that each valve is free to operate with the inspecting command's salvage wrench.	Notes 1 and 2				
c. Perform a mechanical joint tightness test and seat tightness test to Item 1 pressure from the sea side. Then perform a 100-psi seat tightness from the sea side. No leakage allowed.	Note 1				
d. External salvage system caps: (1) Verify the ship's salvage system arrangement plan contains a note that Roylyn type fittings are installed.	Note 3				

INSPECTION TEAM (SSN 21 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
(2) Remove cap assembly, test connect and disconnect with the inspecting command's female fitting.	Kaiser Aero Space & Electronics Dwg. 9495 (Formally Roylyn Inc.)				
(3) Inspect all Roylyn caps. Ensure cap operates properly and is free of paint and debris. Reinstall cap with safety wire, where applicable.					
e. Verify strainers are properly installed on all compartment low salvage lines and are clear of debris.					
3. Internal Air Salvage:					
a. Test satisfactory operation of all internal salvage air valves.	Note 4				
b. Verify all compartment pressure gages are in calibration as indicated on calibration label. AHP-45-GA-008 AHP-45-GA-017 AHP-60-GA-018 AHP-629-GA-006 AHP-629-GA-007	Note 5				
4. Bulkhead Flappers:					
a. Test satisfactory local and remote (as applicable) operation of all ventilation system bulkhead flappers. VH-6 VH-7					

INSPECTION TEAM (SSN 21 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
b. Verify from ships' records that applicable ventilation system bulkhead flapper maintenance has been completed for VH-8 within required periodicity.	Note 5				
5. Hull Access Hatches, Watertight Doors and Torpedo Loading Hatches: Inspection performed by local PMT.					
a. Perform or witness hatch maintenance to complete salvage inspection and reference the PMT inspection.	Note 5				
6. External Gagging Devices:					
a. Witness demonstration that all valves with external gagging devices can be gagged from open to shut with the inspecting command's salvage wrench and with the number of turns specified on the ship's salvage system arrangement plan. Record number of turns to operate: DE-3_____turns, VH-2 turns.	Notes 2, 6, and 7				
b. Witness resetting of each gagging device and demonstrate satisfactory operation of the valves by normal means.	Notes 7 and 8				
7. Air Bank Dew Points:					
a. Verify from ships' records that applicable air bank air sampling maintenance has been completed, is in specification and within required periodicity.	Note 5				
b. Perform or witness AHPD Operational Test and Measure Dew point of Effluent.	Note 5				

INSPECTION TEAM (SSN 21 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
8. Towing Equipment					
a. Verify from ships' records that Towing Equipment maintenance has been completed within required periodicity.	Note 5				

PART II: DISSUB SURVIVAL, ESCAPE AND RESCUE

INSPECTION ITEM (SSN 21 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
1. Submarine Rescue Fittings:							
a. Verify four rescue vehicle hold-down sockets are installed per plan or authorized alteration on both logistic escape trunks (LET). From one socket per LET, remove center capscrew and plug; demonstrate guide is free.	NSTM S9086-T9-STM-010 Chapter 594 Ship's Plans Notes 5 and 9						
b. Perform inspection of the LETs rescue seating surface. (1) Inspect rescue seating surface.	Notes 5 and 9						
(2) Verify rescue seating surface PMR's performed within periodicity.	Note 9 SMS 1230-081-008 SMS 1230-081-045						
(3) Inspect rescue seating surface protective cover.	Note 5						
c. Verify from ships' records that SRC downhaul shackle has been replaced within PMS periodicity.	Notes 5 and 9						
d. LET hatch fairings must be maintained in a condition to be easily disassembled to support submarine rescue. Verify PMS has been completed within the required periodicity on both LET hatches. Visually inspect LET hatch fairings for compliance with the specifications called out in the PMS. Paint fouling or corrosion of fairing fasteners must be immediately	Notes 5 and 9						

INSPECTION ITEM (SSN 21 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
corrected. Demonstrate the ability to remove one fastener at a time in each fairing section required to be removed in the fairing disassembly procedure.							
2. Logistics Escape Trunks:							
a. Demonstrate that each access hatch operates satisfactorily with all respects of locking, unlocking, opening and shutting from below and above (with salvage wrench or hand wheel as applicable).							
b. Demonstrate that each access hatch can be opened with 5th percentile swing force operability criteria for surfaced emergency egress.							
c. Demonstrate satisfactory operation of the escape hatch closing mechanisms per the installed instruction plates and equipment.							
d. Demonstrate satisfactory installation of Improved Powered Hatch Operator with intensifier and compensator as one mode of hatch operation of LET. (1) Verify inventory of all parts. (2) Verify periodic pressure testing of hoses. (3) Verify assembly of intensifier and gearbox to upper hatch operator.	Ship's Drawing Note 5						

INSPECTION ITEM (SSN 21 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
(4) Verify installation of upper hatch operator compensator. (5) Demonstrate satisfactory operational check of intensifier pump and gears.							
e. Demonstrate satisfactory operation and examine the condition of the following equipment: (1) Vent valves (trunk and compartment).							
(2) Blow valves (trunk and compartment).							
(3) Flood and drain valves (including remote operation mechanisms and strainer installations).							
(4) Demonstrate satisfactory operation and examine the condition of the following equipment: Conduct Hood Inflation System or Stole Charging Valve operational check to confirm valves operate properly and verify watertight caps installed.	Note 5						
(5) Pressure proof lights checked to ensure correct globe sealing and verified that globe is free from cracks.							
(6) Verify from ships' records that applicable maintenance to clear sea pressure sensing lines has been	Note 5						

INSPECTION ITEM (SSN 21 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
completed within required periodicity.							
f. Verify the following equipment installed: (1) Diver's knife. (2) Ballpeen hammer. (3) Persuader (crows' foot).	Note 11						
g. Check Flood Line Orifice.	Not Clogged						
h. Verify valve hand wheels are properly color coded and labeled per Ship's Drawing Index, Ship's placards and Posted Information Plates	NSTM S9086-RK-STM-010 Chapter 505						
i. Verify gages are in calibration as indicated on calibration label. (1) FWD Escape Trunk TD-618-GA-96 (SSN 23 only) TD-800-GA-35 ALP-800-GA-2 ALP-800-GA-1 ALP-618-GA-3 IPHO-FWD-LET-001							
(2) AFT Escape Trunk TD-64-GA-64 ALP-64-GA-28 ALP-64-GA-27 ALP-62-GA-26 IPHO-AFT-LET-002							
j. Verify upper watertight hatch cavity drain valve operation is satisfactory.							

INSPECTION ITEM (SSN 21 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
3. Emergency Communications Equipment:							
a. SEPIRB. (1) Perform or witness SEPIRB maintenance.	Note 5						
(2) Perform or witness SEPIRB launcher maintenance.	Note 5						
b. AN/BQN-13. (1) Inspect AN/BQN-13 Beacon to ensure that: (a) Cable is free of abrasions, cuts or damage. (b) Cable plug and encapsulation are free of defects. (c) Unit has no physical damage.							
(d) Transducer is free of oil leaks, bubbles and paint.							
(2) Perform or witness AN/BQN-13 maintenance.	Note 5						
c. Signal Ejector or 3" Launcher. (1) Demonstrate satisfactory operation of each launcher manually and hydro-pneumatically as applicable.							
(2) Verify a minimum of six Red Submarine Emergency Identification Signals and Submarine Floating Signal pyrotechnics stowed in compartment with launcher.							
(3) Operational verification must include a demonstrated launch

d. O2 candle furnace: Amount onboard: FWD:_____ AFT:_____	Required: 2 FWD, 1 AFT						

NOTES
(SSN 21 CLASS)

1. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of an availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship's Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b. and 2.c. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

2. The inspected ship’s, vice the inspecting command’s, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

3. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

4. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

5. The current DISSUB and Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the DISSUB and Salvage Inspection item.

6. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship’s valve drawing.

7. Prior to testing Outboard Diesel Exhaust Valve, ensure replacement spring-loaded locking pin is available onboard.

8. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.

9. Unsatisfactory conditions degrade the submarine rescue mating capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Part I, Chapter 8 of this manual.

10. One or more Logistics Escape Trunks (LET) may be removed during refit. When removed, the LET is isolated from service air and electric power. Communications circuits, electrical power, and charging manifold tests should be conducted prior to LET removal to ensure piping and electrical system continuity, and tested again upon reinstallation.

11. Diver's knife and ballpeen hammer may be stored in secure stowage in escape compartment.

12. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.

13. A minimum of 30 Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON-DISSUB canisters with quantities and location(s) logged by the crew.

14. Oxygen candle quantity and location impacts inspection acceptance criteria.

a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be stowed forward or aft.

b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.

c. Oxygen candle igniters must be of a quantity and location (FWD or AFT) that supports onboard candle load-out.

15. DISSUB Atmosphere Control pre and post D7DS supplies:

a. If total ships manning exceeds designated 153 personnel (SSN 21 and SSN 22) or 220 personnel (SSN 23), refer to OPORD 2000 to determine adjusted quantities of supplies.

b. For SSN 21 and SSN 23 D7DS configuration, perform step 8 and omit step 7.

c. For SSN 22, if SHIPALT 4731D has not been installed, perform step 7 and omit step 8. If SHIPALT 4731D has been installed, perform step 8 and omit step 7.

d. These Post DISSUB quantities are from NAVSEA ltr 4700 Ser 391/0205 of 21 Dec 20.

APPENDIX B

SSN 688 CLASS DISSUB AND SALVAGE INSPECTION CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces require substantial support equipment and are designated for industrial activity accomplishment.
2. Configuration differences are noted as comments in the reference column.
3. Portions of this inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as "pre-availability inspections" to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship's Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC and the Senior Inspecting Officer.
4. The user is directed to use the latest revision of the PMS maintenance requirement.
5. An asterisk (*) will be used in addition to a check mark (✓) in the Unsat column to identify any exceptions or discrepancies. An explanation of the exception or discrepancy will be included in the DISSUB and Salvage Inspection Report, Appendix F of this chapter.

PART I: SALVAGE

INSPECTION TEAM (SSN 688 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
1. Salvage Drawings:					
a. Verify salvage drawings: (1) Have been updated during ship's new construction period or last CNO Maintenance Availability. or (2) Latest revision is identified in ship's plan index.	Navy Modernization Process Management and Operations Manual NAVSEA SL720-AA-MAN-030 Ship Dwg. Consolidated Index Number 513 or 845				
(3) Have correct distribution.					
(4) Are identified as Selected Record Drawings					
2. High and Low Salvage Connections:					
a. Verify deck touch plate markings are installed and per plan.	Ship's Plans				
b. Check that each valve is free to operate with the inspecting command's salvage wrench.	Notes 1 and 2				
c. Perform a mechanical joint tightness test and seat tightness test to Item 6 pressure from the sea side. Then perform a 100-psi seat tightness from the sea side. No leakage allowed.	Note 1				

INSPECTION TEAM (SSN 688 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
d. External salvage system caps: (1) Verify the ship's salvage system arrangement plan contains a note that Roylyn type fittings are installed.	Note 3				
(2) Remove cap assembly, test connect and disconnect with the inspecting command's female fitting.	Kaiser Aero Space & Electronics Dwg. 9495 (Formally Roylyn Inc.)				
(3) Inspect all Roylyn caps. Ensure cap operates properly and is free of paint or debris. Reinstall cap with safety wire, where applicable.					
e. Verify strainers are properly installed on all compartment low salvage lines and are clear of debris.					
3. Internal Air Salvage:					
a. Test satisfactory operation of all internal salvage air valves.	Note 4				
b. Verify all compartment pressure gages are in calibration as indicated on calibration label. AHP-631-GA-014 AHP-62-GA-015	Note 5				
4. Bulkhead Flappers:					
a. Test satisfactory local and remote (as applicable) operation of all ventilation system bulkhead flappers. VH-6 VH-7 VH-8					

INSPECTION TEAM (SSN 688 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
b. Verify from ships' records that applicable ventilation system bulkhead flapper maintenance has been completed for VH-9 within required periodicity.	SMS 5120-081-097				
5. Hull Access Hatches, Watertight Doors and Torpedo Loading Hatches: Inspection performed by local PMT.					
a. Perform or witness hatch maintenance to complete salvage inspection and reference the PMT inspection.	Note 5				
6. External Gagging Devices:					
a. Witness demonstration that all valves with external gagging devices can be gagged from open to shut with the inspecting command's salvage wrench and with the number of turns specified on the ship's salvage system arrangement plan. Record number of turns to operate: VH-3_____turns, VH-5_____turns.	Notes 2 and 6				
b. Witness resetting of each gagging device and demonstrate satisfactory operation of the valves by normal means.	Note 7				
7. Air Bank Dew Points:					
a. Verify from ships' records that applicable air bank air sampling maintenance has been completed, is in specification and within required periodicity.	Note 5				
b. Perform or witness AHPD Operational Test and Measure Dew point of Effluent.	Note 5				

INSPECTION TEAM (SSN 688 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
8. Towing Equipment					
a. Verify from ships' records that Towing Equipment maintenance has been completed within required periodicity.	Note 5				

PART II: DISSUB SURVIVAL, ESCAPE AND RESCUE

INSPECTION ITEM (SSN 688 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
1. Submarine Rescue Fittings:							
a. Verify four rescue vehicle hold-down sockets are installed per plan or authorized alteration on both escape trunks. From one socket per trunk, remove center capscrew and plug; demonstrate guide is free.	NSTM S9086-T9-STM-010 Chapter 594 Ship's Plans Notes 5 and 8						
b. Perform inspection of the escape trunk rescue seating surfaces. (1) Inspect rescue seating surface.	Notes 5 and 8						
(2) Verify rescue seating surface PMR's performed within periodicity.	Note 8 SMS 1230-081-016 SMS 1230-081-046						
(3) Inspect Rescue seating surface protective cover.	Note 5						
c. Verify from ship' records that SRC downhaul shackle has been replaced within PMS periodicity.	Notes 5 and 8						
d. Escape trunk hatch fairings must be maintained in a condition to be easily disassembled to support submarine rescue. Verify PMS has been completed within the required periodicity on both escape trunk hatches. Visually inspect escape trunk hatch fairings for compliance with the specifications called out in the PMS. Paint fouling or corrosion of fairing fasteners must be immediately corrected. Demonstrate	Notes 5 and 8						

INSPECTION ITEM (SSN 688 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
the ability to remove one fastener at a time in each fairing section required to be removed in the fairing disassembly procedure.							
2. Escape Trunks:							
a. Demonstrate that each access hatch operates satisfactorily with all respects of locking, unlocking, opening, shutting from below and above (with salvage wrench or hand wheel as applicable).							
b. Demonstrate the escape upper hatches have the minimum specified pop-up.							
c. Demonstrate satisfactory operation of the escape hatch closing mechanisms per the installed instruction plates and equipment.							
d. Demonstrate that escape trunk upper hatch maximum hydraulic closing pressure is satisfactory. Demonstrate that the hydraulic accumulator maintains the nitrogen pre-charge as specified in OP 61-1 (rig-for-dive) and that the hand pump operates satisfactorily.							
e. Demonstrate satisfactory operation and examine the condition of the following equipment: (1) Vent valves (trunk and compartment).							

INSPECTION ITEM (SSN 688 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
(2) Blow valves (trunk and compartment).							
(3) Flood and drain valves (including remote operation mechanisms and strainer installations).							
(4) Demonstrate satisfactory operation and examine the condition of the following equipment: Conduct Hood Inflation System or Stole Charging Valve operational check to confirm valves operate properly and verify watertight caps installed.	Note 5						
(5) Pressure proof lights checked to ensure correct globe sealing and verified that globe is free from cracks.							
(6) Verify from ships' records that applicable maintenance to clear sea pressure sensing lines has been completed within required periodicity.	Note 5						
f. Verify the following equipment installed: (1) Diver's knife. (2) Ballpeen hammer. (3) Persuader (crows' foot).	Note 9						
g. Check Flood Line Orifice.	Not Clogged						

INSPECTION ITEM (SSN 688 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
h. Verify valve hand wheels are properly color coded and labeled per Ship's Drawing Index, Ship's placards and Posted Information Plates.	NSTM S9086-RK-STM-010 Chapter 505						
i. Verify gages are in calibration as indicated on calibration label. (1) FWD Escape Trunk ALP-800-GA-001 ALP-800-GA-002 TD-800-GA-030 ALP-622-GA-004 HEH-622-GA-001 HEH-622-GA-004 O-500-GA-001							
(2) AFT Escape Trunk ALP-64-GA-030 ALP-64-GA-031 TD-64-GA-031 ALP-60-GA-33 HEH-62-GA-002 HEH-63-GA-003							
j. Verify upper watertight hatch cavity drain valve operation is satisfactory.							
3. Emergency Communications Equipment:							
a. SEPIRB: (1) Perform or witness SEPIRB maintenance.	Note 5						
(2) Perform or witness SEPIRB launcher maintenance.	Note 5						

INSPECTION ITEM (SSN 688 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
b. AN/BQN-13: (1) Inspect AN/BQN-13 Beacon to ensure that: (a) Cable is free of abrasions, cuts or damage. (b) Cable plug and encapsulation are free of defects. (c) Unit has no physical damage.							
(d) Transducer is free of oil leaks, bubbles and paint.							
(2) Perform or witness AN/BQN-13 maintenance.	Note 5						
c. Signal Ejector or 3" Launcher: (1) Demonstrate satisfactory operation of each launcher manually and hydro-pneumatically as applicable.							
(2) Verify a minimum of six Red Submarine Emergency Identification Signals and Submarine Floating Signal pyrotechnics stowed in compartment with launcher.							
(3) Operational verification must include a demonstrated launch (water slug) from both remote and local operating stations.

NOTES
(SSN 688 CLASS)

1. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of an availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship's Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b. and 2.c. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

2. The inspected ship's, vice the inspecting command's, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

3. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

4. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

5. The current DISSUB and Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the DISSUB and Salvage Inspection item.

6. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship's valve drawing.

7. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.

8. Unsatisfactory conditions degrade the submarine rescue mating capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Part I, Chapter 8 of this manual.

9. Diver's knife and ballpeen hammer may be stored in secure stowage in escape compartment.

10. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.

11. A minimum of 30 Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON- DISSUB canisters with quantities and location(s) logged by the crew.

12. Oxygen candle quantity and location impacts inspection acceptance criteria:

a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be stowed forward or aft.

b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.

c. Oxygen candle igniters must be of a quantity and location (FWD or AFT) that supports onboard candle load-out.

13. DISSUB Atmosphere Control D7DS supplies:

a. If total ships manning exceeds designated 154 personnel, refer to OPORD 2000 to determine adjusted quantities of supplies.

b. These Post DISSUB quantities are from NAVSEA ltr 4700 Ser 391/0205 of 21 Dec 20.

APPENDIX C

SSBN/SSGN 726 CLASS DISSUB AND SALVAGE INSPECTION CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces require substantial support equipment and are designated for industrial activity accomplishment.
2. Configuration differences are noted as comments in the reference column.
3. Portions of this inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as "pre-availability inspections" to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship's Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC, and the Senior Inspecting Officer.
4. The user is directed to use the latest revision of the PMS maintenance requirement.
5. An asterisk (*) will be used in addition to a check mark (✓) in the Unsat column to identify any exceptions or discrepancies. An explanation of the exception or discrepancy will be included in the DISSUB and Salvage Inspection Report, Appendix F of this chapter.

PART I: SALVAGE

INSPECTION TEAM (SSBN/SSGN 726 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
1. Salvage Drawings:					
a. Verify salvage drawings: (1) Have been updated during ship's new construction period or last CNO Maintenance Availability. or (2) Latest revision is identified in ship's plan index.	Navy Modernization Process Management and Operations Manual NAVSEA SL720-AA-MAN-030 Ship Dwg. Consolidated Index Number 513 or 845				
(3) Have correct distribution.					
(4) Are identified as Selected Record Drawings					
2. High and Low Salvage Connections:					
a. Verify deck touch plate markings are installed and per plan.	Ship's Plans				
b. Inspect external valve operating gear for conditions of the salvage valve; i.e., excessive paint, lack of lubrication, distortion, damaged or missing grease boots.	Note 1				
c. Check that each valve is free to operate with the inspecting command's salvage wrench.	Notes 2 and 3				
d. Perform a mechanical joint tightness test and seat tightness test to Item 1 pressure from the sea side. Then perform a 100-psi seat tightness from the sea side. No leakage allowed.	Note 2				

INSPECTION TEAM (SSBN/SSGN 726 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
e. External salvage system caps: (1) Verify the ship's salvage system arrangement plan contains a note that Roylyn type fittings are installed.	Note 4				
(2) Remove cap assembly, test connect and disconnect with the inspecting command's female fitting.	Kaiser Aero Space & Electronics Dwg. 9495 (Formally Roylyn Inc.)				
(3) Inspect all Roylyn caps. Ensure cap operates properly and is free of paint or debris. Reinstall cap with safety wire, where applicable.					
f. Verify strainers are properly installed on all compartment low salvage lines and are clear of debris.					
3. Internal Air Salvage:					
a. Test satisfactory operation of all internal salvage air valves.	Note 5				
b. Verify all compartment pressure gages are in calibration as indicated on calibration label. SA-20-GA-01 SA-52-GA-02 SA-55-GA-03 SA-71-GA-04	Note 6				
4. Bulkhead Flappers:					
a. Test satisfactory local and remote (as applicable) operation of ventilation system bulkhead flappers. VH-11 VH-12					

INSPECTION TEAM (SSBN/SSGN 726 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
VH-13 VH-14					
b. Verify from ships' records that applicable ventilation system bulkhead flapper maintenance has been completed for VH-18 within required periodicity.	Note 6				
5. Hull Access Hatches, Watertight Doors and Torpedo Loading Hatches: Inspection performed by local PMT.					
a. Perform or witness hatch maintenance to complete salvage inspection and reference the PMT annual inspection.	Note 6				
6. External Gagging Devices:					
a. Witness demonstration that all valves with external gagging devices can be gagged from open to shut with the inspecting command's salvage wrench and with the number of turns specified on the ship's salvage system arrangement plan. Record number of turns to operate:_____turns.	Notes 3, 7 and 8				
b. Witness resetting of each gagging device and demonstrate satisfactory operation of the valves by normal means.	Notes 8 and 9				
7. Air Bank Dew Points:					
a. Verify from ships' records that applicable air bank air sampling maintenance has been completed, is in specification and within required periodicity.	Note 6				
b. Perform or witness AHPD Operational Test and Measure Dew point of Effluent.	Note 6				

INSPECTION TEAM (SSBN/SSGN 726 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
8. Towing Equipment:					
a. Verify from ships' records that Towing Equipment maintenance has been completed within required periodicity.	Note 6				

PART II: DISSUB SURVIVAL, ESCAPE AND RESCUE

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
1. Submarine Rescue Fittings:									
a. Verify four rescue vehicle hold-down sockets are installed per plan or authorized alteration on all three LETs. From one socket per hatch, remove center capscrew and plug; demonstrate guide is free.	NSTM S9086-T9-STM-010 Chapter 594 Ship's Plans Notes 6 and 10								
b. Perform inspection of the LETs rescue seating surface. (1) Inspect rescue seating surface.	Notes 6 and 10								
(2) Verify rescue seating surface PMR's performed within periodicity.	Note 10 SMS 1230-081-003 SMS 1230-081-044								
(3) Inspect rescue seating surface protective cover.	Note 6								
c. Verify from ships' records that SRC downhaul shackle has been replaced within PMS periodicity.	Notes 6 and 10								
d. LET hatch fairings must be maintained in a condition to be easily disassembled to support submarine rescue. Visually inspect LET hatch fairings for compliance with the specification called out in the Submarine Maintenance Standard (SMS). Paint fouling or corrosion of fairing fasteners must be immediately corrected. Demonstrate the ability to remove one fastener at a time in each	Note 10 SMS No. 1670-081-011								

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
fairing section required to be removed in the fairing disassembly procedure.									
2. Logistics Escape Trunks:									
a. Demonstrate that each access hatch operates satisfactorily with all respects of locking, unlocking, opening, shutting from below and above (with salvage wrench or hand wheel as applicable).									
b. Demonstrate that each access hatch can be opened with 5th percentile swing force operability criteria for surfaced emergency egress.									
c. Demonstrate satisfactory operation of the escape hatch closing mechanisms per the installed instruction plates and equipment.									
d. Demonstrate satisfactory installation of Improved Powered Hatch Operator with intensifier and compensator as one mode of hatch operation of LET. (1) Verify inventory of all parts.	Ship's Drawing Note 6								
(2) Verify periodic pressure testing of hoses. (3) Verify assembly of intensifier and gearbox to upper hatch operator.									

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
(4) Verify installation of upper hatch operator compensator. (5) Demonstrate satisfactory operational check of intensifier pump and gears.									
e. Demonstrate satisfactory operation and examine the condition of the following equipment: (1) Vent valves (trunk and compartment).									
(2) Blow valves (trunk and compartment).									
(3) Flood and drain valves (including remote operation mechanisms and strainer installations).									
(4) Demonstrate satisfactory operation and examine the condition of the following equipment: Conduct Hood Inflation System or Stole Charging Valve operational check to confirm valves operate properly and verify watertight caps installed.	Note 6								
(5) Pressure proof lights checked to ensure correct globe sealing and verified that globe is free from cracks.									
(6) Verify from ships' records that applicable maintenance to clear sea pressure sensing lines has been	Note 6								

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
completed within required periodicity.									
f. Verify the following equipment installed: (1) Diver's knife. (2) Ballpeen hammer. (3) Persuader (crows' foot).	Note 12								
g. Check Flood Line Orifice.	Not Clogged								
h. Verify valve hand wheels are properly color coded and labeled per Ship's Drawing Index, Ship's placards and Posted Information Plates.	NSTM S9086-RK-STM-010 Chapter 505								
i. Verify gages are in calibration as indicated on calibration label. (1) FWD Escape Trunk TD-86-GA-030 ALP-86-GA-002 ALP-86-GA-003 ALP-10-GA-001 IPHO-1 (FWD)									
(2) MID Escape Trunk TD-89-GA-031 ALP-89-GA-020 ALP-89-GA-047 ALP-55-GA-045 IPHO-2 (MID)									
(3) AFT Escape Trunk TD-91-GA-032 ALP-91-GA-019 ALP-91-GA-048									

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
ALP-74-GA-046 IPHO-3 (AFT)									
j. Verify upper watertight hatch cavity drain valve operation is satisfactory.									
3. Emergency Communications Equipment:									
a. SEPIRB: (1) Perform or witness SEPIRB maintenance.	Note 6								
(2) Perform or witness SEPIRB launcher maintenance.	Note 6								
b. AN/BQQ-6 Emergency Communications and Distress Beacon Groups. (1) Verify from ships' records that applicable maintenance for the AN/BQQ-6 has been completed within required periodicity.	Note 6								
(2) Check that the AN/BQQ-6 Emergency Communications Group receptacle is marked "61/62/63 Receptacle/Emergency Communications for AN/BQQ-6".									
c. Signal Ejector or 3" Launcher. (1) Demonstrate satisfactory operation of each launcher manually and hydro-pneumatically as applicable.									
(2) Verify a minimum of six Red Submarine Emergency Identification Signals and									

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
Submarine Floating Signal pyrotechnics stowed in compartment with launcher.									
(3) Operational verification must include a demonstrated launch (water slug) from both remote and local operating stations.									
4. Life Saving and Safety Equipment:									
a. Inventory allowance (randomly, type and quantity as applicable) and witness satisfactory performance of PMS procedures on the following: (PMS procedures are to be demonstrated on one representative candidate from each of the sub groups listed). (1) Auto-Inflatable life preservers QTY (30)	Note 6								
(2) Inherently buoyant life preservers. QTY (10)	Note 6								
(3) Man overboard bag.	Note 6								
(4) Safety harness (belts). QTY (20)	Note 6								
(5) Safety track.	Note 6								
(6) Distress marker lights. QTY (2)	Note 6								
(7) Life lines and stanchions.	Note 6								
b. Qualified swimmer designated for man overboard.	Note 13								

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
c. Emergency Air Breathing: (1) Masks (test random 5% per compartment for proper operation per applicable MRC).	Note 6								
(2) Inspect 10% per compartment of emergency air breathing manifold in-line filters and filter housing for presence of corrosion.	Note 6								
5. Escape Training and Procedures:									
a. Verify that all hands are trained in Submarine Escape.	CIN F-063-0005 or F-000-0080								
b. Verify required number of Senior Survival School graduates on board: _____	CIN F-493-0150 Required: 2								
c. Guard Books. FWD: REV ____ CHG____ MID: REV ____ CHG____ AFT: REV ____ CHG____	Latest Revision								
d. SSM OP 61-1 REV ____ CHG ____ SSM OI 638-3 REV ____ CHG ____ SSM OI 638-4 REV ____ CHG ____	Latest Revision								
6. Survivability Equipment:									
Inventory allowance (randomly, type and quantity as applicable) and witness satisfactory performance of PMS procedures on the following:									

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
(PMS procedures are to be demonstrated on one representative candidate from each of the sub groups listed). a. SESSPE Suits.	Note 6								
b. Crash Bags.	Note 6								
c. Automatic Vent Valve.	Note 6								
d. Portable Desalinators: (1) Inventory quantity onboard: FWD: _____ MID: _____ AFT: _____	Required: 2 FWD; 2 MID; 2 AFT								
(2) Verify from ships' records that applicable MROD maintenance has been completed within required periodicity.	Note 6								
e. Atmosphere Monitoring: (1) O_2 and CO_2 Gas Monitors (Analox SUBMKIIP): (a) Amount onboard: FWD: _____ MID: _____ AFT: _____	Stored in same locker as Crash Bag Required: 1 FWD, 1 MID, 1 AFT								
(b) Verify from ships' records that applicable Analox SUBMKIIP maintenance has been completed within required periodicity.	Note 6								
(2) Verify from ships' records DISSUB Detector Gas Kit (Draeger) maintenance has been	Note 6								

INSPECTION ITEM (SSBN/SSGN 726 CLASS)	Reference Note	Fwd		Mid		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat	Sat	Unsat		
completed within required periodicity.									
7. Atmosphere Control: Pre D7DS Note 16									
a. CO_2 absorbent canisters: (1) Amount onboard: FWD: _____ MID: _____ AFT: _____	Required: AEL 2-330023074 Note 14								
(2) Verify from ships' records that applicable CO_2 absorbent canister maintenance has been completed within required periodicity. Additionally, randomly select 10% of canisters onboard and weigh them per the applicable MRC.	Note 6								
b. LiOH Curtain Kits: Verify from ships' records that applicable LiOH curtain kit maintenance has been completed within required periodicity Amount onboard: FWD: _____ MID: _____ AFT: _____	Note 6								
c. O_2 candles. (1) Amount onboard for DISSUB: FWD: _____ MID: _____ AFT: _____	Note 15 Required: AEL 1-230013100								
(2) O_2 candle Ignitors:	Note 15								
d. O_2 candle furnace:	Required:

d. O_2 candle furnace: Amount onboard: FWD: _____ MID: _____ AFT: _____	Required: 1 FWD; 1 MID; 0 AFT								
e. Verify from ships' records that applicable O_2 Back-Up Distribution System maintenance has been completed within required periodicity.	Note 6								

NOTES
(SSBN AND SSGN 726 CLASS)

1. Reach rods, universal joints, and connecting links in the superstructure should be secured with non-corrosive pins. Inspect valve stems for misalignment and ensure that reach rod connection is one of square socket design with the non-corrosive pin used only to secure the reach rod to the universal.

2. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of an availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship's Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b., 2.c. and 2.d. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

3. The inspected ship's, vice the inspecting command's, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

4. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

5. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

6. The current DISSUB and Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the DISSUB and Salvage Inspection item.

7. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship's valve drawing.

8. Prior to testing Outboard Diesel Exhaust Valve, ensure replacement locking pin is available onboard.

9. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve

subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.

10. Unsatisfactory conditions degrade the submarine rescue mating capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Part I, Chapter 8 of this manual.

11. One or more Logistics Escape Trunks (LET) may be removed during refit. When removed, the LET is isolated from service air and electric power. Communications circuits, electrical power and charging manifold tests should be conducted prior to LET removal to ensure piping and electrical system continuity, and tested again upon reinstallation.

12. Diver's knife and ballpeen hammer may be stored in secure stowage in escape compartment.

13. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.

14. A minimum of 30 (SSBN) or 67 (SSGN) Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON-DISSUB canisters with quantities and location(s) logged by the crew.

15. Oxygen candle quantity and location impacts inspection acceptance criteria.

a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be towed forward or aft.

b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.

c. Oxygen candle igniters must be of a quantity and location (FWD, MID or AFT) that supports onboard candle load-out.

d. TZ-0968 (SSGNs) increases oxygen candle stowage in the MID compartment.

16. DISSUB Atmosphere Control pre and post D7DS supplies:

a. If total ships manning exceeds designated 165 personnel (SSBN) or 166 personnel (SSGN), refer to OPORD 2000 to determine adjusted quantities of supplies.

b. For SSBN 743 with TZ-0957A not completed, perform step 7 and omit step 8.

c. For SSBN/GN 726-742 and SSBN 743 with completed TZ-0957A, perform step 8 and omit step 7.

d. These Post D7DS quantities are from NAVSEA ltr 4700 Ser 391/0205 of 21 Dec 20.

APPENDIX D

SSN 774 CLASS DISSUB AND SALVAGE INSPECTION CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces require substantial support equipment and are designated for industrial activity accomplishment.
2. Configuration differences are noted as comments in the reference column.
3. Portions of this inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as "pre-availability inspections" to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship's Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC, and the Senior Inspecting Officer.
4. The user is directed to use the latest revision of the PMS maintenance requirement.
5. An asterisk (*) will be used in addition to a check mark (✓) in the Unsat column to identify any exceptions or discrepancies. An explanation of the exception or discrepancy will be included in the DISSUB and Salvage Inspection Report, Appendix F of this chapter.
6. New construction submarines will have had no PMRs completed or tracked. Those line items referencing PMRs can be marked N/A.
7. For new construction submarines, if a maintenance item has never been accomplished it is considered in periodicity unless it will come due prior to completion of sea trials.

PART I: SALVAGE

INSPECTION TEAM (SSN 774 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
1. Salvage Drawings:					
a. Verify salvage drawings: (1) Have been updated during ship's new construction period or last CNO Maintenance Availability. or (2) Latest revision is identified in ship's plan index.	Navy Modernization Process Management and Operations Manual NAVSEA SL720-AA-MAN-030 Ship Dwg. Consolidated Index Number 594 or 845				
(3) Have correct distribution.					
(4) Are identified as Selected Record Drawings					
2. High and Low Salvage Connections: (N/A to 792 AFS)					
a. Verify deck touch plate markings are installed and per plan.	Ship's Plans				
b. Check that each valve is free to operate with the inspecting command's salvage wrench.	Notes 1 and 2				
c. Perform a mechanical joint tightness test and seat tightness test to Item 18 pressure from the sea side. Then perform a 100-psi seat tightness from the sea side. No leakage allowed.	Notes 1 and 3				
d. External salvage system caps: (1) Verify the ship's salvage system arrangement plan contains a note that Roylyn type fittings are installed.	Note 4				

INSPECTION TEAM (SSN 774 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
(2) Remove cap assembly, test connect and disconnect with the inspecting command's female fitting.	Kaiser Aero Space & Electronics Dwg. 9495 (Formally Roylyn Inc.)				
(3) Inspect all Roylyn caps. Ensure cap operates properly and is free of paint or debris. Reinstall cap with safety wire, where applicable.					
e. Verify strainers are properly installed on all compartment low salvage lines and are clear of debris.					
3. Internal Air Salvage:					
a. Test satisfactory operation of all internal salvage air valves.	Note 5				
b. Verify all compartment pressure gages are in calibration as indicated on calibration label. AHP-45-GA-055 AHP-519-GA-001	Note 6				
4. Bulkhead Flappers:					
a. Test satisfactory local and remote (as applicable) operation of ventilation system bulkhead flappers. VH-71 VH-72					
b. Verify from ships' records that applicable ventilation system bulkhead flapper maintenance has been completed for VH-73 within required periodicity.	SMS 5120-081-200				

INSPECTION TEAM (SSN 774 CLASS)	Reference Note	Sat	Unsat	Submarine Inspector Signature	Inspection Team Member Signature
5. Hull Access Hatches, Watertight Doors and Torpedo Loading Hatches: Inspection performed by local PMT.					
a. Perform or witness hatch maintenance to complete salvage inspection and reference the PMT inspection.	Note 6				
6. External Gagging Devices:					
a. Witness demonstration that all valves with external gagging devices can be gagged from open to shut with the inspecting command's salvage wrench and with the number of turns specified on the ship's salvage system arrangement plan. Record number of turns to operate:DE-2 _____turns, VH-2_____turns.	Notes 2, 7 and 8				
b. Witness resetting of each gagging device and demonstrate satisfactory operation of the valves by normal means.	Notes 8 and 9				
7. Air Bank Dew Points:					
a. Verify from ships' records that applicable air bank air sampling maintenance has been completed, is in specification and within required periodicity.	Note 6				
b. Perform or witness AHPD or HPAC (793AFS) Operational Test and Measure Dew point of Effluent.	Note 6				
8. Towing Equipment					
a. Verify from ships' records that Towing Equipment maintenance has been completed within required periodicity.	Note 6				

PART II: DISSUB SURVIVAL, ESCAPE AND RESCUE

INSPECTION ITEM (SSN 774 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
1. Submarine Rescue Fittings:							
a. Verify four rescue vehicle hold-down sockets are installed per plan or authorized alteration on logistics escape trunk (LET) and lockout trunk (LOT) seating surfaces. From one socket per hatch, remove center capscrew and plug; demonstrate guide is free.	NSTM S9086-T9-STM-010 Chapter 594 Ship's Plans Notes 6 and 10						
b. Perform inspection of the LET and LOT rescue seating surface. (1) Inspect rescue seating surface.	Notes 6 and 10						
(2) Verify rescue seating surface PMR's performed within periodicity.	Note 10 SMS 1230-081-054 SMS 1230-081-055 SMS 1230-081-037 SMS 1230-081-047 SMS 1230-081-058 SMS 1230-081-059						
(3) Inspect rescue seating surface protective cover.	Note 6						
c. Verify from ships' records that SRC downhaul shackle has been replaced within PMS periodicity.	Notes 6 and 10						
d. LET and LOT hatch fairings must be maintained in a condition to be easily disassembled to support submarine rescue. Verify PMS has been completed within the required	Notes 6 and 10						

INSPECTION ITEM (SSN 774 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
periodicity on LET and LOT hatches. Visually inspect LET and LOT hatch fairings for compliance with the specifications called out in the PMS. Paint fouling or corrosion of fairing fasteners must be immediately corrected. Demonstrate the ability to remove one fastener at a time in each fairing section required to be removed in the fairing disassembly procedure.							
2. Logistics Escape Trunk and Lockout Trunk:							
a. Demonstrate that each access hatch operates satisfactorily with all respects of locking, unlocking, opening, shutting from below and above (with salvage wrench or hand wheel as applicable).							
b. Demonstrate that each access hatch can be opened with 5th percentile swing force operability criteria for surfaced emergency egress.							
c. Demonstrate satisfactory operation of the escape hatch closing mechanisms per the installed instruction plates and equipment.							
d. Demonstrate satisfactory installation of Improved Powered Hatch Operator with intensifier and compensator as one mode of hatch operation of LET and LOT. (1) Verify inventory of all parts.	Ship's Drawing Note 6

		Sat	Unsat	Sat	Unsat		
ALP-801-GA-058 ALP-801-GA-059 ALP-801-GA-060 TD-801-GA-522 TD-801-GA-523 TD-801-GA-524 IPHO-1 (LET)							
j. Verify upper watertight hatch cavity drain valve operation is satisfactory.							
k. Verify installation of lockout trunk high and low plugs, and demonstrate satisfactory plug operation.							
l. Perform or witness lockout trunk partition maintenance.	Note 6						
m. Air Sampling Valves F65 in LOT- See Figure 454-1 F62 in LET - See Figure 454-3	S9SSN-ZQ-SSM-FR0 Chapter 4-6-7						
(1) Valve Inspection. Remove the protective cap and the threaded pipe cap from the Air Sampling Valve. Verify that the needle valve is shut and that the internal portion is clean and free of debris.							
(2) Cap Inspection. (Controlled assembly required.) Reinstall the threaded pipe cap using the following controlled reassembly procedure:							
(a) Inspect the threaded cap to ensure the cap is clean, free of nicks,							

INSPECTION ITEM (SSN 774 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
gouges or other defects which may cause damage to the Air Sampling Valve.							
(b) Reinstall Air Sampling Valve threaded cap to ensure proper fit.							
(c) Inspect the O-ring that seals the protective cap. Ensure that the O-ring is clean, free of cuts, cracks, hardening or irregularities.							
(d) Reinstall the protective cap ensuring proper fit.							
3. Emergency Communications Equipment:							
a. SEPIRB: (1) Perform or witness SEPIRB maintenance.	Note 6						
(2) Perform or witness SEPIRB launcher maintenance.	Note 6						
b. AN/BQN-13: (1) Inspect AN/BQN-13 Beacon to ensure that: (a) Cable is free of abrasions, cuts or damage. (b) Cable plug and encapsulation are free of defects. (c) Unit has no physical damage.							
(d) Transducer is free of oil leaks, bubbles and paint.							
(2) Perform or witness AN/BQN-13 maintenance.	Note 6						

INSPECTION ITEM (SSN 774 CLASS)	Reference Note	Fwd		Aft		Submarine Inspector Signature	Inspection Team Member Signature
		Sat	Unsat	Sat	Unsat		
c. Signal Ejector or 3" Launcher: (1) Demonstrate satisfactory operation of each launcher manually and hydro-pneumatically as applicable.							
(2) Verify a minimum of six Red Submarine Emergency Identification Signals and Submarine Floating Signal pyrotechnics stowed in compartment with launcher.							
(3) Operational verification must include a demonstrated launch (water slug) from both remote and local operating stations.							
4. Life Saving and Safety Equipment:							
a. Inventory allowance (randomly, type and quantity as applicable) and witness satisfactory performance of PMS procedures on the following: (PMS procedures are to be demonstrated on one representative candidate from each of the sub groups listed). (1) Auto-Inflatable life preservers QTY (26)	Note 6						
(2) Inherently buoyant life preservers. QTY (10)	Note 6						
(3) Man overboard bag.	Note 6						
(4) Safety harness (belts). QTY (20)	Note 6						
(5) Safety track.	Note 6

(3) ExtendAir Deployment Kits: (a) Amount onboard: FWD:_____	Required: 5 FWD; 0 AFT; Plus 1 additional NON-DISSUB Deployment Kit						
b. O_2 candles: (1) Amount onboard for DISSUB: FWD:_____ AFT:_____	Note 16 Required: AEL 1-230013101						
(2) O_2 candle Ignitors:	Note 16						
c. O_2 candle furnace: Amount onboard: FWD:_____ AFT:_____	Required: 2 FWD; 1 AFT						

NOTES
(SSN 774 CLASS)

1. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship's Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b. and 2.c. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

2. The inspected ship's, vice the inspecting command's, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

3. "J" pressure or seat tightness testing is not required for new construction ships.

4. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

5. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

6. The current DISSUB and Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the DISSUB and Salvage Inspection item.

7. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship's valve drawing.

8. Prior to testing Outboard Diesel Exhaust Valve, ensure replacement locking pin is available onboard.

9. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.

10. Unsatisfactory conditions degrade the submarine rescue mating capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Part I, Chapter 8 of this manual.

11. The Logistics Escape Trunk (LET) may be removed during refit. When removed, the LET is isolated from service air and electric power. Communications circuits, electrical power, and charging manifold tests should be conducted prior to LET removal to ensure piping and electrical system continuity, and tested again upon reinstallation.

12. Diver's knife and ballpeen hammer may be stored in secure stowage in escape compartment.

13. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.

14. If total ships manning exceeds designated 132 personnel, refer to OPORD 2000 to determine adjusted quantities of atmosphere control supplies.

15. A minimum of 30 Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON-DISSUB canisters with quantities and location(s) logged by the crew.

16. Oxygen candle quantity and location impacts inspection acceptance criteria.

a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be stowed forward or aft.

b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.

c. Oxygen candle igniters must be of a quantity and location (FWD or AFT) that supports onboard candle load-out.

APPENDIX E

SAMPLE PRE-INSPECTION INFORMATION OR CERTIFICATION

From: Commanding Officer, USS (Ship's Name and Hull No.)

To: Senior Inspecting Officer

Subj: DISSUB AND SALVAGE INSPECTION OF USS (Ship's Name and Hull No.)

Ref: (a) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume IV, Chapter 18

Encl: (1) SSN 688 Class DISSUB and Salvage Inspection Check-Off List

1. The overall responsibility for the coordination and assembly of reference plans and publications in support of the Ship's DISSUB and Salvage Inspections is assigned to (preferably the XO, 1st Lt, or Weapons Officer). The Ship's Topside Coordinator is (Name), and the Ship's Below Decks Coordinator is (Name).

2. The following information and certification is presented per reference (a).

Reference:	Inspected Item:	Certification of Ship's Representative:
(a) Encl (1), Part I, para. 2	<u>High and Low Salvage</u>. External Salvage Valves have been overhauled & seat tightness tested.	Date: _____ Tested by: _____ (Overhauling Activity)
(b) Encl (1), Part I, para. 3.b., Part II, para. 2.i.	Gages have been tested or calibrated within the past 12 months. (list any discrepancies in para. 3)	_____ Ship's Force Representative
(c) Encl (1), Part I, para. 6.	<u>External Gagging Devices</u>. Valves will be lined up & reset by:	_____ Qualified Eng. Petty Officer
(d) Encl (1), Part II, para. 2.	<u>Escape Trunks</u>. Ship's representative for escape trunk will be:	_____ Ship's Representative
(e) Encl (1), Part II, para. 3.	<u>Emergency Communications Equipment</u> Operational and stowed with the following exceptions:	_____ Yes, or list exceptions in paragraph 2.

Reference:	Inspected Item:	Certification of Ship's Representative:
(f) Encl (1), Part II, para. 4	Life Saving & Safety Equipment PMS procedures last conducted on: (List discrepancies in paragraph 3.)	_____ Date

(Forward and Aft)

	Amount on Board	Required (COSAL)
Inflatable life preservers	_____	_____
Number of non-inflatable life preservers	_____	_____

	Amount on Board	Required (COSAL)
Number of safety harnesses	_____	_____
Distress Marker Lights	_____	_____

NOTE: MUST CONFORM TO CURRENT PMS SCHEDULE.

(g)	Encl (1), Part II, para. 5.	Escape Training and Procedures. All hands are qualified in SESSPE escape.	_____ Yes, or list discrepancies in paragraph 3.
(h)	Encl (1), Part II, para. 3.c.	Signal Ejector or 3" Launcher operation and Red Submarine Emergency Identification Signal inventory will be accomplished by:	_____ Ship's Representative
		Signal Ejector or launcher operation cannot be demonstrated as muzzle is above waterline or ship is in dry-dock. The signal ejector was last operated	_____ (Date)

NOTE: IF EJECTOR WAS NOT OPERATED IN PAST THIRTY DAYS, OPERATION MUST BE DEMONSTRATED BY FLOODING THROUGH MUZZLE WITH FIRE HOSE.

Reference:	Inspected Item:	Certification of Ship's Representative:
(i) Encl (1), Part II, para. 7 or 8.	Atmosphere Control Pre and Post D7DS	
	a. LiOH Curtain Kits:	_____ Amount
	b. Atmosphere Control. The following amount of absorbent is aboard:	_____ Type and Amount
	The allowance is:	_____ Amount
	O_2 candles applicable	_____ Yes or No
	The following number of O_2 candles are onboard:	_____ Number or N/A
	The allowance is:	_____ Number or N/A
(j) Encl (1), Part II, para. 6.e.	a. Atmosphere Monitoring DISSUB O_2 and CO_2 Gas Monitors (Analox - Required: 1 FWD and 1 AFT):	_____ Amount

RETENTION OF MATERIAL DEFICIENCY REPORTS AND RECORDS OF EQUIPMENT CHARACTERISTICS AND TESTS

REFERENCES.

(a) NAVSEA S9086-G9-STM-000 - NSTM Chapter 231 (Propulsion and SSTG Steam Turbines)
(b) NAVSEA S9086-HK-STM-010 - NSTM Chapter 241 (Propulsion Reduction Gears, Couplings, Clutches and Associated Components)
(c) NAVSEA S9086-HN-STM-010 - NSTM Chapter 244 (Propulsion Bearings and Seals)

LISTING OF APPENDICES.

A Bearing Log (Submarines Only)

19.1 PURPOSE. This chapter provides a listing of the inspection reports and equipment records, including the retention requirements, which must be maintained by each ship.

19.2 INSPECTION REPORTS. A copy of each of the following inspection reports will be retained until superseded by a subsequent report:

a. Board of Inspection and Survey Inspection Reports.

b. Hull Surveys.

c. Distressed Submarine and Salvage Inspections.

d. Docking Reports (CNO Maintenance Availability to CNO Maintenance Availability).

e. Turbine Lifting and Repair Reports.

f. Technical Assistance Reports by System Commands, Naval Sea Systems Command Technical Representatives, etc.

g. Boiler Inspection Reports (retained until equipment is transferred or vessel is stricken. May be discarded if old data is incorporated in a new report).

h. Battery Inspection Reports.

i. Diesel Engine Inspection Reports since last overhaul and associated Naval message on the status of discrepancies.

j. Main and Air Ejector Condenser Eddy Current (Probalog) Reports.

19.3 RETENTION OF RECORDS OF EQUIPMENT CHARACTERISTICS AND TESTS. The following records will be maintained onboard until superseded:

a. Anti-Submarine Warfare Test Program Reports.

b. Structureborne, Airborne and Waterborne Noise Reports.

c. (Submarine Force surface units only) Radar, Radio and Acoustic Radiation Patterns.

d. Equipment Calibration and Alignment Graphs and Charts.

e. Antenna and Superstructure Arrangement Photographs.

f. Record of Shipboard Tests.

g. Lube Oil and Trend Analysis Reports.

h. Battery Records (test discharges, etc.).

i. (Submarines only) Remote Temperature Element (RTE) Alarm Set point, Bearing Maximum Operating Temperature, Proximity to RTE Alarm, Installed Bearing Clearance, Actual Bearing Clearance, Bearing Replacement Clearance, Stamped Depth and Thrust Constant, Depth Micrometer Reading, and calculated bearing Wear for Main Thrust Bearings, Main bearings and Journals (required by reference (a) 231-7.2.1) for:

   (1) Main Propulsion Shafting.

   (2) Main and Auxiliary Engines.

   (3) Main Propulsion Motors and Generators.

   (4) Ship Service Turbine Generators.

   (5) Reduction Gear (RTE Alarm Set point and Bearing Maximum Operating Temperature only).

   Appendix A will be used to record data.

j. Readings and Clearances for Main Bearings and Journals:

   (1) Rudder and Diving Planes.

   (2) Diesel Generator Bearings.

k. Navigational Light Certification.

l. Equilibrium Diagram.

m. Panama Canal Tonnage Certification.

n. Aviation Helicopter Certification.

o. Weight Handling Equipment Certification.

p. Cavitation Curves.

q. Machinery or Vibration Survey Results.

r. (SSN, SSBN, and SSGNs only) Resistance Test Records must be maintained for the following equipment in the Electrical Work Centers PMS Space Manual:

   (1) Ship’s Service Turbine Generators.

   (2) Ship’s Service Motor Generators.

   (3) 400 Hz Motor Generators.

   (4) Emergency Diesel Generators.

   (5) Emergency Propulsion Motors.

(6) Secondary Propulsion Motors.

(7) Trim and Drain Pump Motors.

(8) Main and Shaft Lube Oil Pump DC Motors.

(9) High Pressure Brine Pump Motors.

(10) Low Pressure Blower Motors.

APPENDIX A

BEARING LOG (SUBMARINES ONLY)

Bearing: _____ Ship: _____

Data Taker		Assembly Documentation			Measured Wear			RTE Alarms			Approval		
1	2	3	4	5	6	7	8	9	10	11	12	13	14
Date	Data Taker (Print Name)	Data Taker (Print Rate)	Data Taker Signature	Max Allowable Wear (Wmax)	Stamped Depth Constant (DC)	Depth Mic Reading (MR)	Measured Wear (=7-6) (W) (=MR-DC)	RTE Alarm Set point (ASP)	Max Operating Temperature (from logs) (Tmax)	Safety Margin (=9-10) (20^{o}F min) (ASM) (=ASP-Tmax)	MLPO (initials)	MPA (initials)	ENG (initials)

Notes:

For thrust bearings, record the measured thrust clearance in column 7 and maximum thrust specification in column 5.

RTE Set points are: 270ºF for Main propulsion turbine and SSTG thrust bearings.
250ºF for Main propulsion turbine and SSTG journal bearings.
For remaining propulsion plant bearings, 30ºF higher than the maximum observed during Sea Trials or the applicable HM&E Test Procedure (i.e., SUBMEPP Test Procedure or annual MRC to verify Set points).

Date	Comments
	Comments: Date each entry. Note the serial number (if any) of this bearing, date of any bearing replacement, nonstandard dimensions, applicable Liaison Action Requests, Departure From Specification if approved, unusual conditions of journal or bearing (if opened), any additional or abnormal readings taken, recent temperatures for this bearing, temperature of lube oil cooler outlet used to set RTE alarm, or any other notes that may be helpful in the future.

BEARING LOG INSTRUCTIONS

Fill out for each Main Engine, Reduction Gear, Line Shaft, and SSTG Bearing.
A logbook should have a section for each piece of equipment (Port and Stbd SSTG, Port and Stbd Main Engine, Reduction Gear, and Line Shaft). To fill out the log, complete the following entries:

1. **Name of ship and hull number**: i.e., USS *SEAWOLF*, SSN 21
2. **Bearing Name and location**: i.e., #1 Propulsion turbine forward journal bearing.
3. **Name and date**: Print the data takers name and the date data was recorded.
4. **Data Taker Signature**: Signature of data taker.
5. **Max Allowable Bearing Wear (Wmax)**: The maximum increase in depth micrometer measurement above the stamped depth constant.
6. **Stamped Depth and Thrust Constant (DC) or Bearing Constant**: The depth micrometer reading taken when this bearing was installed, aligned and bolted down. It is found stamped on the bearing bracket near the depth micrometer hole. Thrust constants are normally not stamped. These must be obtained from builders new construction completed test procedures on microfiche or repair activity work documents when replaced.
7. **Depth Micrometer Reading (MR)**: Depth measurement taken between machined surface of bearing bracket and top of rotor journal.
8. **Measured Wear (W)**: Measured bearing wear. Calculated as W = MR-DC. (MR = Depth micrometer reading, DC = Stamped depth constant.) If the measured bearing wear (W) is greater than the maximum allowable wear (Wmax) or wear limit per applicable PMS MRC, then the bearing must be disassembled, inspected and repaired or replaced.
9. **RTE Alarm Set point (ASP)**: As determined by reference (a) (231-3.10.3.4.3, 231-3.10.3.4.4, and Table 231-3-2) and ships operating logs or by approved shipyard or repair activity test procedure meeting the requirements of the Naval Ships' Technical Manual (NSTM) or SUBMEPP test procedure.
10. **Bearing Full Load Maximum Operating Temperature (Tmax)**: The maximum operating temperature noted on the bearing during Post Construction or Overhaul Sea Trial testing following a SUBMEPP or Shipyard test procedure or the latest performance of RTE testing per appropriate NSTM or PMS MRC. The temperature should be compared to observed temperatures during normal ships operations for abnormalities.
11. **Alarm Safety Margin (ASM)**: Calculated as ASM = ASP - Tmax (ASP = Alarm Set point, Tmax = Maximum normal operating temperature). If the alarm set point does not meet the requirements of NSTM references (a), (b) or (c), as applicable, reset the alarms per the NSTM or SUBMEPP test procedure or PMS MRC, as required, following the guidance of the NSTM.
12. **Comments**: Date each entry. Note the serial number (if any) of this bearing, date of any bearing replacement, nonstandard dimensions, applicable Liaison Action Requests, Departure From Specification if approved, unusual conditions of journal or bearing (if opened), any additional or abnormal readings taken, installed (assembled clearances) and

maximum clearances if the bearing is installed by Ship's Force, recent temperatures for this bearing, temperature of lube oil cooler outlet used to set RTE alarm, or any other notes that may be helpful in the future and applicable PMS MRC. Installed assembly documentation is not required to be retained in this log if bearing removal and installation was performed by an IMA, IMF, Regional Maintenance Facility or a Shipyard since data is maintained by those installations and can be obtained by the ship, if required, via ISIC. Ships are required to obtain initial depth micrometer readings to ensure stamped depth constant is updated any time a bearing is rolled out.

(c) NAVFAC 4-159-01N - Unified Facilities Criteria Manual
(d) OPNAVINST 3150.27 - Navy Diving Program
(e) NAVSEA 00C Instruction 10560.2 - Diving Equipment Authorized For Navy Use (ANU) Program

LISTING OF APPENDICES.

A System Safety Certification Verses Authorized for Navy Use Requirements Matrix

20.1 PURPOSE. To provide guidance for the proper administration of a uniform maintenance program in support of the certification requirements for Diver Life Support Systems (DLSS).

20.2 DIVER LIFE SUPPORT SYSTEM MAINTENANCE AND CERTIFICATION.

20.2.1 General. This chapter of the JFMM is intended to cover all afloat, portable and shore-based diving and manned hyperbaric systems capable of supporting one or more divers, operators or occupants embarked in wet or dry pressurized environments which are certified per reference (a) by either the NAVSEA 00C4 or NAVFAC OFP Certification Authority. Submarine based diver life support systems such as Dry Deck Shelter (DDS), *Virginia* Class Lock-Out Trunks (LOTS), SSGN Lock-Out Chambers (LOCS) and Submarine Rescue Chamber (SRC) are handled by a Deep Submergence Systems (DSS) System Safety Certification program under NAVSEA 07Q4. These type of deep submergence systems are addressed in volume V, part III of the JFMM.

20.2.2 Objective. The objective of system certification is to verify, by use of an independent technical review, that a diving system provides acceptable levels of personnel safety throughout its specified operating range, when approved operating and maintenance procedures are followed. This review is accomplished by performing a detailed assessment of the material and procedural adequacy of the system. The certification process establishes maximum reasonable assurance that diving system personnel can be recovered without injury. Certification of a diving system does not relieve its operators from the responsibility of maintaining system safety on a continuing basis. System certification cannot positively ensure that an accident will not happen; it is, however, intended to provide “maximum reasonable assurance” that a catastrophic or critical accident will not occur.

20.2.3 United States Navy Diving and Manned Hyperbaric Systems Safety Certification. The requirements, procedures and guidance for the administration of the certification program for all

portable, surface ship afloat and shore-based DLSS must be per reference (a). In addition, references (b) through (e) provide further key guidance related directly to various aspects of DLSS.

a. Reference (a) provides a single document which:

(1) Identifies the administrative and technical requirements leading to the initial dive system material and system certification.

(2) Documents the requirements for maintaining satisfactory material and operability conditions to support continued Unrestricted Operation to design depth.

(3) Identifies the responsibilities for implementing and executing the certification program policies and procedures.

(4) Provides procedures for requesting waivers to approved operating and maintenance procedures, and for departures from approved system design.

(5) Provides standardization for re-entry control (REC) procedures. These procedures provide the necessary instructions for maintaining the DLSS in the "as certified" condition. It is mandatory that these procedures be followed for any activity conducting work within the DLSS Scope of Certification (SOC).

b. Reference (b) provides a wide variety of information, including diving system design, configuration management, materials, toxicity, flammability, pressure vessels, lubrication, construction, testing, QA, traceability and repair. It is intended to be used by the various U.S. Navy diving communities in case their existing system specific design documentation does not specifically address their particular need or application.

c. Reference (c) supplements reference (b) providing specific building requirements for ashore manned hyperbaric systems.

d. Reference (d) establishes Navy-wide diving program policy, requirements and guidance for the development, oversight and operation of all Navy diver DLSS and associated support systems and processes. It specifically delegates System Certification Authority to Commander, Naval Sea Systems Command for all portable and afloat systems and to Commander, Naval Facilities Engineering Command for all shore-based systems. Also, reference (d) identifies the Authorized For Navy Use (ANU) program for authorizing the use of diving life support and non-life support equipment. The ANU process for evaluating equipment for inclusion on the ANU is described in reference (e). The Appendix A matrix identifies what type of DLSS equipment is being handled by ANU or System Safety Certification program(s) as a general guide.

APPENDIX A

SYSTEM SAFETY CERTIFICATION VERSES AUTHORIZED FOR NAVY USE REQUIREMENTS MATRIX

Equipment Type	Authorized For Navy Use	Certify
Deep Dive Systems		X
Hyperbaric Research Facilities		X
Recompression Chamber System		X
Diving Bells		X
Topside Surface Supported Diving Systems		X
Underwater Breathing Apparatus Used with Deep Dive Systems		X
Mixed Gas and O^2 SCUBA Rebreathers		X
Open Circuit Air SCUBA	X	
Surface Supplied Hats (Air, HeO^2)	X	X (Note 1)
Divator MK 2 DP 1 or 2 Surface Supplied System		X
Diver Life Vests and Buoyancy Compensators	X	
Diver Operated Tools	X	
Diver Held Sonar, Navigation, etc.	X	
Diver Communications	X	
Wet Suits	X	
Variable Volume (Dry) Suits	X	
Air Compressors, Filters, etc.	X	X (Note 2)
Diving Accessories (Mask, Fins, Watches, Knives, Compass, Depth Gauges, Weight Belts, etc.)	X	

Notes:

1. Certification may be required for initial use.
2. When compressor or diving air systems are permanently installed as components of a diving or recompression system, they must be included in the SOC. The Commanding Officer or Officer In Charge must ensure that compressors and diving equipment are properly installed and maintained per reference (a).

(c) NAVSEA S9515-A4-MMA-010/020 - Low Pressure Electrolyzer (LPE-T) Treadwell model Technical Manual, Volumes 1 and 2
(d) NAVSEA 29515-S9515-A7-MMA-010/020 – Low Pressure Electrolyzer (LPE-H) Technical Manual, Volumes 1 and 2 – Hamilton model
(e) NAVSEA S9515-AL-MMA-010 - Integrated Low Pressure Electrolyzer (ILPE) Technical Manual
(f) NAVSEA S9515-A6-MMA-010 - Advance Integrated Low Pressure Electrolyzer (AILPE) Technical Manual
(g) NAVPERS 18068 - Manual of Navy Enlisted Manpower and Personnel Classifications and Occupational Standards

21.1 PURPOSE. To establish the prerequisites and procedures for qualification of personnel, operation and maintenance of shipboard submarine oxygen generating plants designated 6L16 Electrolytic Oxygen Generators (EOG), 6L16 Automated Electrolytic Oxygen Generators (AEOG), Low Pressure Electrolyzers (both models Treadwell and Collins formerly Hamilton) (LPE), Integrated Low Pressure Electrolyzers (ILPE) and Advance Integrated Low Pressure Electroylzer (AILPE).

21.1.1 Policy. Type Commander (TYCOM) policy regarding the operation and maintenance is:

a. All current technical documentation must be available at the oxygen generator for operator use. As a minimum, the on-hand documentation will include reference (a), (b), (c) (d), (e) or (f), as required, and the MRCs that support the installed unit.

b. Planned Maintenance System (PMS) must be maintained current to the latest Periodic Force Revision and all scheduled and situational planned maintenance requirements must be accomplished.

NOTE: OXYGEN GENERATOR OPERATORS AND MAINTENANCE TECHNICIANS MUST BE LIMITED TO THOSE INDIVIDUALS HOLDING THE NAVY ENLISTED CLASSIFICATIONS (NEC) REQUIRED BY REFERENCE (G) FOR THE TYPE OF OXYGEN GENERATOR PLANT OPERATED OR MAINTAINED.

c. At least two qualified operators and one qualified electrical technician must be onboard during oxygen generator operation. Two qualified operators meet this requirement if at least one of the operators is also a qualified maintenance technician.

d. Safety related deficiencies must be corrected prior to oxygen generator operation.

e. A minimum of two qualified Oxygen Clean Workers on board to conduct maintenance on oxygen systems and the oxygen generator (except submarines with LPEs, ILPEs and AILPEs) except as noted in paragraph 21.1.1.f.

f. For *Virginia* Class submarines, the following hulls must be required to maintain a minimum of two qualified Oxygen Clean Workers on board: SSN 776, SSN 777, SSN 778, SSN 779, SSN 782 and SSN 784 or as determined by TYCOM.

21.1.2 Background.

a. Oxygen generator casualties result primarily from improper maintenance, operation or insufficient operator familiarization with current operating instructions and safety precautions. The recurring nature of these casualties necessitates that positive action be taken to ensure operating and maintenance personnel are properly trained and qualified. Additionally, technical documentation must be continuously updated for use by the ship's oxygen generator operating, maintenance and support personnel.

b. Naval Sea Systems Command (NAVSEA) and TYCOM Technical Notices and Advance Change Notices (ACN) provide the Fleet with the latest technical information and operating instructions concerning oxygen generators. These Notices and ACNs will remain in effect until cancelled by a subsequent Notice or ACN, or are incorporated as a revision to the applicable technical manual.

21.2 RESPONSIBILITIES.

21.2.1 Immediate Superior In Command.

a. Ensure assigned units are in compliance with the policy stated in paragraph 21.1.1.

b. Conduct periodic inspections and audits to ensure that:

(1) Operating and maintenance personnel proficiency is being maintained.

(2) Technical manuals, operating and maintenance notices and PMS documentation are current.

(3) Operation and maintenance is per this chapter, reference (a), (b), (c), (d), (e) or (f) as required, and the supporting Operating Instructions (OIs) and PMS.

c. Ensure Performance Monitoring Team (PMT) inspectors perform material inspections of the ship's oxygen generators approximately 90 days prior to entry and departure from a Chief of Naval Operations (CNO) Maintenance Availability. The material inspection, prior to the availability, will identify material deficiency corrective actions which must be corrected prior to completion of the availability.

21.2.2 Performance Monitoring Team.

a. Conduct periodic and pre and post-CNO Maintenance Availability material inspections. Ensure a review of the inspected units Material Maintenance Log is part of the material inspection.

b. Initiate a quarterly monitoring program for those units receiving an unsatisfactory grade during the material inspection. Maintain the units on the quarterly monitoring program until two consecutive satisfactory evaluations, with no safety related deficiencies noted.

c. Provide copies of all reports following material inspections, monitoring periods and On Site Analysis Reports to the TYCOM and the ISIC.

d. Ensure appropriate TYCOM personnel are contacted regarding safety related issues.

e. Conduct an operational inspection following the applicable PMS prior to Fast Cruise during a CNO Maintenance Availability. Conduct oral interviews with all oxygen generator qualified personnel to determine individual knowledge levels and training effectiveness. The operational inspection will include:

(1) Start up checks.

(2) Power-Off maintenance check out.

(3) Start up.

(4) Operation to maximum allowable amperage.

(5) Performance of operational PMS.

(6) Shutdown. (EOGs/AEOGs)

(7) Placement in a static condition and restarted. (EOGs/AEOGs)

(8) Shutdown and purge complete.

21.2.3 Commanding Officer.

a. Report reduced status following established procedures any time the personnel requirements stated in paragraph 21.1.1 cannot be met.

b. Implement and execute a shipboard training program to qualify and maintain oxygen generator personnel qualifications.

c. Prohibit operation of the oxygen generators if shipboard procedures are not in compliance with this chapter and reference (a), (b), (c), (d), (e) or (f) as required.

d. Ensure the Oxygen Generator Material Maintenance Log is maintained and correctly reflects **all** corrective and planned maintenance performed.

e. Ensure periodic reviews of the Oxygen Generator Material Maintenance Logs are conducted by the Division Leading Petty Officer, Division Officer and Engineer Officer.

f. Ensure all safety related deficiencies are promptly entered into the Equipment Status Log.

g. Prior to a CNO Maintenance Availability, ensure the PMT conducts a material inspection of the oxygen generators. Ensure oxygen generators are placed into Lay Up and adequately protected following Inactive Equipment Maintenance requirements.

h. Ensure PMT conducts a Post-CNO Maintenance Availability material inspection prior to placing the oxygen generators in electrolysis.

i. Ensure the PMT conducts an operational inspection per paragraph 21.2.2 prior to commencing Fast Cruise during a CNO Maintenance Availability. Oxygen generators

will be operated by Ship's Force qualified operators as described in paragraph 21.1.1. The oxygen generators will be in a static shutdown condition, pressurized with nitrogen and meet the pressure testing requirements of reference (a), (b), (c), (d), (e) or (f) as required.

j. Ensure electrolysis is secured and oxygen generators (all models) are placed in a safe condition prior to commencing any training drill which may cause a "loss of power" casualty (either normal or alternate power). If the oxygen generators are to be placed in a static condition for the duration of the training drill, ensure normal power will be restored to restart electrolysis, or alternate power will be available to conduct a complete purge, prior to the expiration of the 45-minute hold limitations of reference (a) and, (b) as required. For LPEs, ILPEs or AILPEs place in safe condition per reference (c), (d), (e) and current shipboard requirements and instructions.

21.3 REQUIREMENTS FOR SHIPBOARD PERSONNEL QUALIFICATION.

21.3.1 Training. Oxygen generator operators and maintenance technicians must be graduates of the training courses required for the appropriate NEC per the requirements of reference (g).

NOTE: PERSONNEL QUALIFIED TO PERFORM MAINTENANCE ON THE OXYGEN GENERATOR MUST ALSO BE GRADUATES OF OXYGEN CLEAN WORKER SCHOOL (EXCEPT SUBMARINES WITH LPEs AND ILPEs) AS NOTED IN PARAGRAPHS 21.1.1.E AND .F OF THIS CHAPTER.

a. The NECs required for EOG installations:

(1) NEC 4252/740B: An individual certified to this NEC will have successfully completed EOG Operator and Maintenance Course A-852-0050.

(2) NEC 4752/952B: An individual certified to this NEC will have successfully completed EOG Operator and Technician Course A-623-0039.

b. The NECs required for AEOG installations:

(1) NEC 4208/735B: An individual certified to this NEC will have successfully completed AEOG Operation and Mechanical Maintenance Course A-652-0087.

(2) NEC 4708/766A: An individual certified to this NEC will have successfully completed AEOG Electrical and Electronic Maintenance Course A-623-0008.

c. The NECs required for LPE installations:

(1) NEC 4253/Q53A: An individual certified to this NEC will have successfully completed LPE Operation and Mechanical Maintenance Course A-652-0190.

(2) NEC 4653/N53: An individual certified to this NEC will have successfully completed LPE Electrical and Electronic Maintenance Course A-623-0050.

d. The NECs or course completion required for ILPE installations:

(1) An individual certified by successful completion of ILPE Operation and Mechanical Maintenance Course A-652-0093.

(2) NEC 4641/N41Z: An individual certified to this NEC will have successfully completed ILPE Electrical and Electronic Maintenance Course A-623-0132.

21.3.2 Watchstanding Prerequisites. Prior to being certified as qualified for oxygen generator watches, the following watchstander prerequisites must be met:

a. For 6L16 NEC 4252/740B: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway, with the oxygen generator(s) in operation.

b. For 6L16 NEC 4752/952B: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only. Technicians qualifying as operators are governed by paragraph 21.3.2.

c. For AEOG NEC 4208/735B: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway with the oxygen generator(s) in operation.

d. For AEOG NEC 4708/766A: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only; technicians qualifying as operators are governed by paragraph 21.3.2.

e. For LPE NEC 4253/Q53A: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway with the oxygen generator(s) in operation.

f. For LPE NEC 4653/N53Z: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only; technicians qualifying as operators are governed by paragraph 21.3.2.

g. Personnel with successful completion of course A-652-0093 ILPE maintenance: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway with the oxygen generator(s) in operation.

h. Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only; technicians qualifying as operators are governed by paragraph 21.3.2. For ILPE NEC 4234/N41Z or successful completion of course A-623-0132: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only; technicians qualifying as operators are governed by paragraph 21.3.2.

i. Demonstrate an understanding of the approved NAVSEA Oxygen Generator Log Sheets, including the significance of data recorded and operational limits.

j. Demonstrate a knowledge of corrective action(s) to be taken in the event of sudden changes in equipment operating parameters.

k. Successfully complete qualifications for the oxygen generator and supporting systems per current shipboard qualification requirements/instructions.

VOLUME IV

CHAPTER 22

SUBMARINE ANTENNA TESTING

REFERENCES.

(a) NAVSEA S9425-CG-STD-010 - Installation Standards for Submarines

22.1 PURPOSE. To provide Type Commander policy with respect to pressure testing submarine communication antennas and Photonics systems. This policy is not applicable to periscopes, radar antennas and other non-communication antennas and cabling. Amplifying information is contained in reference (a).

22.2 BACKGROUND. Submarine antenna and Photonics systems associated cable connections between the antenna and electrical hull fitting are sensitive to seawater intrusion. In the event that seawater enters an electrical hull fitting, radome or other powered component and the system is subsequently powered-on or used for transmission, significant component damage may occur.

22.3 POLICY.

22.3.1 Hydrostatic Pressure Testing.

a. Hydrostatic pressure testing of submarine antennas and cable assemblies prior to initial installation on the submarine is mandatory except for buoys, floating wires, multifunction antenna and the Submarine High Data Rate (SubHDR) antenna system. When the Mast Antenna (Unit 1) is opened for any repairs, including the removal of the IFF/GPS Radome, a hydrostatic test is mandatory. This pre-installation test is intended solely to verify the correctness of the final assembly and does not equal or replace the more elaborate acceptance testing required for various individual manufactured components. Submarine communications antennas that are required to be hydrostatic pressure tested are:

NOTE: ALL VERSIONS OF OE-538/592 ANTENNAS ARE HYDROSTATICALLY TESTED AT THE NAVAL UNDERSEA WARFARE CENTER - NEWPORT OE-538/592 DEPOT PRIOR TO BEING ISSUED TO THE FLEET FOR INSTALLATION.

(1) Multifunction Antennas (all versions), OE-538 (SSNs) and OE-592 (SSBNs and SSGNs).

NOTE: ALL SUBHDR MASTS ARE HYDROSTATICALLY TESTED AT THE SUBHDR NATIONAL MAINTENANCE CENTER PRIOR TO BEING ISSUED TO THE FLEET FOR INSTALLATION.

(2) Submarine High Data Rate Antenna, OE-562 (SubHDR).

b. Buoys that are excluded are:

(1) Submarine Launched One-Way Tactical (SLOT) Buoys (AN/BRT-1 and AN/BRT-1A).

(2) Submarine Emergency Position Indicating Radio Beacon (SEPIRB) Buoy (T-1630/SRT or T-1630A/SRT).

c. All versions of Floating wires are excluded (i.e. Buoyant Cable Antennas).

NOTE: THE TOWED BUOY ANTENNA, AN/BRR-6 (SSBN 730 - 738) AND THE AN/BRR-6B (SSBN 739 - 743) WILL BE HYDROSTATIC TESTED BEFORE INSTALLATION ACCORDING TO THE MAINTENANCE MANUAL.

22.3.2 Fleet Maintenance. Maintenance actions conducted by Fleet Maintenance Activities or Ship's Force regarding the watertight integrity test requirements between submarine antennas and their respective hull connectors, must be:

a. When the antenna or cable is disconnected or replaced shipboard, the Technical Work Document will include the following checks in the assembly procedure to reconnect the cable to the base of the antenna or electrical hull fitting:

(1) Craftsman verification that surface finishes of O-ring seating surfaces are per applicable specifications.

(2) Craftsman verification that the O-ring is properly installed and per applicable specifications.

(3) For submarine SubHDR and Photonics systems outboard cable removal and replacement, accomplish per volume V, part I, chapter 7, Appendix B, NOTE 31 of this manual.

NOTE: DEEP DIVE TESTING DOES NOT APPLY TO THE PHOTONIC SYSTEM.

b. Prior to performing a deep dive certification after a maintenance action, passive testing or pre-energize testing, or both, must be performed following the system specific Technical Manual, Submarine Maintenance Engineering, Planning and Procurement (SUBMEPP) approved Maintenance Standard, SUBMEPP approved Standard Test Procedure or Maintenance Requirement Card (MRC) to ensure the system is not grounded prior to use.

c. Upon completion of a deep dive certification for a maintenance action, passive testing, pre-energize testing, or both, must be performed following the system specific Technical Manual, SUBMEPP approved Maintenance Standard, SUBMEPP approved Standard Test Procedure or MRC to ensure the system is not grounded prior to use.

22.4 PROCEDURE.

a. Upon completion of maintenance and before underway for submerged operations, the ship must place CAUTION tags on the Main Power Switch or transmit keys for the affected antennas. The Amplifying Instructions for the CAUTION tags will state:

"DO NOT OPERATE OR TRANSMIT ON THIS ANTENNA UNTIL COMPLETION OF PASSIVE CHECKS FOLLOWING A DIVE TO TEST DEPTH. PASSIVE CHECKS MUST BE PERFORMED PRIOR TO EACH USE UNTIL THE DEEP DIVE IS COMPLETE."

b. It is understood that in some cases, due to water depth restrictions, the deep dive may not be performed for quite some time. In these cases, the ship should dive to the

maximum depth possible and conduct passive checks. Provided the checks are satisfactory, the CAUTION tag may be replaced with one stating:

> "DO NOT OPERATE OR TRANSMIT ON THIS ANTENNA FOLLOWING OPERATIONS GREATER THAN (enter max depth obtained). PASSIVE CHECKS MUST BE PERFORMED PRIOR TO EACH USE UNTIL THE DEEP DIVE IS COMPLETED."

c. The tag(s) may be removed following completion of a deep dive to test depth and completion of satisfactory passive testing performed following the system specific technical manuals or Maintenance Index Pages and MRCs to ensure the system is not grounded.

VOLUME IV

CHAPTER 23

GAS TURBINE ENGINE INSPECTION FOR SURFACE FORCE SHIPS

REFERENCES.

(a) OPNAVINST 9220.3 - Propulsion and Auxiliary Plant Inspection and Inspector Certification Program
(b) GGTB 11 - General Gas Turbine Bulletin Number 11, Gas Turbine Fleet Representatives
(c) NAVSEA S9086-HC-STM-000 - NSTM Chapter 234, Marine Gas Turbines
(d) GGTB 0 - General Gas Turbine Bulletin Number 0, Technical Directive Zero Index
(e) GGTB 3 - General Gas Turbine Bulletin Number 3, Marine Gas Turbine Logbook and Service Records
(f) OPNAVINST 3120.32 - Standard Organization and Regulations of the U.S. Navy
(g) NAVSEA S9086-HC-STM-000 - NSTM Chapter 259, Marine Gas Turbine Combustion Air Intake and Uptake Systems
(h) GGTB 36 - General Gas Turbine Bulletin Number 36, Gas Turbine Exhaust Leak Guidance

23.1 PURPOSE. The Marine Gas Turbine Inspector (MGTI) program is intended to provide for the timely identification of discrepancies prior to Planned Major Maintenance Availabilities, deployments, when mandated by operating hour requirements and to provide technical assistance to operational units when so directed by the Type Commander (TYCOM). This chapter provides the guidance for Marine Gas Turbine inspection requirements, including preparation, procedures, criteria and reporting and is applicable to all gas turbines on fleet surface, amphibious and auxiliary platforms and craft.

23.2 DISCUSSION. It has long been the Navy's practice for Ship's Force to accomplish as many repairs as possible at the organizational or intermediate levels. This maintenance philosophy requires trained and experienced personnel, capable of identifying problems so that planned and corrective measures can be recommended, planned for and accomplished in a timely manner. To address the need for experienced personnel the MGTI program has been developed. Reference (a) provides the details for the MGTI program.

23.3 MARINE GAS TURBINE INSPECTOR.

23.3.1 Certification. MGTI inspector certification and recertification requirements outlined in reference (a) are amplified as listed in sub-paragraphs "a" through "e":

a. MGTIs function as the Naval Sea Systems Command (NAVSEA) Technical Representatives. All their technical decisions and recommendations are made in concert with and fully supported by their appropriate Regional Maintenance Center (RMC).

b. Upon verification of competency, Naval Surface Warfare Center, Philadelphia Division (NSWCPD) will issue a 36-month certification. Certification will remain valid provided the MGTI conducts at least two (any combination) of the following:

Gas Turbine Readiness Reviews (GTRR), Assessments, pre-deployment inspection, pre-Planned Major Maintenance Availability inspection and attends one MGTI seminar during the previous 12 months.

c. MGTI certifications will be extended in 18-month intervals. Requests for extension must be submitted to NSWCPD with info to NAVSEA 05Z via the TYCOM. By endorsement, the Commanding Officer will certify that the MGTI meets the requirements of paragraph 23.2.1. A MGTI whose certification has lapsed or been suspended will be required to recertify, under procedures established by NSWCPD, on a case-by-case basis.

d. Commanding Officers will ensure MGTIs are afforded the opportunity to attend MGTI seminars and maintain certification. Commanding Officers are also encouraged to nominate to the TYCOM motivated and capable technicians for certification as MGTIs as outlined in reference (a).

e. A MGTI assigned as ship's company cannot perform inspections as described in section 23.3 on that ship. (No inspector will be permitted to inspect themself.)

23.3.2 Authorized Functions and Responsibilities.

23.3.2.1 Naval Sea Systems Command. NAVSEA must provide technical authority oversight over all marine gas turbines and associated equipment. The designated NAVSEA Technical Warrant Holder must:

a. Assure safe and reliable system operation.

b. Set and enforce all technical requirements.

c. Approve all major Departures from Specifications (DFS).

23.3.2.2 Naval Surface Warfare Center, Philadelphia Division. NSWCPD must:

a. Provide support to NAVSEA for the MGTI programs. Ensure that the required technical documentation to support the MGTI Inspector programs is maintained current.

b. Establish and monitor the requirements and standards for routine and industrial inspections of marine gas turbine systems.

c. Develop, implement and maintain a program to train and certify MGTIs.

d. Ensure that inspections of newly constructed ships and ships undergoing major overhaul or conversion are conducted per this instruction.

e. Conduct periodic technical audits of the MGTI Training Course.

f. Provide management of technical data, gas turbine history and the associated repair management information database system.

g. Conduct the semi-annual MGTI seminars.

h. Maintain a roster of all certified MGTIs by name, rating, duty station, date of certification and expiration date of certification. Revoke inspector certification and initiate action to decertify inspectors who fail to comply with requirements of reference (a).

i. Ensure that the requirements for MGTI certification, recertification and certification extensions are met prior to final approval.

j. Provide technical oversight and management of the MGTI and NSWCPD programs:

(1) Establish and enforce requirements for MGTI certification and recertification.

(2) Ensure periodic MGTI seminars are conducted.

(3) Ensure periodic technical audits of all Integrated Logistics Support documentation and Training.

(4) Maintain the Gas Turbine Management Information System WEBLOG.

(5) Routinely evaluate and ensure state of the art inspection, maintenance and repair tools and techniques are used.

23.3.2.3 Fleet Commander. The Fleet Commander must:

a. Identify and designate those fleet activities which have inspection responsibilities and maintain a base of certified MGTIs within those activities.

b. Ensure the availability of "school ships" to support MGTI Inspector training.

c. Host the semi-annual MGTI seminars on an alternating coast basis.

23.3.2.4 Regional Maintenance Center. The RMC must:

a. Provide certified MGTIs to perform inspection.

b. Review the guidelines and inspection requirements for all gas turbine inspections required by this instruction and ensure that each inspection report is recorded and updated into the Gas Turbine Management Information System.

c. Schedule and coordinate inspections of all marine gas turbine systems required by this instruction with the appropriate technical activities to avoid the unnecessary opening of gas turbines.

d. Provide a qualified MGTI when requested by the ship, Immediate Superior In Command (ISIC) or TYCOM.

23.3.2.5 Regional Maintenance Center Commanding Officers. RMC Commanding Officers must:

a. Coordinate inspections in cognizant maintenance areas.

b. Maintain an up-to-date status of required marine gas turbine system inspections which must include the latest inspection for all ships assigned to RMCs in their respective area of responsibility.

23.3.2.6 Immediate Superior In Command. The ISIC must:

a. Monitor the follow-up action required to correct noted discrepancies by randomly sampling the ship's deferred maintenance action file and most recent gas turbine inspection report.

b. Assist Commanding Officers in arranging for the corrective action of items beyond the capability of Ship's Force, when requested.

23.3.2.7 Ship Commanding Officer, Officer In Charge or Maintenance Team. Ship Commanding Officers, Officers In Charge or the Maintenance Team must:

a. Request gas turbine inspections.

b. Prepare for scheduled inspections to include required operational testing.

c. Review inspection results and initiate corrective action for those items within Ship's Force capability. Initiate requests for the correction of items beyond Ship's Force capability. If any of the discrepancies cannot be corrected within 72 hours following completion of the inspection, or if said discrepancies will impact the ship's operational schedule, initiate a Casualty Report for the affected gas turbine(s).

d. Assess the impact (if any) of corrective action on operating schedules and advise the operational commanders. Decide (with repair activities) the optimum timing of repair actions to minimize impact on operating schedules.

e. Submit reports.

f. Schedule gas turbine inspections as required by appropriate Planned Maintenance System (PMS) or Class Maintenance Plan item.

23.3.2.8 Marine Gas Turbine Inspectors. MGTIs are authorized and responsible for, but not limited to, performing the following:

a. Perform periodic intermediate level inspections per Gas Turbine Bulletins (GTB) and Ancillary Equipment Bulletins.

b. Perform GTRR, Assessments, post casualty investigations, pre-deployment inspections and pre-Planned Major Maintenance Availability inspections.

c. Provide troubleshooting assistance to ships and Fleet Maintenance Activities (FMA).

d. Oversee in-place gas turbine repairs if currently qualified for the specific repair.

e. Oversee Gas Turbine Technical Directive installations.

f. Monitor compliance with configuration status accounting and technical directive reporting requirements.

g. Make engine change-out recommendations to NSWCPD via the RMCs.

h. Act as team leader (if currently qualified for specific repairs) for in-place gas turbine repairs and gas turbine change-out if attendant FMA does not have a team leader qualified for the specific repair.

i. MGTIs are part of the technical authority chain-of-command and are accountable to the NAVSEA Technical Warrant Holder for the performance of their inspection duties.

NOTE: THE SHIP'S FORCE MGTI CAN ONLY ACCOMPLISH SPECIAL INSPECTIONS AND OPERATIONAL ASSESSMENTS ON THEIR OWN SHIP. THE SHIP'S FORCE MGTI WILL ASSIST THE RMC MGTI DURING ROUTINE AND AVAILABILITY RELATED INSPECTIONS. THE SHIP'S FORCE MGTI MAY NOT INDEPENDENTLY CONDUCT ROUTINE, STRENGTH AND INTEGRITY INSPECTIONS ON THEIR OWN SHIP.

23.4 GAS TURBINE INSPECTIONS AND REQUIREMENTS.

23.4.1 Applicability.

a. All gas turbine engines on surface, amphibious or auxiliary platforms or craft of the force will be inspected as prescribed in this section.

b. Frequency of inspections of gas turbine installations by a certified MGTI will be scheduled for execution by the Commanding Officer using the Gas Turbine Assessment Class Maintenance Plan tasks issued by SURFMEPP. All Gas Turbine Readiness Review assessments and inspection will be conducted per references (a), (b) and (c), established PMS and GTB Inspection requirements as listed in reference (d). ISIC or TYCOM guidance may be solicited to avoid scheduling conflicts.

23.4.2 Pre-Planned Major Maintenance Availability.

a. Prior to planned Depot level maintenance availabilities, a routine inspection must be performed on all ship's gas turbine engines to determine maintenance or overhaul requirements. Where possible TYCOM or ISIC must ensure there is adequate time set aside in the ships employment schedule to support these inspections.

b. Results of this inspection will be entered into the Current Ship's Maintenance Project (CSMP) and will enable the ship to submit work requests for work accomplishment by FMAs or industrial activities during Planned Major Maintenance Availabilities.

23.4.3 Pre-Deployment.

a. Gas turbine engines must be inspected by a certified MGTI prior to deployment. A deployment is defined as scheduled operational commitments of 90 days or greater away from a ship's homeport.

b. Discrepancies resulting from this inspection will be entered into the ship's CSMP. Noted discrepancies provide the basis for but do not limit the work to be accomplished by Ship's Force or FMAs prior to deployment. A follow-up inspection may be scheduled 30 to 60 days before deployment or as operational commitments dictate to verify the status of repairs. The requirement to conduct a follow-up inspection will be determined by the MGTI. Follow-up inspections will be conducted when possible by the same MGTI who conducted the initial inspection.

23.4.4 Gas Turbine Bulletin Inspections.

a. GTB Inspections are determined by engine operating hours and require scheduling 60 days prior to the inspection. Operating hours, updated monthly in the Marine Gas Turbine Information System WEBLOG via reference (e), are the engine hours used to determine inspections.

b. Reference (d) lists all Technical Directives and their revisions and amendments.

c. When GTB inspections are required coincidence with pre-availabilities or pre-deployments, they should be coordinated with pre-availability or pre-deployment inspections to minimize duplicate effort and optimize inspections.

d. Any ship not able to complete required GTB Inspections within the required periodicity will request a DFS from the TYCOM.

23.4.5 Casualties. Ship's Force must conduct the initial investigation after a casualty following current directives. If Ship's Force is unable to identify the cause of the casualty or repairs required, a certified MGTI or an RMC Technical Representative must be requested to verify the nature of the casualty, investigate for cause and make recommendations for repairs. This may be a partial inspection covering failed areas only. However, the MGTI must ensure the inspection is sufficient in scope to determine the full extent of damage and necessary repairs.

23.5 REQUESTING PROCEDURES.

a. Gas turbine inspections are to be scheduled by the ship per PMS, GTBs or ISIC or TYCOM directives.

b. Gas turbine inspections are actively managed by SURFMEPP utilizing the Class Maintenance Plan. All routine gas turbine inspections will be pushed by SURFMEPP to the ship's CSMP as part of the ship's BAWP. SURFMEPP will also push non-routine gas turbine inspections as requested by TYCOM or the Maintenance Team.

c. Once the Work Notification is available in the CSMP, the Maintenance Team may schedule the requisite inspection(s). Scheduling requests should be submitted a minimum of 60 days prior to the desired dates of routine inspections.

d. Gas turbine inspections may be conducted in conjunction with assessment programs scheduled by the ISIC or TYCOM.

23.6 PREPARATION FOR INSPECTION. The MGTI must send out a preparation package 30 days prior to the inspection.

23.7 INSPECTION PROCEDURES.

23.7.1 Post Casualty Inspections. For post casualty inspections, the Commanding Officer, Engineer Officer, Main Propulsion Assistant (MPA) and leading Gas Turbine Technician (GS) should meet with the inspector on his arrival and, where possible, the Engineer Officer, MPA and leading GS should accompany the MGTI during the inspection.

23.7.2 Pre-Availability Inspections. For pre-availability inspections, pre-deployment inspections, GTRR and Assessments, the MPA and the leading GS should meet and where possible, accompany the MGTI during the inspection.

23.8 INSPECTION CRITERIA. Deficiencies and out-of-specification readings or observances noted should be immediately corrected or recorded as specified in the applicable bulletin(s) and re-inspections scheduled. Three categories of deficiencies must be recorded per the guidance of paragraphs 23.8.1 through 23.8.4. Document the assessment finding of Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), per volume VI, chapter 42, of this manual.

23.8.1 Repair Before Operating. A Repair Before Operating (RBO) is any condition existing that, if left unattended, would definitely pose a hazard to personnel safety. RBOs may not be departed via DFS, with exception as noted. If there is not an immediate or near future danger to personnel, the discrepancy must be assigned as severely degraded with major operational restrictions in accordance with paragraph 23.8.2 and instruction. Only a MGTI that is currently certified may issue an RBO. RBO deficiencies require re-inspection by a MGTI that is currently certified after repairs and before the gas turbine engine is operated. The following items are examples of RBO items and **are not to be construed as a complete list**.

a. Conditions existing that if left uncorrected would definitely result in an uncontained failure of the engine.

b. Continuous Fuel Oil leak with puddling that poses risk of ignition.

c. Loss of structural integrity in intake or exhaust ducts which may result in personnel injury.

d. Exhaust duct failure(s) that may allow exhaust gas leakage into ship compartments. References (c), (g), and (h) provide guidance for defining leaks (major DFS eligible).

e. Non-functional over-speed trips.

f. Lube oil leaks that exceed maximum limits in GGTB 17.

g. Any disk cracks.

23.8.2 Severely Degraded. A severely degraded condition is any condition existing that if left unattended, would pose a hazard to equipment that may result in catastrophic failure rendering the gas turbine inoperable but does not pose a hazard to personnel safety. Any condition which is designated as severely degraded requires a Major DFS. A gas turbine with a severely degraded condition cannot be operated until it is corrected or repaired and re-inspected unless it has been properly approved as a Major DFS by the Technical Warrant Holder. The following items are examples of severely degraded items and are not to be construed as a complete list.

a. Intake duct cracking that may allow foreign debris into inlet airstream.

b. Blow-In-Door (BID) discrepancies resulting in unfiltered air entering the combustion air gas path as detailed in GGTB 27.

c. Loose paneling, insulation, fasteners or other mechanical features in the inlet.

d. Bent, broken or binding Variable Stator Vane (VSV) actuation arms.

e. Compressor blade tip clang.

f. Non-functional compressor surge control bleed valves.

g. Casing cracks.

h. Bearing debris found within lube oil sumps.

23.8.3 Major Deficiencies. This finding is made when major problems exist, but the engine is still operable with restrictions. Any deficiency that has been noted as major must require either immediate correction within 30 days of discovery or a report must be submitted and updated quarterly to the TYCOM per paragraph 23.9. until the deficiencies are corrected or resolved or brokered by the Maintenance Manager. Major deficiencies require re-inspection, by an MGTI that is currently certified, after repairs and before the gas turbine engine is operated. This requirement does not alter the normal Casualty Reporting or DFS reporting requirements. The following items are examples of major items and are not to be construed as a complete list.

a. Improperly rigged or worn VSVs and bushings.

b. Chafed fuel oil or lube oil lines. (Beyond serviceable limits of GGTB 6)

c. Stall (no tip clang)

d. Bent or damaged blades.

e. Loose or missing casing split line bolts.

f. GTB inspection periodicity or time limits exceeded.

g. Combustor liner out of specifications.

h. Degraded turbine shrouds beyond serviceable limits.

i. Eroded turbine section beyond serviceable limits.

j. Vertical or side mount out of specifications.

k. Enclosure shock mounts exceeding GGTB 10 limit.

l. Fuel nozzles not maintained per PMS or GTB.

m. Turbine thermocouples not per technical manual requirements.

n. Fuel nozzles not maintained per PMS.

o. Broken or discrepant electrical harness cannon plugs on engine controller or sensor systems.

p. Foreign Object Damage screen with cracks or missing wires that are beyond serviceable limits.

q. Excessive compressor or bleed air leaks.

r. Non-fuel hydraulic system leaks.

s. Continuous vibrations exceeding alarm limits (not to include alarms that occur during transient operations).

23.8.4 Minor Deficiencies.

a. Deficiencies exist which do not adversely affect reliability, performance or safety of the engine or operating personnel. These deficiencies, if not corrected, could result in gradual deterioration of the engine, reduced efficiency and eventually major repairs.

b. Gas turbine engine can be operated with no restrictions. Discrepancies must be entered in the CSMP and scheduled for correction at earliest opportunity.

23.9 INSPECTION RESULTS. Upon completion of inspections, the MGTI will brief the Commanding Officer, Engineer Officer, MPA and senior GS of the results. Provide information for inclusion into the ships CSMP.

a. Any RBO will be noted in Block 35 of the 2-Kilo.

b. The engine cannot be started until RBO repairs are complete and re-inspected by an MGTI.

c. A formal GTRR report must be submitted to the TYCOM Code N43 via the Navy Propulsion web site (https://weblog.navy.mil). All Gas Turbine GTRR reporting to be in compliance with the latest revision of reference (b).

CHAPTER 24

WOOD HULLED SHIPS AND CRAFT

REFERENCES.

(a) NAVSEA S9086-DA-STM-000 - NSTM Chapter 100 (Hull Structures)
(b) NAVSEA S9100-AD-MMA-010 - MCM-1 CLASS Manual for Structural Repair of MCM-1 Class Ships
(c) COMDTPUB P16700.4 - Navigation and Vessel Inspection Circular Number 7-95
(d) NAVSEA DWG 631-8629935 – Yard Patrol 676 CL Paint Schedule

24.1 PURPOSE. This chapter contains basic overview of the inspection of structures on wood-hulled or wooden-decked ships and craft and preventive measures to avoid wood decay. Modern wooden boats and craft are built with wood beams, frames, and planking sealed in Glass Reinforced Plastic (GRP). Traditionally wooden boats did not use Fiberglass Reinforced Plastic and thus maintenance can be very different. References for class specific maintenance procedures are provided within.

24.2 WOOD DECAY.

24.2.1 Primary Causes. Wood decay is caused by a fungus growth, which breaks down the cell structure within the wood. This fungus thrives in fresh water, but its growth is significantly retarded by salt water. Wood decay generally occurs in those spaces which are poorly ventilated and where fresh water has gained access. Poor drainage, allowing fresh water to stand, even in small amounts, is particularly hazardous. The primary causes of wood decay found in ships using wood for hulls, decking and structures are identified as:

a. Insufficient ventilation and air circulation especially in spaces plagued by dampness and high humidity (i.e., chill room platforms and areas around freshwater tanks).

b. Obstructed drainpipes, scuppers, limbers, and drain holes.

c. Poorly maintained deck seams, especially around plywood decking and deckhouse areas.

d. Depressions in the deck from sanding which allows fresh water to stand.

e. Leaking plumbing especially in heads, water closets, and food preparation areas.

24.2.2 Recognition. Decay in the deck and hull structure is often concealed and hard to detect. It is usually not recognizable by visible fungus except in joints between surfaces. Decay may be suspected if paint coating is discolored or swollen in appearance, the wood surface is cupped. The affected wood has a pronounced stringy, fibrous appearance. Thoroughly decayed wood is brittle which, when dry, breaks easily across the grain with a distinct brash fracture and may crumble into powder. Black stains spreading along the grain from ferrous metal fastenings are usually a result of chemical reactions instead of from decay fungi. Testing procedures for suspected decay areas are detailed in reference (a).

24.2.3 Preventive Measures. Detailed preventive measures are described in reference (a). General preventive measures for the reduction of wood decay are identified in the following paragraphs, and should be accomplished by Ship's Force.

a. Correct or remove all interference with complete water runoff.

b. Repair freshwater leaks in plumbing drains and freshwater supply systems.

c. Maintain ventilation system in proper operation. Ensure ventilation system filters are kept clean, maintained clear of all foreign material, and ventilation terminals remain open.

d. Carefully maintain deck seams, especially around plywood decking, deckhouse, hull fittings and foundation areas.

e. In fair weather, open hatches and deck plates to supplement the air circulation.

f. Remove wet dunnage or shoring in below deck spaces and permit to dry.

g. Avoid heavy buildup of paint.

h. Check bilges and accessible voids for standing fluids once each watch. Identify and correct any leaks and promptly remove any fluids. Periodically operate all bilge Limber Chains and clear all obstructions and debris in the bilges. Wooden hulled craft are designed to operate with dry bilges. Prolonged contact with fluids will result in wood swell, which can lead to external glass reinforced plastic delamination, planking damage, and machinery misalignment.

i. During inclement weather or wash-down events, inspect and identify existing leaks into the ship. Back trace the water leak to the point source, and repair the deficiency at the source. Do not apply sealer to the interior side of a freshwater leak; this will allow the water to pool and further damage the wood.

24.3 CLASS SPECIFIC MAINTENANCE.

24.3.1 Mine Countermeasure Class Vessels.

a. The Mine Countermeasure (MCM) Class was developed using modern wooden ship construction methods. The basic hull structure is formed of laminated wooden members that use high strength glue, bolts and screws to be held in position. The exterior hull and all weather-exposed decks are covered by GRP. The GRP's primary role is to protect the hull from marine borers below the waterline, and prevent freshwater intrusion into the wooden structure above the waterline. Reference (b) provides instruction for temporary and permanent repairs of the wooden structural components of the MCM Class ships, and the GRP sheathing. Pertinent chapters include repair of GRP in both waterborne, and dry dock situations, Deck Planking, Hull Frames, Deck Beams and Longitudinal Girders, Deck House and Watertight Bulkheads, and the embedded EMI screen on the 02 level deckhouse and deck.

b. For shipboard repair of wooden structural members and GRP, MCM class vessels are to use West System two-part epoxy, or the same adhesive (typically Resorcinol glue) as specified in original construction drawings. Where Reference (b) is silent, literature to the use of West System epoxy for boat building and repair is readily available from

the manufacture's website, and customer assistance line. Resorcinol glue requires significant clamping force on the joining wood members to provide a proper bond, and has no gap filling capabilities. For these reasons, Resorcinol glue is currently not specified for shipboard repairs. Wood putty, spackle, marine sealants (including 3M Products 4200 and 5200) or other wood glue style products are not authorized for use as adhesives or fairing compounds of wooden structural members unless they are specified in the as-built configuration drawings.

24.3.2 Yard Patrol Class Vessels. The Yard Patrol Class was developed using modern wooden ship construction methods. The basic hull structure is formed of laminated wooden members that use high strength glue, bolts and screws to be held in position. The exterior hull and all weather-exposed decks are covered by GRP. The GRP's primary role is to protect the hull from marine borers below the waterline, and prevent freshwater intrusion into the wooden structure above the waterline. Reference (c) and (d) provides general guidance for temporary and permanent repairs of the wooden structural components of the Yard Patrol Class ships, and the GRP sheathing.

24.3.3 USS *Constitution*. The USS *Constitution* is the world's oldest commissioned naval vessel still afloat. This one-of-a-kind vessel is maintained by a dedicated team at Naval History & Heritage Command Detachment Boston.

(d) OPNAVINST 5100.23 - Navy Occupational Safety and Health (NAVOSH) Program Manual

LISTING OF APPENDICES.

A Gas Free Engineering Program Assessment Sheet

25.1 PURPOSE. To define Fleet Gas Free Engineering (GFE) inspection policy and oversight policy.

25.2 SCOPE. This chapter is applicable to all Gas Free service provided by all personnel (military and civilian) assigned to a Naval Maintenance Facility (NMF), Navy ship or submarine. NMF is defined as Regional Maintenance Center (RMC), Regional Support Group (RSG), Ship Repair Facility (SRF), and Department of the Navy Shipyards.

25.3 DISCUSSION. The correct application of GFE programs is varied and may be confusing to individuals unfamiliar with references (a) through (d).

a. During ship repair operations including shipbuilding, ship repair, ship breaking, and related employment (related employment means any employment performed as an incident to or in conjunction with ship repairing, shipbuilding, or ship breaking work, including, but not restricted to, inspection, testing, and employment as a watchman).

b. Table 25-1 shall be used to identify applicable requirements for the entity performing work.

Table 25-1

Entity performing ship repair operation and location of ship during those operations	**NAVSEA SAF-010**	**NSTM 074 V3**	**OSHA 29 CFR 1915**	**Applicable guidance**
Submarine Ship's Force Personnel entry into confined spaces including all tanks, voids, battery wells, missile tubes and reactor compartments when located at an NMF	X			• In port GFE services must be obtained from the local supporting NMF while pier side. If in port without a supporting NMF, the Medical Department Representative (MDR) may check spaces gas free only for submarine personnel. • The MDR shall not, under any

Entity performing ship repair operation and location of ship during those operations	NAVSEA SAF-010	NSTM 074 V3	OSHA 29 CFR 1915	Applicable guidance
				circumstances, provide gas free services to Department of War (DoW) or contractor civilian personnel in port.
Submarine Ship's Force personnel entry into confined spaces, including all tanks, voids, battery wells, missile tubes and reactor compartments when underway		X		In accordance with reference (b), on submarines, the MDR serves as the GFE. The MDR's GFE services are strictly limited to underway periods.
Submarine Ship's Force Personnel entry into confined spaces including all tanks, voids, battery wells, missile tubes and reactor compartments when at a private shipyard	X		X	When pierside in a private shipyard, GFE services will be obtained from an NFPA marine chemist by Ship's Force through the governing contract with the private shipyard. If such support services are not provided for in the contract, Ship's Force shall obtain required GFE services through the local supporting NMF.
Surface ship Ship's Force entry into confined spaces while ship is at a Naval Station berth.		X		For entry into confined spaces for inspections, preventive maintenance, and access to stowage reference (b) requirements will be followed or the ship may obtain NMF GFE/National Fire Protection Agency (NFPA) marine chemist services.
Surface ship Ship's Force hot work while ship is at a Naval Station berth.		X		Follow reference (b) requirements or obtain NMF GFE/NFPA marine chemist services, as required below: • Hot work certifications will not be issued to conduct work where DoW civilians or contractors are working in the same space or may be affected by the hot work. The ship's GFE shall coordinate hot work with NMF GFE and/or NFPA marine chemists in advance to ensure awareness and coordination of Ship's Force work. The ship's GFE shall follow NMF

Entity performing ship repair operation and location of ship during those operations	NAVSEA SAF-010	NSTM 074 V3	OSHA 29 CFR 1915	Applicable guidance
				GFE and NFPA marine chemist guidance as appropriate. • When pier side, ship's force shall not certify hot work within, on or immediately adjacent (through heat transfer, spark, or hot slag contact) to: 1. Spaces that contain or last contained combustible or flammable liquids or gases. 2. Fuel tanks that contain or last contained fuel.
		X		3. Pipelines, heating coils, pump fittings or other accessories connected to spaces that contain or last contained fuel. • When in a port location without services from NMF GFE or NFPA marine chemist, the ship's GFE will seek approval to conduct certification for emergent hot work operations referenced above from the applicable Type Commander/echelon III N43. • Ship's Force afloat Gas Free Engineer shall not provide GFE services to DoW or contractor civilian personnel under these circumstances. • With permission of the local supporting NMF or Marine Chemist, if conditions remain unchanged from the environment described on certifications the ship's GFE may maintain certificates initially issued by NMF GFE or NFPA certified marine chemist.

Entity performing ship repair operation and location of ship during those operations	NAVSEA SAF-010	NSTM 074 V3	OSHA 29 CFR 1915	Applicable guidance
				If conditions change work must be stopped and recertification obtained by originating NMF GFE or NFPA marine chemist.
Surface ship Ship's Force entry into confined spaces or hot work operations when in a private shipyard.	X	X	X	• GFE services for operations noted will be obtained from the private shipyard through the governing contract with the private shipyard. • If such support services are not provided for in the contract, Ship's Force shall obtain required GFE services through the local supporting NMF or NFPA certified marine chemist.
Surface ship Ship's Force entry into confined spaces or hot work operations when in a Naval shipyard or Naval Ship Repair Facility.	X	X		• Follow reference (a) requirements. • While at a NMF, upon written approval from the NMF GFE or MCSPM, Afloat GFE Personnel may issue Navy Gas Free Certification and Test Logs for Ship's Force personnel in accordance with reference (b).
Tender, uniformed personnel, working on the tender or tended vessel not in a private shipyard, Naval shipyard or Naval Ship Repair Facility		X		Tenders shall follow reference (b) for all repair work on the tender or on tended vessels.
Tender, uniformed personnel, working on a tender or tended vessel while in a Naval shipyard or Naval Ship Repair Facility	X			When work is conducted while vessels (tender/ship/submarine) is at an NMF, reference (a) becomes the governing instruction. See the requirements for "Ship's Force entry into confined spaces or hot work operations when in a Naval shipyard or Naval Ship Repair Facility" identified above
Tender, uniformed personnel, working on the tender or			X	When work is conducted while vessels (tender/ship/submarine) is at private

Entity performing ship repair operation and location of ship during those operations	NAVSEA SAF-010	NSTM 074 V3	OSHA 29 CFR 1915	Applicable guidance
tended vessel while in a private shipyard.				shipyard reference (c) is the governing instruction. See the requirements for "Ship's Force entry into confined spaces or hot work operations when in a private shipyard" identified above.
DoW civilians and NMF uniformed personnel performing any ship repair operations including hot work and entry into confined or poorly ventilated enclosed spaces regardless of the geographical location of the ship.	X			• NMF personnel shall follow reference (a) requirements. • In accordance with reference (d) Navy shore non-maritime commands performing ship repair operations shall comply with reference (a). Examples of Navy shore non-maritime commands performing ship repair operations include: 1. Assault Craft Unit personnel conducting landing craft repair work at its shore repair activity. 2. NAVAIR personnel performing hot work or confined space entry shipboard. 3. NSWC personnel entering confined spaces for inspections. 4. NSWC personnel using flammable materials to perform hull patching onboard ships.
Non-DoW Contractors (including foreign contractors) performing any ship repair operations including hot work and entry into confined or potentially dangerous atmospheres within U.S. territorial waters.			X	• Non-DoW (contractor) personnel: contractor personnel conducting ship repair work on ships located inside U.S. territorial waters are required to follow reference (c) requirements whether the ship is in a government or privately owned ship repair facility. • NSAs shall ensure all contracts include reference (c) requirements and ensure contractor compliance.
Non-DoW Contractors		X	X	Provisions in reference (b) allow the

Entity performing ship repair operation and location of ship during those operations	NAVSEA SAF-010	NSTM 074 V3	OSHA 29 CFR 1915	Applicable guidance
(including foreign contractors) performing any ship repair operations including hot work and entry into confined or potentially dangerous atmospheres outside U.S. territorial waters.				shipboard GFE to provide GFE services to contractor personnel when the ship is located outside U.S. territorial waters. These provisions are intended solely as a last resort to accomplish mission and time critical work and are not intended to relieve contractors of the obligation to provide their own services in accordance with reference (c) whenever and wherever possible. Until this distinction can be formally addressed, the contracting office shall notify Ship's Force whenever a contractor cannot provide their own GFE services. Ship's Force will then seek applicable Type Commander/Echelon III N43 approval on a case-by-case basis prior to providing GFE services to contractor personnel (both foreign and U.S. nationals) outside U.S. territorial waters.

Notes:

1. **NMF is defined as Regional Maintenance Center (RMC), Regional Support Group, Ship Repair Facility, Department of the Navy Shipyards.**
2. **Contractor work onboard naval vessels outside U.S. territorial waters: Provisions in reference (b) allow the shipboard Gas Free Engineer to provide GFE services to contractor personnel when the ship is located outside U.S. territorial waters. These provisions are intended solely as a last resort to accomplish mission and time critical work and are not intended to relieve contractors of the obligation to provide their own certified GFE services whenever and wherever possible. Until this distinction can be formally addressed, the contracting office must notify Ship's Force whenever a contractor cannot provide their own GFE services. Ship's Force will then seek applicable Type Commander or Echelon III N43 approval on a case-by-case basis prior to providing GFE services to contractor personnel (both foreign and U.S. nationals) outside U.S. territorial waters.**
3. **Example: An Assault Craft, conducting landing craft repair work at its shore repair activity.**
4. **When an RMC is conducting work on a naval vessel that is located pierside, NMF personnel must follow reference (a) requirements.**

5. a. Ship's Force should follow reference (b) requirements or may obtain NMF GFE or National Fire Protection Agency (NFPA) marine chemist services, if necessary, when pierside for Ship's Force entry into confined and enclosed spaces for inspections, preventive maintenance, and access to stowage.

b. Ship's Force should follow reference (b) requirements or obtain NMF GFE or NFPA marine chemist services, if necessary, when pierside for hot work certifications for Ship's Force work in confined and enclosed spaces, except as noted in paragraph c. of this note. Ship's Force will not provide hot work certification following reference (b) requirements to conduct work where DoW civilians or contractors are working in the same space or may be affected by work conducted by Ship's Force. The afloat Gas Free Engineer must coordinate hot work aboard ship with NMF Gas Free Engineers or NFPA marine chemists aboard ship in advance of specific Ship's Force evolutions to ensure awareness and coordination of Ship's Force work. The afloat Gas Free Engineer must follow NMF Gas Free Engineer and NFPA marine chemist guidance as appropriate.

c. Ship's Force, when pierside, must not certify hot work operations within, on or immediately adjacent (through heat transfer, spark or hot slag contact) to:

(1) Spaces that contain or last contained combustible or flammable liquids or gases.

(2) Fuel tanks that contain or last contained fuel.

(3) Pipelines, heating coils, pump fittings or other accessories connected to spaces that contain or last contained fuel.

d. Ship's Force, when pierside, must obtain support services for hot work operations listed in paragraph c. of this note through the local supporting NMF. When pierside in a private shipyard, optional GFE services for operations in paragraphs a. and b. of this note and required GFE services for operations in paragraph c. of this note will be obtained from an NFPA marine chemist by Ship's Force through the governing contract with the private shipyard. If such support services are not provided for in the contract, Ship's Force must obtain required GFE services through the local supporting NMF.

e. When in a port location without services from NMF GFE or NFPA marine chemist, the afloat Gas Free Engineer will seek approval to conduct certification for emergent hot work operations referenced in paragraph c. of this note from the applicable Type Commander or Echelon III N43. Ship's Force afloat Gas Free Engineer must not provide GFE services to DoW or civilian contractor personnel under these circumstances.

f. With permission of the local supporting NMF, if conditions remain unchanged from the environment described on the confined space entry tag, afloat Gas Free Engineer may maintain certificates initially issued by NMF Gas Free Engineer or NFPA certified marine chemist referenced in paragraphs a., b. and d. of this note. If conditions change, immediately evacuate space and obtain recertification by originating NMF Gas Free Engineer or NFPA marine chemist.

g. Submarine personnel must obtain GFE services from the local supporting NMF while pierside.

6. Tenders must follow reference (b) for all repair work, on the tender itself or ships or submarines, except when the work is conducted while the vessel (tender, ship or submarine) is at an NMF at which point reference (a) becomes the governing instruction. Locations where in port GFE services are not available ensure that entry into, or hot work in or on fuel tanks, spaces in which fuel tank vents terminate, piping or equipment servicing such spaces or other confined spaces known to contain flammable fuels or fuel vapors is permitted only if approved by the Commanding Officer (CO) for each occasion as specified in paragraph 074-19.4.b of reference (b). Treat tanks as Immediately Dangerous to Life or Health and follow procedures in paragraph 074-19.14 of reference (b).

7. Non-DoW (contractor) personnel: contractor personnel conducting ship repair work on ships located inside U.S. territorial waters are required to follow reference (c) requirements whether the ship is in a government or privately owned ship repair facility. RMCs must ensure all contracts include reference (c) requirements and ensure contractor compliance.

25.4 OVERSIGHT. To ensure compliance with reference (b), the afloat GFE program on surface ships, aircraft carriers and submarines must be evaluated using the following requirements:

a. The CO must require the safety officer to evaluate the GFE program at least annually as outlined in reference (b). The safety officer, Damage Control Assistant, and submarine Medical Department Representative must use Appendix A, Gas Free Engineering Program Assessment Sheet, to conduct the annual evaluation. A copy of this report will be sent to the Type Commander (TYCOM) Safety Officer.

b. The TYCOM Safety Officer must perform an annual evaluation of the afloat GFE program and provide a report to the Fleet N43 during the first quarter of the calendar year.

(1) TYCOM, as part of the annual evaluation, must collect and analyze data from assessment results from Safety Center Surveys, Board of Inspection and Survey (INSURV) material inspections, Afloat Training Group (ATG) program assessments, crew certification and Immediate Superior In Command (ISIC) assessments.

(2) TYCOM must also spot check afloat GFE programs using Appendix A to include in the annual self-evaluation.

c. Submarine ISICs, INSURV, ATG, and TYCOM may use Appendix A to support scheduled assessments of afloat GFE programs. Table 25-2 outlines applicable sections to be assessed. Each assessing agent will have the option of expanding their assessment to other sections, if they deem necessary, based on any developing deficiency trends during the assessment. The assessing agent may elect to accept satisfactory results of another recent assessment, if it was performed within the last 3 to 6 months. Section 9 of Appendix A is the performance section that can be observed as a stand-alone event or in conjunction with planned unit drills.

Table 25-2

Periodicity	Assessing Agent	Section
Basic Phase of the Fleet Response Training Plan	ATG	Section 1, 2, 3, 5, 6, 9
Material Inspection (36 Months)	INSURV	Section 1, 2, 3, 5, 6, 9
Follow up based on assessment results	TYCOM **or** ISIC	All Sections

d. Suggested changes or updates can be made to the TYCOM Safety Officer.

APPENDIX A

GAS FREE ENGINEERING PROGRAM

ASSESSMENT SHEET

Purpose: This assessment tool is comprehensive because it reviews the GFE Program administrative requirements, training records, equipment usage, GFE personnel performance and gas free evolutions.

Directions: This evaluation will take approximately 4 to 6 hours to complete. Review the assessment sheet in its entirety before starting. To ensure a complete and thorough assessment, applicable reference material, training records, 3-M documentation, equipment and coordinated drill observation with Ships Force personnel should be pre-arranged prior to starting the evaluation.

a. If a line item requirement is met, annotate "yes" in the appropriate block.

b. If a line item is not met, annotate "no" in the appropriate block.

c. If a line item does not apply on the check sheet, depending on ship configuration, place not applicable (N/A) in the appropriate block.

NOTE: THE REFERENCES IDENTIFIED BELOW ARE SPECIFIC TO THIS APPENDIX, NOT THE MAIN BODY OF THE CHAPTER.

(074-18.10)	Does the Safety Officer evaluate the Gas Free Engineering program annually?			
(074-18.10)	Did the evaluation include recertification of GFEP?			
(074-18.10)	Did the Safety Officer evaluate the CPR program for compliance and effectiveness?			
(074-18.10)	Does the Gas Free Engineer and Safety Officer maintain a record of annual evaluation results?			
Section 4: Gas Free Certification – Reference (a)				
Review annual evaluations. Safety Officer and Afloat Gas Free Engineer must have copies of these evaluations.	Did the evaluation identify deficiencies of the program? If so, was a plan of action developed to rectify the deficiencies?			
(074-18.15)	Is a gas free certificate issued for all confined space inspections or testing?			

Reference	Section	Surface Ship	Aircraft Carrier	Sub-marine
(074-18.16)	Are the certifications maintained for a period no less than 12 months?			
(074-18.16) Appendix C of 074	Is the Gas Free Engineering notebook being maintained?			
(Section 20) Appendix D of 074 **If hot work was performed during the gas free evolution, validate through site visits or review a random sampling of certificates maintained by the Gas Free Engineer to assess hot work compliance.**	Is the gas free certification accurately filled out? Does the certification contain the following information at a minimum: - Date and time of test - Date and time of certificate expiration - Date and time of retesting and update of certificate - Signature of GFEP performing tests or retests, as applicable. - Name of the command - Location and identification of the space - The type of operation for which the certificate is requested such as hot work, spray painting, etc. - Category of conditions found to exist (e.g., “Safe for Personnel - Not Safe for Hot Work”) - Requirements for conditions or operations within the space - Special conditions, as appropriate - Results of the test performed			
(074-20.5)	Are there any abnormalities of testing results? Have follow-up actions been taken on the results?			
(074-20.2, 074-20.3 and 074-20.4)	Are GFEP issuing certificates for work they are authorized to? Did the GFE or GFEA delegate testing to GFEPOs? Were all the requirements for delegating met?			
(074-18.12.B)	While inport did S/F use a NMF Gas Free Engineer or NFPA Marine Chemist to certify hot work operations within, on or immediately adjacent to (review GFE certificates):			

Reference	Section	Surface Ship	Aircraft Carrier	Sub-marine
	(1) Spaces that contain or last contained combustible or flammable liquids or gases. (2) Fuel tanks that contain or last contained fuel. (3) Pipelines, heating coils, pump fittings or other accessories connected to spaces that contain or last contained fuel.			
(074-18.12.B)	Did S/F seek support services from local NMF for hot work operations on these spaces?			
(074-18.12.C)	Did the afloat Gas Free Engineer consult with NMF Gas Free Engineers or NFPA marine chemists where DoW civilians or contractors are working in the same space or may be affected by work conducted by Ship's Force?			
(074-19.14)	Has the command ever entered into Immediate Danger to Life and Health space? If so, was it under emergency conditions?			
	Did the CO authorize the opening and entry into Immediate Danger to Life and Health spaces?			
(074-19.5)	Did personnel working in a confined space have an observer or an attendant outside the space?			
	Did outside attendants maintain communication with personnel entering or working inside confined spaces?			
Section 5: Command Training – Reference (a)				
(074-18.9)	Have all hands received gas free engineering program familiarization upon reporting aboard and annually thereafter?			
(074-18.9)	Are training records maintained by			

Reference	Section	Surface Ship	Aircraft Carrier	Sub-marine
	the division officer or in R-ADM? MDR?			
Appendix B	Does the lesson plan cover the key elements of Appendix B for command personnel on the GFE program?			
(074-25.7) **Review drill packages**	Does the Gas Free Engineer or Gas Free Engineer Assistant provide confined space rescue training to personnel participating in confined space rescue at least semi-annually?			
Section 6: Gas Free Engineering Equipment – Reference (a)				
Reference (c) (Refer to ships Damage Control Repair Station Allowance Equipment List (AEL) and equipment AEL for total number of kits required.)	Is the gas free equipment quantities maintained per applicable AEL? (Compare the Damage Control Repair Station shortage list against inventory list.) Document shortage in remarks section.			
Submarine: Refer to equipment AEL	Does the shortfall list have current requisition numbers assigned?			
(074-27.14.b) Spot check calibration gas cylinders	Is the calibration gas within the expiration date?			
Spot-check chemical detection tubes.	Are there any expired chemical detection tubes?			
Detection Equipment (references (d), (e), (f) or (g)).	Review PMS 13-week file. Was the maintenance performed following applicable MRCs? Any documented discrepancies?			
SAR or SCBA (references (h), (i) or (j))	Review PMS 13-week file. Has the maintenance been performed following the applicable MRCs within periodicity and when required? Any documented discrepancies?			
Review SAR, BAC or SCBA Material Check	Is the ASA check sheet filled out and is there evidence of a quarterly			

Reference	Section	Surface Ship	Aircraft Carrier	Sub-marine
Sheet (reference (k))	review by DCA or LCPO? Are there any UNSAT marks, if so, is there any corrective action(s) documented (i.e., CSMP entry, 8 o'clock report entries)?			
Section 7: JFMM Requirements for Inport GFE Operations - COMUSFLTFORCOMINST 4790.3				
074-18.14 Or COMUSFLTFORCOMINST 4790.3 (Volume IV Chapter 25)	Did SF conduct GFE services for contractor personnel when the unit was outside U.S. territorial waters? Was this specified in the contract? Did the unit obtain TYCOM or Echelon III N43 approval prior to conducting GFE services?			
	When in a port location without services from NMF Gas Free Engineer or NFPA marine chemist, did the afloat Gas Free Engineer seek approval to conduct certification for emergent hot work operations from the Type Commander Echelon III N43?			
	Did submarine personnel obtain GFE services from the local supporting NMF while pierside?			
	Did the tender, in a port where GFE services are not available, ensure that entry into, or hot work in or on fuel tanks, spaces in which fuel tank vents terminate, piping or equipment servicing such spaces or other confined spaces known to contain flammable fuels or fuel vapors was approved by the Commanding Officer?			
Section 8: Hot Work Annex – Reference (a)				
(074-22.3) Cleaning or ventilating for Hot Work (Field observation or	Check for confined spaces where hot work is being performed, was the space tested, inspected, emptied of flammable cargo, cleaned and			

Reference	Section	Surface Ship	Aircraft Carrier	Sub-marine
certificate review)	ventilated and certified Safe for Hot Work?			
	Are hot work sites always inspected for combustible or flammable materials before hot work is authorized?			
	If combustible materials cannot be removed from a hot work site, what is done?			
	What method of venting is used to prevent explosions?			
(074-22.4) Fire Watch (Field observation or certificate review)	Was there a fire watch? Was the fire watch equipped with extinguishing equipment? Did the fire watch have the right personal protective equipment? Was the fire watch properly staged to extinguish a fire if it was to occur? Was there adequate number of fire watches?			
(074-22.6) Boundary Spaces (Field observation or certificate review)	Prior to hot work, how are potential adjacent space hazards controlled?			
(074-22.6.2) Pipes, Tubes, Coils (Field observation or certificate review)	Are pipes, tubes, coils or similar items which service, enter or exit a confined space flushed, blown, purged or otherwise cleaned and certified Safe for Hot Work before the performance of hot work on such items?			
	Are valves to pipes, tubes or similar items closed, pipes blanked off and tagged out?			
(074-22.6.3) Hot work on Closed Containers or Structures (Field observation or	Are hollow structures, drums, containers, jacketed vessels or similar items cleaned, flushed, purged, inerted, filled with water or otherwise made safe prior to hot			

Reference	Section	Surface Ship	Aircraft Carrier	Sub-marine
certificate review)	work?			
	Are the items inspected, cleaned, tested and certified before performing hot work?			
	Before hot work, are items which are closed and subject to pressure build-up vented from any application of heat?			
	Is the method of venting selected to prevent ignition or explosion during the venting process?			
(074-24.3)	Are the requirements for Gas Inerting operations met? Are the requirements of 074-24.3.1 followed when vent holes must be drilled?			
Section 9: Gas Free Engineering Performance (This can be assessed as a standalone event or in conjunction with planned drills.) – Reference (a)				
(074-27.9.1) Pre-Check of the Four-Gas Analyzer	Was the four-gas analyzer's battery charged and all the components inspected before use?			
	Was the sampling probe visually inspected to verify that the water barrier, filter, and O-ring in place?			
(074-27.13) Four Gas Analyzer Calibration	Before calibration, is the Four Gas Analyzer zeroed in a fresh air environment?			
	Were the four gas analyzers calibrated before each day's use?			
(074.L.4) Dreager Pump	Was the rapid opening time test performed?			
	Was the 30-minute leak test performed for model 21/31 or 15 minutes for Accuro? Was the counter zeroed?			
(074 25) Emergency Rescue Procedures (This will	Were the procedures followed as outlined in Section 25? Annotate specific discrepancies in Remarks

LISTING OF APPENDICES.

A INSURV Material Inspection Plan of Action and Milestones

26.1 PURPOSE. To define the responsibilities and provide guidance for the preparation and conduct of a Board of Inspection and Survey (INSURV) Material Inspections (MI).

26.1.1 Scope. The policies and actions required by this chapter are applicable to all ships of the U.S. Navy.

26.1.2 Background. INSURV was established by Title 10, U.S. Code, Section 8674, as a board of Naval Officers to make recommendations to the Secretary of the Navy as to which vessels, if any, should be stricken from the Naval register. Additionally, per reference (a), INSURV has been tasked with providing assurance to the Chief of Naval Operations (CNO) regarding the ship's material readiness and command's self-assessment effectiveness.

26.1.3 Discussion.

a. INSURV is charged with conducting five basic types of inspections.

(1) Combined Trials or Acceptance Trials for new construction or conversion ships. Details are discussed in volume I, chapter 4 of this manual.

(2) Guarantee Material Inspection or Final Contract Trials for new construction or conversion ships. Details are discussed in volume I, chapter 4 of this manual.

(3) MI are conducted on U.S. Navy commissioned ships and submarines as discussed in this chapter and reference (a).

(4) Special Trials and Re-Trials, when approved by CNO, for cases where either a vessel was incomplete at Final Contract Trial (FCT), or mission degrading deficiencies occurred at FCT and impacted the Board's ability to make a Fleet Introduction assessment per reference (b).

(5) Surveys for ships scheduled for decommissioning, Retention, Mobilization or as a Foreign Military Sale. Refer to reference (c) for additional information.

NOTE: COMBINED TRIALS AND GUARANTEE MI ARE CONDUCTED ON SUBMARINES ONLY. ACCEPTANCE TRIALS AND FINAL CONTRACT TRIALS ARE CONDUCTED ON ALL OTHER SHIPS.

b. Detailed procedures for reporting MI deficiencies in the Maintenance and Material Management system are contained in reference (d).

c. Milestones for inspections are shown in Appendix A of this chapter.

26.1.4 Policy.

a. As designated in reference (a), Inspections conducted by INSURV provide assurance to Congress, Secretary of the Navy (SECNAV), Chief of Naval Operations (CNO), Fleet Commanders, Systems Commanders (SYSCOM), Type Commanders (TYCOM) and Commanding Officers (CO) that mechanisms to identify, document and resolve material deficiencies are adequate; that these processes are judiciously executed; and that they provide the commensurate level of effectiveness, efficiency and material readiness.

b. However, per reference (a), periodic material inspections must be scheduled with minimal notice given to the vessels' crews. Minimal notice is generally considered to be 30 days. The intent of minimal notice is to capture as-found material condition. The 30-day notification period is to allow for scheduling of necessary resources and to develop an inspection schedule of events. To this end, the ship will establish a program to complete administrative and organizational preparations for the INSURV inspection commencing no earlier than official notification of the inspection by INSURV. Ships must utilize the guidance shown in Appendix A of this chapter.

26.2 RESPONSIBILITIES.

26.2.1 Type Commander. The Type Commander must:

a. Act as the cognizant authority for the conduct of INSURV inspections for all ships and maintain awareness of inspections due.

b. Nominate, in conjunction with cognizant numbered Fleet Commander, ships and submarines for inspections and surveys by INSURV. TYCOM and numbered Fleet commander schedulers are considered trusted agents for the purpose of scheduling MIs without violating Title 10 notification requirements.

d. Review Safety Survey results and corrective action status report provided by the ship's CO.

e. Track and work to resolve historical issues with systems, equipment and processes identified by INSURV.

f. Coordinate with the Immediate Superior In Command (ISIC) to disseminate the best practices and lessons learned.

26.2.2 Immediate Superior In Command. Upon a vessel receiving notification of an MI from INSURV, the ISIC must (TYCOM responsible if ISIC is not assigned):

a. For Surface Force Ships only, if the ISIC is deployed, the ISIC will request the numbered fleet commander assign non-deployed local Squadron to assist with inspection preparations.

b. Monitor Ship's Force preparation for the inspection.

c. Send reports per Appendix A. Surface Ship ISICs will conduct an inspection readiness assessment prior to submitting. Develop and disseminate a standardized Schedule of Events for assigned ships.

d. Ensure preparation for the sequence of accomplishing inspection underway demonstrations is conducted in advance of inspection.

e. Ensure post inspection reporting procedures are followed.

f. Attend post-INSURV inspection critiques.

g. Ensure supporting subordinate commands are prepared for the scheduled INSURV.

h. Ensure that the ship is prepared to discuss Current Ship's Maintenance Project (CSMP) deficiencies which have not been corrected, and those items which have been removed from the CSMP and passed to history.

i. Monitor the reporting and correction of inspection deficiencies through the CSMP. A Plan of Action and Milestones (POAM) should be developed to track Part 1 deficiencies identified by INSURV. Monthly completion reports should be made to the TYCOM, info INSURV.

26.2.3 Ship Commanding Officer. The CO must:

a. Ensure that the ship is prepared for minimal notice inspections.

b. Promulgate a departmental and ship wide schedule of events in preparation for INSURV.

c. Be prepared to discuss with the senior member of the board any item from the previous INSURV Inspection which is still on the CSMP, all items which were determined to be not correctable and designated "pass to history", or those for which reporting had been deferred by the TYCOM, including supporting rationale and reference material.

d. Designate an officer as INSURV Coordinator and a Chief Petty Officer, preferably the 3-M Coordinator (3MC), as their assistant.

e. Assign a senior coordinator for each INSURV functional area as defined in paragraph 26.4.2.

f. (Surface Force Ships Only) Submit a letter of concern to INSURV, TYCOM and ISIC.

26.2.4 INSURV Coordinator. The INSURV Coordinator must:

a. Brief all department heads on the review of the CSMP, confirm existing job control numbers as valid, and report any existing deficiencies which are not in the CSMP.

b. Review the automated work request (AWR) or CSMP package with the TYCOM or ISIC maintenance document control office to ensure quality (e.g., readability, proper printing and page-break by work center).

c. Segregate the AWR originals by INSURV departmental designations for turnover to the INSURV team.

d. Provide the original of the complete CSMP Report to the INSURV team.

e. Retain a copy of the AWRs and the CSMP for use during the inspection.

f. Distribute copies of the AWRs to department heads and work centers.

g. Collect and track all INSURV deficiencies identified during the inspection.

h. Coordinate work center updating of the CSMP and the processing of updated Ship's Maintenance Action Forms, OPNAV 4790/2K (2-Kilo), or AWRs.

26.2.5 Regional Maintenance Centers. Regional Maintenance Centers (RMC) are not mission funded to support INSURV. The RMCs receive tasking and reimbursable funding directly from INSURV as noted in volume II, part IV, chapter 2 of this manual. In support of the tasking and funding, the RMC will:

a. Provide RMC support coordination for INSURV in each home port.

b. Provide subject matter experts with the experience and system knowledge for assessment to accomplish INSURV approved procedures based on the tasking, schedule and funding provided by INSURV.

c. Provide documented subject matter experts findings to, and formatted for, INSURV.

d. Utilize subject matter expert resources in the most cost-effective manner to support the tasking.

26.3 INSPECTION SCHEDULING.

26.3.1 Combined Trial or Acceptance Trial Inspections. The scheduling of these trials for new construction or conversion ships will be coordinated by the TYCOM and Program Executive Officer (PEO) per volume I, chapter 4 of this manual and reference (b).

26.3.2 Guarantee Material Inspection or Final Contract Trials. The scheduling of the Guarantee Material Inspection or FCTs will be coordinated by the PEO per volume I, chapter 4 of this manual and reference (b).

26.3.3 Material Inspections. The INSURV MI will provide invaluable independent assessments of how well naval maintenance processes perform.

a. Per reference (a) and Title 10 requirements, MIs must be conducted every three years, if practicable. Reference (a) outlines the situations that render an MI not practicable and include: operational commitments, CNO availability extensions, and INSURV capacity. MIs postponed due to operational commitments require cognizant Fleet commander approval.

b. The desired outcome is for INSURV's MIs to be conducted in a manner not to interfere with carrier strike group or amphibious readiness group operations. In achieving this end state, TYCOMs will avoid scheduling INSURV MIs in the time frame between the numbered fleet commander deployment certification event (e.g., Composite Training Unit Exercise, Joint Warrior, etc.) and the end of post-deployment stand down.

(1) Surface Force Ships. The MI will optimally be conducted after necessary certifications have been achieved in the Basic Training phase and prior to the start of exercises in the Integrated Level Training phase. Additionally, MIs can be scheduled in the sustainment phase on a limited basis when scheduling earlier in the FRP was unachievable.

(2) Aircraft Carriers. The optimal time to conduct MIs is 60 to 90 days following the completion of the CNO maintenance availability. Avoid conducting MIs after the air wing is embarked for carrier qualification.

(3) Submarines. INSURV MIs are integrated into the submarine engineered operating cycle per reference (e). MIs should be scheduled within 180 days post major availability.

26.4 PREPARATION FOR INSURV INSPECTION.

26.4.1 Active Preparation. INSURV will notify the CO of the assigned dates of the inspection. Direct and early liaison with the INSURV Coordinator is essential to ensure agenda approval, facilitate travel arrangements, berthing and other similar items. Ships should make use of the information and data available at the INSURV web site (https://flankspeed.sharepoint-mil.us/sites/USFF-INSURV-HQ/) to better understand and prepare for an inspection. Ships are strongly encouraged to liaison with INSURV regarding current material problem areas that may exist within the fleet and to actively resolve them as appropriate within their own command.

26.4.2 Ship's Internal Organization. The ship will establish an internal organization for the INSURV. While the details of such an organization will vary from ship to ship, two key elements must be addressed:

a. Specific personnel assignments must be made to ensure that all necessary logistic and support arrangements for the INSURV are adequately covered (e.g., transportation, berthing, laundry, clerical assistance).

b. INSURV inspects by functional areas, which may not exactly correspond to the standard ship's organization. For purposes of the inspection, the ship will assign one-to-one correspondence for each inspector, with a senior coordinator for each INSURV functional area. Assigned individuals should be thoroughly familiar with each CSMP deficiency, show the inspector exactly where the deficiency is, be able to explain why it has not been corrected and answer questions about related items in the same category, etc. Knowledgeable ship's representatives are essential for a successful inspection.

26.4.3 Updating the Current Ship's Maintenance Project.

a. The CSMP must be reviewed, updated and purged of all completed maintenance actions. All outstanding corrective maintenance should be documented as a deferral. This evolution is important since the CSMP is the primary source of deficiencies that will be presented to INSURV. A vital part of the review is to ensure that deficiencies are properly assessed and documented.

b. Any deficiencies noted during the pre-inspection audit will be entered in the CSMP and reissued for final INSURV documentation.

c. INSURV will disseminate a data file (MM001 file) to either the Force 3MC (in the case of surface ships and CVNs), or directly to the unit's 3MC (in the case of submarines). Once received, this file should be uploaded to the unit's CSMP.

26.5 BOARD OF INSPECTION AND SURVEY INSPECTION CONDUCT AND DOCUMENTATION.

26.5.1 Inspection Conduct. The inspection will be conducted as specified in reference (e) for submarines and reference (f) for surface ships.

a. Flight operations (if applicable) and other ship evolutions will not be scheduled during the conduct of the inspection, except when scheduled in direct support of the inspection or when specifically requested by INSURV.

b. A proposed "open and inspect" list will be submitted to the ship's assigned senior coordinator for each INSURV functional area. The senior INSURV member may modify the "open and inspect" list at any time.

26.5.2 Deficiency Documentation.

a. Preparation of INSURV deficiency forms will be per reference (d) and this instruction.

b. INSURV will provide the ship with a copy of new deficiencies found during the inspection.

c. The final forms generated by INSURV will be screened by the TYCOM following the inspection. Whenever an item is considered not cost-effective to correct or is inconsistent with reference (d), the TYCOM will authorize passing the item to the history file.

d. Deficiencies corrected while INSURV is on board are still required to be properly documented.

26.6 POST BOARD OF INSPECTION AND SURVEY INSPECTION ACTIONS.

26.6.1 Deficiency Processing and Resolution.

a. INSURV deficiencies will be reported by entering them into the ship's CSMP once received, typically within 10 days following completion of the inspection if not already resolved by Ship's Force.

b. Upon completion of the INSURV inspection, Ship's Force must take the following actions:

(1) With TYCOM assistance, screen all INSURV deficiencies. Identify those which are mission degrading or safety items.

(2) Initiate prompt action on all mission degrading and safety items. All Part I "Mission Degrading" items and any additional items that are deemed to significantly degrade the ability of the ship to carry out its assigned mission must be documented by an appropriate CASREP per reference (g).

(3) Correct all deficiencies within the capability of Ship's Force as soon as possible. If unable to correct within 10 days following completion of inspection, a CSMP entry must be made.

(4) Modify deficiencies previously identified and processed to include the assigned INSURV number and any modifications, per the requirements of reference (d).

(5) Comply with the requirements of reference (d) if instances occur where INSURV enters multiple deficiencies under a single INSURV number.

(6) A POAM should be developed to track completion of all Part 1 deficiencies identified by INSURV.

26.6.2 Post INSURV Inspection Reports. INSURV will issue a final report to document the inspection.

APPENDIX A
INSURV MATERIAL INSPECTION PLAN OF ACTION AND MILESTONES

MILESTONE	**DUE**	**RESPONSIBLE ACTIVITY**
INSURV tasking requirements to RMC.	I-60 days	INSURV and RMC
Notify Ship of Scheduled INSURV Material Inspection and provide the ship with the MI precepts (instructions, events, etc.)	I-30 days	President, INSURV
Download applicable INSURV Inspection Guides and distribute to Ship's Force.	I-30 days	Ship
(Naval Air Forces) Develop and send readiness to conduct inspection message from TYCOM to INSURV including embarkation points, security clearance forwarding data, and other pertinent event notices such as time of check in for underway personnel.	I-30 days	TYCOM and Ship
Review Previous Inspection Reports.	I-30 days	ISIC and Ship
Identify Ship's INSURV Coordinator to INSURV.	I-30 days	Ship
Schedule INSURV pre-brief.	I-29 days	Ship
Develop schedule of events utilizing the directions and instructions provided by INSURV.	I-25 days	Ship
Conduct INSURV pre-brief.	I-25 days	INSURV and Ship
For all surface ships, complete and deliver CO letter of concerns to INSURV (copy to TYCOM).	I-25 days	Ship
Provide RMC with reimbursable funds for all personnel (salaries and overtime), travel, and per diem costs associated to INSURV material inspection, administration, coordination, and subject matter expert support.	I-25 days	INSURV
RMCs provide subject matter expert names to ship and INSURV.	I-21 days	RMC
Ensure timely subject matter expert support.	I-0	RMC
Report the ship's return to port and any significant results to TYCOM N43.	I+1 day	ISIC or TYCOM Rep

MILESTONE	**DUE**	**RESPONSIBLE ACTIVITY**
Report the time ship cleared for underway to TYCOM N43.	I+2days	ISIC
Load the CSMP bulkload (MM001 file) from INSURV.	I+15 days	Ship
Report status of INSURV Part I and Part I Safeties to RMCs and TYCOM, info INSURV.	I+30 days	Ship or ISIC
Screen Remaining Deficiencies and assign Responsible Actions.	I+45 days	ISIC or Ship
Submit Lessons Learned to TYCOM.	I+45 days	ISIC
Submit Pass to History Items.	I+120 days	Ship
Report status of all of Part I and Part I-S Safeties to RMCs and TYCOM until all deficiencies are completed, info INSURV.	I+180 days	Ship or ISIC

D Sample Five Year Strength and Integrity Reboiler Inspection Report Cover Letter
E Sample Other Reboiler Inspection Report Cover Letter
F Sample Reboiler Inspection RBO and Severely Degraded Discrepancies Message
G Sample Reboiler Inspection RBO - Discrepancies 30 Day Update Message
H Summary of Reboiler Inspection Scheduling and Responsibilities
I Sample Reboiler Inspection RBO and Discrepancies Rescission Message

27.1 PURPOSE. To provide policy, procedures, requirements and responsibilities for Reboiler Inspections including:

a. Scheduling.

b. Industrial Preparations.

c. Naval Sea Systems Command (NAVSEA) Technical Warrant Holder (TWH).

d. Naval Surface Warfare Center Philadelphia Division (NSWCPD) In-Service Engineering Agent (ISEA).

e. Type Commander (TYCOM).

f. Ship’s Force.

g. Ship Repair Facility (SRF).

h. Regional Maintenance Center (RMC).

i. ISEA inspector.

j. SRF or RMC Steam Systems Subject Matter Expert (SME).

k. Steam Generating Plant Inspector (SGPI).

l. Documenting and Reporting Inspection Results.

27.2 POLICY. Periodic inspections of reboilers are required and include the following support systems: steam inlet and outlet piping, safety devices, feed water systems, drain systems and chemical injection piping, and control and indicating components associated with shell pressure and water level. Inspections must be conducted by a SGPI or NSWCPD ISEA inspector as applicable per the requirements of references (a), (b) and (c). Responsibilities for the technical and programmatic stewardship and continuation of the SGPI and ISEA inspection programs are formally assigned in references (a) and (d). Specific inspection criteria and specific periodicity intervals are detailed in references (a) through (d).

27.3 TYPES OF INSPECTIONS.

	Inspections:	Accomplished by:
a.	Annual	Ships Force
b.	Eddy Current Inspection	Shipyard
c.	Routine (RTE)	SGPI
d.	Five-Year Strength and Integrity (5YR-SI) Inspection: (1) Pre-Start of Availability (PSAI) (2) Start of Availability (SAI) (3) Industrial Support Visit (ISV) (4) Completion of Availability (CAI)	ISEA inspector accompanied by a local SRF or RMC SGPI and a Steam Systems SME
e.	Inactivation	ISEA inspector
f.	Reactivation	ISEA inspector
g.	Special Inspection	SGPI, Steam Systems SME, or ISEA inspector
h.	Pre and Post Repair Operational Assessments	SGPI

27.4 RESPONSIBILITIES.

27.4.1 NAVSEA Technical Warrant Holder.

a. Provide NAVSEA technical authority for steam reboilers and inspections.

b. Review and provide technical adjudication of Departure from Specifications (DFS) requests per volume V, part I, chapter 8 of this manual.

c. Ensure Integrated Logistics Support products for inspections and inspected components and systems are fully codified and updated regularly.

d. Ensure SGPI and SRF or RMC Steam System SME refresher training is held semi-annually at a TWH directed location, alternating between TYCOM Areas of Responsibility (AOR) and NSWCPD.

e. Obtain annual funding for ISEA management of the reboiler inspection and Repair Management Information System (RIRMIS)

f. Ensure funding for state-of-the-art inspection tools, techniques, and associated training courses is available and tools and training are being utilized by SGPI's, SME's and ISEA inspectors.

g. Provide oversight of SRF or RMC SGPI and Steam Systems SME programs as follows:

(1) Ensure periodic audits of SGPI and Steam Systems SME training curriculums are conducted.

(2) Enforce requirements for SGPI and Steam Systems SME certification and recertification.

(3) Enforce requirements for SRF or RMC Steam Systems SME oversight and status of AOR steam reboiler inspection preparations, repair planning, repair execution, contractor Condition Report review as required, repair testing and assisting SGPIs with system and component operational testing.

(4) Authorize SGPI and SME certification and recertification per references (a) and (d) by NAVSEA letter.

27.4.2 NSWCPD or ISEA.

a. ISEAs are part of the TWH's technical pyramid and are accountable for the enforcement of associated technical requirements.

b. ISEA is responsible for:

(1) Providing technical support to SGPIs, ISEA inspectors, and Steam Systems SMEs as required.

(2) Verifying SGPIs and steam systems SMEs meet certification and re-certification requirements per reference (a).

(3) Ensuring ISEA inspectors are qualified and trained.

(4) Maintaining sufficient ISEA inspector staffing.

(5) Obtaining Fleet funding to conduct the 5YR-SI inspection cycle.

c. ISEA inspectors conduct the 5YR-SI inspection cycle (PSAI, SAI, ISV, CAI) and other inspections specified in paragraph 27.7 and references (b) and (c). ISEA inspectors do not conduct RTE inspections, but can assist if requested.

d. The lead ISEA inspector(s) are responsible for:

(1) Providing technical and programmatic support to the NAVSEA TWH for the RTE Inspection and 5YR-SI inspection cycle programs.

(2) Ensuring technical and administrative documentation supporting the SGPI and ISEA inspection programs are current and updated.

(3) Monitoring and updating NAVSEA and Fleet requirements and execution standards for RTE and 5YR-SI inspections.

(4) Developing, implementing and maintain a program to train and certify NSWCPD inspectors per references (a) through (d).

(5) Ensuring inspections on reactivated and deactivated ships are conducted as required per reference (c).

(6) Conducting periodic audits of the SGPI training course curriculums per references (a) and (d).

(7) Providing management of steam reboiler system technical data, inspection and repair history, and the associated RIRMIS.

(8) Coordinating and provide technical presentations to support the semi-annual SGPI and SRF or RMC Steam Systems SME refresher training.

(9) Maintaining the roster of certified SGPI's and SRF or RMC steam systems SME's by name, rating, duty station, date of certification, and expiration date of certification. Recommend individual SGPI certification and provide awareness that actions to decertify inspectors who fail to comply with the requirements of references (a) and (d) will be initiated.

(10) Ensuring that the requirements for SGPI and SRF or RMC steam systems SME certification and recertification are met (includes certification extensions).

e. The designated ISEA Inspector will notify the cognizant lead SRF or RMC SGPI and SRF or RMC steam systems SME a minimum of one week prior to any 5YR-SI Inspection Cycle PSAI, SAI, ISV, or CAI occurring in the SGPI's and SME's AOR. If not possible due to emergent tasking, the assigned ISEA inspector will notify the lead SRF or RMC SGPI or steam systems SME within one working day of tasking.

27.4.3 TYCOM Maintenance Program Manager.

a. Fund steam reboiler inspections required by references (a) through (c).

b. Assist with coordination of inspections with the Naval Supervisory Authority (NSA) and local repair activities.

c. Provide mission tasking and funding for SGPIs and ISEA inspectors as applicable to travel to and from inspection sites, perform inspections, resolve inspection technical issues, and document and report findings per the requirements of references (a) through (c).

d. Assist ship's Commanding Officers in ensuring inspection repair actions beyond the capability of Ship's Force are satisfactorily accomplished using other resources as required.

e. Review RIRMIS and inspection summary naval messages and ensure deferred inspection discrepancies are entered into the Current Ship's Maintenance Project (CSMP) and are programmed for repair.

f. Review inspection summary naval message major discrepancies and recommended repairs, Repair Before Operate (RBO) actions, and safety concerns and take appropriate actions.

g. Attend or direct staff to attend all SGPI RTE inspection and ISEA inspector 5YR-SI inspection cycle in-briefs and out-briefs as required. Assist SGPI's and ISEA inspectors with in-brief and out-brief scheduling.

27.4.4 SRF or RMC Commanding Officers.

a. Provide a SGPI when requested by a ship or TYCOM to conduct inspections.

b. Ensure SRF or RMC SGPI and steam system SME's attend semi-annual SGPI or SME refresher training as applicable to maintain their certification.

c Provide resources to ensure SRF or RMC SGPI and steam system SME's meet all requirements to maintain certification per reference (a) and (d)

27.4.5 Ship Commanding Officer.

a. Request inspections via naval message with primary and alternate dates to the TYCOM. Include information copies to the cognizant SRF or RMC and NSWCPD for accomplishment using the format in Appendix A.

b. Schedule steam reboiler inspections as required by appropriate Planned Maintenance System, Class Maintenance Plan items, and reference (a).

c. Prepare for scheduled inspections and operational tests per references (b) and (c).

d. Conduct inspections that are the responsibility of Ship's Force and provide reports required by references (b) and (c).

e. Review inspection results and initiate corrective actions for discrepancies within Ship's Force capability.

f. Initiate requests for assistance on repair actions beyond Ship's Force capabilities. Any severely degraded discrepancy as outline in paragraph 27.8.1c of this chapter, which cannot be corrected prior to the end of the maintenance availability or if inspection is during an operational state (i.e. STS), submit a major temporary DFS per volume V, part I, chapter 8 of this manual for the affected steam reboiler or specific system components per references (b) and (c) and contact the ISEA inspector and local SRF or RMC steam systems SME.

g. Assess the impact of repairs and associated corrective actions on the ship's operating schedule and advise the TYCOM of any adverse effects.

h. Submit reports per paragraph 27.8.1.d.

27.4.6 SRF or RMC Senior SGPI.

a. SRF or RMC Senior SGPIs are part of the TWH's technical pyramid and are accountable for the enforcement of associated NAVSEA technical requirements.

b. Ensure all assigned SGPIs complete training, attend at least one SGPI training refresher annually, and maintain current SGPI certifications per references (a) and (d).

c. Perform steam reboiler inspections per references (a) through (d) and paragraph 27.7 of this chapter

d. Review and submit reports per paragraph 27.8.1d of this chapter.

e. Coordinate inspections in cognizant maintenance areas.

f. Send inspection messages prepared in accordance with Appendix B through Appendix G.

g. Maintain an updated list of upcoming steam reboiler inspections. The list must include the next required inspection date for all ships assigned to the SRF or RMC AOR.

27.4.7 SRF or RMC Steam Systems SME.

a. SRF or RMC steam systems SMEs are part of the TWH's technical pyramid and are accountable for the enforcement of associated NAVSEA technical requirements.

b. Review NSA and Ship's Force maintenance and repair industrial work packages to ensure specifications and special instructions are included. Adhere to current technical requirements, mandate proper material(s) selection, repair procedures are applicable and correct. Quality assurance inspections and test procedures are correct and being accomplished in accordance with applicable requirements.

c. Provide solutions to help resolve technical or scheduling issues negatively impacting maintenance availability or operational ship repairs occurring in the applicable RMC AOR.

d. Provide direct technical support and oversight for repairs performed by Ship's Force, contractors, and naval or private shipyards. This work includes assessment, disassembly, repair, reassembly and testing of steam systems equipment.

e. Provide direct technical support and oversite for mandatory industrial preparations for 5YR-SI inspection cycle PSAI, SAI, ISV, and CAI in the SRF or RMC AOR. Provide status of industrial preparations for inspections to the designated ISEA inspector and local RMC lead SGPI upon request.

f. Attend ship maintenance availability production meetings as required. Assist with scheduling of steam reboiler maintenance availabilities, critical repairs, inspection preparation, inspection and test events, and help resolve associated technical issues.

g. Respond to requests for and attend onsite shipboard or repair shop industrial repair in-process inspections or "call-outs" and "check points" and function as the NSA or government representative as applicable.

27.4.8 SRF or RMC SGPI.

a. SRF or RMC SGPIs are part of the TWH's technical pyramid and are accountable for the enforcement of associated NAVSEA technical requirements.

b. Maintain SGPI certification by completing periodic requirements described in references (a) and (d).

c. Perform inspections per the requirements of references (a) through (d) and paragraph section 27.7 of this chapter.

d. Participate in the coordination of critical operational assessments and test events with Ship's Force, AOR SRF or RMC steam system SME, and repair contractor to support in-port and underway events.

e. The assigned SGPI will notify the AOR's SRF or RMC steam systems SME a minimum of one week prior to any RTE or Special Inspection occurring in the applicable AOR. If not possible due to emergent tasking, the assigned SGPI will notify the lead RMC SGPI within one working day of tasking.

27.5 INSPECTION SCHEDULING.

a. Commanding Officers of ships request RTE Inspections and initiation of the 5YR-SI inspection cycle SAI by naval message per Appendix A. A Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), must be submitted requesting a SGPI and ISEA inspector to conduct inspections.

b. Commands, NSAs and Ships can initiate requests for SGPI and ISEA inspections, requests for SRF or RMC steam systems SMEs and SGPIs to witness operational tests, and requests for SRF OR RMC steam systems SMEs to perform ISV's in a timely manner to ensure successful coordination of scheduling. Commands and ships must ensure inspection scheduling complies with references (b) and (c) and Appendix H.

c. RTE inspections, 5YR-SI cycle inspections, and other inspection services must be coordinated by specific AORs for optimum utilization of SGPI, SRF or RMC steam systems SME and ISEA inspector resources.

d. TYCOM may utilize 5YR-SI cycle SAI and CAI inspection results documented in RIRMIS to satisfy the pressure vessel and piping portion of a RTE inspection.

e. Appendix H of this chapter provides a summary of inspection scheduling responsibilities.

27.6 SAFETY.

a. The safety of civilian and military inspectors, SRF or RMC steam systems SMEs, Ship's Force, industrial activity personnel, and other support contractors involved in inspection, industrial preparations, reboiler system component disassembly, and reassembly must be given the highest priority throughout the preparation and inspection process.

b. There must be a safety observer outside the reboiler entrance to provide assistance when personnel are working inside the reboiler.

c. Ensure the "Idle Reboiler Condition" is set and maintained per the requirements of the Steam Plant Manual and reference (b) and (c) in preparation for inspections. Contact

the ISEA inspector or cognizant SRF or RMC steam systems SME for requirements if clarification is required.

d. Do not enter any part of the idle reboiler until it has been fully ventilated and certified as "gas free" and safe for entry by a Naval Maintenance Facility Gas Free Engineer, Ship's Force Gas Free Engineer, or National Fire Protection Agency Marine Chemist.

e. Ensure the idle reboiler is tagged out per reference (c). This includes setting and maintaining two-valve protection per chapter 10 of this volume.

f. Ensure all safety precautions associated with entry into sealed tanks, voids or pressure vessels, including gas-free certification procedures, are followed per the requirements of references (e), (f), (g), and chapter 25 of this volume.

g. Ensure all precautions cited in reference (c) section 5.3 are followed before entering a reboiler.

h. Post warning signs that indicate personnel are working in the reboiler in all of the following locations: reboiler control console and in conspicuous places in the shaft alley. The signs must remain posted until the work has been completed.

i. Drain connections on all interconnecting reboiler and steam or feed system piping should be opened to the atmosphere and monitored to observe potential instances of valve leak-by.

j. Portable lighting used inside the reboiler must be watertight and explosion proof. The use of unshielded or non-approved lighting in an open reboiler is prohibited. Portable lighting can be obtained from the National Stock System.

k. Maintain an inventory log for accountability of all items taken into a reboiler. Foreign material exclusion closures will be used to the maximum extent practical to prevent tools or other foreign materials from being inadvertently left in the reboiler or associated systems.

    (1) Personnel entering reboilers will remove all jewelry and empty their pockets of all unnecessary items.

    (2) Removal of all items and foreign material exclusion closures from the reboiler must be verified and accounted for from the inventory log prior to conducting a final closeout inspection. Final closeout inspection must be accomplished by the Reactor Officer or their designated representative.

27.7 INSPECTION REQUIREMENTS.

All reboiler inspections, including pre and post inspection operational assessments should be scheduled concurrently. Appendix H of this chapter provides a summary of inspection scheduling responsibilities.

27.7.1 Routine Inspection.

Steam Reboiler Routine Inspection (RTE) inspections will be conducted at least every 36 months. To provide flexibility to accommodate mission requirements, inspections may be performed as early as 24 months but shall not exceed 42 months after its last inspection. The 36 month periodicity begins with the first warm-up of the reboiler to normal operating pressure and

temperature following the previous inspection. Inspections that exceed the 36 month interval require a minor temporary DFS approved by the TYCOM, normally with concurrence from the ISEA. A major temporary DFS approved by the TWH and cognizant Ship Design Manager is required to operate beyond 42 months. Exceeding any RTE inspection interval without a DFS requires that the reboiler system be placed out of commission until inspected by a SGPI. Additional requirements are as follows:

a. RTE inspections are scheduled by the Carrier Planning Activity.

b. RTE inspections are conducted by a SGPI. An ISEA inspector can assist if requested by SGPI.

c. The TYCOM may utilize 5YR-SI inspection cycle SAI and CAI results documented in RIRMIS to satisfy the pressure vessel portion of a RTE Inspection.

d. RTE inspections will not be considered complete until a SGPI has updated RIRMIS and completed a satisfactory post availability operational assessment.

e. The Routine inspection will be conducted in conjunction with ECI or tube renewals.

f. A STS inspection conducted by an SGPI in accordance with reference (c), Figure 5-5, is required as a condition of approval for both minor (exceed 36 months but within 42 months) and major (beyond 42 months) temporary DFS's. The STS inspection results will be documented in RIRMIS by the inspecting SGPI and attached to the request for DFS.

27.7.2 Five-Year Strength and Integrity (5YR-SI) Inspection Cycle.

The 5YR-SI inspection cycle will be conducted every 64 months. To provide flexibility to accommodate mission requirements, 5YR-SI inspection cycle may be performed as early as 54 months but not exceed 72 months after the previous 5YR-SI inspection. The 64 months period begins with the first warm-up of the reboiler to normal operating pressure and temperature following the previous inspection. Inspections that exceed the 64 months interval require a minor temporary DFS per volume V, part I, chapter 8 of this manual approved by the TYCOM, normally with concurrence from the ISEA. A major temporary DFS approved by the TWH and cognizant Ship Design Manager is required to operate beyond 72 months. Exceeding any 5YR-SI inspection cycle interval without a DFS per volume V, part I, chapter 8 of this manual requires that the reboiler be placed out of commission until inspected by ISEA inspector. A STS inspection conducted by an SGPI in accordance with reference (c), Figure 5-5, is required as a condition of approval for both Minor (exceed 64 months but within 72 months) and major (beyond 72 months) temporary DFS's. The STS inspection results will be documented in RIRMIS by an SGPI and attached to the request for a DFS. The Strength and Integrity inspection will be conducted in conjunction with ECI or tube renewals. Additional requirements and details are as follows:

a. Pre-Start of Availability Inspection.

(1) PSAI's are scheduled at TYCOM discretion in coordination with the ISEA inspector to support Advanced Planning (AP).

(2) PSAI's can only be conducted by an ISEA inspector accompanied by a local SRF or RMC SGPI and a steam systems SME.

(3) PSAI results will be documented in RIRMIS by the ISEA inspector, major findings and repair recommendations will be reported by naval message by the ISEA.

b. Start of Availability Inspection.

(1) SAI's are scheduled by the Carrier Planning Activity in coordination with the Naval Supervising Activity (NSA).

(2) SAI's can only be conducted by an ISEA inspector, accompanied by a local SRF or RMC SGPI and a steam system SME.

(3) SAI results will be documented in RIRMIS by the ISEA inspector, major findings and repair recommendations will be reported by naval message by ISEA

c. Industrial Support Visit.

(1) ISV's are coordinated with the industrial activity or NSA to assess status of critical repairs or provide ISEA onsite technical support

(2) ISV's can only be conducted by an ISEA inspector, accompanied by a local SRF or RMC SGPI and a steam system SME.

(3) ISV results will be documented in RIRMIS by the ISEA inspector, major findings and status of repairs will be reported by naval message by the ISEA

d. Completion of Availability Inspection.

(1) CAI's are scheduled by NSA.

(2) CAI's certify all repairs identified at SAI's and subsequent ISV's are accomplished in accordance with requirements.

(3) CAI's can only be conducted by an ISEA inspector, accompanied by a local SRF or RMC SGPI and a steam system SME.

(4) CAI results will be documented in RIRMIS by the ISEA inspector, the status of repairs will be reported by naval message by the ISEA

27.7.3 Special Inspections.

Additional reboiler inspections requested by the TYCOM in coordination with Ship's Force are performed by an SGPI or SRF or RMC steam system SME per the requirements of references (a) through (d). ISEA inspectors participate in special inspections if requested by the TYCOM or cognizant SRF or RMC for specific conditions. Special inspections are conducted whenever the following conditions exist:

a. Major repairs defined by reference (c) are accomplished. This inspection is requested by the TYCOM in coordination with Ship's Force. An ISEA inspector and local SRF or RMC SGPI is required to perform this inspection. This includes:

(1) Repair or adjustments to safety devices or remote isolation devices.

(2) Repairs to the reboiler pressure vessel, including nozzles, circumferential welds, shell and head plates, manhole plate and attachment hinge welds which exceed reference (c) criteria.

(3) Repairs to or replacement of pressure vessel piping and valves.

b. When the TYCOM desires to assess a specific or unique material condition. This inspection is requested by the TYCOM in coordination with Ship's Force. An ISEA inspector is required to perform this inspection.

27.7.4 Operational Assessment.

a. Operational assessments shall be accomplished prior to and at the completion of all Chief of Naval Operations – Maintenance Availabilities (CNO-MAs). These assessments include both cold and hot (steaming) safety device and safety feature operational tests per the requirements of reference (c).

b. Operational assessments will be conducted by an SGPI normally accompanied by a SRF or RMC steam system SME with Ship's Force.

c. Results will be documented in RIRMIS by the SGPI.

27.7.5 Inactivation Inspection.

a. Inactivation inspections are conducted prior to final component and system official inactivation in general accordance with 5YR-SI inspection cycle requirements as applicable per direction of the TYCOM.

b. Inactivation inspections are conducted by an ISEA inspector, accompanied by a local SRF or RMC SGPI and a steam system SME.

c. If a RTE inspection or 5YR-SI inspection cycle CAI has been conducted in the last 18 months, applicable results from the last inspection RIRMIS report may be used to document final inactivation conditions (including lay-up).

d. Inspection results will be documented in RIRMIS by the ISEA inspector.

27.7.6 Reactivation Inspections.

a. Depending on the dates of the last CAI, reactivation may require a full 5YR-SI cycle of inspections (PSAI, SAI, ISV and CAI).

b. This inspection is conducted by an ISEA inspector, accompanied by a local SRF or RMC SGPI and a steam systems SME.

c. Inspection results will be documented in RIRMIS by the ISEA inspector.

27.8 ADDITIONAL INSPECTION AND REPORTING GUIDELINES.

a. RBO Discrepancies:

(1) RBOs are issued for discrepancies that, if not corrected prior to continued operation, could endanger personnel or equipment.

(2) Discrepancies that require a RBO to be issued are defined by paragraph 27.8.b.

(3) Only an SGPI with a current certification may issue a RBO deficiency. All RBO items shall be corrected and re-inspected by a certified SGPI or NSWCPD inspector, and preferably by the same SGPI or NSWCPD inspector who originally identified the discrepancy prior to operation of the reboiler. RBO discrepancies include those for which continued unrestricted operation could endanger personnel or equipment. RBOs may not be departed via DFS. If there is not an immediate or near future danger to personnel or equipment, the discrepancy shall be assigned as "SEVERELY DEGRADED" with major operational restrictions.

(4) The SGPI that issues the RBO must notify the TYCOM by naval message within 24 hours using the format in Appendix F of this chapter.

(5) RBO discrepancies and associated repairs are tracked and re-inspected by the SGPI and SRF or RMC steam systems SME's or ISEA inspectors.

(6) RBO's cannot be rescinded by a DFS.

(7) The SGPI that issues the RBO must notify the TYCOM of the correction and re-inspection of all RBO discrepancies by naval message using the format in Appendix I of this chapter, prior to closeout and operation (including warm-up) of the reboiler system.

b. RBO Criteria:

(1) Inoperative, degraded or misadjusted safety devices.

(2) Fire or Safety hazards, oil soaked lagging, oil leaks or other fire hazards.

(3) Reboiler that does not pass applicable hydrostatic test.

(4) Control equipment inoperable in their automatic mode or failed cold checks.

(5) Non-deferrable defects within the pressure vessel boundary.

(6) Ultra-sonic test (UT) inspection results of piping that are below minimum requirements of reference (b) or when visual inspection dictates replacement.

(7) Improperly assembled flanged joints (mixed fasteners, undersized Flexitallic gaskets, non-level in Level I systems).

(8) Out of periodicity, inoperative critical temperature or pressure measuring instruments.

(9) Valve tightness integrity which limits its ability to perform intended function and exceeds the criteria of reference (h).

(a) Non-conformance of electrical safety and deteriorated or damaged wiring or components.

(b) Inability to maintain reboiler water chemistry within limits. Ineffective reboiler feedwater program based on log review which left uncorrected may result in severe degradation of the reboiler watersides. Inoperative or degraded treatment, sampling, or blowdown systems.

(10) Any other discrepancy deemed by the SGPI which would cause injury to personnel and damage to equipment.

NOTE: A SEVERELY DEGRADED DESIGNATION IS ASSIGNED TO A DEFICIENCY THAT IS NOT AN IMMEDIATE OR NEAR FUTURE DANGER TO PERSONNEL OR EQUIPMENT, BUT WILL HAVE MAJOR OPERATIONAL RESTRICTIONS.

c. "SEVERELY DEGRADED" Designation Criteria.

(1) A severely degraded discrepancy in accordance with this chapter must be corrected or repaired prior to reboiler operation unless it has been properly approved as a major DFS. A major DFS must be submitted to NAVSEA for review and approval with accompanying engineering analysis recommendations from the originator.

(2) The status of a reboiler related DFS will be verified by the SGPI during the inspection for conformance with the requirements of this manual prior to placing the reboiler into operation.

d. Reporting Inspection Results.

(1) The lead inspector must personally debrief inspection results and provide a preliminary RIRMIS report to the ship's Commanding Officer or his designated representative and TYCOM prior to departure.

(2) Inspection results must be entered into RIRMIS immediately after the completing the inspection by the cognizant lead inspector. RIRMIS must be finalized not later than no later than seven days after the completion of all final repairs identified during inspections.

(3) Inspection results must be reported by naval message by the lead inspector no later than 14 days after the completing the inspection using the guidance provided in Appendix C and Appendix D.

(4) The ship's Reactor Officer must report repair status and corrected discrepancies by naval message within 30 days of inspection completion and update at 30-day intervals thereafter using the format in Appendix G of this chapter. Update messages shall list the RIRMIS Item Number 2-Kilo Job Sequence Number (JSN) of discrepancy items which have been completed since the last update message. Update messages must continue until all discrepancies are corrected or appropriately deferred to the next CNO-MA. The TYCOM is the sole authority for deferral of discrepancies.

27.9 STEAM REBOILER INSPECTION PREPARATION.

a. Depending on ship operational commitments or posture, an operational assessment shall be conducted by a SGPI or designated Ship's Force representative prior to disassembling the reboiler for inspection. Detailed assessment requirements are provided in references (b) and (c).

b. Prepare the reboiler for inspection per references (b) and (c).

c. The cognizant SRF or RMC steam systems SME is responsible for reviewing the Repair Activity and NSA planning documents, tracking progress and providing assistance as required, reporting the status of industrial work and inspection preparations (including lagging removal and UT inspection of pressure vessel components and piping) for 5YR-SI inspections. When 5YR-SI inspection preparation industrial work and UT inspections are completed, the TYCOM and ISEA inspector shall be notified immediately that the reboiler is ready for ISEA inspection.

d. Wire shut and danger tag all steam and water valves to the reboiler per the reference (c). Post warning signs "PERSONNEL WORKING IN REBOILER" per reference (c) and paragraph 27.6 of this chapter.

e. The ship's Reactor Officer must ensure all Ship's Force responsibilities are complete using guidance provided in reference (c) and provide applicable reports to the cognizant SGPI, SRF or RMC steam systems SME or ISEA inspector as applicable.

f. Provide inspectors three months of reboiler chemistry, reboiler watch, and reboiler layup logs for review.

27.10 REBOILER INSPECTION.

27.10.1 Reboiler Inspection Forms. Reboiler inspections will be documented using RIRMIS.

27.10.2 Completion of Inspection. A debrief and a preliminary inspection report, including a summary of restrictive discrepancies, will follow the CAI inspection. Paragraph 27.8.d of this chapter identifies official reporting requirements.

27.10.3 Operating Procedures. Each ship with reboilers will have approved Steam Plant Manual for:

a. Normal operations including startup and shutdown.

b. Operating parameters, limitations, alarms and set points.

c. Systems diagrams.

27.10.4 Eddy Current Inspection. Eddy Current Inspection (ECI) is governed by reference (i) and is accomplished every 36 months.

a. The ECI will be scheduled by the Carrier Planning Activity via the Baseline Availability Work Package.

b. The ECI performed by Shipyard or Ship Repair Facility personnel trained and qualified in the use of ECI equipment and ECI data interpretation.

c. Reports are generated and distributed per reference (i).

APPENDIX H

SUMMARY OF REBOILER INSPECTION SCHEDULING AND RESPONSIBILITIES

TYPE OF INSPECTION	PERIODICITY OR REQUIREMENT	SCHEDULING RESPONSIBILITY	LEAD FOR INSPECTION
Routine	36 months not to exceed 42 months	TYCOM	SGPI
Five-Year Strength and Integrity	64 months not to exceed 72 months	TYCOM	ISEA inspector
5YR-SI Pre-Start of Availability	180 days max. prior to CNO-MA	TYCOM Ship's Force	ISEA inspector, steam systems SME
5YR-SI Start of Availability	Beginning of CNO-MA	TYCOM	ISEA inspector
5YR-SI Industrial Support Visit	As required during CNO-MA	Naval Supervisory Authority	ISEA inspector or steam systems SME
5YR-SI Completion of Availability	Prior to final reboiler close-out	NSA	ISEA inspector
Inactivation or Reactivation	Prior to Inactivation or Reactivation	Inactive Ship Facility	ISEA inspector
Eddy Current Inspection	36 months, as governed by reference (i)	Carrier Planning Activity	Shipyard Contracting Activity
Special	Major repairs	TYCOM Ship's Force	ISEA inspector and SGPI

TABLE OF CONTENTS

PART I

FOREWORD - QUALITY MAINTENANCE

1.1 Purpose V-I-FWD-1

1.2 Scope V-I-FWD-1

1.3 Manual Organization V-I-FWD-1
- 1.3.1 Basic Maintenance Principles V-I-FWD-1
- 1.3.2 Special Circumstances and Maintenance Support V-I-FWD-2
- 1.3.3 Order of Precedence V-I-FWD-2
- 1.3.4 Advisories V-I-FWD-4

1.4 Need for Quality Maintenance Processes V-I-FWD-4

1.5 Changes and Corrections V-I-FWD-5

Appendices
- A Glossary of Terms V-I-FWD-A-1

CHAPTER 1 - ORGANIZATIONAL RESPONSIBILITIES

1.1 Purpose V-I-1-1

1.2 Quality Assurance Organizations V-I-1-1

1.3 Fleet Commander Responsibilities V-I-1-2

1.4 Type Commander Responsibilities V-I-1-2

1.5 Immediate Superior In Command Responsibilities V-I-1-4

1.6 Ship Responsibilities V-I-1-8
- 1.6.1 Ship's Commanding Officer V-I-1-8
- 1.6.2 Ship's Executive Office V-I-1-9
- 1.6.3 Ship's Department Head V-I-1-9
- 1.6.4 Ship's Supply Officer V-I-1-11
- 1.6.5 Ship's Engineer Officer (Submarines only) V-I-1-11
- 1.6.6 Availability Coordinator (Submarines only) V-I-1-12
- 1.6.7 Ship's Maintenance Manager (Aircraft Carriers only) V-I-1-13
- 1.6.8 Ship's Principal Assistant V-I-1-13
- 1.6.9 Ship's Division Officer V-I-1-13
- 1.6.10 Ship's Work Center Supervisor V-I-1-14
- 1.6.11 Ship's Craftsman V-I-1-15
- 1.6.12 Ship's Quality Assurance Officer V-I-1-15
- 1.6.13 Ship's Assistant Quality Assurance Officer V-I-1-18

1.6.14 Ship's Quality Assurance Supervisor V-I-1-18
1.6.15 Ship's Quality Assurance Inspectors V-I-1-18
1.6.16 Ship's Controlled Material Petty Officer V-I-1-19
1.6.17 Ship's Cleanliness Inspector or Certifier V-I-1-20
1.6.18 Ship's Nondestructive Test Examiner V-I-1-20
1.6.19 Ship's Nondestructive Test Inspector V-I-1-21
1.6.20 Ship's Maintenance Planner (Submarines and Aircraft Carriers only) V-I-1-22

1.7 Regional Maintenance Center or Fleet Maintenance Activity Responsibilities V-I-1-22
1.7.1 RMC Commander or FMA Commanding Officer V-I-1-22
1.7.2 RMC Deputy Commander or FMA Executive Officer V-I-1-23
1.7.3 RMC Production Officer or FMA Repair Officer V-I-1-23
1.7.4 FMA Supply Officer V-I-1-25
1.7.5 FMA Nuclear Repair Officer V-I-1-25
1.7.6 RMC or FMA Planning and Estimating Officer V-I-1-26
1.7.7 RMC or FMA Division Officer V-I-1-27
1.7.8 RMC or FMA Work Center Supervisor V-I-1-27
1.7.9 RMC or FMA Craftsman V-I-1-27
1.7.10 RMC Quality Assurance Department Head (Code 130) or Industry Management Department (Code 400 at Puget Sound Naval Shipyard and Intermediate Maintenance Facility) V-I-1-28
1.7.11 RMC Code 133 Division Head or FMA Quality Assurance Officer V-I-1-28
1.7.12 RMC or FMA Assistant Quality Assurance Officer V-I-1-30
1.7.13 RMC or FMA Quality Assurance Supervisor V-I-1-30
1.7.14 RMC or FMA Quality Assurance Inspector V-I-1-31
1.7.15 RMC or FMA Controlled Material Petty Officer or Controlled Material Handler V-I-1-31
1.7.16 RMC or FMA Cleanliness Inspector or Certifier V-I-1-32
1.7.17 RMC or FMA Nondestructive Test Division Officer V-I-1-32
1.7.18 RMC or FMA Command Examiner V-I-1-32
1.7.19 Nondestructive Test Examiner V-I-1-33
1.7.20 RMC or FMA Nondestructive Test Inspector V-I-1-33

1.8 Other Activity Responsibilities V-I-1-34

Appendices
A Format for Submarine QA Pre-Underway Checklist V-I-1A-1

CHAPTER 2 - QUALITY MAINTENANCE PROCESSES

2.1 Purpose V-I-2-2

2.2 Technical Work Documents V-I-2-2
2.2.1 Minimum Requirements for using Technical Work Documents V-I-2-2
2.2.2 Maintenance Procedure V-I-2-5
2.2.3 Formal Work Package V-I-2-5
2.2.4 Controlled Work Package V-I-2-5
2.2.5 Maintenance Certification Record and Controlled Work Package (Non-SUBSAFE) V-I-2-8

2.2.6 Sequencing Document V-I-2-9

2.3 Formal Work Package Development V-I-2-10
2.3.1 Responsibility for Preparation of Formal Work Packages and Controlled Work Packages V-I-2-10
2.3.2 Security Classification V-I-2-10
2.3.3 Formal Work Package Format V-I-2-10
2.3.4 Formal Work Package Approval V-I-2-17
2.3.5 Controlled Work Package Approval V-I-2-18
2.3.6 Formal Work Package In Process Use V-I-2-18
2.3.7 Formal Work Package Changes V-I-2-18

2.4 Troubleshooting V-I-2-25

Appendices
A Technical Work Document Illustration V-I-2A-1
B Work Package Decision Process V-I-2B-1
C Certification Signature Requirements for Reactor Plant, Nuclear Support Facility and Controlled Industrial Facility Work V-I-2C-1
D Formal Work Package Approval and Revision Sheet V-I-2D-1
E Technical Work Document Review and Approval Matrix V-I-2E-1

CHAPTER 3 - PERSONNEL QUALIFICATION AND TRAINING

3.1 Purpose V-I-3-1

3.2 General V-I-3-1

3.3 Qualification V-I-3-2
3.3.1 Re-qualification V-I-3-2
3.3.2 Required Service Record Entries V-I-3-2

3.4 Qualification Requirements V-I-3-2
3.4.1 Ship's Quality Assurance Officer V-I-3-2
3.4.2 Ship's Assistant Quality Assurance Officer V-I-3-3
3.4.3 Immediate Superior In Command V-I-3-3
3.4.4 Regional Maintenance Center and Fleet Maintenance Activity Quality Assurance Officer V-I-3-4
3.4.5 Regional Maintenance Center and Fleet Maintenance Activity Assistant Quality Assurance Officer V-I-3-4
3.4.6 Quality Assurance Supervisor V-I-3-4
3.4.7 Quality Assurance Inspector V-I-3-4
3.4.8 Controlled Material Petty Officer and Controlled Material Handler V-I-3-5
3.4.9 Gas Systems Cleanliness Inspector and Certifier V-I-3-5
3.4.10 Oxygen Clean Instructors V-I-3-5
3.4.11 Ship's and Fleet Maintenance Activity Oxygen Clean Workers V-I-3-5
3.4.12 Oxygen Calibration Technicians V-I-3-5
3.4.13 Work Center Supervisors and Planners V-I-3-5

3.4.14 Qualification Requirements for Submarine Nuclear Propulsion Plant Operator Welders (Navy Enlisted Classification Code 3351 and Supervisor Welders 3361) V-I-3-6
3.4.15 Qualification Requirements for Submarine Fly-By-Wire Ship Control System Maintenance Technician V-I-3-6

3.5 Training V-I-3-6
3.5.1 Maintenance Personnel Training V-I-3-6
3.5.2 Requirements V-I-3-6
3.5.3 Submarine Safety Awareness Training (Submarines and Submarine Repair Facilities only) V-I-3-7

Appendices
A NAVEDTRA 43523 Qualification Matrix V-I-3A-1
B Outlines of Typically Effective Training Topics V-I-3B-1
C Recommended Training Topics for Selected Positions V-I-3C-1

CHAPTER 4 - WELDER, BRAZER AND NONDESTRUCTIVE TESTING QUALIFICATIONS

4.1 Purpose V-I-4-1
4.1.1 General Requirements V-I-4-2
4.1.2 Training V-I-4-2

4.2 General Requirements for Brazers and Welders V-I-4-2
4.2.1 Eye Examination V-I-4-3
4.2.2 Brazing and Welding Procedures V-I-4-3
4.2.3 Brazing and Welding Personnel Knowledge V-I-4-3
4.2.4 Brazer and Welder Identification Numbers V-I-4-3
4.2.5 Validation of Qualification V-I-4-4
4.2.6 Qualification Records V-I-4-4
4.2.7 Effective Date of Qualification V-I-4-5

4.3 Brazer Qualifications V-I-4-5
4.3.1 Prerequisite V-I-4-5
4.3.2 Qualification Test V-I-4-5
4.3.3 Limitations V-I-4-5
4.3.4 Test Assembly Evaluation V-I-4-5
4.3.5 Maintenance of Qualification V-I-4-5
4.3.6 Qualification Renewal V-I-4-5
4.3.7 Transfer of Qualification V-I-4-6

4.4 Qualification Requirements for Welders V-I-4-6
4.4.1 Navy Enlisted Classification Code Achievement V-I-4-6
4.4.2 Specific Qualifications V-I-4-6
4.4.3 Aluminum, Metal Boat and Craft Qualifications V-I-4-6
4.4.4 Maintenance of Qualification V-I-4-6
4.4.5 Qualification Renewal V-I-4-6
4.4.6 Transfer of Qualification V-I-4-6

4.5 Assemblies Where the Possibilities of Failure is Remote and Would Not Result in Danger of Ship Personnel, Ship, Boat, Craft, Plant, or Structure V-I-4-6
4.5.1 Authorization V-I-4-6
4.5.2 Requirements V-I-4-6

4.6 Qualification Requirements for Nondestructive Test Personnel V-I-4-7
4.6.1 Purpose V-I-4-7
4.6.2 Levels of Certification V-I-4-7
4.6.3 Certification of Nondestructive Test Personnel V-I-4-7
4.6.4 Renewal of Certification V-I-4-7
4.6.5 Maintenance of Qualification V-I-4-7
4.6.6 Qualification Administration V-I-4-8
4.6.7 Approval of Nondestructive Testing Qualification Examinations V-I-4-8
4.6.8 Transfer of Qualification V-I-4-8
4.6.9 Nondestructive Testing Personnel Records V-I-4-8
4.6.10 Nondestructive Testing Qualification Log V-I-4-8
4.6.11 Qualification of Generic Material Identity Testing Personnel V-I-4-8

CHAPTER 5 - IN-PROCESS CONTROL

5.1 Purpose V-I-5-2

5.2 Test, Measurement and Diagnostic Equipment V-I-5-2
5.2.1 General Requirements V-I-5-2
5.2.2 Torque Wrenches V-I-5-2
5.2.3 Gauges V-I-5-5

5.3 Torque V-I-5-5
5.3.1 General Requirements V-I-5-5
5.3.2 Torque Requirements V-I-5-5

5.4 Inspections V-I-5-5
5.4.1 General Requirements V-I-5-5
5.4.2 Inspection Records V-I-5-5
5.4.3 Critical Inspections V-I-5-5
5.4.4 Cleanliness Inspections V-I-5-7
5.4.5 Nuclear Propulsion Plant and Nuclear Support Facility General Cleanliness Requirements V-I-5-8
5.4.6 General Shipboard Steam Plant Systems Cleanliness Requirements V-I-5-10
5.4.7 Set Stud Inspection V-I-5-12

5.5 Software Acceptability V-I-5-13

5.6 Submarine Safety Maintenance Certification and Re-Entry Control, Nuclear and Non-Nuclear V-I-5-14
5.6.1 Purpose V-I-5-14
5.6.2 Re-Entry Control Program V-I-5-15
5.6.3 Nuclear Submarine Safety System Re-Entry V-I-5-16
5.6.4 Re-Entry Control Administrative Procedures V-I-5-16

5.6.5 Using a Controlled Dive Departure from Specification to Close a Maintenance Certification Record or Re-Entry Control V-I-5-20
5.6.6 Voyage or At Sea Repairs V-I-5-21
5.6.7 Exceptions to Re-Entry Control V-I-5-21
5.6.8 Certification Continuity Report V-I-5-21

5.7 Reactor Plant Work Accomplishment Report (Submarines Only) V-I-5-22
5.7.1 Purpose V-I-5-22
5.7.2 Specific Instructions for Completing Reactor Plant Work Accomplishment Report Cover Sheet V-I-5-23
5.7.3 Specific Instructions for Completing Reactor Plant Certification When New or Previously Uncertified Material is Installed in a Submarine Safety Application V-I-5-23
5.7.4 Specific Instructions for Completing Reactor Plant Certification When Previously Certified Material is Reinstalled V-I-5-24

5.8 Material Condition Monitoring Unrestricted Operations Maintenance Requirement Card Program (Submarines Only) V-I-5-24

5.9 Submarine Fly-By-Wire Maintenance Certification V-I-5-25
5.9.1 Purpose V-I-5-25
5.9.2 Submarine Flight Critical Component Boundary Work Control Procedures V-I-5-26
5.9.3 Submarine Flight Critical Component Boundary Work Control Closeout V-I-5-27
5.9.4 Objective Quality Evidence to Support Controlled Work on Fly-By-Wire Ship Control System Submarine Flight Critical Component V-I-5-27

5.10 Aircraft Carrier Maintenance Document V-I-5-28
5.10.1 Purpose V-I-5-28
5.10.2 Non-Nuclear Deviations, Waivers and Departure from Specifications ... V-I-5-28
5.10.3 Liaison Action Requests - Nuclear Cognizant Areas V-I-5-29
5.10.4 Nuclear Liaison Inquiry - Nuclear Cognizant Areas V-I-5-30
5.10.5 Steam Plant Action Request - Non-Nuclear Cognizant Areas V-I-5-30
5.10.6 Steam Plant Liaison Inquiry - Non-Nuclear Cognizant Areas V-I-5-32
5.10.7 Reactor Plant Configuration Change Report V-I-5-33
5.10.8 Technical Manual Deficiencies and Manual Change Requests V-I-5-36
5.10.9 Fleet COSAL Feedback Report V-I-5-37

5.11 Additively Manufactured Part Maintenance Action Reporting and Guidance V-I-5-38

Appendices
A Determining Software Usability V-I-5A-1
B Format for Submarine Certification Continuity Report V-I-5B-1
C Format for Fleet Maintenance Activity Certification Report to Tended Submarine V-I-5C-1
D Format for Non-Fleet Maintenance Activity Certification Report to Tended Submarine V-I-5D-1
E RPCCR Cover Letter for SHIPALTs (Sample) V-I-5E-1

CHAPTER 6 - MATERIAL CONTROL

6.1 Purpose V-I-6-1
6.1.1 Discussion V-I-6-1
6.2 Nuclear V-I-6-2
6.2.1 Controlled Material Determination V-I-6-2
6.2.2 Controlled Material Procurement V-I-6-3
6.2.3 Receipt Inspection of Nuclear Controlled Material V-I-6-4
6.2.4 Marking of Nuclear Repair Parts V-I-6-8
6.2.5 Nuclear Repair Parts Downgrading V-I-6-11
6.2.6 Storage, Issue and Handling of Nuclear Repair Parts V-I-6-11
6.3 Non-Nuclear V-I-6-18
6.3.1 Controlled Material Determination V-I-6-18
6.3.2 Quality Assurance List (Submarines only) V-I-6-24
6.3.3 Controlled Material Procurement V-I-6-25
6.3.4 Receipt Inspection of Controlled Material V-I-6-27
6.3.5 Receipt Inspection of Open Purchase (Non-Supply System) or Locally Manufactured Material or Upgrading Supply System Material to Level I (Fleet Maintenance Activity only). V-I-6-34
6.3.6 Authorized Material Certification Activities V-I-6-36
6.3.7 Marking of Level I Stock Program Material and Controlled Material V-I-6-36
6.3.8 Level I Submarine Flight Critical Component Stock Program Material Downgrading V-I-6-41
6.3.9 Storage, Issue and Handling of Level I, Scope of Certification or Submarine Flight Critical Component Stock Program Material V-I-6-41

CHAPTER 7 - TESTING REQUIREMENTS

7.1 General V-I-7-1
7.1.1 Key Element V-I-7-2
7.1.2 Testing Requirements for Systems, Portions of Systems and Components V-I-7-2
7.2 Testing V-I-7-4
7.2.1 Test Procedures V-I-7-4
7.2.2 Test Requirements V-I-7-5
7.2.3 Test Pressure Source References V-I-7-6
7.2.4 Non-Nuclear Pressure Drop Tests V-I-7-6
7.3 Weight Handling Equipment V-I-7-8
7.4 Exemptions or Alternative Test Requirements (Non-Nuclear) V-I-7-10
7.4.1 General V-I-7-10
7.4.2 Exemptions and Alternatives to Test Requirements (Non-Nuclear unless Specifically Addressed in Nuclear Technical Documents) V-I-7-11
7.5 Reactor Plant and Nuclear Support Facility Testing V-I-7-13

7.5.1 Hydrostatic Tests, Pneumatic Tests or Drop Tests V-I-7-13
7.5.2 Mechanical Joint Fasteners V-I-7-14
7.5.3 Valve Seat Leak Tests V-I-7-14

7.6 Supplemental Test Criteria (Non-Nuclear) V-I-7-14

Appendices
A Testing Requirements for Surface Ship Systems V-I-7A-1
B Testing Requirements for Submarine Systems V-I-7B-1

CHAPTER 8 - DEPARTURE FROM SPECIFICATION (DFS, WAIVERS, NUCLEAR LIAISON ACTION REQUEST, AND STEAM PLANT ACTION REQUESTS)

8.1 Purpose V-I-8-1
8.1.1 Background V-I-8-1
8.1.2 Terminology V-I-8-2
8.1.3 Specification V-I-8-2

8.2 Departure From Specification V-I-8-3
8.2.1 Reporting Departures from Specification V-I-8-4
8.2.2 Reporting Departures from Specification while Conducting a CNO Availability Sea Trial (Submarines Only) V-I-8-4
8.2.3 Types of Departures from Specification V-I-8-4
8.2.4 Permanent and Temporary Approval of Departure from Specification V-I-8-4
8.2.5 Major Departure from Specification V-I-8-5
8.2.6 Minor Departure from Specification V-I-8-10

8.3 Departure From Specification Procedures V-I-8-11
8.3.1 General Administrative Requirements V-I-8-11
8.3.2 Review of Outstanding Departures from Specification V-I-8-14
8.3.3 Clearing of Departure from Specification by Exposing Sea Connected Systems and Hull Integrity Boundary Items to Submergence Pressure (Submarines only) V-I-8-14
8.3.4 Incorporation of Departure from Specification in Selected Record Drawings, Data or Technical Variance Documentation V-I-8-14
8.3.5 Preparations for Correction of Departure from Specification and Clearance During Depot Level Availabilities V-I-8-15
8.3.6 Numbering of Departures from Specification V-I-8-15
8.3.7 Submission and Approval of Departures from Specification V-I-8-15
8.3.8 Departure from Specification Approval and Reporting for Ships While at Sea or at a Port Without a Fleet Maintenance Activity V-I-8-17
8.3.9 Extending a Temporary Departure V-I-8-18
8.3.10 Electronic Non-Conformance Administration V-I-8-19

8.4 Nuclear Cognizant Areas V-I-8-20
8.4.1 Nuclear Powered Surface Ships V-I-8-20
8.4.2 Reactor Plant Systems V-I-8-20
8.4.3 Propulsion Plant Systems (Aircraft Carriers only) V-I-8-21

8.5 Non-Nuclear Cognizant Areas V-I-8-21

Appendices
A Departure From Specification Request Message Format V-I-8A-1
B Departure From Specification Clearance or Cancellation Report Message Format V-I-8B-1

CHAPTER 9 - AUDITS, SURVEILLANCE, EVALUATIONS AND ASSESSMENTS

9.1 Purpose V-I-9-1

9.2 General V-I-9-1
9.2.1 Audits V-I-9-1
9.2.2 Surveillance V-I-9-2
9.2.3 Evaluation V-I-9-2
9.2.4 Assessments V-I-9-2
9.2.5 Key Elements V-I-9-2
9.2.6 Record Retention V-I-9-2

9.3 Responsibilities and Procedures V-I-9-3
9.3.1 Ship's Force Audits, Surveillance and Evaluation Program V-I-9-3
9.3.2 Fleet Maintenance Activity Audit, Surveillance and Evaluation Program V-I-9-4
9.3.3 Immediate Superiors in Command Assessments, Audits and Surveillance V-I-9-6
9.3.4 Type Commander Assessments V-I-9-9

9.4 Reporting Audit, Surveillance and Assessment Results and Corrective Action V-I-9-9
9.4.1 Reporting Requirements for External Audits, Surveillances and Assessments V-I-9-9
9.4.2 Correcting Deficiencies in Certified Controlled Work Packages or Objective Quality Evidence Records V-I-9-11

Appendices
A Vertical Audits V-I-9A-1
B Horizontal Audits V-I-9B-1
C Surveillances V-I-9C-1
D Submarine Quality Assurance Assessment Evaluation Criteria V-I-9D-1
E Quality Assurance Audit, Assessments and Surveillance Discrepancy Form V-I-9E-1

CHAPTER 10 - QUALITY ASSURANCE RECORDS

10.1 Purpose V-I-10-1

10.2 General V-I-10-1
10.2.1 Quality Assurance Record Requirements V-I-10-1
10.2.2 Record Retention in General V-I-10-2

10.3 Type Commander Quality Assurance Record Retention V-I-10-4
10.3.1 Assessment Record Retention V-I-10-4
10.3.2 Departure from Specification Record Retention V-I-10-4
10.3.3 Material Certification Statement Retention (Submarines only) V-I-10-4

10.4 Immediate Superior In Command Quality Assurance Record Retention V-I-10-4
10.4.1 Assessment and Surveillance Record Retention V-I-10-4
10.4.2 Departure from Specification Record Retention V-I-10-4
10.4.3 Material Certification Statement Retention (Submarines only) V-I-10-5

10.5 Ship's Quality Assurance Record Retention V-I-10-5
10.5.1 Controlled Work Package Log V-I-10-5
10.5.2 Completed Controlled Work Packages V-I-10-5
10.5.3 Controlled Material Records V-I-10-5
10.5.4 Qualification Records V-I-10-6
10.5.5 Departure from Specification Records V-I-10-6
10.5.6 Assessments, Evaluations and Audits V-I-10-7
10.5.7 Training V-I-10-7

10.6 Additional Submarine and Nuclear Unique Quality Assurance Record Retention Requirements V-I-10-7
10.6.1 Submarine Safety, Nuclear, Level I, Submarine Flight Critical Component, Scope of Certification and Other Certification V-I-10-7
10.6.2 Nuclear Records V-I-10-8
10.6.3 Re-Entry Control/Maintenance Certification Record Exception Objective Quality Evidence and Other Controlled Assembly Records V-I-10-8

10.7 Fleet Maintenance Activity Quality Assurance Record Retention V-I-10-9
10.7.1 Submarine Safety, Nuclear, Level I, Scope of Certification and Other Certification V-I-10-9
10.7.2 Reactor Plant Work Accomplishment Report (Submarines only) V-I-10-9
10.7.3 Controlled Work Package Log V-I-10-9
10.7.4 Completed Controlled Work Packages V-I-10-9
10.7.5 Controlled Material Records V-I-10-9
10.7.6 Assessment, Audits, Surveillance and Evaluations V-I-10-10
10.7.7 End of Fleet Maintenance Activity Certification Report to Tended Submarines (Submarines only) V-I-10-10
10.7.8 Nuclear, Submarine Safety and Scope of Certification Work V-I-10-10
10.7.9 Qualification Record V-I-10-10

CHAPTER 11 - QUALITY ASSURANCE FORMS AND FORM INSTRUCTIONS

11.1 Purpose V-I-11-1

11.2 Use of QA Forms V-I-11-1

11.3 National Item Identification Number V-I-11-1

11.4 Certification Signatures on QA Forms V-I-11-1

11.5 List of Forms V-I-11-1

CHAPTER 12 - SUBMARINE PRESERVATION

12.1 Purpose V-I-12-1

12.2 General Preservation Requirements V-I-12-1

12.3 Submarine Preservation Maintenance Processes V-I-12-1
12.3.1 Maintenance Processes V-I-12-1
12.3.2 Coating System Maintenance Authorization V-I-12-2
12.4 Quality Assurance for Critical Coated Areas V-I-12-2
12.4.1 Critical Coated Areas V-I-12-2
12.4.2 Requirements for Critical Coated Areas V-I-12-2
12.4.3 Test and Inspection Records V-I-12-2
12.4.4 Blaster and Painter Certification V-I-12-3
12.4.5 Coating Inspector Certification V-I-12-3
12.4.6 Coating Inspector Responsibilities V-I-12-3
12.4.7 Inspection of Final Coating System V-I-12-4
12.4.8 Review of Records for Final Coating Evaluation V-I-12-4
12.4.9 Acceptance or Rejection of Final Coating Systems V-I-12-5

CHAPTER 13 - WIRE REMOVAL AND REPLACEMENT

13.1 Purpose V-I-13-1
13.2 Action V-I-13-1

Appendices
A Wire Removal and Replacement Form MAT-2 ..... V-I-13A-1

PART III

FOREWORD - SCOPE OF CERTIFICATION

1.1 Purpose V-III-FWD-1
1.2 Scope V-III-FWD-1
1.3 Need For Scope of Certification Quality Maintenance Processes V-III-FWD-1

Appendices
A Glossary of Terms V-III-FWD-A-1

CHAPTER 1 – ORGANIZATIONAL RESPONSIBILITIES

1.1 Purpose V-III-1-1
1.2 Responsibilities V-III-1-1
1.2.1 Type Commander V-III-1-1
1.2.2 Immediate Superior In Command V-III-1-2
1.2.3 Sustaining Activity or User Activity V-III-1-5

CHAPTER 2 - QUALITY MAINTENANCE PROCESSES

2.1 Applicability V-III-2-1
2.2 Controlled Work Package V-III-2-1

CHAPTER 3 - PERSONNEL QUALIFICATION AND TRAINING

3.1 Applicability V-III-3-1

3.2 General V-III-3-1
3.3 Discussion V-III-3-1
3.4 Qualification Requirements V-III-3-1
3.4.1 Qualifications V-III-3-1
3.4.2 Scope of Certification Quality Maintenance Qualifications V-III-3-1
3.5 Training V-III-3-1
3.5.1 Scope of Certification Awareness Training (Submarines and Submarine Repair Facilities Only) V-III-3-1
3.5.2 Immediate Superior in Command and Type Commander Training V-III-3-1

CHAPTER 4 - WELDER, BRAZER AND NONDESTRUCTIVE TESTING QUALIFICATIONS

4. Applicability V-III-4-1

CHAPTER 5 - IN PROCESS CONTROL

5.1 Purpose V-III-5-1
5.2 Exceptions to Re-Entry Control V-III-5-1
5.3 Planned Maintenance V-III-5-1
5.4 Test, Measurement and Diagnostic Equipment V-III-5-2
5.5 Torque V-III-5-2
5.6 Inspections V-III-5-2
5.6.1 General Requirements V-III-5-2
5.6.2 Inspection Records V-III-5-2
5.6.3 Critical Inspections V-III-5-2
5.6.4 Cleanliness Inspections V-III-5-4
5.7 Software V-III-5-5
5.8 Scope of Certification Maintenance Certification and Re-Entry Control V-III-5-5
5.8.1 Purpose V-III-5-5
5.8.2 Re-Entry Control Program V-III-5-6
5.8.3 Re-Entry Control Administrative Procedures V-III-5-6
5.8.4 Using a Departure from Specification to Close a Maintenance Certification Record Re-Entry Control V-III-5-10
5.8.5 Voyage or At Sea Repairs V-III-5-11
5.8.6 Exceptions to Re-Entry Control V-III-5-11
5.8.7 Certification Continuity Report V-III-5-12
5.9 Material Condition Monitoring Hull Integrity Procedures Program (Submarines only) V-III-5-13
5.10 Temporary Modifications V-III-5-14
5.10.1 Temporary Modification Program V-III-5-14
5.10.2 Configuration Control V-III-5-14

Appendices
A Message Format for Certification Continuity for DSS V-III-5A-1
B Letter Format for Certification Report to Tended DSS V-III-5B-1
C Message Format for DDS Transfer of Custody Certificate of Continuity for Off-loads V-III-5C-1
D Message Format for DDS Transfer of Custody Certificate of Continuity for On-loads V-III-5D-1
E Message Format for DDS Acceptance of Custody V-III-5E-1

CHAPTER 6 - MATERIAL CONTROL

6.1 Purpose V-III-6-1
6.1.1 Material Control Divisions V-III-6-1
6.1.2 Deep Submergence Systems-Scope of Certification V-III-6-1

6.2 Controlled Material Determination V-III-6-1
6.2.1 General Requirements V-III-6-1
6.2.2 Scope of Certification Material Control Divisions V-III-6-2

6.3 Receipt Inspection of Controlled Material V-III-6-3
6.3.1 General Requirements V-III-6-3
6.3.2 Quality Assurance Forms for Receipt Inspections V-III-6-6
6.3.3 NAVSUP WSS DSS-SOC Stock Program Material V-III-6-6
6.3.4 General Requirements for Receipt of Scope of Certification Material V-III-6-7
6.3.5 Verification of Completion of Required Testing V-III-6-14
6.3.6 Authorized Material Certification Activities V-III-6-14
6.3.7 Marking of DSS-SOC Stock Program Material V-III-6-14

6.4 Storage, Issue and Handling of Scope of Certification Material V-III-6-15

6.5 Re-use of Previously Certified Scope of Certification Material V-III-6-15
6.5.1 Material Removed from a Deep Submergence System or Operating Ship V-III-6-16
6.5.2 Reuse of Scope of Certification Material V-III-6-17
6.5.3 Material Recertification Required V-III-6-18
6.5.4 Material Recertification Following Transfer to Outside Agency (Excluding Naval Shipyards) V-III-6-18
6.5.5 Material Recertification Following Transfer to a Naval Shipyard V-III-6-18

CHAPTER 7 - TESTING REQUIREMENTS

7.1 Purpose V-III-7-1

7.2 Testing Requirements V-III-7-1

CHAPTER 8 - DEPARTURE FROM SPECIFICATIONS

8.1 Purpose V-III-8-1

8.2 Departure from Specification V-III-8-1
8.2.1 Reporting Departures from Specification V-III-8-1
8.2.2 Approval of Departures from Specification V-III-8-1

8.2.3 Major and Minor Departure from Specification Classification....V-III-8-1
8.2.4 General Administrative Requirements....V-III-8-2
8.2.5 Submission and Approval of Departures from Specification....V-III-8-2
8.2.6 Departure from Specification Approval and Reporting for DSSs While at Sea....V-III-8-3

CHAPTER 9 - AUDITS, SURVEILLANCE, EVALUATIONS, ASSESSMENTS AND SURVEYS

9.1 Purpose....V-III-9-1

9.2 Responsibilities and Procedures....V-III-9-1
9.2.1 User Activity Surveillance and Evaluation Program....V-III-9-1
9.2.2 Sustaining Activity Audit, Surveillance and Evaluation Program....V-III-9-1
9.2.3 Immediate Superiors In Command Assessments, Audits and Surveillance....V-III-9-1
9.2.4 Type Commander Assessments....V-III-9-2

9.3 System Certification Authority Certification Surveys and Functional Audits....V-III-9-2
9.3.1 Certification Process....V-III-9-2
9.3.2 Certification Survey Cards....V-III-9-2
9.3.3 Administration of Survey and Audit Findings....V-III-9-3
9.3.4 Administration of Surveys for Initial Certification or Reinstatement of Certification....V-III-9-3
9.3.5 Manned Use in Pursuit of Certification or Reinstatement of Certification....V-III-9-5
9.3.6 Sustaining Certification Surveys....V-III-9-6
9.3.7 Continuation of Certification....V-III-9-8

CHAPTER 10 - QUALITY ASSURANCE RECORDS

10.1 Purpose....V-III-10-1

10.2 Departure from Specification Record Retention....V-III-10-1

10.3 User and Sustaining Activity Quality Assurance Record Retention....V-III-10-1

CHAPTER 11 - QUALITY ASSURANCE FORMS AND FORM INSTRUCTIONS

11.1 Purpose....V-III-11-1

11.2 List of Forms....V-III-11-1

VOLUME V
PART I
FOREWORD
QUALITY MAINTENANCE

REFERENCES.

(a) NAVSEAINST 5400.95 - Waterfront Engineering and Technical Authority Policy

LISTING OF APPENDICES.

A Glossary of Terms

1.1 PURPOSE. To provide procedures and guidance to ensure, with a reasonable level of confidence, that work performed on or for Navy ships is accomplished with first time quality. Further, it is to give the sailors who serve on U.S. Navy ships the confidence that their equipment and systems will operate reliably and safely, in peace or when in harm's way.

1.2 SCOPE.

a. The guidance contained in this volume is applicable to every ship and activity of the fleet. The requirements are applicable to Ship's Force when performing maintenance on their own ship, to each Fleet Maintenance Activity (FMA) when performing work on tended ships, and to outside organizations (shipyards, contractors, Regional Maintenance Centers) performing work on ships. This volume does not currently apply to outside organizations (shipyards, contractors) when an availability is conducted in a depot facility and the contract specifies the use of other specifications.

b. This volume is directive in nature and may be cited as authority for action as the need dictates. Where higher authority imposes more stringent requirements or conflicts exist with previously issued Fleet directives, such requirements must have precedence. When such conflicts are identified, they should be reported immediately to the Fleet and Type Commanders (TYCOM).

c. The ultimate authority for risk acceptance (and all other matters pertaining to a ship regardless of platform) is the operational commander. Reference (a) contains the NAVSEA policy on what constitutes a non-conformance with technical requirements, and how those non-conformances are adjudicated. This manual defines how the operational commander implements the Departure From Specification process to originate a non-conformance and trigger the adjudication policy contained in reference (a).

1.3 MANUAL ORGANIZATION.

1.3.1 Basic Maintenance Principles. In order for repairs to be conducted reliably and with first time quality, several principles must be adhered to:

a. The worker must have a process that guides them in the performance of maintenance (see part 1 chapter 2 of this volume).

b. The worker must be trained so that work can be done safely and effectively (see Part I Chapter 3 of this volume).

c The worker must have the proper technical direction (see Part I Chapter 5 of this volume).

d. The worker must have the proper material (see Part I Chapter 6 of this volume).

e. For essential and critical systems, confidence must be established by appropriate testing (see Part I Chapter 7 of this volume).

1.3.2 Special Circumstances and Maintenance Support. In the course of conducting maintenance, special actions are required if technical requirements cannot be met. Other actions not directly related to conducting maintenance are required to support the conduct of maintenance. Other chapters in this volume discuss these:

a. Resources (Organization) (see Part I Chapter 1 of this volume).

b. Departure from Specification (DFS, Waivers and Nuclear Liaison Action Request) (see Part I Chapter 8 of this volume).

c. Audits and surveillance (see Part I Chapter 9 of this volume).

d. Retention of records (see Part I Chapter 10 of this volume).

e. Blank reproducible forms and form instructions (see Part I Chapter 11 of this volume).

1.3.3 Order of Precedence. Guidance documents originate from a variety of sources. When a conflict exists, Tables FWD-1 and FWD-2 below are provided to assist in determining precedence of the governing document on a case-by-case basis. Particular cases may require adjudication by your Immediate Superior In Command. Equipment and material under the cognizance of Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) is maintained per NAVSEA 08 directives.

1.3.3.1 Operations. Table FWD-1 identifies guidance for aligning, starting, stopping and changing modes of operation of systems and equipment.

Precedence Order
1. Operating Setting Advisories Issued Before October 2009 (e.g., Operating Advisories (Fleet Advisories, Class Advisories). Gas Turbine Technical Directives (GTBs, AYBs, etc.))
2. Operating Procedures (e.g., Operating Sequence Systems (OSS) (EOSS, CSOSS, AFOSS, etc.) Reactor Plant Manual, Steam Plant Manual, Steam & Electric Plant Manual, Ships System Manuals)
3. Technical Manuals (e.g., Component Technical Manuals, NSTM, OEM Technical Manual)
4. Directives (e.g., SORM, EDORM, NAVORDS)
5. Instructions (e.g., NAVSEA Letters)
6. Locally Generated OSS (e.g., Following the OSS Users Guide)

Table FWD-1 Operating Systems and Equipment Precedence Order

1.3.3.2 Maintenance and Technical. Table FWD-2 identifies guidance used for preventive maintenance, troubleshooting, assessment, alignment, calibration, non-permanent changes and TEMPALTs.

Precedence Order
1. DFS and Requirement Setting Advisories Issued before October 2009 (e.g., DFS, LAR-Waiver, Fleet Advisories, Class Advisories, Gas Turbine Technical Directives (GTBs, AYBs, etc.))
2. PMS (e.g., MRCs, PMRs, Steam Plant Manual, Steam & Electric Plant Manual, Maintenance Requirements)
3. Requirements (e.g., JFMM, P9290, 7010, 0010, SSCB, FBW, CRL, CMP, DDGOS, GSO, URO-MRC, SOC Notebook)
4. Drawings (e.g., NAVSHIP drawings, BUSHIP Drawings, NAVAIR Drawings TVDs, SYSCOM Approved Vendor Drawings, DDS Approved Drawings)
5. Technical Manuals (e.g., Component Technical Manuals, NSTMs)
6. Directives (e.g., SORM, EDOM, NAVORD, SYSCOM Technical Bulletins, Type Commander Technical Notes)
7. Instructions (e.g., NWPs, SYSCOM Instructions)
8. Maintenance Procedures (e.g., FWPs, CWPs, TWDs, UIPIs, PPIs, Maintenance Standards, Handbooks)

Table FWD-2 Maintenance and Technical Documents Precedence Order

The following abbreviations are used in Tables FWD-1 and FWD-2:

0010	SUBSAFE Manual
7010	Material Control Standard
AFOSS	Aviation Fuels Operational Sequencing System
AYB	Ancillary Equipment Bulletin
CMP	Class Maintenance Plan
CRL	Calibration Requirements List
CSOSS	Combat Systems Operational Sequencing System
CWP	Controlled Work Package
DDGOS	Deep Diving General Overhaul Specifications
DDS	Dry Deck Shelter
DFS	Departures From Specification
EDOM	Engineering Department Organizational Manual
EOSS	Engineering Operational Sequencing System
FBW	Fly-By-Wire
FWP	Formal Work Package
GSO	General Specifications for Overhaul
GTB	Gas Turbine Bulletins
JFMM	Joint Fleet Maintenance Manual

LAR	Liaison Action Requests
NAVORD	Naval Ordinance
NSTM	Naval Ships Technical Manual
NWPs	Naval Warfare Publications
OEM	Original Equipment Manufacturer
OSS	Operational Sequencing System
P9290	System Certification Procedures and Criteria Manual for Deep Submergence Systems
PMR	Planned Maintenance Requirements
PPI	Portsmouth Process Instruction
SOC	Scope of Certification
SORM	Ships Organization Requirements Manual
SSCB	SUBSAFE Certification Boundary Book
SYSCOM	System Command
TVD	Technical Variance Document
TWD	Technical Work Document
UIPI	Uniform Industrial Process Instruction
URO MRC	Unrestricted Operations Maintenance Requirement Card

Table FWD-3 Precedence Order Abbreviations

1.3.4 Advisories. Commencing with Revision B CH-2, advisories (bulletins, class advisories, Fleet advisories, In-Service Engineering Activity advisories, etc.) will no longer be used to change or set requirements. Any change to requirements will be done by an appropriate document change form (e.g., Advance Change Notice (ACN)).

1.4 NEED FOR QUALITY MAINTENANCE PROCESSES.

a. Quality maintenance processes play a vital role in the mission capability and personnel safety of many organizations. The three examples in sub-paragraphs (1) through (3) demonstrate how actions, which seem small and insignificant can result in severe consequences. In all cases, if a strong and effective quality process had been in effect, the tragic results may have been averted.

(1) On April 10, 1963, while engaged in a sea trials deep dive off the coast of Maine, a flooding casualty occurred in the engine room of the USS *THRESHER* (SSN 593). A piping failure in one of the salt water systems was subsequently determined to be the most likely cause for the loss of the ship and all personnel onboard. The comprehensive investigation, which followed, recommended numerous changes in the design and maintenance processes for submarines resulting in the Submarine Safety (SUBSAFE) Program, as it is known today.

(2) On January 28, 1986 the space shuttle Challenger was launched from Cape Canaveral Florida. Seventy-three seconds into flight, the spacecraft exploded and seven astronauts lost their lives. Subsequently, on June 6, 1986 a Presidential Commission concluded that the cause of the Challenger accident was the failure of the pressure seal in the aft field joint of the right solid rocket

motor. Neither the National Aeronautics Space Administration nor the rocket engine builder developed a solution to the unexpected occurrences of O-ring erosion and blow-by, even though this problem was experienced frequently during shuttle flight history. The commission further concluded that a quality program would have tracked and discovered the reason for increasing erosion and blow by. Additionally, the commission found that the pressure to fly a launch schedule of 24 flights a year created pressure throughout the agency that directly contributed to unsafe launch operations. In short, the syndrome of "they've operated with that problem before and the risk is small" prevailed. The safety and technical requirements became secondary to operational commitments.

(3) On October 30, 1990, a major steam leak occurred in the fire room on board USS *IWO JIMA* (LPH 2) resulting in the deaths of ten watch standers. The investigation determined the cause to be failure of the bonnet fasteners of a ship service turbine generator root valve. The valve had just been repaired by a shipyard where the bonnet fasteners were replaced with mis-matched and incorrect material. The required fasteners were heat-treated steel studs and nuts. The fasteners installed during the maintenance were a mixture of bolts, studs and black oxide coated brass nuts. The high temperature and pressure placed on the fasteners during plant light off caused the brass nuts to fail catastrophically, which allowed the valve bonnet assembly to separate from the body. The replacement fasteners were furnished by Ship's Force, but no one (ship or shipyard) checked the fasteners, prior to installation, to ensure that the requirements of the technical manual and drawings were met.

b. The examples in sub-paragraph "a" clearly demonstrate that, with the technical complexity of present day surface ships and submarines, the need for special administrative and technical controls necessary to ensure conformance to technical specifications during maintenance and testing is necessary. The necessity to perform the work correctly and following technical specifications is paramount in order to preclude loss of life or loss of a ship. The quality program was developed to assure maintenance of the modern day Fleet is performed following technical specifications, thus ensuring the highest state of material readiness.

c. The fundamental rule for all maintenance is that technical specifications must be met at all times. If for some reason the specified technical requirements cannot be met, acceptable alternatives must be approved by the appropriate authority and documented as a Departure from Specification or Liaison Action Request (LAR) prior to the continued operation of the ship.

1.5 CHANGES AND CORRECTIONS. Changes, corrections and updates to this volume will be made by the Fleet as required to maintain the volume current with higher authority technical requirements. When higher authority directives are issued which impose more stringent requirements, the Fleet will issue implementing instructions. Comments and suggestions for improving this volume are encouraged from all users. Address comments, recommendations and proposed changes to Submarine Maintenance Engineering, Planning and Procurement Activity using the manual change request form in the front of this volume. If changes are submitted in

electronic format, faxed or E-mail, each change request must contain the information required on the Change Request Form.

APPENDIX A
GLOSSARY OF TERMS

TERM	DEFINITION
Acceptance Trials	Trials and material inspections conducted underway by the INSURV Board for ships constructed in a private industrial activity to determine suitability for acceptance of a ship by the Navy.
Accepting Authority	The officer designated by the Chief of Naval Operations (CNO) to accept a vessel for the Navy, normally NAVSEA.
Acid Spot Test	See Generic Material Verification or Identification.
Additive Manufacturing	Additive manufacturing, also known as 3D printing, is a process used to create a physical (or 3D) object by layering materials one by one based on a digital model. Unlike subtractive manufacturing that creates its final product by cutting away from a block of material, additive manufacture adds parts to form its final product.
Alpha Trial	Builders Propulsion Trial; Acceptance Trial for SSN, SSBN, SSGN Propulsion Plant; Initial Tightness Dive (SSN, SSBN, SSGN); Dive to Maximum Authorized Depth (Selected SSN platforms).
Annual	Within 12 calendar months beginning on January 1 at 0000hr and ending on December 31 at 2359hr.
Aircraft Carriers	All ships under the responsibility of Naval Air Forces, Atlantic and Pacific Fleets. Includes all CVNs and supporting activities.
As Built Drawing	Drawings approved by the Planning Yard (PY), used for installation, and revised to indicate the actual “as installed” configuration on the ship.
Assist Work Center	The Work Center or group on board ship or at a repair activity with responsibility for accomplishment of a work or maintenance procedure as assist to or under direction of a Lead Work Center.
Audit	A detailed analysis and evaluation of records to determine compliance with existing requirements.
Backup Valve	A valve which, when closed, provides, in part or in whole, the secondary isolation boundary to sea pressure.
Boundary	The specific limits of the physical area involved in work and testing accomplished. That line, point or location identified as the border between controlled and uncontrolled areas. Depending on the type of system involved, it means the system component nearest to the work

TERM	DEFINITION
	area which is operated to regulate or shut off the flow of fluid or de-energize electricity to the portion of the system which is being worked.
Bravo Trial	Normally the initial Dive to Test Depth; Noise Trial (SSN, SSBN, SSGN); Strategic Weapons System Missile Testing (SSBN); Weapons testing (Surface Combatants).
Builder's Trials	Evaluation trials and inspections conducted underway by the builder to assure the builder and the Navy that the ship is, or will be, ready for Acceptance Trials. These trials should be a comprehensive test of all ship's equipment and be similar in scope to Acceptance Trials. For nuclear powered surface ships, this is the Acceptance Trial for the Nuclear Propulsion plant.
Casting	A part formed by pouring molten metal into a mold.
Certification	To provide assurance, in writing, that the component or system conforms to the technical requirements.
Certification (Material)	The process of receipt inspection of material received from the Naval Supply System, which establishes the correct level of essentiality and acceptability of the material following the appropriate specifications and material control standard.
Certified Oxygen Clean	Certified Oxygen Clean applies to material, which is intended for or installed in shipboard oxygen generating, storage and distribution systems. The Naval Sea Systems Command (NAVSEA) source document, which governs certification of oxygen cleanliness, is MIL-STD-1330, Standard Practice for Precision Cleaning and Testing of Shipboard Oxygen, Helium, Helium-Oxygen, Nitrogen and Hydrogen Systems.
Certifying Activity	The activity, approved by Systems Command, that is qualified to complete all of the necessary certifying requirements of the particular specification or standard.
Change In Configuration	Ship's configuration is defined by drawings and drawing revisions specified in the Ship's Drawing Index and by equipment technical manuals applicable to equipment installed in the ship following these drawings. Changes, which do not conform to these documents are a change in configuration. For example: a. Material substitutions. b. Pipe joint additions or deletions.

TERM	DEFINITION
	c. Significant rerouting or relocation of piping, cabling and equipment. d. Seal welding of normally mechanically sealed assemblies. e. Changes in piece dimensions.
Charlie Trial	Combat Systems and retesting (SSN, SSBN, SSGN); Acceptance Trials (DDG).
Cleanliness	a. Reactor Plant - Minimum reactor plant cleanliness requirements according to NAVSEA 0989-064-3000; Cleanliness Requirements For Nuclear Propulsion Plant Maintenance and Construction. b. Steam Plant - Minimum steam plant cleanliness requirements according to NAVSEA 0989-064-3000. c. Commercial Cleanliness - A term that is used to describe the minimum level of cleanliness, which should be maintained during work on propulsion plant systems and equipment not covered by NAVSEA 0989-064-3000. Commercial cleanliness is the absence of foreign material, which could, if present, interfere with the function of these systems and components. d. Oxygen System - Minimum oxygen system cleanliness requirements according to MIL-STD-1330, Standard Practice for Precision Cleaning and Testing of Shipboard Oxygen, Helium, Helium-Oxygen, Nitrogen and Hydrogen Systems.
Cleanliness Inspector or Certifier	Individuals trained and qualified to perform cleanliness inspections required by work procedures for systems or components requiring cleanliness controls.
Coaming (Submarine)	The structure surrounding holes in, and extending through one or both sides of the pressure hull structure. They are usually connected by a corner or tee weld. They provide complete or partial strength compensation for the hole. Coamings are used for items like manholes. Hull valves generally use an insert.
Combined Trials	Combined Trials are a combination of an Acceptance Trial with a Final Contract Trial. The INSURV Board normally conducts Combined Trials for nuclear powered submarines.
Component	A self-contained combination of parts, subassemblies, or assemblies which performs a distinctive function in the overall operation of an

TERM	DEFINITION
	equipment.
Component Drawing	A vendor, NAVSEA, or shipbuilder drawing which shows the assembly and details of a component such as a valve or pump. Sometimes it is divided into two drawings, one showing the assembly and the other the details. The component drawing list of material usually has a column entitled Material Identification and Control (MIC) level. It is this column on the list of material that is the source of information on whether a piece has a non-nuclear designation of Level I or Level NA (Not Applicable). A material designation does not normally appear on a component drawing list of material. It is shown instead on a Quality Assurance List (QAL). If a component drawing list of material has no MIC level column, then drawing notes should be reviewed to determine if one or more parts are Level I.
Continuity of Submarine Safety Certification	A status defined by those procedures, tests, and inspections required when hardware is renewed or replaced within the Submarine Material Certification Boundary, as well as the periodic checks or inspections required to assure continued satisfactory material condition for certification.
Controlled Assembly	Process used for Re-Entry Control (REC) Exceptions or Exceptions to Retest Requirements for Mechanical Joints and consists of: a. Verification that surface finishes of gasket and O-ring sealing surfaces are following applicable specifications. b. Verification that fastener material and installation is following applicable specifications. c. Verification that gaskets and O-rings are properly installed and following applicable specifications. d. Assembly is documented on a Quality Assurance (QA) form 34. e. Inspected by a Quality Assurance Inspector (QAI) or Quality Assurance Supervisor (QAS).
Controlled Dive	Conduct of a dive in incremental stages by a submarine to maximum authorized operating depth as measured to the keel to accomplish inspections of those joints and penetrations worked within certified boundaries and not tested prior to ship’s underway.
Controlled Material	Any material which must be identified, verified and regulated throughout the manufacturing, installation or repair process in order to meet the specifications required of the end product. Controlled material

TERM	DEFINITION
	is comprised of the following: a. Three special classes of material requiring NAVSEA or Naval Inventory Control Point mandated controls while held in the supply system and control and certification by the end user by use of the procedures in Part I, Chapter 6 of this volume: 1. Non-Nuclear Level I. 2. Submarine Flight Critical Component. 3. Nuclear Level I. b. Material which NAVSEA considers to be of sufficient criticality to warrant basic receipt inspection by the end user and segregated storage while in supply or a work center, but not necessarily the control and certification required by Part I, Chapter 6 of this volume: 1. Naval Nuclear Propulsion Plant Material stocked with SMIC X1, X3 or X5 (instrumentation drawers, low chloride lagging). 2. Non-Nuclear Materials stocked with SMIC SQ, CP, DG, QA, SP or VG. 3. HY-80, 100 or 130 plate.
Controlled Material Handler	An individual at the TRIDENT Refit Facilities who is qualified to perform the duties of a Controlled Material Petty Officer.
Controlled Material Petty Officer	An individual responsible for the receipt inspection and control of SUBSAFE, Level I, Project Target, Nuclear Level I and Scope of Certification materials after issue from the supply system.
Controlled Work Package	The records that provide the Objective Quality Evidence (OQE) necessary to certify that the completed maintenance was authorized, required tests were completed and work was certified. This consists of the Formal Work Package (FWP) and OQE.
Craftsman	A mechanic or other individual trained in QA methods and procedures (i.e., inspections, cleanliness, testing, documentation) to perform maintenance on ship's systems or components.
Deep Dive	The first dive to maximum operating depth. This depth will not necessarily coincide with the design test depth of the hull. See definition of Maximum Operating Depth.

TERM	DEFINITION
Defect	An imperfection that impairs completeness or quality or does not meet required specification.
Delivery	The date the Navy accepts the ship from the ship builder. This requires a recommendation from the INSURV Board to accept or deliver the ship. Delivery of the ship is based on Acceptance Trials and satisfactory correction or resolution of deficiencies.
Departure From Specification	A lack of compliance with any authoritative document, plan, procedure, instruction, etc. See Part I, Chapter 8 of this volume for more information.
Design Intent	The revision of a drawing from which the original equipment or part was intended to be built, or the revision to which design intends the ship to be built. This revision is typically reserved for use by planning yards and should not be used by Organizational and Intermediate level maintenance activities.
Detrimental Material	A material which, when contacting hardware, may have a deleterious effect on the hardware.
Deviation	Any non-conformance of a component or product with specified requirements.
Dock Trial	Dock Trials are those ship trials conducted at the Industrial Activity to determine the ability of the ship, from a material standpoint, to conduct Sea Trials safely.
Documentation	The records of OQE establishing the requisite quality of the material, component or work accomplished. Documentation should be traceable from the item to the records and be filed in an auditable manner.
Downgrading	The formal process used to decertify (removal of MIC mark(s), general identification marks, and in some cases demilitarize) controlled material for general use or disposal.
Electrode	A consumable filler metal which fuses during the welding process and becomes an integral part of the material or non-consumable electrode that fuses the metal during the welding process, but does not become an integral part of the material (e.g., tungsten).
Emergent Work, Emergent Repair, Emergent Maintenance	A task which requires immediate repair in order to correct mission impacting maintenance.

TERM	DEFINITION
Face Feeding	The manual addition of brazing alloy at the intersection of the fitting face and the pipe. Supplemental face feeding is the addition of brazing material to increase fillet size.
Fast Cruise	A period immediately prior to underway trials during which Ship's Force operates the ship for dockside training. Fast Cruise must, as far as is practical, simulate at-sea operating conditions.
Final Contract Trials	Trials that are conducted prior to the end of the guarantee period to determine if there are any defects, failures, or deterioration other than that due to normal wear and tear.
Fleet Introduction Team	A team of personnel assembled to support a pre-commissioning crew by monitoring progress of construction and coordinating training and facilities. They provide administrative support in all facets of new construction.
Fleet Maintenance Activity	FMAs include tenders, shore based maintenance activities (Regional Maintenance Centers, Naval Ship Repair Facilities, Naval Submarine Support Facilities, Naval Intermediate Maintenance Facilities (NAVIMFAC), TRIDENT Refit Facilities, Weapons Repair Facilities and other activities of that type) and supporting activities (port services, etc. that perform maintenance on Fleet assets).
Fly-By-Wire Ship Control System	A Ship Control System in which the controls are actuated by electrical impulses, as from a computer.
Foreign Material	Any material or object that should not be on or within clean hardware. Examples include grit, chips, particles, oil, slag, scale, fibers, tape, tools, and loose articles.
Forging	Defined as a part formed by hammering or pressing a piece of heated metal to form a shape.
Formal Work Package	Written instructions, prepared per Part I, Chapter 2 of this volume for use in production and repair, delineating all the essential elements and guidance necessary to produce acceptable and reliable products.
Gas System Cleanliness Inspector or Certifier	Any person qualified under the requirements of this manual to perform the tasks of initial, in-process and final Cleanliness Certification Inspections for Gas systems.
Generic Material Verification or Identification	A broad identification of materials by simple, direct and rapid analysis methods or a combination of methods (e.g., Color, Magnetic Properties Test, Acid Spot Tests, Metal Comparator Tests). These tests are

TERM	DEFINITION
	designed for simple screening and identification of materials by alloy family (as opposed to classification of specific alloys within a family).
Group	Normally that first 1-Star organization or Command above the Squadron before to TYCOM.
Guarantee Material Inspection	A material inspection, conducted in port prior to Post Shakedown Availability (PSA) by a Trial Board prior to the end of the guarantee period when CNO has authorized a Combined Trial to determine if contractor responsible equipment has operated satisfactorily during the guarantee period. It must include the opening and inspection of equipment designated by the Board together with the operation and visual inspection of equipment and the review of material maintenance records.
Guarantee Period (New Construction)	The period of time immediately following preliminary acceptance (delivery), normally eight or nine months (six months for nuclear powered ships), for which the industrial activity is responsible for the correction of deficiencies.
Guarantee Period (Post Shakedown Availability)	The guarantee period following PSA varies with the type of contract. Historically, a "cost plus" type contract has had a guarantee period of six months and a "fixed price" type contract a period of 90 days. The Supervising Authority will advise at the time of PSA the guarantee that applies.
Homogeneous Lot	a. Nuclear: A lot of material in which each piece is manufactured from the same heat, batch, or melt or has the same vendor traceability code number. b. Non-Nuclear: A group of like items that are produced in a common heat or batch or are produced under continuous cast or pour process with the same vendor traceability numbers, are of the same nominal size, and are received in a single shipment. For batch or continuous cast or pour processes, samples for chemical and mechanical properties must be taken no less than once in every 8 hours of operation. If additional production processes are used that alter the mechanical properties of the material (e.g., heat-treat, cold or hot forge, extrusion), then all items of the same "Heat" number and additionally processed under the same conditions at the same time must be considered as a homogeneous lot.
Hull Integrity Boundary	Pressure hull plating (shell plate), pipe, components, etc., NPS 1/2 inch and larger, from the inboard joint of the backup valve (or equivalent) outboard to the hull.

TERM	DEFINITION
Hull Integrity Fasteners	Hull Integrity Fasteners (HF) are male threaded type items such as bolts, socket head cap screws, studs and bolt studs which are loaded by the differential sea pressure and internal hull pressure, and which are a part of pressure hull integrity components or of systems penetrating the Pressure Hull Structure, from the pressure hull to and including the inboard joint of the backup valve or its equivalent. Nuts and lock-washers are specifically excluded.
Hull Valve	A valve which, when closed, provides, in part or in whole, the first isolation boundary to sea pressure. The hull valve may also be referred to as the primary closure.
Immediate Superior In Command	The ISIC is defined as: a. For Submarines - The Squadron or Group. b. For Aircraft Carriers - The TYCOM. The TYCOM may designate a representative in carrying out certain Immediate Superior in Command functions. c. For Surface Forces - The Command holding administrative control.
Industrial Activity	The activity responsible for accomplishing construction or repair of ships whether private or public. This includes Naval shipyards, private shipyards, shipbuilders, vendors, Naval Aviation Depots, Naval Ship Repair Facilities, and other Naval Repair and Technical Activities (Naval Underwater Weapons Center, Naval Ships Weapons Center, etc.).
Initial Dive	For purposes of seawater valve and system testing, as defined in NAVSEAINST C9094.2, the first dive to a depth not previously reached during the trials.
Initial Tightness Dive	First submergence (a submarine's Alpha Trial).
In-Process Surveillance	The review of work in progress by personnel not directly involved with the work to assess such attributes as tagging and installation of controlled material, compliance with technical procedures, and recording of required data.
In-Service	Nuclear powered ships are assigned an active status of In-Service approximately two to four weeks (two to four months for aircraft carriers) prior to the commencement of Sea Trials and maintain this status until commissioning.

TERM	DEFINITION
Inspection	A certification conducted by a separate individual qualified as an inspector (QAS, QAI, Cleanliness Certifier or Cleanliness Inspector, Nondestructive Test (NDT), Radiological Controls Monitor, Radiological Controls Shift Supervisor) on any system or component, which by its nature, is critical to the successful completion of the task.
Inspection Record	Record data showing the results of an inspection with appropriate identifying information as to the characteristics inspected and item inspected.
INSURV	Prior to the acceptance and delivery of a new ship, whether built by a private or naval industrial activity, all machinery, electronics and weapons systems installed must be subjected to acceptance trials to determine that the installations are capable of meeting performance specifications. Depending upon your platform, these trials are referred to as either Acceptance Trials, Combined Trials or INSURV. This independent verification of the ship's readiness for acceptance and recommendation for fleet introduction is the responsibility of the President, Board of Inspection and Survey.
Latest Revision	The most recent authorized revision and change level of a drawing. The latest revision of a hull applicable drawing may not identify current configuration for a specific hull.
Leading Petty Officer or Work Center Supervisor	That person as defined by the appropriate Organization and Regulations Manual, responsible for ensuring the quality of work performed by their work center.
Lead Work Center	The Work Center or group on board ship or at a repair activity with prime responsibility for accomplishment of a work or maintenance procedure.
Level I	A designation for systems and components for which the Navy requires a high degree of assurance that chemical composition and mechanical properties of the installed materials meet the specified requirements.
Level of Essentiality	A range of controls in two broad categories representing a high degree of confidence that procurement specifications for piping system components have been met. These categories are: a. Verification of material, which ensures that the manufacturer has complied with procurement requirements for chemical composition and physical properties of the material. b. Confirmation of satisfactory completion of tests and inspections required by the ordering data (e.g., Liquid Penetrant Testing (PT), dimensions, hydrostatic strength and porosity).

TERM	DEFINITION
Liaison Action Request	A request for technical concurrence from Planning Yard or NAVSEA. Procedures for requesting information from the Reactor Plant Planning Yard are contained in Commissioned Submarine General Reactor Plant Overhaul and Repair Specification (NAVSEA 0989-LP-037-2000), Nuclear Support Facilities Overhaul and Repair Specification (NAVSEA 0989-LP-058-1000), Commissioned Surface Ship General Reactor Plant Overhaul and Repair Specification (NAVSEA 0989-043-0000) and TYCOM instructions. For non-nuclear systems and components, the LAR can be in any format which is convenient for the user, provided that it is identified as a LAR, clearly defines the exact information needed, lists the drawings in question, and states the date by which a reply is requested to support ship schedules. Volume II of the Fleet Modernization Program Management and Operations Manual contains a format for a non-nuclear LAR which FMAs may adapt for their use.
Loss of Traceability	A situation in which controlled material cannot be positively traced to the results of chemical and physical testing performed to prove that the material is that required by the specification to which it was made or bought. In each instance of loss of traceability, the FMA or ship Quality Assurance Officer must initiate action to restore traceability or use alternate, traceable material.
Maintenance Certification Record	The record (QA form 9) used to document the physical work boundaries, define the work involved, specify the material control and fabrication control procedures, specify inspection and test requirements, list the certification records involved, and provide approval and acceptance signatures and dates for work within the SUBSAFE boundary, a nuclear system or a Level I system or component.
Maintenance Manager	Those persons, such as Port Engineers, Ship Superintendents, Ship's Coordinators, and Maintenance Planning Managers, assigned to assist Ship's Force in the tracking of work candidates, development of work packages, and tracking of FMA or Industrial Activities assigned jobs.
Maintenance Requirement Card	Defines maintenance inspections and actions associated with the Planned Maintenance System (PMS).
Maintenance Standard	(Submarines only) A document which specifies minimum technical requirements for acceptable refurbishment of submarine components, including inspection and testing criteria and parts replacement information, following NAVSEA maintenance plans.
Major Repair	Non-nuclear major repairs are those repairs which: a. Structurally affect the pressure-containing portion of a piping system or component through welding (except as defined under Minor

TERM	DEFINITION
	Repair), brazing or other fabrication process, including new mechanical joints in which a flange or union tailpiece is replaced using a weld or braze. b. Involve installation of new pressure boundary parts or components which have not been previously strength tested.
Mapping Drawing	A diagrammatic drawing, verified by ship check, that identifies and specifies the location of elements which must meet a SUBSAFE requirement of NAVSEA 0924-062-0010, SUBSAFE Requirements Manual. Pipe joints, flexible connections and castings are examples of items identified on the mapping drawing. Pipe joints are each numbered (e.g., MSW-56178) and the type of joint identified (e.g., WB - butt weld). The mapping drawing will also reference a QAL as applicable. Mapping drawings are discussed in the introductions of the SUBSAFE Certification Boundary Book. Most of the symbols seen on a mapping drawing are: BF - Brazed joint, face fed BP - Brazed joint, pre-inserted ring CN - Casting F or FG - Flange FH - Flexible connection HF - Hull Integrity Fastener IN - Pressure hull insert PE - Penetration PF - Pressure hull fitting PM - Pressure hull penetrating mast SL - Seal U - Threaded pipe union WA - Welded attachment WB - Butt weld WF - Fillet weld WL - Seal weld WM - Bimetallic weld WN - Welded nozzle WR - Root connection (or boss) WS - Socket weld
Material Identification and Control Number or Marking	A unique number assigned to certified material by the Certifying Activity (for material) which provides traceability to OQE following the applicable Material Control Standard.
Maximum Operating Depth (Also Maximum Authorized Operating Depth)	The depth to the keel for a particular submarine which is authorized by Commander Submarine Forces Atlantic or Commander Submarine Forces Pacific upon the recommendation of NAVSEA, as the depth not to be exceeded in operations. This depth is normally the Test Depth but may be reduced in specific cases. The depth authorized may be less than,

TERM	DEFINITION
	but in no case exceed, the depth recommended by NAVSEA.
Minor Repair	Minor repairs are operations that could be considered maintenance such as replacing packing and pressure seal ring, lubricating, lapping or grinding of seats, and replacing damaged parts such as stems and discs. For the purpose of this manual the definition in Naval Ships' Technical Manual Chapter 505 or NAVSEA S9074-AR-GIB-010/278, whichever is applicable, is used for the term "Minor" repair.
Moderate Speed	The range of speed that allows the submarine optimum recovery (as shown on applicable submerged operating envelope curves) if loss of stern plane control, flooding, or both, occurs. Normally 8-15 knots.
Naval Supervisory Authority or Supervisory Authority	The officer designated to represent the Navy Department at an industrial activity; normally a Supervisor of Shipbuilding (new construction), Regional Maintenance Center (Conversion and Repair) or the Commander of a Naval Shipyard.
New Mechanical Joint	A joint where either a flange or union is replaced. A new mechanical joint is a major repair and requires a hydrostatic test to the specific requirements of a particular system.
Nominal Operating Pressure	The approximate pressure at which an essentially constant pressure system operates when performing its normal function. This pressure is used for the system basic pressure identification.
Nondestructive Testing	All methods of testing used to detect or measure the significant properties or performance capabilities or material, parts, assemblies, equipment, or structures which do not impair the service ability of the parts tested. These tests include: a. Radiographic Testing (RT). b. Magnetic Particle Testing (MT). c. Liquid Penetrant Testing (PT). d. Ultrasonic Testing (UT). e. Visual Testing (VT). f. Eddy Current Testing (ET).
Nondestructive Testing (NDT) Supervisor	The NDT Supervisor is the individual designated by the respective Division Officer and is qualified in specific methods for which they are designated NDT Supervisor. (There may be more than one NDT

TERM	DEFINITION
	Supervisor in an organization.)
Nuclear Regional Maintenance Department (NRMD)	NRMD performs intermediate level nuclear maintenance and repair work, consolidating efforts in a regional area, thus eliminating duplication of infrastructure and maximizing effective use of funds. This is accomplished by the use of military personnel integrated into the experienced nuclear production, radiological and engineering resources of the parent shipyard. NRMDs are an expansion of their parent shipyard.
Objective Quality Evidence	Any statement of fact, either quantitative or qualitative, pertaining to the quality of a product or service based on observations, measurements, or tests which can be verified. (Evidence will be expressed in terms of specific quality requirements or characteristics. These characteristics are identified in drawings, specifications, and other documents which describe the item, process, or procedure). a. Tests can be based on heat, batch, continuous cast or pour, or other manufacturing processes, providing the manufacturer can prove the test sample was representative of the material supplied. b. Material supplied will bear a unique traceability marking and report of supporting test quantitative data will bear an identical marking.
Oxygen Clean Inspector	A Cleanliness Inspector or Cleanliness Certifier qualified by the Oxygen Clean Instructor and certified by the Department Head or Commanding Officer to perform cleanliness inspections on systems under the requirements of MIL-STD-1330.
Oxygen Clean Instructor	An individual certified by their Commanding Officer to train and qualify personnel in the procedures and requirements of MIL-STD-1330.
Oxygen Clean Worker	An individual qualified by the Oxygen Clean Instructor and certified by the Department Head to perform maintenance on systems under the requirements of MIL-STD-1330.
Planning Yard	The Naval Shipyard or other activity designated by NAVSEA to perform the following tasks pertaining to specifically assigned ships: a. To provide, or coordinate the provision of technical and other services in design matters. b. To be responsible for the availability of a complete up-to-date file of working drawings, Selected Record Drawings, and Data.

TERM	DEFINITION
	c. To provide a central repository, reproduction, and distribution services, or to coordinate such services, for working drawings, Selected Record Drawings, and Data. d. To provide these services to the fullest extent possible within the limits of the funds provided.
Positive Material Identification	Process by which the craftsman ensures that the material to be or being installed is the correct material as specified by the plan, technical manual, etc. This process is also referred to as "Positive Material Identification and Verification".
Post Shakedown Availability	An industrial activity availability following Final Contract Trials or Guarantee Material Inspection assigned to correct deficiencies found during the shakedown period or to accomplish other authorized improvements.
Pressure Boundary Part	An item which separates an internal fluid from the atmosphere (or another fluid at reduced pressure) or which joins two other pressure boundary parts.
Pressure Hull Fittings	All items and assemblies which penetrate the hull integrity boundary and are attached either mechanically or by welds to penetrations, inserts or plating. This includes structural, piping, mechanical and electrical pressure hull fittings and mechanical stuffing boxes; specifically excluded are all cables, O-Rings, V type packing or packing around mechanical shafts.
Procedure	Written instruction designed for use in production and repair, delineating all the essential elements and providing guidance necessary to produce acceptable and reliable products. The term "procedure" includes PMS Maintenance Requirement Card (MRC), technical manuals, reactor plant manuals, standard operating procedures, ship's instructions, etc.
Product Quality Deficiency Reporting	A method for reporting deficiencies in new or newly reworked material which may be attributable with contractual or specification requirements or substandard workmanship performed by depots, naval shipyards, contractors or subcontractors.
Q-Point	Critical Quality Control Point. A work process, regardless of type (maintenance, training, administrative, etc.), whose proper accomplishment overwhelmingly affects the ultimate first time quality success of the process.

TERM	DEFINITION
Quality Assurance	A systematic review of Quality Maintenance records and all production actions which will provide adequate proof and confidence that work performed or material manufactured will perform as designed and that there is documentary evidence to this effect.
Quality Assurance Inspector	The designated individual(s) in FMA and ship work centers who inspect the work of other individuals, not their own work. Certified as qualified by the Commanding Officer or Repair Officer.
Quality Assurance List	(Submarines only) QAL on NAVSEA Drawings specify NDT requirements for items scheduled for installation within the SUBSAFE boundary during new construction. The QALs should only be utilized for guidance subsequent to a ships' commissioning, since they will not necessarily reflect current NDT requirements.
Quality Assurance Officer	An individual assigned the responsibility for the organization, administration, training and execution of the QA Program.
Quality Assurance Supervisor or Specialists	Personnel assigned to the FMA Quality Assurance Officer to assist in implementing the QA Program. QASs are certified as qualified by the FMA Commanding Officer. A Quality Assurance Specialist is an individual at the TRIDENT Refit Facilities who is qualified to perform the duties of a QAS.
Quality Control	On the job supervision, management and inspection which identifies and ensures proper workmanship or materials are being produced.
Reactor Plant Cleanliness Inspector or Certifier	Any person qualified under the requirements of the manual to perform the tasks of initial, in-process and final Cleanliness Certification Inspections for Reactor Plant Systems.
Reactor Plant Work Accomplishment Report	A report submitted to the Reactor Plant Planning Yard by ships, FMAs and shipyards which certifies work accomplished by them on reactor plant hull integrity areas. These areas, identified on the ship specific Reactor Plant Work Accomplishment Report, are nuclear and are usually within the SUBSAFE boundary.
Re-Entry	Includes any and all work and testing in a SUBSAFE certified system including penetration of the pressure hull from the first breaching through final grooming, testing and return to final operation, (e.g., breaking a mechanical flange, a sil-braze, or welded joint, removal of a valve bonnet, repacking a gland).
Re-Entry Control	The controls used to document the re-entry and re-certification of SUBSAFE systems or components. The QA form 9 (Maintenance

TERM	DEFINITION
	Certification Record) is used to document the acceptance of a completed SUBSAFE system Re-entry.
Reinstall	To use or install the previously installed item or component.
Re-Made Mechanical Joint	A flange or union joint which has been reassembled using existing or new threaded fasteners on which no brazing or welding was accomplished on the joint parts during the repair or modification process.
Repair	Refurbishment other than mere disassembly or cleaning.
Replace	To install a new item or component.
Rework	The unplanned repetition of a step or a series of steps in a Formal Work Package.
Sample	One or more units of a product selected at random from the material or process represented.
Selected Record Data	Tables, charts, drawing indices, allowance lists, damage control books and other data (excluding drawings) specifically selected for their reference value and maintained current throughout the life of the ship.
Selected Record Drawing	A designated group of drawings made applicable to an individual ship by illustrating final shipboard installations of important features, systems and arrangements that must be maintained up to date and correct throughout the life of the ship.
Ship	Any submarine, surface ship, tender, or other vessel assigned to the Fleet.
Ship's Drawing Index	A list of drawings, normally on microfiche, or Compact Disc Read Only Memory (CD ROM) which applies to each ship. It lists ship construction drawings, ship modification drawings and manufacturer (vendor) component drawings. It is here that system diagrams, mapping drawings and in some cases, QALs are identified by drawing title or by a code in a column after the drawing title and number. The SDI is located in ATIS and TVD applicability data.
Small Item	Items that have a marking surface less than 3/8 of a square inch area.
Software	Gaskets, packing and seals used in mechanical flange or union joints in piping systems.
Special Cleanliness	A requirement for components used in oxygen and nitrogen systems to prevent combustion of contaminants and maintain purity of the gas. The

TERM	DEFINITION
	cleaning requirements are discussed in Naval Ships' Technical Manual Chapter 550, Industrial Gases: Generating, Handling and Storage.
Special Material Identification Code	A two-digit letter or number code at the end of the National Stock Number or Navy Item Control Number to provide visibility to designated items to ensure maintenance of their technical integrity. The following SMICs from Appendix C of SPCCINST 4441.170 or Appendix B of SPCCINST 4441.176 are for material commonly used in the Fleet.
	CP An item that requires special cleaning and packaging for oxygen or nitrogen service (e.g., valves, piping system, generators).
	C1 An item that requires special cleaning and packaging for oxygen or nitrogen service (e.g., valves, piping system, generators) which also must meet the requirements of Level I.
	DG An item that requires special cleaning and packaging for oxygen or hydrogen service (e.g., valves, piping system, generators).
	D1 An item that requires special cleaning and packaging for oxygen or hydrogen service (e.g., valves, piping system, generators) which also must meet the requirements of Level I.
	LI (Level I) An item that supports either a SUBSAFE or Level I system that has undergone the extreme material control or QA techniques that provide OQE of its acceptance for its appropriate application. Each item has certification papers (or special markings that provide traceability to the certification) that pedigree its material and physical properties, provide traceability to manufacturer, contract list and lot, and document the QA system or test requirements applied to the item.
	NT Annular ball bearings for quiet operation applicable to submarine usage (noise tested bearings).
	QA Equipment or parts requiring special material control and QA which supports surface ship or submarine applications.
	Q3 Items that support a Level I or SUBSAFE critical component or system that has undergone QA during the acquisition process (e.g., a ball and seat assembly utilized in a Level I or SUBSAFE ball valve based on ship system application). This, however, does not include Trash Disposal Unit, Signal Ejector, Salvage Air, and open ended applications which are procured as Level I or SUBSAFE. "Q3" SMIC invokes chemical and mechanical certifications

TERM	DEFINITION
	traceable to the heat code permanently marked on the material. It should be noted that "Q3" SMIC coded material is not receipt inspected or MIC marked by the receipt inspection activities.
	SP An item which is unique to the Navy Strategic Systems Program Office controlled fleet ballistic missile weapon system. The SMIC SP establishes a weapons system relationship but does not signify the technical considerations as described in definition X2, X3 and LI.
	SQ Items inducted to the Submarine Antenna Quality Assured Material (SAQAM) program, which is administered by Naval Supply Weapon Systems Support, Mechanicsburg. It includes whole components and repair parts.
	SW SEAWOLF Class Ship Control System approved Ships Flight Critical Components.
	S1 An item which is unique to surface ship applications which also meets the requirements of Level I.
	TR TRIDENT Ship's Program.
	VG Equipment or parts requiring special material control and QA which support surface ship or submarine applications. Special cleaning and packaging for oxygen or hydrogen service is required.
	VU VIRGINIA Class Ship Control System approved Ships Flight Critical Components.
	X1 NAVSEA Nuclear Propulsion Directorate (08) controlled material identified as "2S" cognizance material with an "X1" SMIC.
	X2 Naval Reactor Plant material, which is specially designed, manufactured or treated for use in a Naval Reactor Plant. In addition, this material is inspected (or sample inspected) by a Naval shipyard prior to being placed in Navy Supply System Stock.
	X3 Naval Reactor Plant material specially designed, manufactured or treated for use in a Naval Reactor Plant.
	X4 Naval Reactor Plant valves and auxiliary equipment used in secondary Nuclear Level I applications which are technically receipt inspected and certified as ready for use by a receipt inspection activity.

TERM	DEFINITION
	X5 Naval Reactor Plant component level items not qualifying for X1, X2, X4 or X6 SMIC assignment. This material is not inspected by a Naval shipyard prior to being placed in Naval Supply Stock and will not have a Ready-For-Issue tag attached. X6 Naval Reactor Plant items specifically designed, manufactured or treated for use in Level I Naval Reactor Plant applications. All Level I items which do not qualify for SMIC X1, X2 or X4 assignment are assigned SMIC X6. Since the outer packaging of material received from the Naval Supply System may not be marked with an X6 SMIC, end users should consult applicable logistics information (e.g., the Q Coordinated Shipboard Allowance List, FEDLOG, Haystack, etc.) to determine the current applicable SMIC assignment. If an X6 SMIC is currently assigned in any of the applicable logistics information, the material is considered pre-certified Level I material and does not require a Ready-For-Issue tag. X7 Naval Reactor Plant material qualified and marked as acceptable for use in reactor plant clean and steam plant clean applications under the technical cognizance of the Naval Sea Systems Command (Directorate, Naval Nuclear Propulsion Program; NAVSEA 08) that is managed by Navy Supply Systems Command Weapon Systems Support and is specially designed, manufactured or treated for use in both reactor plant clean and steam plant clean applications.
Specification	Any directive, whether technical or administrative, in any format, such as instruction, technical manual, drawing, standard or publication.
Steam Plant Cleanliness Inspector or Certifier	Any person qualified under the requirements of this manual to perform the tasks of initial, in-process and final Cleanliness Certification Inspections for Steam Plant Systems.
Submarine Antenna Quality Assured Material	Submarine antenna material which is quality assured by the SAQAM and marked or recorded to ensure proper documentation and traceability
Submarines Only	All ships under the responsibility of Submarine Forces, Atlantic and Pacific Fleets. Includes all submarine classes (e.g., SSN, SSBN, SSGN) and supporting activities: ARDMs, ASs, and UUVs.
Submarine Safety Certification	Investigative effort and corrective action developed under the certification requirements for safety of submarine operations which has as its specific aim an order of magnitude increase in the safety of

TERM	DEFINITION
	submarine operations. Accomplishment provides reasonable assurance that the integrity of defined critical systems and components, and the casualty recovery capabilities are adequate to permit unrestricted operations to test depth.
SUBSAFE	The acronym for Submarine Safety which applies to all submarine classes. The SUBSAFE program provides a high level of confidence in the material condition of the hull integrity boundary and in the ability of submarines to recover from flooding and control surface (e.g., bow, rudder, stern plane) casualties.
SUBSAFE Attribute	Test and inspection requirements for SUBSAFE systems and components.
SUBSAFE Certification	That area within which the requirements of the SUBSAFE Requirements Manual apply. It includes those inboard piping and mechanical systems maintaining watertight integrity and recovery capability from a flooding casualty.
SUBSAFE Certification Boundary Book	A book presenting simplified diagrams or sketches which show the hull non-nuclear integrity and certified system boundaries for a specific submarine, class of submarine or group of submarines within a class.
SUBSAFE System	A submarine system or component designed, installed and maintained to: a. Prevent flooding of the submarine (e.g., failure would cause flooding of ship). b. Enhance recovery in the event of flooding (e.g., flood control). c. Ensure reliable submerged ship control (e.g., certain parts of the steering and diving system). d. SUBSAFE systems are shown in the SUBSAFE Certification Boundary Book.
Surface Force Only	All ships under the responsibility of Naval Surface Forces, Atlantic and Pacific Fleets. Includes all surface ship classes and supporting activities that are NOT under the responsibility of Submarine Forces or Naval Air Forces (e.g., Aegis Ashore, CG, DDG, ESB, LCC, LCS, LHA, LHD, LPD, LSD, MCM).
Surveillance	Observations and analysis of actual work procedures and methods to verify compliance with technical requirements.

TERM	DEFINITION
System	All components, piping, fittings, including electrical and mechanical items, which together form and contribute to the operation of an integrated functional arrangement. The "system" as used in this manual is not limited to piping only unless "piping" is specified. Any part which receives the fluid, controls, or is controlled by the fluid is included.
System Design Pressure (Non-Nuclear)	System design pressure is the pressure used in the calculation of piping and piping components minimum wall thickness and will not be less than the maximum system pressure (for general guidance, design pressure may be estimated within 2 to 3% by multiplying maximum operating pressure by 112%).
Target Material or Project Target Material	As defined in NAVSEA S9213-45-MAN-000. All material issued with a "Project Target Ready-For-Issue" tag for use as Nuclear Level I is either X1, X2 or X4 SMIC coded.
Technical Data	Recorded information (regardless of the form or method of recording) of a scientific or technical nature (including computer databases and computer software documentation). This term does not include computer software or financial, administrative, cost or pricing, or management data or other information incidental to contract administration. The term includes recorded information of a scientific or technical nature that is included in computer databases. For these purposes, technical data includes the characteristic of a particular science, trade or profession.
Technical Repair Standard	See Maintenance Standard. Document which provides minimum requirements for the acceptable repair and refurbishment of submarine equipment and components and identifies planned and contingency material necessary to ensure satisfactory operation until the next planned maintenance action.
Technical Variance Document	(Submarines Only) The documentation used to document configuration changes made during an availability or refit that influence a maintenance, alteration and repair, but will not be incorporated in a revision to a drawing as accomplished on the ship. Some examples of types of TVD: 1. Design-TVDs (DTVDs) are used in many instances, to identify updates to design drawings in order to correct drawing errors, capture changes, clarify information, provide alternate installation methods or procedures or alternate material for those instances when it is not warranted or cost effective to complete a drawing revision. DTVDs should not be utilized when significant changes have occurred and are

TERM	DEFINITION
	not authorized as the sole means to change information for provisioned items. Design-TVD is typically provided through a Liaison Action Request or Reverse Liaison Action Request or through a D-Type Engineering Report in New Construction. Work performed in accordance with Design-TVD is not considered a non-conformance and is not subject to additional approvals as a non-conformance. Incorporation of drawing updates associated with DTVDs as official revision to ship drawings will be accomplished as directed by the Program Executive Officer - SSBN, Strategic Submarines and Program Executive Officer - SSN, Attack Submarines Program Offices in accordance with their Configuration Management Plans. "DT" is used in Advanced Technical Information System to identify drawings with Design-TVD. DT should not be used as a general abbreviation for Design-TVD anywhere else. 2. "As Built" TVDs are used to specify which ships the change is actually installed on.
Technical Work Document	The work procedure that will provide the craftsman with clear, concise and technically correct instructions to complete the maintenance task while conforming to technical specifications. Technical Work Documents consist of three general types: Maintenance Procedures, Formal Work Packages and Controlled Work Packages.
Test Depth	For the purpose of the proper method of measuring and specifying Test Depth, the following applies: Test Depth must be measured to the bottom of the keel for all types of submarine operations. Builders trials and trials following major industrial activity availabilities greater than six months, must be at a tolerance of plus zero (0), minus twenty (20) feet of Test Depth when specified. All other trials can be conducted at 95% to 100% of Test Depth to satisfy all the requirements specified for 100% Test Depth.
Test-Drop	A pressure test used to determine the integrity of a system. It is performed upon satisfactory completion of the strength and porosity hydrostatic test and is accomplished by pressurizing the system to its system working pressure while it is arranged for normal operation. Pressure is applied using either air or an inert gas as applicable. The test is held and monitored for a specified period of time and the system tightness is determined by correcting the pressure drop for temperature change.
Test Equipment or Working Level	For purposes of this manual, test equipment will be interpreted as comprising all general purpose equipment (standard measuring

TERM	DEFINITION
Instruments	instruments), special testing equipment, including such classes as checkout equipment, acceptance equipment, inspection equipment, gauges and associated accessories.
Test-Hydrostatic	A test where the system or a portion of the system is filled with fluid and pressurized above normal operating pressure to a specified hydrostatic test pressure and inspected for leaks and visible permanent deformation.
Test-Joint Completion	See Test-Mechanical Joint Tightness.
Test-Mechanical Joint Tightness	A pressure test where a portion of a system or the entire system is pressurized to its system nominal operating pressure or "J" test pressure to determine leak tightness after closing a mechanical joint where leak tightness is obtained by gaskets, seal welding or threads.
Test-Operational	(Non-Nuclear) a. A test of a system to nominal operating pressure using the system fluid, pumps and installed system gages vice test instrumentation to determine leak tightness; or b. A test of a system to assure that all items, components, controls and indications function as designed and following specifications.
Test-Pneumatic	A test where a portion of the system or the entire system is pressurized with gas and inspected for leaks.
Test Pressure Drawing	Drawings which have been developed from system diagrams for classes of submarines and contain strength and mechanical joint tightness pressures for all portions of piping systems. These pressures are displayed in "indicators" which contain two test pressure values as illustrated in the Submarine Non-Nuclear Piping Systems Test Manual, NAVSEA S9505-AF-MMA-010/PIPING SYSTEMS.
Test-Shop	A test performed on a section of piping or a system by an FMA work center when the subassembly piping or component is not installed in an onboard system.
Test-Soap	A method of determining the tightness of a system by applying a soap and water solution to the system joints while the system is being either pressure or vacuum tested. The test is held a sufficient length of time to permit a thorough examination for leaks. When vacuum testing the leak, the testing solution should be compatible with the system to preclude contamination and will be specified on the applicable Test Pressure Drawings.

TERM	DEFINITION
Test-Strength and Porosity	A hydrostatic test conducted at a specified strength test or "H" pressure that is above nominal or system operating pressure.
Torque	The twisting force exerted multiplied by the distance through which the force acts. In the Navy, torque is usually measured in foot-pounds or inch-pounds. a. Breakaway Torque. The torque required to start the self-locking fastener moving when the locking element is fully engaged and with no axial load. b. Final Torque. When construction drawings specify that running torque has been incorporated into the required torque, final torque is the torque value specified in the construction drawing and running torque is NOT added to the required torque during joint assembly. c. Required Torque. The torque following the design drawing or technical manual requirements, the torque from appropriate torque tables in Submarine Fastening Criteria (Non-Nuclear), Description, Design, and Maintenance, NAVSEA S9505-AM-GYD-010 or the torque following an applicable approved process instruction. d. Running Torque. The torque required to continue turning a self-locking fastener prior to contact with the seating surface.
Traceability	A positive capability of finding all objective evidence, including receipt inspection data, for a particular piece of material given only the piece of material, marked following applicable material control standards.
Unrestricted Operation Maintenance Requirement Card	Unrestricted Operations Maintenance Requirement Card for continued unrestricted submarine operations to design test depth. Refer to the SUBSAFE Requirements Manual, NAVSEA 0924-062-0010.
Upgrading	The process of conducting the certification of open-purchased material to controlled material following the appropriate military and material control standard.
Valve Repair, Restoration, Overhaul	a. Repair. Any work done to improve the material condition or operation of the valve correcting deficient conditions such that the component may be returned to service, but which, in total does not meet the full intent of the applicable restoration or overhaul technical standard, is considered a repair. b. Restoration or Overhaul. All valve parts replaced or restored to the requirements of the applicable technical standard (e.g., the full

TERM	DEFINITION
	intent of the restoration or overhaul technical standard is invoked).
Verification	Certification required to be performed by the craftsman.
Waterline	The term "waterline" in this manual refers to where the hull of a ship meets the surface of water when afloat.
Welded Fabrication or Weldment	The construction, alteration or repair of any welded assembly, or parts thereof, by welding and allied processes. Included are all operations such as pre-heat and post-heat treatments, forming, fairing and NDT that must be controlled to obtain weldments suitable for intended service.
Work	a. Any action that actually or potentially changes (including disassembly for the purposes of inspection or repair) the approved configuration of any part, component or ship's system. b. Any action that removes or affects the ship's ability to operate ship's systems or components following ship's systems **or** operating manuals or reactor plant manuals. c. Any testing or inspections required to establish, maintain or reestablish certification. d. Any design, engineering, planning or configuration management functions that involve the final review or approval of technical information. Examples of work include the following: 1. Action which disassembles or removes any part, component or ship's system. 2. Action specified in a Technical Work Document. 3. Any action that removes or affects the ship's ability to operate ship's systems or components following ship's systems manuals, operating manuals or reactor plant manuals, excluding tagout per the Tagout User's Manual, including but not limited to: (a) Component or system tests. (b) Intrusive inspections (such as breaking the plane of electrical panels requiring electrical safety). (c) Valve line ups that alter the normal system line up not governed by operating procedures.

TERM	DEFINITION
	(d) Removing valve hand wheels, disconnecting of reach rods.
Work Center	For FMAs, the individual shops within divisions of the Repair, Weapons Repair Departments, etc. (e.g., 38A, 91A, 72A, 25A). For ships, usually the divisions within a department (e.g., Machinery Division, Sonar Division).
Working Standards (Calibration)	These standards comprise a wide variety of equipment used throughout the laboratory in support of all measurements performed in the laboratory. These standards are used day-by-day in performing calibrations in the Fleet Electronic Calibration Laboratory or Mechanical Instrument Repair and Calibration Shop. Contrast, reference and transfer standards are used less frequently to support and assure the accuracy of working standards within the Fleet Electronic Calibration Laboratory, Mechanical Instrument Repair and Calibration Shop, Fleet Meter Calibration Laboratory or Field Calibration Activity.

LISTING OF APPENDICES.

A Format for Submarine QA Pre-Underway Checklist

1.1 PURPOSE. To provide a list of responsibilities and duties of key personnel within the organizations that are involved in the Fleet Quality Assurance (QA) Program. Responsibilities and duties listed in this section are further amplified in other sections of this volume.

1.2 QUALITY ASSURANCE ORGANIZATION. The QA Program for the Fleet is organized into five levels of responsibility:

a. Fleet.

b. Type Commander (TYCOM).

c. Immediate Superior in Command (ISIC).

d. Ship Commanding Officer or Officer in Charge.

e. Regional Maintenance Center (RMC) Commander or Fleet Maintenance Activity (FMA) Commanding Officer.

1.3 FLEET COMMANDER RESPONSIBILITIES. The Fleet is responsible to provide policy and direction for the implementation and operation of the QA program as listed:

a. Promulgate the QA program through the guidelines and procedures of volume V (Quality Maintenance) of the Joint Fleet Maintenance Manual.

b. Promote effective and consistent use of Volume V (Quality Maintenance) of the Joint Fleet Maintenance Manual by TYCOMs.

c. Ensure the scope of training through fleet schools provides the necessary skills for maintenance and management personnel to successfully support the QA program.

d. Jointly authorize changes to this volume after evaluation and analysis of proposed changes by each TYCOM.

e. Review TYCOM QA program by sponsoring an annual Quality Assurance Officer (QAO) Conference or Symposium, inviting TYCOM QAO and Naval Sea Systems Command (NAVSEA) technical authorities. The stated purpose should be to establish common trends, discussions of various QA concerns, improvements, and required actions.

f. Ensure assessments of FMAs and RMCs occur per volume IV, chapter 2 of this manual.

1.4 TYPE COMMANDER RESPONSIBILITIES.

a. (Submarines only) Obtain NAVSEA approval for exception to Re-Entry Control (REC) requirements.

b. Administer a Departure from Specification (DFS) system to:

(1) Establish and maintain an auditable method of processing requests for approval of DFS.

(2) Review and evaluate DFS requests and obtain clarification of technical specifications from NAVSEA where appropriate.

(3) Approve or disapprove DFS requests.

(4) Obtain NAVSEA approval of DFS when required by the appropriate NAVSEA technical specification or manual.

(5) Keep NAVSEA informed of all major DFS requests.

(6) Provide a periodic status report of all outstanding major DFS to ISIC Material Officers for their action to ensure their records agree with TYCOMs and to pursue DFS clearance.

(7) Conduct liaison with NAVSEA on outstanding major DFS requiring NAVSEA action. Provide a periodic status report to NAVSEA of those DFS for which NAVSEA action is overdue.

(8) Ensure outstanding DFS for deploying or returning ships are passed between parent and deployed ISICs as required by paragraph 1.5.1.g.(6).

(9) (Surface Force Ships, Aircraft Carriers, and Aegis Ashore Missile Defense Systems only). Maintain a file of all outstanding DFSs.

c. Perform assessments of nuclear FMAs annually, not to exceed 18 months.

d. (Submarines only) Perform assessments of ISICs annually not to exceed 18 months.

e. Perform assessments of FMAs non-nuclear programs annually not to exceed 18 months.

f. At the discretion of the TYCOM perform random, unannounced ISIC, FMA and ship QA assessments and monitor visits.

g. Review and evaluate FMA and ISIC reports of corrective action taken on QA assessments to ensure compliance with this program.

h. (Submarines only) Maintain a system to provide Submarine Safety (SUBSAFE) certification for submarines.

i. Perform an annual self-evaluation of the QA program and provide a copy to the Fleet QAO.

j. Evaluate and analyze proposed changes to this volume.

k. (Submarines Only) Perform annual SUBSAFE, Deep Submergence System Scope of Certification (DSS-SOC) and Fly By Wire Ships Control System (FBW-SCS) awareness training for staff members that routinely review SUBSAFE, SOC or FBW-SCS Objective Quality Evidence, make determinations on SUBSAFE, SOC or FBW-SCS DFSs and perform other SUBSAFE, SOC or FBW-SCS work oversight functions.

l. (Submarines only) For FBW-SCS, DSS-SOC, and SUBSAFE, develop and implement the necessary instructions and procedures to meet the requirements of references (a), (b) and (c), to ensure these requirements are adhered to during the life cycle of the ship.

m. (Submarines only) Maintain FBW-SCS certification per reference (a). In relation to the planning and performance of post Upgrade, Alteration or Major Repair Work Sea Trials for maintaining FBW-SCS certification of previously certified submarine FBW-SCS, TYCOM must:

(1) Approve at-sea testing developed by the In-Service Engineering Activity (ISEA) following Upgrade, Alteration or Major Repair Work and apply appropriate restrictions and in each message state that ship's speed is restricted to 20 knots or less when an FBW-SCS fault condition results in a major nonconformance affecting control of ship's pitch, heading, depth and control surfaces. The ship's speed is restricted to 20 knots or less until satisfactory

resolution of the major non-conformance and TYCOM approval to operate the FBW-SCS to previously authorized conditions is granted, unless specifically addressed in the Sea Trial agenda or as stated in Departure From Specifications, Deviations or Waivers.

(2) Following verification from the ISIC of satisfactory completion of all at-sea testing, correction of all mandatory deficiencies, receipt of certification that the FBW-SCS material condition of those parts of the ship installed, repaired or tested by the ISEA or activity performing the work is satisfactory, and upon confirmation that FBW-SCS certification was not affected for those portions of ship FBW-SCS not affected by the ISEA or activity performing the work, issue a message to the ship, with copies to Chief of Naval Operations (CNO), ISIC and NAVSEA, certifying the FBW-SCS and authorizing FBW-SCS unrestricted use in support of submarine unrestricted operations or specifically identify any operating restrictions of the ship or system.

n. (Submarines only) For assigned activities, provide NAVSEA 07Q informational copies of critiques, trouble reports and incident reports for SUBSAFE, FBW-SCS, DSSSOC issues that result in a problem severity level of Level 1 (critical) or Level 2 (serious) as defined in reference (d).

1.5 IMMEDIATE SUPERIOR IN COMMAND RESPONSIBILITIES. ISICs are responsible to the TYCOM for the following:

NOTE: (SUBMARINES ONLY) WHEN ISIC FUNCTIONS ARE DELEGATED OUTSIDE OF THE SQUADRON (NAVAL SUBMARINE SUPPORT COMMAND, SUBMARINE SQUADRON SUPPORT CENTER, ETC.) THERE MUST BE A FORMAL TRANSFER OF RESPONSIBILITY VIA A MEMORANDUM OF AGREEMENT (MOA) OR OTHER FORMAL METHOD.

a. Organize and implement a QA program to carry out the provisions of this volume.

b. (Submarines only) Organize and implement a program to verify performance of required maintenance to sustain the material condition necessary to support Unrestricted Operations (URO) to authorized operating depth per the applicable class URO Maintenance Requirement Card (MRC) manual, and this volume.

c. (Submarines, Aircraft Carriers, Readiness Support Groups and RMCs only) Organize and implement a work request screening process such that those jobs requiring special controls are recognized and the supporting technical documentation is provided to the maintenance activity as required by this volume.

d. (Submarines only) Review Ship's Force Controlled Work Packages (CWP) for FMA accomplished nuclear work as required by Part I, Chapter 2, Appendix E, Technical Work Document (TWD) Review and Approval matrix, of this volume.

e. (Submarines only) Ensure ship's certification continuity report, when required by this volume, is received before the ship is underway. Review the ship's underway certification continuity report to ensure that it is in the proper format and includes all reports required. In particular, the ISIC will ensure all URO planned maintenance is up to date. Discrepancies noted must be resolved prior to underway.

f. Review and sign the MOA required by Volume II, Part I, Chapters 2 and 3 for aircraft carriers, volume II, part II, chapters 2 and 3 for Surface Force ships and volume II, part III, chapters 2 and 3 submarines of this manual. This agreement will list the responsibilities and actions of each party before start of any availability (e.g., unscheduled availabilities, Tiger Team repairs, technical assist visits) that involves work within SUBSAFE, FBW-SCS, nuclear or Level I certification boundaries to ensure responsibilities for recertification of work performed is not split between maintenance activities and that each activity is responsible to certify the work they performed.

g. (Submarines only) Administer a DFS system to:

(1) Establish and maintain system of processing requests for DFSs.

(2) Review and evaluate DFS requests and obtain clarification of technical specifications from TYCOM or NAVSEA where appropriate.

(3) Approve or disapprove DFS requests.

(4) Obtain TYCOM or NAVSEA approval of DFS when required by the appropriate TYCOM, NAVSEA directive, technical specification or manual.

(5) Ensure the deployed ISIC directing the supporting FMA will act as the cognizant ISIC for those actions required to approve, review and track DFSs for ships deployed. The parent ISIC, with concurrence from the deployed ISIC, may, on a case-by-case basis, perform these functions. In such cases, the parent ISIC will inform the deployed ISIC when such action(s) concurred upon is or are complete.

(6) The parent ISIC will provide a complete file of all outstanding DFSs to the deployed ISIC, prior to any ship deployment. The deployed ISIC will provide a complete file of all outstanding DFSs to the parent ISIC at the end of deployment.

(7) Specify procedures for:

(a) Submission of Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo), for DFS that require a future maintenance action to clear the departed condition.

(b) Submission of Ship's Configuration Change Form, OPNAV 4790/CK (CK) for permanent repair DFS which result in new Allowance Parts List and Coordinated Shipboard Allowance List support requirements.

(8) Keep parent ISIC apprised on the status of DFSs for deployed units.

(9) Maintain files of outstanding DFSs.

(10) Aggressively pursue clearing of DFSs.

h. Monitor the QA program and procedures of assigned FMA periodically and monitor corrective actions on discrepancies noted during the last TYCOM audit.

i. Schedule and conduct a QA Program assessment in conjunction with the Fleet Readiness Training Plan (or as determined by each TYCOM) of all assigned ships to

ensure the repair actions undertaken by Ship's Force conform to the provisions of the QA Program as well as pertinent technical requirements.

j. Review and endorse TYCOM audit report of assigned FMA(s).

k. Conduct periodic monitoring of Ship's Force work and QA program on all assigned ships during maintenance periods.

(1) Perform at least one surveillance during each refit, upkeep or FMA availability.

(2) Conduct monitoring during industrial availabilities (e.g., Selected Restricted Availability, Drydocking Selected Restricted Availability, Extended Refit Period, Post Shakedown Availability, Phased Maintenance Availability, Docking Phased Maintenance Availability, Depot Modernization Period, Engineered Refueling Overhaul and Regular or Refueling Overhaul).

l. (Submarines only) Perform annual SUBSAFE, SOC and FBW-SCS awareness training for staff members (Submarine Squadrons and associated Naval Submarine Support Centers and Performance Monitoring Teams to include Weapons, Combat Systems and Material Departments with the associated Chain of Command) that routinely review SUBSAFE, SOC or FBW-SCS objective quality evidence, make determinations on SUBSAFE, SOC or FBW-SCS DFSs, perform other SUBSAFE, SOC or FBW-SCS work oversight functions.

m. (Submarines only) Conduct an oral interview of relieving Ship's Force QAO which covers the following topics as a minimum:

(1) URO Program Management including a review of the ship's current URO Schedules and Inventories and completion procedures.

(2) DFS Program Management including a review of all outstanding departures.

(3) QA Training and Qualification Program.

(4) QA Surveillance and Assessment Program including a review of the ship's last ISIC QA Assessment and corrective actions.

(5) CWP opening and closing review processes.

n. Ensure fact-finding critiques are held to establish underlying causes and pursue corrective actions when necessary. When major errors or problems occur during maintenance that affect Nuclear, Level I, FBW-SCS, Submarine Flight Critical Components (SFCC), DSS, SOC or SUBSAFE work, a critique may be necessary. Examples include when significant problems or trends occur or those that did result or could result in incidents, significant unplanned rework, serious equipment damage, malfunction or personnel injury. Minor problems are isolated deficiencies with minimal overall impact and no significant consequences; these should normally be corrected on the spot and without expending much time and effort.

(1) (Submarines only) Contact the TYCOM immediately for issues which will result in a SUBSAFE, FBW-SCS, DSS or SOC critique, SUBSAFE, FBW-SCS, DSS or SOC trouble report, or SUBSAFE, FBW-SCS, DSS or SOC fact-

finding. On the same calendar day, the ISIC will provide the TYCOM an email outlining the issue reported by the Ship or Activity.

(2) (Submarines only) Additional guidance and direction for critiques is contained in reference (d).

(3) (Submarines only) Copies of critiques and incident reports for SUBSAFE, FBW-SCS, DSS or SOC issues that result in a problem severity level of Level 1 (critical) or Level 2 (serious) will be sent to the TYCOM electronically.

NOTE: THE ISIC IS ONLY RESPONSIBLE TO AUDIT FBW WORK PERFORMED BY FORCES AFLOAT OR TYCOM MANAGED ACTIVITIES.

o. (Submarines only) ISIC responsibilities. Maintain FBW-SCS certification per reference (a). In relation to the planning and performance of post Upgrade, Alteration or Major Repair Work Sea Trials, for maintaining FBW-SCS certification of previously certified submarine FBW-SCS, the ISIC must:

(1) Provide sufficient time for crew training during the Upgrade, Alteration or Major Repair Work period to permit Ship's Force to attain a level of knowledge and proficiency of the FBW-SCS adequate to ensure proper operation and safety of the ship and its personnel during Sea Trials. ISIC must also ensure crew has proper number of trained operators.

(2) Following Upgrade, Alteration or Major Repair Work report, by message, crew readiness and prior to each underway until certified, verification from the ISEA or activity performing the work that all work performed by the ISEA or activity performing the work necessary for at-sea testing or Sea Trials has been completed, including resolution of ISIC FBW-SCS Certification Audit Deficiencies recommendations and status of incomplete ISIC FBW-SCS Certification Audit Category Deficiencies, and that the material condition of those parts of the ship installed, repaired, or tested by the ISEA or activity performing the work is satisfactory, certify to the TYCOM, with information copies to the CNO, the appropriate Fleet Commander and NAVSEA, that the FBW-SCS material condition of those parts of the ship installed, repaired or tested by the ISEA or activity performing the work is satisfactory for Sea Trials following approved at-sea tests or Sea Trial agenda.

(3) Following verification from the ISEA or activity performing the work of satisfactory completion of all at-sea testing or trials, completion of controlled dives, correction of all mandatory Sea Trial deficiencies, and resolution of all ISIC FBW-SCS Certification Audit Category IA recommendations, certify to the TYCOM, with information copies to CNO, the appropriate Fleet Commander and NAVSEA, the FBW-SCS material condition of those parts of the ship installed, repaired, or tested by the ISEA or activity performing the work is satisfactory, and recommend authorization for FBW-SCS unrestricted use in support of submarine unrestricted operations, subject to ISIC verification that FBW-SCS certification of areas outside ISEA or activity performing the work tasking has been sustained, or specifically identify any operating restrictions of the ship or system.

p. (Submarines only) The ISIC will transmit a Submarine Material Transfer Message to the gaining ISIC for deploying or deployed submarines when the unit out chops to include the following:

(1) Status of outstanding Casualty Reports.

(2) Status of outstanding Z0ZZ.

(3) Status of outstanding (SUBS).

(4) Status of active DFS actions.

(5) Status of Periodic Maintenance Requirements (Integrated Maintenance and Modernization Plans and UROs) for accomplishment.

(6) Status of Alterations for accomplishment.

(7) Status of Pre-Overhaul Tests or Pre-Availability Testing for ships within 12 months of a scheduled CNO availability.

(8) Current Operational Interval or Operational Cycle expiration dates.

(9) Status of Material Condition Assessment if in progress.

(10) (SOC Only) Report the following information for assigned DSS (LOT, LOC, DDS):

(a) Date of last Internal Survey.

(b) Date of last Sustaining Certification Survey.

(c) Status of any outstanding survey audit cards.

q. (Submarines only) Prior to submerged underway operations when submarines are in a port with an ISIC, or when a submarine is in an availability such as Continuous Maintenance Availability, Interim Drydocking, Emergent Availability or CNO Availability, the ISIC QAO must complete a QA Pre-Underway Checklist. Appendix A of this chapter provides the minimum requirements for the QA Pre-Underway Checklist.

r. (Submarines Only) Review all FBW-SCS or SFCC maintenance Objective Quality Evidence (OQE) provided by assigned units and forward to the ISEA using email address shipcontrol@us.navy.mil.

1.6 SHIP RESPONSIBILITIES.

1.6.1 Ship's Commanding Officer. Commanding Officer is responsible to:

a. Designate a QAO in writing who will have sufficient time on board to maintain program continuity.

b. Approve Technical Work Document (TWD) as required in part I, chapter 2, Appendix E, TWD Review and Approval matrix, of this volume.

c. (Submarines only) Provide the ISIC a written report of ship's certification continuity prior to underway, as specified in part I, chapter 5, paragraph 5.6.8 of this volume.

d. (Submarines only) Organize and implement a program to ensure performance of required maintenance to sustain the material condition necessary to support URO to authorized operating depth per the applicable class URO MRC manual and Volume VI of this manual.

e. (Submarines only) Organize and implement a program to ensure performance of required maintenance to sustain the material condition necessary to support FBW unrestricted operations per reference (a).

f. (Submarines only) Organize and implement a program to ensure performance of required maintenance to sustain the material condition necessary to support DSS-SOC certification (if required) per reference (b).

g. (Submarines only) Approve and sign all recertification Reactor Plant Work Accomplishment Reports (RPWAR) and ensure these documents are forwarded to the Reactor Plant Planning Yard with copy to NAVSEA Nuclear Propulsion Directorate (08), TYCOM and ISIC.

h. Certify all QA personnel qualifications (respective Department Head on Aircraft Carriers).

i. Review and sign with the shipyard or other industrial activity, RMC, FMA and ISIC, an MOA on responsibilities and action of each party with respect to work accomplishment prior to start of SUBSAFE, nuclear, FBW-SCS or Level I work per this manual.

j. Approve DFSs per part I, chapter 8 of this volume.

1.6.2 Ship's Executive Officer. Executive Officer is responsible for the following:

a. Monitoring the QAO's administration of the ship's QA Audit, surveillance, training and qualification programs.

b. Providing senior command level authority to back-up the QAO in the performance of the QAO's duties.

c. Spot checking performance of QA training by attending or monitoring training periodically.

d. Assigning an Assistant Quality Assurance Officer (AQAO) who is an E-6 or above to be an administrative assistant to the QAO.

e. (Submarines only) Ensure Department Heads, Division Officers and Work Center Supervisors are meeting all quality maintenance requirements for the control and documentation of material deficiencies. This should include verification that the ship, departments and work centers have an adequate process to ensure that Quality Maintenance deficiencies reported by outside agencies (e.g., PMT, TSRA, INSURV) are promptly and properly documented.

1.6.3 Ship's Department Head. Department Heads are responsible to:

a. Ensure area(s) in or adjacent to their work centers, divisions and spaces are designated for the stowage of controlled material per Part I, Chapter 6 of this volume.

b. Review or approve Formal Work Package (FWP) and TWD as required in part I, chapter 2, Appendix E, TWD Review and Approval matrix, of this volume.

c. Ensure personnel in their departments involved in performing, planning, approving or supervising shipboard maintenance on SUBSAFE, nuclear, FBW-SCS and Level I systems participate in QA training.

d. Verify the department maintains sufficient numbers of qualified Quality Assurance Inspectors (QAI) and Controlled Material Petty Officers (CMPO).

e. Participate in oral examination of shipboard QAI and Quality Assurance Supervisor (QAS) assigned to their departments.

f. Ensure personnel within their departments perform QA surveillance, qualification, training, etc. as defined in this volume.

g. Review and approve information submitted to the FMA for identification of controlled work. This information must include a TWD serial number when required by part I, chapter 2 of this volume. This review will also ensure that the work request identifies specific categories applicable in each of the following situations as required by this volume:

(1) SUBSAFE.

(2) Level I.

(3) Submarine Antenna Quality Assured Material (SAQAM).

(4) Nuclear.

(5) Special cleanliness requirements.

(6) Special testing requirements.

(7) Special fabrication requirements.

(8) DFS.

(9) SOC.

(10) SFCC.

h. Ensure fact-finding critiques are held to establish underlying causes and pursue corrective actions when necessary. When major errors or problems occur during maintenance that affect Nuclear, Level I, FBW-SCS, SFCC, DSS, SOC or SUBSAFE work, a critique may be necessary. Examples include when significant problems or trends occur or those that did result or could result in incidents, significant unplanned rework, serious equipment damage, malfunction or personnel injury. Minor problems are isolated deficiencies with minimal overall impact and no significant consequences; these should normally be corrected on the spot and without expending much time and effort.

(1) (Submarines only) Contact the ISIC immediately for issues which will result in a SUBSAFE, FBW-SCS, DSS or SOC critique, SUBSAFE, FBW-SCS, DSS or SOC trouble report, or SUBSAFE, FBW-SCS, DSS or SOC fact-finding.

(2) (Submarines only) Additional guidance and direction for critiques is contained in reference (d).

(3) (Submarines only) Copies of critiques and incident reports for SUBSAFE, FBW-SCS, DSS or SOC issues that result in a problem severity level of Level 1 (critical) or Level 2 (serious) will be sent to the TYCOM electronically.

i. Review DFS for technical accuracy and sign.

j. Spot check performance of QA training by attending or monitoring training at least quarterly.

k. (Aircraft Carriers only) Certify QA qualifications for personnel assigned to their department by signing the applicable Personnel Qualification Standard cover sheet of reference (e).

1.6.4 Ship's Supply Officer. The Supply Officer is responsible to:

a. Ensure procurement, receipt and stowage of Nuclear, SOC, SFCC, SAQAM and Level I materials are in compliance with this volume, applicable material control standards and instructions.

b. Designate and maintain areas for stowage of Level I (LI) and SOC stock program material, SFCC and Nuclear Repair Parts (NRP) in the custody of the supply department.

c. File the Supervisor of Shipbuilding letter of certification for Level I, SFCC and NRP which are in the custody of the supply department.

d. Turn over the material certification documentation (or copy of, when only partial issue of lot) for LI, SOC, SEAWOLF Class Component (SW) or VIRGINIA Class Component (VU) stock program material and NRP to the customer.

e. Send LI, SOC stock program material, NRP, SW, VU and copies of material certification documents to FMA work centers when the ship is providing the material.

f. Ensure copies of the material certification documents are forwarded to the requesting activity, when LI, SOC stock program material, SFCC and NRP items are removed from own ship's systems or from onboard repair parts.

g. Return defective LI, SOC stock program material, SW, VU and NRP to the Navy supply system and submit defective material reports following supply department procedures.

h. Ensure appropriate supply department personnel receive training on nuclear and non-nuclear controlled material certification, procurement, receipt inspection and LI, SOC stock program material, SW, VU and NRP stowage requirements.

1.6.5 Ship's Engineer Officer (Submarines only). The Engineer Officer is responsible to:

a. Submit blank RPWAR forms to the FMA with each work request and CWP serial number, when FMA assistance is necessary for reactor plant SUBSAFE work. Ensure all work requests requiring special reactor plant SUBSAFE work controls are properly identified.

b. Verify continuity of reactor plant SUBSAFE certification by controlling and documenting work and tests performed for each Re-Entry.

c. Review and sign the necessary recertification information on the applicable RPWAR pages for repairs requiring RPWAR submission and forward the original to the Reactor Plant Planning Yard with a copy to NAVSEA 08, TYCOM and ISIC.

d. Maintain current the reactor plant hull integrity records using the completed RPWAR, filed in an auditable manner with the latest revision of the NAVSEA drawing "Status of Reactor Plant Work Accomplishment Reports for (individual ship)". Reproducible blank RPWAR will also be maintained in this same file to support future maintenance. Documentation of the actual maintenance performed and testing accomplished by Ship's Force is to be maintained in the ship's completed CWP file required by this volume.

e. Review or approve Oxygen, Nuclear and SUBSAFE CWPs as required by Part 1, Chapter 2, Appendix E of this volume.

f. Coordinate with the Ship's QAO and Engineering Department Master Chief to incorporate QA training as required by Part I, Chapter 3 and Part III, Chapter 3 (as applicable) of this volume and reference (a) (as applicable) into the Engineering Department Training Plan.

1.6.6 Availability Coordinator (Submarines only). A submarine served, nuclear-trained Limited Duty Officer will be assigned to augment the normal ship's complement during Depot Modernization Periods, Engineered Refueling Overhauls, SSBN Extended Refit Periods or Engineered Overhauls and will act as the Availability Coordinator for the ship. The Availability Coordinator's responsibilities include:

a. Become a knowledgeable member of the availability project team.

b. To support these requirements, the Availability Coordinator will be assigned as early as possible during the pre-availability test and inspection period, nominally 15 months before the availability starts. Prior to reporting to the submarine, the Availability Coordinator will be trained in shipyard processes and Availability Work Package requirements per reference (q). After reporting to the submarine, the Availability Coordinator should spend a significant portion of his time working with the shipyard project team prior to the start of the availability. This may require that they remain ashore during key pre-availability planning phases while the submarine is at sea. Finally, to prevent interference with his responsibilities for availability planning and execution, the Availability Coordinator should not be assigned routine watch standing duties. Availability Coordinator should maintain proficiency requirements (about two watches per month), but their watch standing duties should not interfere with daily project management routine or the increased pace of coordination associated with major key events (e.g., undocking).

c. Educate or train Ship's Force on shipyard tools and processes to be used during the availability. This responsibility does not circumvent the requirements placed on the industrial activity to train Ship's Force, but the Availability Coordinator will coordinate and complement the training provided by the industrial activity.

d. Coordinate the integration and execution of Ship's Force responsibilities during the availability planning and execution.

e. Act as the primary liaison between Ship's Force and the shipyard project team.

1.6.7 Ship's Maintenance Manager (Aircraft Carriers only). Maintenance Manager is responsible to establish and maintain a Quality Deficiency Reporting Program for resolving quality issues for work performed by outside activities and to ensure that each work request or job order is screened for Quality Control and QA requirements and marked up or stamped as to specific category applicable in each of the following situations as required by this volume:

a. Nuclear.

b. Level I.

c. Special cleanliness requirements.

d. Special testing requirements.

e. Special fabrication requirements.

1.6.8 Ship's Principal Assistant. Principal Assistants will be responsible for duties as assigned by the Engineer or Reactor Officer.

1.6.9 Ship's Division Officer. Division Officers are responsible to:

a. Review TWD as required in Part I, Chapter 2 Appendix E, TWD Review and Approval matrix, of this volume.

b. Review the FWP as required in Part I, Chapter 2, paragraph 2.3.4 of this volume.

c. Verify controlled work is accomplished following an approved CWP.

d. Ensure personnel assigned to their divisions perform QA surveillance, qualification, training, etc. as defined in this instruction.

e. Supervise QA training of division personnel.

f. Provide timely response to QA 14, indicating root cause analysis and actions taken.

g. Issue unique identification numbers for brazers and welders.

h. Maintain a log of unique identification numbers assigned to brazers or welders.

i. Ensure annual validation of qualification is performed for brazers or welders and entries are entered into the individual service records.

j. Maintain an auditable file for each brazer or welder assigned.

k. Maintain an auditable log of each brazer or welder for proper maintenance of qualification.

l. (Submarines Only) Perform frequent reviews of the division's CSMP to ensure all quality maintenance requirements for control and documentation of material deficiencies have been properly entered.

m. Ensure the CSMP references the active DFS and maintain a record of active DFS's in their work center.

1.6.10 Ship's Work Center Supervisor. Work Center Supervisor is responsible to:

a. Review the FWP as required in part I, chapter 2, paragraph 2.3.4 of this volume.

b. Have TWD prepared, when designated the Lead Work Center (LWC), and as required by part I, chapter 2, paragraph 2.2 of this volume:

(1) Verify the FWP provides the correct written instructions, both in sequence and requirements, to satisfactorily accomplish the controlled work.

(2) Verify the FWP contains or lists the correct technical specifications or requirements (e.g., torque values, dimensions, Nondestructive Testing (NDT) inspection, special cleanliness, recertification test) for certification attributes to be documented on the appropriate QA form.

(3) Ensure signatures for repair work attributes are annotated as requiring Certification Signature Block (CSB) or signature, as applicable, on the QA form and in the FWP as discussed in part I, chapter 2 of this volume by use of (R), (S), (C), (I), (Q) and (V) in the margin by the appropriate step.

c. Ensure all controlled work is accomplished following approved CWP.

d. Ensure proper work authorizations have been obtained prior to starting work.

e. Ensure tools, measuring and test equipment used during maintenance and testing are of proper range, scale and in calibration.

f. Conduct QA training of work center personnel.

g. Ensure work center personnel are properly trained and qualified, if required, prior to assignment to tasks requiring QA or special cleanliness (e.g., oxygen, hydrogen, reactor plant, steam plant) certifications.

h. Ensure only material specified by the applicable drawings, standards, or specifications is ordered and installed.

i. Submit request for use of rejected material using a Reject Tag (QA form 3).

j. Obtain written permission from the QAO to downgrade LI stock program material, NRP, or controlled material for non-level use.

k. Supervise QA programs within assigned work centers.

l. Review work for satisfactory completion.

m. Ensure CWPs for completed controlled work are complete, properly reviewed and forwarded with all certifying documents.

n. Initiate a DFS for non-nuclear or Liaison Action Request (LAR) for nuclear tests, inspections, material or other requirements of any maintenance action in which the requirements were not met.

o. (Submarines Only) Frequently review all material deficiencies identified within the work center to ensure all quality maintenance requirements for control and documentation of material deficiencies are properly documented in the CSMP with

emphasis on SUBSAFE, FBW-SCS and DSS-SOC as applicable. Verify deficiencies have an active DFS when required.

p. Provide inputs to the QAO for any changes in CSMP entries for active DFS's.

1.6.11 Ship's Craftsman. Craftsman is responsible to:

a. Perform all maintenance actions following the approved procedure. If that guidance is either incorrect, incomplete or unclear, stop and seek clarification from the work center or shift supervisor.

b. Ensure QA forms associated with the maintenance are correctly completed per the applicable sections of this volume.

c. Enter signature, printed name and date on all QA data forms completed.

d. Initiate a DFS for non-nuclear or LAR for nuclear tests, inspections, material or other requirements of any maintenance action in which the requirements were not met.

e. Ensure only Test, Measuring and Diagnostic Equipment (TMDE) (i.e., measuring devices, instruments, inspection tools, gauges, jigs or fixtures), which have current calibration stickers or records attached or available, are used for production, acceptance and testing. Uncalibrated or untested TMDE will be tagged and removed from service immediately.

1.6.12 Ship's Quality Assurance Officer. QAO is responsible to:

a. Administer the ship's QA program.

b. Review TWD as required in part I, chapter 2, Appendix E, TWD Review and Approval matrix, of this volume.

c. Review the FWP as required in part I, chapter 2, paragraph 2.3.4 of this volume.

d. Verify the FWP, in the CWP, specifies the correct OQE that is to be generated to prove recertification of the system or component.

e. Verify the testing requirements for controlled work, called out in the FWP, are correct and per the latest applicable specifications as required by part I, chapter 2, paragraph 2.3 of this volume.

f. Verify completed test results for controlled work fully satisfy test requirements, or corrective action is taken.

g. Review and close out all TWDs for work on systems or components required for reactor plant startup, propulsion plant startup or ship's underway operations (e.g., if the work is on a spare component it may not be necessary to close the TWD) prior to startup or getting underway.

h. Maintain the following record files per Part I, Chapter 10, paragraph 10.5 of this volume:

(1) Completed CWPs.

(2) QA Assessments, audits, surveillance and deficiency correction.

(3) Controlled material.

i. Determine suitability for use of Level I, SOC, SFCC or Nuclear Level I material from another ship in own ship's system, when the transfer is directly from the donating ship.

j. Provide disposition instructions for material rejected at receipt inspection.

k. Obtain chemical analysis, NDT, destructive testing and generic materials identity testing results as required by Part I Chapter 6 of this volume to certify material for use in a certified (e.g., Level I, SUBSAFE, Nuclear, Scope of Certification) system.

l. Provide technical services to the Supply Officer for determining material requirements.

m. Authorize downgrading of LI stock program material, NRP or controlled material for non-level use.

n. Review requests for DFS for accuracy and technical merit, and forward to Department Head.

o. Maintain an auditable file of outstanding DFS and the record of DFS numbers assigned. Prior to each underway following any scheduled Fleet or CNO Maintenance Availability, the ship's QAO will audit active DFSs against associated Job Control Numbers to verify a current up to date entry in the Current Ship's Maintenance Project exists.

p. Maintain a file of DFS which have been approved as permanent repairs and result in change in configuration until they are reflected in ship's drawings.

q. Verify ship's mapping plans and selected records and drawings are updated (marked up) when approved DFS authorize a change in configuration as a permanent repair.

r. Submit DFS clearance reports, using Departure Clearance Report (QA form 12A) to the approving authority when the work was done which corrects specific DFS. DFS clearance reports, using a QA-12A, may also be submitted by the ISIC or authorized repair NSA correcting the specific DFS. If unable to use a QA form 12A, use the message format of Part I, Chapter 8, Appendix B, of this volume.

s. Manage the ship's internal QA Audit and Surveillance program as required by Part I Chapter 9 of this volume. Coordinate with the ship's Executive Officer to resolve surveillance scheduling and accomplishment problems.

t. The QAO will create and manage a long range training plan ensuring that QA training is conducted as required by part I, chapter 3 and part III, chapter 3 (as applicable) of this volume and reference (a) (as applicable). The QAO will attend QA training when practical.

u. Assess QA training and provide input to Engineering Department Master Chief and Ship's Engineer for incorporation into the periodic Engineering Department Training assessment as required by reference (g).

v. Implement a formal qualification program for QAIs, CMPOs, Cleanliness Inspector, Certifiers, QASs, Work Center Supervisors and Maintenance Planners (if assigned).

w. Conduct oral qualification interviews for QAIs, QASs, CMPOs, Cleanliness Inspector and Certifiers, Work Center Supervisors and Maintenance Planners.

x. Maintain a current master list of qualified CMPOs, Controlled Material Handlers (CMH), Cleanliness Inspectors, QAIs, QASs (if assigned), Oxygen Clean Workers, Oxygen Clean Instructors, Work Center Supervisors and Maintenance Planners as specified in Part I, Chapter 10 of this volume.

y. (Submarines only) Verify all reactor plant hull integrity area maintenance is accomplished following appropriate directives.

z. (Submarines only) Verify the appropriate work control is initiated for work within the SUBSAFE, SOC and FBW-SCS certification boundary.

aa. (Submarines only) Maintain SUBSAFE and SOC RECs and FBW CWP records including the CWP log.

ab. (Submarines only) Coordinate with the ISIC and the FMA to ensure the administration, scheduling and reporting of the URO MRC program is per the applicable class URO MRC manual, and this volume.

ac. (Submarines only) Retain any QA form 34 generated in connection with controlled assembly performed as a REC exception per Part I, Chapter 5, paragraph 5.6.7, Note 3 of this volume.

ad. Review in detail as many non-nuclear NDT weld records as possible (minimum of 10 percent per year) to ensure that all of the requirements of the applicable fabrication documents have been and are continuously being met.

ae. Verify an active Job Control Number exists for all active temporary DFSs at the completion of all scheduled Fleet Maintenance Activity Availabilities, major or minor, CNO availabilities or at least quarterly and maintain an auditable record of the verification until superseded.

af. (Submarines only) At the end of a scheduled FMA upkeep, verify all SUBSAFE deficiencies documented in the ship's Current Ship's Maintenance Project have been corrected or have an appropriate DFS.

ag. (Submarines only) Prior to submerged underway operations when submarines are in a port with an ISIC, or when a submarine is in an availability such as Continuous Maintenance Availability, Interim Drydocking, Emergent Availability or CNO Availability, the ship's QAO will complete a QA Pre-Underway Checklist with the ISIC QAO. Appendix A of this chapter provides the minimum requirements for the QA Pre-Underway Checklist.

ah. (Submarines Only) When a SFCC is removed or replaced because of failure, or after a SFCC is installed or reprogrammed, submit QA Form 17D certifying the repair or installation to the ISIC QAO via electronic mail and, or, any alert messages that indicated an FBW-SCS fault affecting a SFCC has occurred.

1.6.13 Ship's Assistant Quality Assurance Officer. A QAO is responsible to perform duties as assigned by the QAO.

1.6.14 Ship's Quality Assurance Supervisor. QAS, if assigned, will perform the duties as specified in paragraph 1.7.13 of this chapter.

1.6.15 Ship's Quality Assurance Inspectors. QAIs are responsible for coordinating and administering the QA Program within their respective work centers. The QAI will:

a. Develop a thorough understanding of the QA program.

b. After verifying work completed, enter initials or signature (as required by the form, tag or procedure), and the date on all applicable QA forms, tags and CWP steps.

c. Verify QA form 2 is filled out correctly and attached to items removed from a controlled system for transfer to another Fleet activity and ensure items received from another ship have QA form 2 tags attached.

d. As LWC QAI, review each CWP prepared which requires QAI CSBs to verify inspection requirements are adequately addressed before submission to QAO or Department Head as required by Part I, Chapter 2, Appendix E, of this volume.

e. Verify all work inspected meets the minimum requirements set forth in latest applicable plans, specifications and directives of higher authority as stated in the FWP.

f. Perform QA inspections of certification attributes as required by Part I, Chapter 5, of this volume.

g. Ensure all inspections beyond the capability of the QAI are performed by FMA inspectors prior to final acceptance or installation of the product by the ship.

h. Ensure only TMDE (i.e., measuring devices, instruments, inspection tools, gauges, jigs or fixtures), which have current calibration stickers with records attached or available, are used for production, acceptance and testing. Uncalibrated or untested TMDE will be tagged and removed from service immediately.

i. Ensure items removed from controlled systems are tagged with QA form 2 when required by Part I, Chapter 6 of this volume. Tags are not required if material is nuclear non-Level (Level N/A) or non-nuclear non-level.

j. Ensure controlled material (Level I, Nuclear Level I, Material Control Division A & B, SFCCs) delivered to an RMC or FMA work center for work is tagged with a QA form 2.

k. Report all work and testing discrepancies or deficiencies to the department head and the QAO via chain of command. Ensure the deficiency is resolved before work continues.

l. Sign QA form 2 when controlled material is installed for SUBSAFE and nuclear systems.

m. As LWC QAI, review all completed QA forms and data sheets for accuracy, completeness and technical correctness.

n. Reject untraceable, damaged, or unclean controlled material using a material reject tag (QA form 3).

o. Witness controlled assemblies, as a second party not involved in the actual work.

p. (Submarines only) Complete the necessary recertification information for maintenance performed by Ship's Force; for material changes, replacement, material generic identification (if not previously documented) or fastener torque on the applicable blank RPWAR pages and submit to the Engineer Officer for review prior to approval by the Commanding Officer. The general notes for report preparation and use, supplied with each RPWAR, will be used in completing the recertification form.

q. Review certification testing as part of CWP preparation.

r. Witness and document results of tests (hydrostatic, drop, joint tightness). Work center tests of components conducted by the FMA need not be witnessed, unless directed by the Department Head or FMA CWP. Promptly inform supervisors of unsatisfactory test results. Ensure test documentation is complete and accurate.

s. Review DFS and LARs prepared by the work center for accuracy and technical merit, and forward to the Division Officer and QAO.

t. Brief maintenance personnel and appropriate supervisors on applicable requirements before starting work. The brief must include at least the following:

(1) Inspection requirements.

(2) Acceptance criteria.

(3) Methods to maintain cleanliness.

(4) Required actions for a loss of cleanliness.

u. Perform cleanliness inspections required for initial, in-process and final cleanliness inspections during maintenance or repairs for those systems requiring cleanliness controls.

1.6.16 Ship's Controlled Material Petty Officer. CMPOs are responsible to:

a. Ensure all material under their cognizance is stored and controlled to the requirements of references (a) or (f).

b. Receipt inspect all LI stock program material, SFCC and NRP received by work center or division.

c. Request disposition instructions for rejected material.

d. Remove QA form 3 from previously rejected and now accepted controlled material, annotate the material acceptance on the QA form 2 and file the QA form 3 with the CWP.

e. Maintain custody of controlled material in segregated stowage per reference (h).

f. Inspect controlled material storage areas of their work center quarterly, as a minimum per part I, chapter 6 of this volume.

g. Ensure controlled material is properly stowed and handled so the identification of the subject material and its certification are always maintained.

h. Ensure nuclear material received without Ready for Issue tags is certified to the required "Level of Essentiality".

i. Reject unsatisfactory material. Fill out and attach QA form 3 and request disposition instructions.

j. Send any material certification documents for material which has been provided by the ship to the RMC or FMA QA office. Ship should retain original.

k. Perform receipt inspection of package alteration kits that contain controlled material when ready for use.

l. Ensure controlled material markings are on all pieces when cutting a smaller piece from a larger one.

m. Ensure controlled material markings are moved to an unaffected area, if the controlled material item will lose the markings due to a fabrication process (e.g., welding, machining) prior to the fabrication process.

n. Ensure all controlled material is identified, color coded, marked and tagged as required by this volume and the applicable material control standard.

1.6.17 Ship's Cleanliness Inspector or Certifier. Cleanliness Inspectors or Certifiers are responsible to perform initial, in process and final cleanliness inspections during maintenance or repairs for those systems requiring cleanliness controls per Part I, Chapter 5, paragraph 5.4, of this volume.

1.6.18 Ship's Nondestructive Test Examiner. The ship's NDT Examiner must be appointed in writing by the Commanding Officer and must be responsible for all aspects of the command's Nondestructive testing program. NDT Examiner qualification and certification requirements are specified in reference (i). The following must comprise the core responsibilities of the ship's NDT Examiner:

a. Coordinate the efforts of other assigned NDT examiners at the activity.

b. Act as the command's point of contact for NDT technical issues. In addition, act as the command's point of contact with NAVSEA for NDT issues.

c. Develop the command's NDT examiner guidelines, to include the command's written practice for NDT certification when required by reference (j) utilizing the input of all participating NDT examiners.

d. Ensure submittal of required reports of certification or recertification to higher authority as required by reference (k).

e. Review all requests for NDT training courses and examiner certification services. Provide recommendations to the chain of command regarding eligibility of the requestor, and the need for such training or certification based on current and projected NDT personnel resources.

f. Approve examination material for all NDT methods utilized at the activity for which they are certified. Ensure examination material reflects changes made to applicable fabrication documents.

g. Approve, and qualify NDT procedures for each method utilized at the activity. Revise and approve procedures as necessary when changes are made to applicable fabrication documents.

h. Schedule and perform NDT Inspector surveillance. Maintain records of surveillance in order to perform trend analysis of inspector abilities and program effectiveness.

i. Schedule and administer NDT examinations. Maintain records of examinations sufficient to trace inspector qualifications to original examination material. Maintain a matrix of high miss questions in order to assess inspector knowledge and program effectiveness.

j. Train, certify and monitor NDT Inspectors as required by applicable specifications and Part I, Chapter 3 paragraph 3.5.1.a of this volume.

k. Schedule eye examinations for NDT Inspectors.

l. Ensure each NDT Inspector's service record is kept updated with qualification status.

m. Maintain individual records of qualification for NDT inspectors.

n. Monitor the welder qualification and training per reference (l). Monitor brazer qualification and training per reference (l) or (m) as applicable to process used.

o. Review all welder or brazer qualification records for completeness, semi-annually.

p. Review completed NDT inspection reports for technical completeness and accuracy and sign, where indicated on the report, on completion of work.

q. Review, approve and monitor the command's welder training and qualification program as required by reference (l). Review, approve and monitor the commands' brazer training and qualification program as required by reference (l) or (m) as applicable processes used.

r. Prepare and execute the training and qualification program for each NDT method that leads to inspector certification in each method and maintains inspector competency in each method.

1.6.19 Ship's Nondestructive Test Inspector. NDT Inspectors are responsible to:

a. Verify CWPs which include NDT inspections properly identify the inspection requirements and acceptance criteria.

b. Ensure NDT inspections are completed correctly and following the applicable requirement and inspection reports are technically complete and accurate.

c. Ensure use of only TMDE (i.e., measuring devices, instruments, inspection tools, gauges, jigs or fixtures), which have current calibration stickers with records attached or available, for production, acceptance and testing. Uncalibrated or untested TMDE will be tagged and removed from service immediately.

d. When no NDT Examiner is assigned, monitor the welder or brazer qualification and training per reference (l).

1.6.20 Ship's Maintenance Planner (Submarines and Aircraft Carriers only). Maintenance Planners are responsible to:

a. Prepare the FWP or CWP as required in part I, chapter 2, of this volume.

b. Perform ship check or job check to verify equipment configuration supports work package development.

c. Develop FWPs or CWPs with the correct written instructions, both in sequence and requirements, to satisfactorily accomplish the work.

d. Develop FWPs or CWPs with the correct technical specifications or requirements (e.g., torque values, dimensions, NDT inspection, special cleanliness, recertification test) for certification attributes to be documented on the appropriate QA form. Fill in all preplaced data required by QA form instructions prior to routing CWP.

e. Ensure signatures for repair work attributes are annotated as requiring CSB or signature, as applicable, on the QA form and in the FWP as discussed in part I, chapter 2 of this volume by use of (R), (S), (C), (I), (Q) and (V) in the margin by the appropriate step.

f. Ensure correct materials, spare parts and special test equipment to be used during maintenance and testing are called out in the materials section of the FWP.

g. Initiate revisions to FWPs or CWPs when requirements of Part I, Chapter 2, of this volume are met.

h. Maintain file of Standardized FWPs per part I, chapter 2, of this volume, for their respective divisions. Submit Standardized FWPs to LWC Supervisor for approval prior to use.

i. Initiate procurement of material specified by the applicable drawings, standards or specifications to complete the designated repairs.

j. Prepare and route a DFS for non-nuclear or LAR for nuclear tests, inspections, material or other requirements of any maintenance action in which the requirements were not met.

1.7 REGIONAL MAINTENANCE CENTER OR FLEET MAINTENANCE ACTIVITY RESPONSIBILITIES.

1.7.1 RMC Commander or FMA Commanding Officer. Responsible for QA in the maintenance, repair and alteration of fleet ships as listed in sub-paragraphs “a” through “f”.:

a. Designate the RMC or FMA QAO in writing.

b. (Submarines only) Provide a written report of certification to the tended ship, at the conclusion of a maintenance period and prior to a tended ship’s next underway.

c. Certify the qualifications of QA personnel.

d. Ensure the RMC or FMA has an effective audit and surveillance program capable of assessing work performance and identifying areas of poor performance.

e. Initiate a semi-annual evaluation of the RMC or FMA QA Program by the QAO.

f. (Submarines only) Implements all aspects of the SUBSAFE and FBW-SCS programs as delineated by references (a), (c), (d) and (n).

1.7.2 RMC Deputy Commander or FMA Executive Officer. Responsible for the following:

a. Monitoring the QAO's administration of the RMC or FMA's QA surveillance, training and qualification programs.

b. Providing senior command level authority to back-up the QAO in the performance of the QAO's duties.

c. Spot checking performance of QA training by attending or monitoring training periodically.

d. Assigning an AQAO who is an E-7 or above or a senior civilian to be an administrative assistant to the QAO.

e. Assigning sufficient QASs and QAIs to the QA Division.

1.7.3 RMC Production Officer or FMA Repair Officer. Production Officer or Repair Officer is responsible to:

NOTES: 1. AT TRIDENT REFIT FACILITIES SOME OF THESE RESPONSIBILITIES MAY BE UNDER THE COGNIZANCE OF THE PLANNING OFFICER. HOWEVER, THEY WILL NOT BE DELEGATED TO A LEVEL LESS THAN A DEPARTMENT HEAD.

2. WHERE NOTED, SOME OF THESE RESPONSIBILITIES MAY BE UNDER THE COGNIZANCE OF THE ENGINEERING DEPARTMENT HEAD AT AN RMC.

a. Implement a work request screening process such that jobs requiring special controls are recognized.

b. Implement a QA Program that ensures all work accomplished by the Production or Repair Department meets the material and workmanship requirements of approved plans and specifications.

c. Provide liaison with other department heads when their functions are directly or indirectly related to the QA requirements of the Production or Repair Department.

d. Review and approve TWD as required in part I, chapter 2, Appendix E, TWD Review and Approval matrix, of this volume.

e. Review and approve the FWP as required in part I, chapter 2, of this volume.

f. (Submarines only) Approve and sign all recertification RPWAR and ensure these documents are forwarded to the Reactor Plant Planning Yard with copy to NAVSEA 08, TYCOM and tended ship's parent ISIC.

g. Review all DFS initiated by the RMC or FMA.

h. (Submarines only) Review and approve all LARs initiated by the FMA.

i. Maintain a sufficient number of qualified personnel to adequately staff the QA Division. At RMCs this may be performed by the Quality Assurance Department Head.

j. Implement a formal training and qualification program for all personnel assigned to the Production or Repair Department who perform, plan, or supervise controlled work, covering QA requirements and practices.

k. Designate nuclear or non-nuclear Metallographic Test Method Examiner and Generic Material Alloy Identification Examiners (as applicable). At RMCs this may be performed by the Quality Assurance Department Head.

l. Verify the RMC or FMA has an effective audit and surveillance program capable of assessing work performance and identifying areas of poor performance. At RMCs, this may be performed by the Quality Assurance Department Head.

m. Ensure fact-finding critiques are held to establish underlying causes and pursue corrective actions when necessary. When major errors or problems occur during maintenance that affect Nuclear, Level I, FBW-SCS, SFCC, DSS, SOC or SUBSAFE work, a critique may be necessary. Examples include when significant problems or trends occur or those that did result or could result in incidents, significant unplanned rework, serious equipment damage, malfunction or personnel injury. Minor problems are isolated deficiencies with minimal overall impact and no significant consequences; these should normally be corrected on the spot and without expending much time and effort. At RMCs, this may be performed by the Engineering or Quality Assurance Department Head.

(1) (Submarines only) Contact the ISIC immediately for issues which will result in a SUBSAFE, FBW-SCS, DSS or SOC critique, SUBSAFE, FBW-SCS, DSS or SOC trouble report, or SUBSAFE, FBW-SCS, DSS or SOC fact-finding.

(2) (Submarines only) Additional guidance and direction for critiques is contained in reference (d).

(3) (Submarines only) Copies of critiques and incident reports for SUBSAFE, FBW-SCS, DSS or SOC issues that result in a problem severity level of Level 1 (critical) or Level 2 (serious) will be sent to the TYCOM electronically.

n. Ensure that each work request or job order is screened for Quality Control and QA requirements and marked up or stamped as to specific category applicable in each of the following situations as required by this manual:

(1) SUBSAFE.

(2) Level I.

(3) Nuclear.

(4) Special cleanliness requirements.

(5) Special testing requirements.

(6) Special fabrication requirements.

(7) SOC.

(8) SFCC.

o. (Submarine Repair Facilities) Oversees the implementation of the SUBSAFE, DSS-SOC and FBW-SCS programs as directed by references (a), (b), (c) and (n).

1.7.4 FMA Supply Officer. Supply Officer is responsible to:

a. Designate area(s) for stowage of LI, SOC, SW or VU stock program material and NRP in the custody of the supply department.

b. Ensure procurement, stowage, and issue of Nuclear, SOC, SFCC and Level I materials are in compliance with the applicable material control standards, instructions and this volume.

c. Ensure accompanying certification documents remain with the LI, SOC stock program material, SW, VU and NRP for which the supply department has custody.

d. Turn over material certification documentation (or copy, if issuing other than the entire lot) for LI, SOC stock program material, SFCC and NRP to the customer.

e. Return defective LI, SOC stock program material, SW, VU and NRP to the Navy supply system following supply department procedures. Submit defective material reports.

f. Ensure appropriate supply personnel receive training on nuclear and non-nuclear material covering material certification, material procurement, receipt inspection, and LI, SOC stock program material, SW, VU and NRP stowage requirements.

g. Ensure semiannual inventories of supply's LI, SOC stock program material, SW, VU and NRP are conducted.

1.7.5 FMA Nuclear Repair Officer. When assigned, the Nuclear Repair Officer is responsible to:

a. Determine and specify the material requirements and the certification requirements for the NRP to be used in nuclear controlled work.

b. Initiate procurement action for NRP required for accomplishment of nuclear tasks.

c. Review and approve the FWP as required in part I, chapter 2, of this volume.

d. Prepare and issue the CWP, when OQE is required at the conclusion of the nuclear work and as required by part I, chapter 2 of this volume.

(1) Verify the FWP is the correct procedure, both in sequence and requirements, to satisfactorily accomplish the controlled work.

(2) Verify the CWP contains or lists the correct technical specifications or requirements (e.g., torque values, dimensions, NDT inspections, special cleanliness, test) for certification attributes to be documented on the appropriate QA form.

(3) Ensure test requirements for controlled work comply with the latest applicable specifications.

(4) Ensure signatures for repair work attributes are annotated as requiring CSB or signature, as applicable, on the QA form and in the FWP as discussed in part I, chapter 2 of this volume by use of (R), (S), (CI), (G), (C), (I), (Q) and (V) in the margin by the appropriate step.

e. (Submarines only) Review and sign the necessary recertification RPWAR pages, as required by part I, chapter 5, of this volume for repair or maintenance actions

performed in Reactor Plant SUBSAFE or Hull Integrity areas by the FMA and forward to the QAO for review.

f. (Submarines only) Maintain copies of approved RPWAR forwarded to the Reactor Plant Planning Yard in an auditable fashion.

g. Provide the tended ship the test requirements and joints or components to be tested for recertification of FMA work prior to commencing work on the tended ship.

h. Ensure only appropriately trained or qualified personnel perform nuclear work.

1.7.6 RMC or FMA Planning and Estimating Officer. Planning and Estimating Officer is responsible to:

a. Determine and specify the material requirements and the certification requirements for the LI, SFCC and other materials to be used in non-nuclear controlled work.

b. Initiate procurement action for LI, SFCC stock program material and other materials required for accomplishment of non-nuclear tasks assigned.

c. Review the FWP as required in part I, chapter 2, of this volume.

d. Prepare and issue the CWP when OQE is required at the conclusion of the non-nuclear controlled work and as required by part I, chapter 2 of this volume.

(1) Verify the FWP is the correct procedure, both in sequence and requirements, to satisfactorily accomplish the controlled work.

(2) Verify the CWP contains or lists the correct technical specifications or requirements (e.g., torque values, dimensions, NDT inspections, special cleanliness, tests) for certification attributes to be documented on the appropriate QA form.

(3) Ensure test requirements comply with the latest applicable specifications.

(4) Ensure signatures for repair work attributes are annotated as requiring CSB or signature, as applicable, on the QA form and in the FWP as discussed in part I, chapter 2, of this volume by use of (R), (S), (CI), (G), (C), (I), (Q) and (V) in the margin by the appropriate step.

e. Provide the tended ship the test requirements and joints or components to be tested for recertification of FMA work prior to commencing work on the tended ship.

f. Initiate and route for approval Departures From Specification required for certification of FMA work per part I, chapter 8 of this Volume including any at sea testing.

1.7.7 RMC or FMA Division Officer. Division Officers are responsible to:

a. Supervise and direct QA program within work centers under their cognizance.

b. Ensure divisional personnel understand the requirements for and of a CWP.

c. Ensure all repair actions performed by their division conform to applicable specifications and any deviation from specifications is reported as a DFS for non-nuclear work or LAR for nuclear work.

d. Ensure CMPOs are assigned, qualified and executing their duties for each work center handling or stowing controlled material.

e. Ensure areas are designated and are appropriate for proper stowage of controlled material.

f. Review the FWP as required in part i, chapter 2, of this volume.

g. Review each TWD as required in part i, chapter 2, Appendix E, of this volume.

h. Conduct or monitor divisional and work center QA training.

i. Obtain written permission from the QAO to downgrade LI Stock Program Material or NRP for non-level use.

1.7.8 RMC or FMA Work Center Supervisor. Work Center Supervisors are responsible to:

a. Ensure controlled and non-controlled material to be installed is correct per plan, drawing or other specification.

b. Review each TWD for the work center as required in part i, chapter 2, Appendix E, of this volume.

c. Review the FWP as required in part i, chapter 2, of this volume.

d. Supervise QA programs within assigned work centers.

e. Review work for satisfactory completion.

f. Ensure CWPs for completed controlled work are complete, properly reviewed and forwarded with all certifying documents, when work is completed.

g. Ensure work center personnel are properly trained and qualified, if required, prior to assignment to tasks requiring QA or special cleanliness (e.g., oxygen, hydrogen, reactor plant, steam plant) certifications.

h. Ensure all personnel use only TMDE (i.e., measuring devices, instruments, inspection tools, gauges, jigs or fixtures), which have current calibration stickers with records attached or available, for production, acceptance and testing. Uncalibrated or untested TMDE will be tagged and removed from service immediately.

i. Prepare DFS or LAR for non-conforming conditions found or caused by the work center, sign, and forward to QAO.

1.7.9 RMC or FMA Craftsman. Craftsman is responsible to:

a. Perform all maintenance actions following the FWP. If that guidance is either incorrect, incomplete or unclear, stop and seek clarification from the work center or shift supervisor.

b. Ensure QA forms associated with the maintenance are correctly completed as required by the applicable sections of this volume.

c. Enter signature, printed name and date on all QA data forms completed.

d. Ensure only TMDE (i.e., measuring devices, instruments, inspection tools, gauges, jigs or fixtures), which has current calibration stickers with records attached or available,

is used for production, acceptance and testing. Uncalibrated or untested TMDE will be tagged and removed from service immediately.

1.7.10 RMC Quality Assurance Department Head (Code 130) or Industry Management Department (Code 400 at Puget Sound Naval Shipyard and Intermediate Maintenance Facility). (For NAVSEA managed RMCs) These departments are responsible to:

a. Implement a QA program per this volume that ensures all work accomplished by the Production or Repair Department meets the material and workmanship requirements of approved plans and specifications.

b. Provides liaison with other department heads when their functions are directly or indirectly related to the QA requirements of the Production or Repair Department.

c. Provide the Commander or Commanding Officer with a semi-annual evaluation of the overall adequacy and effectiveness of the RMC's QA program.

d. Verify the RMC or FMA has an effective audit and surveillance program capable of assessing work performance and identifying areas of poor performance.

e. Maintain sufficient number of qualified personnel to adequately staff the QA Department.

f. Designate nuclear or non-nuclear Metallographic Test Method Examiner and Generic Material Alloy Identification Examiners (as applicable) (Code 130 responsibility at Puget Sound Naval Shipyard and Intermediate Maintenance Facility).

g. Ensure fact-finding or critiques (as applicable) are held to establish underlying causes and pursue corrective actions when major errors, mistakes or problems occur during maintenance, or result in serious damage to equipment or injury to personnel. Notify Commander Navy Regional Maintenance Center of critiques and trouble reports per reference (o).

h. Assign a qualified Quality Assurance Officer to the Code 133 division (RMC) or Code 450 (Puget Sound Naval Shipyard and Intermediate Maintenance Facility).

1.7.11 RMC Code 133 Division Head or FMA Quality Assurance Officer. Code 133 or QAO is responsible to:

a. Organize and implement a QA program within the RMC or FMA to carry out provisions of this volume.

b. Provide guidance and evaluate efforts to produce work of acceptable standards.

c. Prepare QA procedures, where necessary, to implement the provisions of this volume.

d. Assist the TYCOM or ISIC as requested in performing QA audits on tended ships.

e. Assist the TYCOM or ISIC as requested in providing indoctrination training on the QA program to the Engineer Officers and QAOs of assigned ships. Provide QA training for tended ship's personnel qualifying as CMPO, CMH, QAS and QAI.

f. Approve downgrading of controlled material.

g. Determine suitability for use of controlled material received from one ship, for use on another ship, when the transfer is via an RMC or FMA work center.

h. Provide disposition instructions for rejected material.

i. Institute a formal qualification program for QA personnel.

j. Train and qualify work center CMPOs or CMHs. Inform the appropriate Division Officer and the Production or Repair Officer in writing of those qualified and any changes.

k. QAO will review FMA generated DFS for accuracy and technical merit, sign and forward to the Repair Officer. At an RMC, this function will be the responsibility of the NAVSEA Technical Authority Warrant Holder in Engineering Department.

l. Obtain chemical analysis, NDT and destructive testing required to upgrade or certify material for nuclear and non-nuclear applications for both the RMC or FMA and tended ships.

m. Establish and coordinate RMC or FMA procedures for material control as delineated in this volume.

n. Review, open and close out TWDs as required in part i, chapter 2, Appendix E, TWD Review and Approval matrix of this volume. Establish positive controls to ensure that repairs which are not in conformance with specification are not accepted without an approved DFS for non-nuclear systems or LAR for nuclear systems.

o. Review the FWP as required in part i, chapter 2, of this volume.

p. (Submarines only) Review and sign RPWAR.

q. Develop a QA training program, in conjunction with the Training Officer, which includes training for personnel who perform, plan or supervise controlled work.

   (1) Supervise training and qualification of:

      (a) QAS.

      (b) QAIs.

      (c) CMPOs or CMHs.

      (d) Cleanliness Inspectors or Certifiers.

   (2) Review and evaluate training of all personnel performing controlled work. Ensure that the continuing training is in sufficient detail and depth to provide effective training in all topics and areas specified in part I, chapter 3 of this volume.

r. Maintain a current master list of qualified QASs (if assigned), QAIs, CMPOs, CMHs, Cleanliness Inspectors, Oxygen Clean Workers and Oxygen Clean Instructors as specified in part I, chapter 10 of this volume.

s. Establish and administer a comprehensive RMC or FMA QA audit and surveillance program capable of assessing the work performance, training and qualifications and identifying areas of poor performance. Enlist the assistance of other repair department officers and senior enlisted personnel for audits and surveillance in the repair and supply departments.

(1) Prepare and update a written surveillance and annual audit schedule.

(2) Provide the Quality Assurance Department Head (for RMC) and Commander or Commanding Officer (for FMA) with a semi-annual evaluation of the overall adequacy and effectiveness of the RMC's or FMA's QA program.

t. Ensure record files are maintained for CWP, controlled material, audits, surveillance, audit deficiency corrections, qualifications and training.

u. Ensure all testing required for completion of TWD is complete and reviewed prior to the tended ship reactor plant startup, propulsion plant startup, or getting underway or a DFS for non-nuclear systems or LAR for nuclear systems has been submitted and approved.

v. Perform opening reviews of CWP as assigned to assure OQE generated will support work recertification. Perform closing reviews of CWP as assigned to assure technical accuracy and satisfactory OQE exists for record history.

w. Supervise QASs, QAIs, Cleanliness Inspectors, Certifiers, CMPOs, CMHs and other personnel, involved in controlled work, in the performance of their QA duties.

x. Conduct QA audits, surveillance and coordinate corrective actions to ensure compliance with specifications.

y. Maintain QA records and files, which includes completed CWPs including radiography film (if radiography used for acceptance of work), controlled material records (e.g., QA form 1, certification papers received with the material), training and qualification, etc.

1.7.12 RMC or FMA Assistant Quality Assurance Officer. AQAO is responsible to perform duties as assigned by the QAO.

1.7.13 RMC or FMA Quality Assurance Supervisor. QAS is responsible to:

a. Ensure all testing required for completion of CWP is complete and reviewed prior to the tended ship reactor plant startup, propulsion plant startup, or getting underway or a DFS for non-nuclear systems or LAR for nuclear systems has been submitted and approved.

b. Perform opening reviews of CWP as assigned to assure OQE generated will support work recertification. Perform closing reviews of CWP as assigned to assure technical accuracy and satisfactory OQE exists for record history.

c. Train and supervise QAIs, Cleanliness Inspectors, Certifiers, CMPOs, CMHs and other personnel, involved in controlled work, in the performance of their QA duties.

d. Conduct QA audits, surveillance and coordinate corrective actions to ensure compliance with specifications.

e. Maintain QA records and files including completed CWPs (including radiography film if radiography used for acceptance of work), controlled material records (e.g., QA form 1, certification papers received with the material), training and qualification, etc.

f. Review DFS for accuracy and technical merit and forward to QAO (FMA only).

1.7.14 RMC or FMA Quality Assurance Inspector. QAIs are responsible to:

a. Review steps in CWP which require QAI signatures to verify all requirements are adequately addressed.

b. Ensure all work inspected meets the requirements set forth in the latest applicable plans, specifications and directives of higher authority as stated in the CWP.

c. Perform QA inspections of certification attributes.

d. Verify permanent markings on controlled material are properly transferred and new material control tags are affixed.

e. Ensure all personnel use only TMDE (i.e., measuring devices, instruments, inspection tools, gauges, jigs or fixtures), which have current calibration stickers with records attached or available, for production, acceptance and testing. Uncalibrated or untested TMDE will be tagged and removed from service immediately.

f. Sign QA form 2 as controlled material is correctly installed for SUBSAFE, SOC and nuclear systems.

g. Witness and verify testing and inspections. Promptly inform supervisors of unsatisfactory test results.

h. Ensure all test results are completed, properly documented and the QA forms are returned to the CWP except for those specifically designated as work center records.

i. Review DFS for accuracy and technical merit and forward to QAO.

j. Perform cleanliness inspections required for initial, in process and final cleanliness inspections during maintenance or repairs for those systems requiring cleanliness controls

1.7.15 RMC or FMA Controlled Material Petty Officer or Controlled Material Handler. CMPO or CMHs are responsible to:

a. Receipt inspect all controlled material received by their work center or division.

b. Ensure all material under their cognizance is stored and controlled to the governing material control requirements.

c. Inspect controlled material storage areas of their work center quarterly, as a minimum, per Part I, Chapter 6 of this volume.

d. Ensure controlled material is properly stowed and handled so the identification of the subject material and its certification are always maintained.

e. Reject unsatisfactory material. Fill out and attach QA form 3 and request disposition instructions.

f. Send any material certification documents for material which has been provided by a ship along with the QA form 1 to the QA office. Ship must retain originals when the material has been issued for installation.

g. Receipt inspect package alteration kits that contain controlled material when ready for use.

h. Remove QA form 3 from previously rejected and now accepted controlled material, annotate the material acceptance on the QA form 2 and file the QA form 3 with the CWP.

i. Retain custody of controlled material when it is not in the custody of a craftsman or in a controlled material storage area.

j. Ensure controlled material markings are on all pieces when cutting a smaller piece from a large one.

k. Ensure controlled material markings are moved to an unaffected area, if the controlled material item will lose the markings due to a fabrication process (e.g., welding, machining) prior to the fabrication process.

1.7.16 RMC or FMA Cleanliness Inspector or Certifier. Cleanliness Inspectors or Certifiers are responsible to perform initial, in process and final cleanliness inspections during maintenance or repairs for those systems requiring cleanliness controls per Part I, Chapter 5, paragraph 5.4 of this volume.

1.7.17 RMC or FMA Nondestructive Test Division Officer. The following must comprise the core responsibilities of the FMA NDT Division Officer:

a. Coordinate the efforts of assigned NDT Examiners.

b. Ensure submittal of required reports of certification or recertification to higher authority as required by reference (i).

c. Review all requests for NDT training courses and examiner certification services. Provide recommendations to the chain of command regarding eligibility of the requestor and the need for such training or certification based on current and projected NDT personnel resources.

d. Review completed NDT inspection reports for technical completeness and accuracy and sign, where indicated on the report on completion of work.

e. Schedule eye examinations for NDT Inspectors.

1.7.18 RMC or FMA Command Examiner. When more than one NDT Examiner is assigned to the RMC or FMA, the Commander or Commanding Officer will designate (in writing) one of the NDT Examiners as the Command Examiner who will perform the following core responsibilities in addition to the responsibilities in paragraph 1.7.19.

a. Perform the duties of the NDT Division Officer if one is not assigned.

b. Act as the Command's point of contact for NDT technical issues. In addition, act as the Command's point of contact with NAVSEA for NDT issues.

c. Develop the Command's NDT Examiner guidelines, to include the Command's Written Practice for NDT certification when required by reference (j) utilizing the input of all participating NDT examiners.

1.7.19 Nondestructive Test Examiner. RMC or FMA NDT Examiner is responsible to:

a. Approve examination material for all NDT methods utilized at the activity for which they are certified. Ensure examination material reflects changes made to applicable fabrication documents.

b. Approve and qualify NDT procedures for each method utilized at the activity. Revise and approve procedures as necessary when changes are made to applicable fabrication documents.

c. Schedule and perform NDT Inspector surveillance. Maintain records of surveillance in order to perform trend analysis of inspector abilities and program effectiveness.

d. Schedule and administer NDT examinations. Maintain records of examinations sufficient to trace inspector qualifications to original examination material. Maintain a matrix of high miss questions in order to assess inspector knowledge and program effectiveness.

e. Train, certify and monitor NDT Inspectors as required by applicable specifications.

f. Ensure each NDT Inspector's service record is kept updated with qualification status.

g. Maintain individual records of qualification for NDT inspectors.

h. Monitor the welder qualification and training per reference (l). Monitor brazer qualification and training per reference (l) or (m) as applicable to process used.

i. Review all welder or brazer records for completeness semi-annually. This review may be performed by the welding engineers at Trident Refit Facilities (TRF).

j. Review, approve and monitor the commands' welder training and qualification program as required by reference (l). Review, approve and monitor the commands' brazer training and qualification program as required by reference (l) or (m) as applicable to processes used.

k. Prepare and execute the training and qualification program for each NDT method that leads to inspector certification in each method and maintains inspector competency in each method.

1.7.20 RMC or FMA Nondestructive Test Inspector. NDT Inspectors are responsible to:

a. Verify CWPs which include NDT inspections properly identify the inspection requirements and acceptance criteria.

b. Ensure NDT inspections are completed correctly and following the applicable requirement and inspection reports are technically complete and accurate.

c. Ensure use of only TMDE (i.e., measuring devices, instruments, inspection tools, gauges, jigs or fixtures), which have current calibration stickers with records attached or available, for production, acceptance and testing. Uncalibrated or untested TMDE will be tagged and removed from service immediately.

d. Sign QA form 2 as controlled material is correctly installed.

1.8 OTHER ACTIVITY RESPONSIBILITIES. Activities other than RMC or FMAs will conform to the requirements of this volume through a formal MOA, as defined in Volume II, Part I, chapters 2 and 3 for aircraft carriers, volume II, part II, chapters 2 and 3 for Surface Force

ships and volume II, part III, chapters 2 and 3 submarines of this manual, with the ISIC while conducting maintenance on fleet activities. This includes work performed by naval shipyards, government agents, civilian contractors and other activities not specifically mentioned in other sections of this instruction. NSA representative must sign MOA(s) as assurance that any civilian contractor requirements detailed in MOA are contained within applicable contracts.

a. Ship's Force is ultimately responsible for all work accomplished on board their ship.

b. Ship's Force is responsible for the development of TWDs for use in technical assist visits.

c. In some cases, technical assists may provide troubleshooting services or complete equipment changes. Technical representatives are expected to utilize approved QA procedures or observe the requirements of this manual. The contractor or representative must be able to explain what controls they will place on a given job, including testing and documentation to be provided for OQE.

d. Technical support agencies and contracted organizations may not perform work inside the SUBSAFE boundary. Only activities that are listed in reference (n) are authorized to perform SUBSAFE work. In cases where RMCs or other activities are assisting on maintenance inside the SUBSAFE, DSS-SOC and FBW boundary, sub-paragraphs 1.8.a and 1.8.b of this chapter will be strictly adhered to.

e. Product Quality Deficiency Reporting must be per reference (k), with the exception of Aircraft Launch and Recovery Equipment. Quality Deficiency Reporting associated with Aircraft Launch and Recovery Equipment is addressed in reference (p).

APPENDIX A

FORMAT FOR SUBMARINE QA PRE-UNDERWAY CHECKLIST

SSGN, SSBN, SSN _____	Date: _____

URO Review (*with ISIC) (48-24 Hours Prior to Underway) (init)	
	All URO Data for UROs done for periodicity received and reviewed.
	No URO will become due prior to next scheduled INPORT period with the exception of a scheduled URO-22 rise blow.
	Plan approved to complete UROs due next INPORT, availability or underway (e.g. URO 022 rise blow).
	* URO Schedules and Inventories are up to date.
	Retests to certify URO parameter due to maintenance reviewed by QAO or Department Head.
	* Latest URO MRC Change on hand and verified current. Latest Change _____.
	* Review SUBMEPP URO and HIPs web site and the Schedules and Inventories to verify no URO or HIPs (as applicable) are due or will become due prior to return to port (This review is to be completed by the URO-PMR Coordinator and ISIC QAO).
Other Reviews (48-24 Hours Prior to Underway)	
	REC Exception Binder, including QA-11A, updated for work performed this availability.
	No underway limiting OSARs exist or any underway limiting OSAR has been adjudicated via an approved DFS. In addition to OSARs that may impose operational limitations for ships at sea, all deficiencies documented in an OSAR that require a DFS per Chapter 8 of this Volume are considered underway limiting.
	No outstanding Audit, Assessment or Survey ICARS (CAT 1) exist _____. No overdue AS&E responses due. Next report of corrective actions due: _____.
	DEI date_____, next DEI due date (18 months) _____ (DFS_____), Major Deficiencies corrected or not due (30 days and No RBOs).
	The ship's QAO shall complete a QA Pre-Underway Checklist with the ISIC QAO.
	Designated SOC Ships - If Manned Operations are scheduled, verify no SOC planned maintenance (e.g., PMRs, HIPs, or PMS) will become due prior to Manned Operations. Major DFS is required for non-accomplished planned maintenance which will come due during scheduled manned operations.
	Verify there is no rescue seating surface (Escape Trunks, Logistics Escape Trunk and Lockout Trunks) Periodic Maintenance Requirements (PMRs) that will become due prior to underway. Perform the PMR or submit a minor DFS if the PMR will come due during underway.
	Ship's QAO shall review all 59400/series MRCs completed during the last in-port period for any discrepancies not corrected prior to ship underway. Minor DFS is required for non-corrected discrepancies per chapter 8.2.6 of this part and volume.
	Ship's QAO shall review AHPD or HPAC Effluent and EMBT Banks Measure Dewpoint MRCs' for periodicity. MIP 5511 (AHPD effluent) or 5515 (HPAC effluent (SSN795 AFS)) last

	completed_____Due_____. MIP 5542 (EMBT bank) last completed _____. Due _____. If either KMRC is out of periodicity or ship's planned underway will result in exceeding periodicity, a major DFS is required per chapter 8.2.5 of this part and volume.
	The ship's QAO will be relieved on _____ (DD MMM YYYY)

QA-11 Log Review (Within 24 Hours of Underway)

	FMA QA-11 Log Closed		Ship's QA-11 Log Closed Out		DDS QA-11 Log Received and Closed Out

Custody Transfers (Within 24 Hours of Underway)

	DDS Custody Transfer Msg or letter Received or Issued.
	Copy of DDS Continuity Message or Letter received following installation or removal received and reviewed.

DFS Review (includes waiver and deviations) (Within 24 Hours of Underway)

	No active DFS will expire prior during the ship's scheduled underway period without an approved plan to clear or extend the DFS to support ship's schedule.
	All SUBSAFE, SOC, or FBW-SCS AT-SEA TESTING departures verified against Continuity Letter.
	Ship has completed DFS to JCN audit.
	All identified non-conformances adjudicated (no outstanding DFS awaiting approval).
	Verify all CSMP entries are properly documented per Appendix D, paragraph 4.1.d, chapter 19-7, volume VI and all SUBSAFE, Fly-by-Wire and DSS-SOC deficiencies are either cleared or documented on an approved DFS. The Ship's QAO will use the current maintenance management tool for this review and report completion to ISIC QAO prior to ships underway. Submarine Maintenance Coordinator will use the shore based CSMP for this review and report completion to ISIC Material Officer and ISIC QAO prior to ship's underway.

Continuity Letters, Certification or Completion Letter Separate letters required from each activity performing SS, SOC, FBW-SCS SFCC work on ship system. For DDS installation or removal (only), Ship's Continuity Letter issued as USER and Sustaining Activity.

	Lead NSA CERT (PHNSY, PSNS, PNSY, NNSY)		EB/SOSG (SS or FBW)		NGNN/SOSN (SS or FBW)		OII/NSWCCD (SS or FBW)
	Lead FMA/RMC		EB/SOSG (SOC)		NGNN/SOSN (SOC)		OII/NSWCCD (SOC)
	FMA/RMC				Ship (SS or FBW) Continuity letter		Ship (SOC) Continuity letter

Blue text can be tailored to list the regional activities.

(ag) MIL-STD-2132 - Nondestructive Testing Examination Requirements

LISTING OF APPENDICES.

A Technical Work Document Illustration
B Work Package Decision Process
C Certification Signature Requirements for Reactor Plant, Nuclear Support Facility and Controlled Industrial Facility Work
D Formal Work Package Approval and Revision Sheet
E Technical Work Document Review and Approval Matrix

2.1 PURPOSE. To provide the requirements for generating work procedures that will provide the craftsman with clear, concise, and technically correct instructions to complete the maintenance task while conforming to technical specifications. The work instructions will vary in complexity depending on the type of work to be performed, the amount of existing guidance available, the extent of preparation and system restoration required, and the technical ability of the craftsman.

2.2 TECHNICAL WORK DOCUMENTS. Technical Work Documents (TWD) consist of three general types: Maintenance Procedures (MP), Formal Work Packages (FWP) and Controlled Work Packages (CWP). Refer to Appendices A and B to determine which type of TWD is required.

2.2.1 Minimum Requirements for using Technical Work Documents.

a. Nuclear Propulsion plant maintenance as defined in reference (a). This includes non-nuclear systems and components that could affect reactor plant operation.

b. Repair or troubleshooting to Fleet Maintenance Activity (FMA) Nuclear Support Facility systems or components.

c. Radioactive repair work as discussed in reference (b). Major work accomplished in reactor compartments or high radiation areas as required by reference (b).

d. Manufacture and corrective maintenance of mechanical, electrical or electronic nuclear support and test equipment (e.g., steam generator hydrostatic test equipment, switchgear test equipment, scram breaker time response equipment).

e. Propeller or propulsor replacement or repair.

f. Any Freon systems including self-contained units when the gas path is penetrated.

g. FMA work on tended ship's systems.

h. Level I or Submarine Safety (SUBSAFE) system work.

i. Tests for FMA non-nuclear controlled work, which requires hydrostatic testing for recertification.

j. All flammable liquid shipboard systems.

k. Electric motor rewind.

l. (Submarines Only) Repair of Masts and Antennas.

m. Other Ship's Force repair or troubleshooting as determined by the Department Head.

n. Troubleshoot and repair of Gas Turbines when:

(1) Repairs affect the gas path.

(2) Removal, repair or replacement of accessory gearbox and components.

(3) Repairs to bleed air piping.

o. Troubleshoot and repair of Main Propulsion Turbines or Generator Turbines.

p. Troubleshoot and repair of Propulsion and Generator Lube Oil systems.

q. Troubleshoot and repair of Propulsion and Generator Reduction Gearing or Drive Train Assemblies.

r. Troubleshoot and repair of Auxiliary Turbines and pumps in which disassembly is required.

s. Troubleshoot and repair of Boilers, Diesel Engines and their support systems.

t. Any work within the Scope of Certification boundary.

u. Troubleshoot and repair to submarine towed array handling systems.

v. Welding and brazing requiring a CWP per paragraph 2.2.4 of this chapter.

w. Maintenance on Weight Handling Equipment.

x. Maintenance on Recovery Assist, Securing and Traversing systems, per reference (c).

y. Maintenance performed which invokes MIL-STD 1330 or MIL-STD 1622 cleanliness standards.

z. Maintenance on Fly-By-Wire Ship Control Systems, per reference (d).

aa. Steering Gear Systems

ab. (Submarines Only) Special Valves

ac. (SSBN Only) Troubleshooting and repair of Missile Gas, Missile Hydraulic and Missile Tube systems that remove the ability to inert and jettison the tube contents.

ad. Any work on sea-connected (seawater) systems.

ae. Any work on systems or components required to support ship recoverability.

af. Any work on installed damage control systems or components.

ag. (Carriers Only) Troubleshoot and repair of JP-5 purifiers and service pumps.

NOTE: THE HEX PLUGS (MS PLUGS) DISCUSSED IN THESE PARAGRAPHS ARE NOT EQUIVALENT TO THE MS PLUGS DESCRIBED IN THE RE-ENTRY CONTROL EXCEPTIONS OF REFERENCE (H). THE FOLLOWING PARAGRAPHS REFER TO TABLE 2-1.

Style	Description	Ship or Class	Drawing or Specification
Style 1	Rectangular block assembly	SSN 688 Class	NGNN 2300-818
Style 2	Integral assembly or TRIDENT style fitting	SSBN 726 Class SSN 774 Class	NAVSEA 845-4687601
Style 3	Threaded boss assembly or Shroeder test fitting	SSN 21 Class SSN 774 Class	MIL-V-24695
Pressure Test Stations (PTS) and Test Pressure Stations (TPS) in the SUBSAFE boundary refer to components of different design that perform a similar function.			
(1) Style 1 and 2 PTSs and TPSs hex plugs form part of the secondary pressure boundary and serve as contaminant protection. Removal and reinstallation of the hex plug requires a TWD but does not require Re-Entry Controls or controlled assembly. The TWD must verify that seat leakage criteria and seating surface and hex plug inspections are performed following applicable technical specifications. (2) Re-Entry Controls are not required when operating Style 1 or 2 PTSs or TPSs associated needle valves following normal operating procedures identified in Ship Safety Manuals, Steam and Electric Plant Manuals or other NAVSEA-approved procedures. If a ship's operating procedure is unavailable, a locally prepared FWP will be generated to operate the valve. (3) Style 3 PTSs and TPSs have a Delrin cap. Removal and reinstallation of the Delrin cap requires a TWD but does not require Re-Entry Controls or controlled assembly. The TWD must verify that seat leakage criteria and seating surface and Delrin cap inspections are performed following applicable technical specifications. (4) Any disassembly for major or minor repair of Style 1, 2 or 3 PTSs or TPSs requires a SUBSAFE Re-Entry Control CWP.			

Table 2-1 Types of PTS and TPS Fittings

2.2.2 Maintenance Procedure. MPs may be fully usable in their existing form. The minimum requirements to perform any work are a valid MP and permission to perform maintenance.

a. (Submarines Only) If an approved NAVSEA Submarine Maintenance Standard (SMS) is invoked to perform an emergent repair and there is no intention to reset the maintenance interval, then the SMS can be used as a guide to the extent necessary to perform repair. Parts removed can be inspected following the SMS. Inspection

criteria for parts not addressed by the SMS (e.g., those parts identified as mandatory replacement parts) must be inspected following general acceptance criteria or the system drawing or the component technical manual. Additionally, the torque, lubrication, and test criteria cited in the SMS may provide revised values which differ from NAVSEA drawings or component technical manuals.

b. The following are examples of existing MPs:

(1) Planned Maintenance System Maintenance Requirement Cards.

(2) SMSs.

(3) Ship Systems Manuals.

(4) Component Technical Manuals.

(5) Shipyard Process Instructions.

(6) Ship Alteration Instructions.

(7) Reactor Plant Manual Operating Procedures, Operating Instructions, Maintenance and Replacement Instructions, and Reactor Maintenance Requirement Page.

(8) Alteration and Improvement Instructions.

(9) Naval Sea Systems Command (NAVSEA) Drawings which include disassembly or reassembly instructions.

(10) Shipyard Task Group Instructions (TGI).

(11) Steam and Electric Plant Manual.

(12) (Surface Force ships only) Reference (e) Appendix 4E specifications.

2.2.3 Formal Work Package. An FWP coordinates in a single document materials required, initial conditions, MP, test and inspections, and system restoration for the selected maintenance task. In some instances, the maintenance task will not have an existing MP. This will require the activity to develop an FWP in order to ensure first time quality accomplishment of the maintenance task. FWPs should be only as detailed as required by the complexity of the work, craftsman knowledge, technical requirements, extent of tests, and level of worker supervision required (see Appendix B).

2.2.4 Controlled Work Package. A CWP is required when higher authority requires a record (Objective Quality Evidence (OQE)) of repairs, maintenance for fabrication, repair, installation, inspection and testing process for specific systems or components, such as Level I, SUBSAFE, Submarine Flight Critical Components (SFCC) or nuclear. CWPs may be necessary when required by the level of work control of the system (nuclear, SUBSAFE, SFCC and Level I) or when other extensive and formal Quality Assurance (QA) or test requirements exist (weight test, crane repairs, etc.). In its simplest form a CWP will consist of, as a minimum, a MP and the required QA forms. Examples of required CWPs:

a. Level I.

(1) Manufacture, installation, and repair of Level I components or systems except for the following actions, which may be controlled with TWDs other than CWPs.

(a) Software replacement (e.g., O-rings, packing glands, body to bonnet gaskets, silver seal replacements).

(b) Inspections to support routine maintenance programs or troubleshooting.

(c) Replacement of any non-pressure boundary parts which are non-Material Identification and Control (MIC) level pieces.

(2) Repair by welding, brazing, machining, lapping or manufacture of Level I fittings or components.

b. Reactor Plant, Nuclear Support Facility or Controlled Industrial Facility.

(1) Manufacture, installation, and repair of nuclear Level I systems and components. The following actions may be controlled with TWDs other than CWPs provided all assembly procedures and inspections (Quality Assurance Inspector (QAI)) requirements specified in reference (f) are delineated in the procedure section of the FWP:

(a) Software replacement (e.g., O-rings, packing, body to bonnet gaskets, silver seal replacements).

(b) Inspections to support routine maintenance programs or troubleshooting.

(c) Replacement of any non-pressure boundary parts which are non-Material Identification and Control (MIC) level pieces.

(2) Hydrostatic testing as required by reference (g) to certify reactor plant work conducted.

(3) Welding and Nondestructive Testing (NDT) which provides OQE of the integrity of reactor plant piping, and structural welding.

(4) Work affecting the integrity of permanent shielding installations.

(5) Work affecting reactor plant brazed joints that are inaccessible during reactor operations.

(6) Ship’s Force retests of FMA or Ship’s Force nuclear work:

(a) Ship's Force retest of FMA nuclear work that requires hydrostatic testing or an external pressure source to perform the retest.

(b) Ship's Force nuclear work above normal operating pressure that requires hydrostatic testing or an external pressure source. Ships force performed nuclear work that requires an external pressure source at or below normal operating pressure to perform the test or retest do not require CWP.

(c) Pre-Overhaul testing requiring the use of external pressure source or

hydrostatic testing.

(d) Routine gage or instrument calibrations do not require CWPs.

NOTE: WORK ON SUBSAFE/NON-SUBSAFE (RED/BLACK) INTERFACE JOINTS WILL BE MANAGED AS SUBSAFE WORK USING CWP/REC CONTROLS.

c. Work within SUBSAFE or hull integrity boundary.

(1) Work within SUBSAFE or hull integrity boundary, identified in reference (h), including:

(a) Submarine pressure hull grinding, cutting and welding.

(b) Adjustments that affect valve timing associated within the flood control system components or Unrestricted Operations Maintenance Requirement Card affected components to include cap removal or reinstallation of hydraulic variable restrictors.

(c) Pressure testing salvage air valves via the external connection.

(2) Any disassembly for major or minor repair of PTSs or TPSs in the SUBSAFE boundary.

d. Welding or Brazing.

(1) P-1, P-LT, P-3a Special Category or Critical Piping Systems repair, alteration or fabrication, by welding and brazing per reference (i) and reference (j). (Small self-contained Freon units, such as ice cream machines, ice machines, etc., are excluded.)

(2) Pressure Vessel Class A-F, A-1, A-2, A-3, A-LT, M-1, T-1 repair, alteration or fabrication by welding and brazing per reference (i).

(3) Permanent repairs and alterations of the primary structure of surface ships, including ballistic plating and superstructure designed for blast loading. Records must be made and retained for category "C" repairs as required by references (k) and (l).

(4) Welding on submarine hull and structures per reference (m) as listed:

(a) Pressure hull envelope.

(b) Pressure hull structure.

(c) Support structure.

(d) Containment structure.

(e) Extended pressure hull structure.

(f) Interface structure.

e. Weight Handling Equipment Manufacture and Repair except for cranes.

f. Corrective maintenance within the certified boundaries (envelope) of cranes as defined in reference (n).

g. Maintenance within SUBSAFE boundaries of submarine antennas and masts.

h. Maintenance on Recovery Assist, Securing and Traversing systems per reference (c).

i. Maintenance on systems requiring cleanliness controls as defined by MIL-STD 1330 or MIL-STD 1622 (e.g., diver's air, oxygen, nitrogen, hydrogen, helium-oxygen). For MIL-STD 1622 applications, only systems defined as "critical" require a CWP for cleanliness controls. If repair or replacement of any component requires a record of OQE (pressure testing, new Level I (LI) or Scope of Certification (SOC) material, welding, etc.), a Re-Entry Control (REC) or CWP as appropriate is required. However, the following exceptions apply:

(1) A CWP is not required for inspections specified in MIL-STD 1330 during maintenance of cleanliness when performed by Type Commander or Ship's Force personnel on systems and equipment not certified by reference (h), reference (o) or reference (p).

(2) A REC or CWP is not required for maintenance performed following an approved Planned Maintenance System Maintenance Requirement Card by Ship's Force personnel that states that performance of the maintenance does not require REC.

(3) A CWP is not required for inspections on systems defined as "critical" as specified in MIL-STD-1622 during maintenance of cleanliness when performed by Type Commander or Ship's Force personnel and the maintenance of cleanliness is authorized to be performed as a REC Exception in the applicable Deep Submergence Systems SOC Notebook.

j. Maintenance within the FBW SCS certification boundary, per reference (d).

2.2.5 Maintenance Certification Record or Controlled Work Package (Non-SUBSAFE). Various sea water system components and portions of the *Virginia* Class submarine Virginia Payload Tube (VPT) System require frequent entry into the system boundary for routine operations or maintenance actions in order to enable the ship to carry out its mission. Table 2-2 of this paragraph includes certain systems and equipment which require Level I work controls (or similar type controls) that are frequently entered but must be exempt from Maintenance Certification Record (MCR) or CWP Controls. The VPT System (where installed) is not Level I but due to its design and system applications requires additional controls for those portions specified in reference (q). The operational requirements for these systems and equipment have been reviewed. Inherent operational controls and maintenance procedures in the present system are considered adequate and the items listed in Table 2-2 are considered safe exceptions to the formalized MCR or CWP system. The operational control which is considered as meeting the intent of the MCR or CWP requirements is listed beside each item and must be in effect in order to use the exception.

NOTE: MCR EXCEPTIONS ARE FOR SHIP'S FORCE USE ONLY AND ARE NOT AUTHORIZED FOR USE BY REPAIR ACTIVITIES. REPAIR ACTIVITIES MUST NOT REQUEST THE SHIP TO INVOKE A MCR OR CWP EXCEPTION IN CONJUNCTION WITH REPAIR ACTIVITY WORK.

NOTE: MCR EXCEPTIONS ARE NOT AUTHORIZED TO BE USED FOR THE INSTALLATION OF NEW LEVEL I HARDWARE WITHIN THE LEVEL I BOUNDARY.

NOTE: EXCEPTIONS FROM MCRs OTHER THAN THOSE LISTED ARE NOT AUTHORIZED.

Submarine Seawater MCR & VPT System EXCEPTION ITEM	**OPERATIONAL CONTROL REQUIREMENT**	**RECERTIFICATION TESTING**
VPT System Applicable Portions	Controlled assembly (Notes 1 and 2)	As specified in reference (q)
Cleaning Shaft Seal Cooling Water strainers or filters	Controlled assembly (Notes 1 and 2)	None
Cleaning of Auxiliary Sea Water system strainers	Controlled assembly (Notes 1 and 2)	None
Cleaning evaporator, distilling plant and Reverse Osmosis supply water strainers	Controlled assembly (Notes 1 and 2)	None
Shaft Seal Cooling Water Cyclone Separators	Controlled assembly (Notes 1 and 2)	None

Notes:
(1) An FWP, per paragraph 2.2.3 of this chapter, will be used to control and document all work performed as a MCR exception.
(2) Controlled assembly requirements are:
(a) Verification that surface finishes of gasket or O-ring sealing surfaces are following applicable specifications.
(b) Verification that fastener material and installation is following applicable specifications.
(c) Verification that gaskets or O-rings are properly installed and following applicable specifications.
(d) Assembly is documented on a QA form 34.
(e) Inspected by a QAI or Quality Assurance Supervisor (QAS).

Table 2-2 Submarine Seawater & VPT System (where installed) MCR EXCEPTION ITEM (Non-SUBSAFE)

2.2.6 Sequencing Document. A sequencing document is used to tie two or more TWDs together when a single TWD is insufficient (as determined by the Department Head or Principal Assistant for Aircraft Carriers) to complete a maintenance task. If the Department Head (Principal Assistant for Aircraft Carriers) determines a single TWD is insufficient to complete the task, a sequencing document should be developed, which provides the craftsman with directions for going from one TWD to another. Normally, this sequencing document will be in outline format. The sequencing document will be approved as directed by the Department Head (Principal Assistant for Aircraft Carriers).

2.3 FORMAL WORK PACKAGE DEVELOPMENT.

2.3.1 Responsibility for Preparation of Formal Work Packages or Controlled Work Packages.

a. For Ship's Force work processes, the FWP or CWP is prepared by the work center responsible for accomplishing the work.

b. For submarines and aircraft carriers, the FWP or CWP is to be prepared by a qualified Maintenance Planner. The FWP or CWP may also be prepared by any member of the work center as long as it is reviewed by a qualified Maintenance Planner in that work center.

c. For FMA work processes, the FWP or CWP is prepared by the appropriate planning division.

2.3.2 Security Classification. Attention must be paid to proper classification, handling, and marking of an FWP. As initially prepared, the FWP itself or as used in a CWP, is frequently unclassified and becomes classified as data is recorded. FWPs for nuclear propulsion plant systems are frequently CONFIDENTIAL, and almost always contain Naval Nuclear Propulsion Information and should be marked and controlled as required by the appropriate NAVSEA, Naval Operations (OPNAV), and Department of Energy Security instructions (e.g., NAVSEAINST 5510.45 Series, OPNAVINST N9210.3, OPNAVINST 5510.11 Series, CG-RN-1).

2.3.3 Formal Work Package Format. The FWP format in this paragraph identifies elements that may be beneficial when writing an FWP. Asterisk (*) elements are required for all FWPs. This format is a general guide and each element may not be required depending on the task being performed.

a. List of References.

b. List of Enclosures.

c. List of Effective Pages (LOEP).

d. General Information.

e. Material. *

f. Responsibilities.

g. Precautions.

h. Budgeted Man-Rem (if required by the Radiation Health Manual).

i. Initial Conditions (plant or system conditions, prerequisites including tagouts). *

j. Procedure. *

k. Test and Inspection. *

l. System Restoration. *

2.3.3.1 Formal Work Package Elements Defined.

a. List of References. All references used must be listed in a manner which will allow positive identification of the references and will state the revision and advance change notice utilized for planning the FWP.

(1) Reference publications such as Component Technical Manuals, Planned Maintenance System Maintenance Requirement Cards, Maintenance Standards, Naval Ships' Technical Manuals, Standardized Class Shipboard Test Procedures, Ship System Manuals, and Reactor Plant Manuals must be the latest revision and advanced change notice when the FWP was prepared.

(2) Ship configuration drawings such as Selected Record Diagrams, piping arrangement drawings, structural drawings, welding and NDT maps, and mapping drawings should be the "As Built" revision as listed within the Ship's Drawing Index (SDI) per reference (s). All Technical Variance Documents (TVDs) contained within the SDI must be reviewed for applicability during the maintenance planning process. While the "as-built" should be used, it would be prudent to review the change summary of the latest revision of the drawing to determine if changes contained within later revisions are applicable for the specific ship work is being planned for.

(3) Component and equipment drawings will typically be the latest revision when the FWP was prepared; however, an earlier revision of the drawing may be applicable based on the currently installed component or equipment. It is incumbent to positively identify the currently installed component or equipment configuration and the scope of work to determine if the latest revision is applicable. The SDI must be used for verification of TVD. Of note, the latest revision of the drawing listed within the SDI may not be accurate and should be validated using the generic (non-SDI) portion of the ATIS system or other applicable drawing index and repository.

b. List of Enclosures. Enclosures are any technical documents which are not readily available to the craftsman and are used to provide information, direct or document work, or direct contingency work. Each enclosure page will contain, as a minimum, the FWP (file) number, enclosure number, and enclosure sheet number for traceability purposes. Enclosures are not required to be listed as references. Examples of enclosures are:

(1) Diagrams, prints or applicable portions of technical manuals.

(2) Necessary QA forms (CWP only).

(3) Contingency repair (predictable event).

c. LOEP. The LOEP is an accounting of every page, including enclosures that make up the FWP. Each time a change or revision adds, modifies, or deletes a page of the FWP, the LOEP sheet must also be revised. Original pages will be marked "-". Subsequent changes or revisions will reflect latest change or revision number.

d. General Information. This section is used to provide useful information, clarifying remarks, and sequencing allowances.

NOTE: NATIONAL ITEM IDENTIFICATION NUMBER (NIIN) MAY BE USED WHENEVER NATIONAL STOCK NUMBER (NSN) IS CALLED FOR, INCLUDING ALL QA FORMS. THE NATIONAL ITEM IDENTIFICATION NUMBER UNIQUELY IDENTIFIES MATERIAL IN SUPPLY SYSTEM AND

IS ADEQUATE FOR OQE PURPOSES.

e. Materials Required (required element). This section is used to list all material, spare parts, and special tools required to accomplish the job. Material listed in this section should be verified on hand prior to starting work. A Job Material List may be attached as a supplement to the Material List. Lead Work Center (LWC) Supervisor or Division Officer may add materials after the FWP is open that does not constitute a revision per paragraph 2.3.7.3 of this chapter using a non-technical pen and ink change. Example of a line in the materials required list or table:

Item Name	Size/Class/Type	Qty	Matl	MIL-SPEC	Level	PC#/ REF	Step/End Use	NSN/ NIIN
Bolt	½ -13UNCx2½	6ea.	Cr-Mo	MIL-S-1222	Level I	12/E	H.3/ASW-504	

NOTE: THE RESPONSIBILITIES SECTION OF THE FWP IS MANDATORY IF MORE THAN ONE REPAIR ACTIVITY IS INVOLVED IN THE WORK.

f. Responsibilities. List the general responsibilities of all involved ship's divisions or FMA Work Centers and tended ship personnel. Examples are:

(1) "38N will establish and maintain freeze seals as specified in the Freeze Seal Agreement."

(2) "51A will provide motor rewind and balancing services."

g. Precautions. List precautions for personnel and equipment protection that are specific to the job. Three examples of precautions are:

(1) Personnel: Hazards (e.g., toxic or explosive mixtures), stressors (e.g., high noise levels, high heat operations), and protective requirements needed to ensure personnel safety.

(2) Equipment: Safeguards, protective equipment, operating restrictions necessary to prevent equipment damage.

(3) Prevention of the loss of cleanliness: Specific precautions to prevent the loss of cleanliness for the task being performed.

h. Budgeted Man-Rem. In this section, establish the Man-Rem estimate for accomplishment of the task. (See reference (s) for submarines.

i. Initial Conditions (required element). This section contains those prerequisites and plant conditions that must be completed prior to commencing the MP. Examples are material certification, job briefings and actions required for safety precautions listed in the Precautions Section.

(1) Prerequisites must be completed prior to starting the MP and include actions necessary to certify the material, conduct briefings and state safeguards taken against hazards identified in the Precautions Section. Production work, other than shop work will not be performed as a prerequisite. Examples of prerequisites:

(a) "EM01 or 38A: Record name plate data from component to be worked.

Verify the FWP is consistent with the name plate data."

(b) "Division Officer, Leading Petty Officer (LPO), Nuclear Repair Officer (NRO), Radiological Control (RADCON) Officer: Conduct a pre-work briefing. Complete attendance sheet provided as Enclosure ( )."

(2) List the initial plant or system conditions required to properly and safely accomplish the work to be done. This should include work boundaries which will be specified by the Ship or FMA depending on the job. The isolation boundaries will be determined and established by the duty officer or tagout authorizing officer prior to authorizing commencement of the maintenance (this includes the isolation valve lineup, power isolation, etc.). The extent of this section will vary depending upon the type of job.

(a) For a Ship's Force job, this section should identify work boundaries and plant or system conditions (e.g., Pressure or Temperature Band, cold iron). The duty officer or tagout authorizing officer will determine and set the isolation boundaries.

(b) For an FMA ship to shop job, this element is not applicable.

(c) For an FMA job on a tended ship, the FMA must determine the work boundaries and identify to the ship any plant conditions that must be maintained during the work. The ship will determine and set the isolation boundaries.

j. Procedure (required element). This section contains the instructions on how to accomplish the work. Concentrate on putting the steps of the job in proper sequence. Don't describe technically how to do a step (unless past experience has shown some of this type of information is required). The following steps describe how to write this section of the FWP:

(1) Outline the various steps necessary to accomplish the work to be done. Whenever there is a need to provide information, or caution the reader, write the word (NOTE or CAUTION) in capital letters followed by a colon and the text of the note or caution in ALL CAPITAL LETTERS. The NOTE or CAUTION is to appear immediately before the step or section it is applicable to. NOTES and CAUTIONS do not perform work, but are used as the first sentence(r) in a work step. Where NOTES and CAUTIONS are used in the same work step, the CAUTION will be specified first.

(a) CAUTIONS should only be used whenever a specific danger to personnel, equipment, or the potential for loss of cleanliness exists.

1 **CAUTION: THE ANTI-SEIZE COMPOUND USED IN THIS STEP IS A HAZARDOUS MATERIAL AND REQUIRES SPLASH PROOF GOGGLES AND RUBBER GLOVES TO BE WORN WHILE HANDLING OPEN CONTAINER OR USING THE MATERIAL.**

2 **CAUTION: ENSURE CLEANLINESS PLUGS ARE STAGED FOR USE PRIOR TO BONNET REMOVAL.**

(b) NOTES should inform the reader about key information, sequence allowance or direct them to additional information.

1 **NOTE: STEPS 8, 9, AND 10 MAY BE PERFORMED IN ANY SEQUENCE.**

2 **NOTE: STEPS 1 THROUGH 4 MAY BE PERFORMED SIMULTANEOUSLY.**

(2) Work Center Designations. This is not mandatory for Ship's Force work if a single Work Center is performing all steps contained in the FWP. Otherwise, each work step of the procedure must have a Work Center (i.e., 31A, EM01, etc.) designated responsible for performing that step. A specific designation (e.g., NRO, Engineering Officer of the Watch, Engineering Duty Officer, LPO or LWC Supervisor, LPO) may be substituted for Work Center designations where appropriate. More than one Work Center Designation may be used where dual responsibilities are needed. Examples of Work Center Designations:

(a) "38A/93B: Perform a final disc-to-seat blue check. Verify that a satisfactory final seat-to-disc blue check has been performed."

(b) "38N: NOTE: SEE FIGURE [1] OF ENCLOSURE (3) FOR CANOPY JOINT INFORMATION AND LOCATION. Fit-up the upper and lower body-to-bonnet canopy joints."

(3) Symbols. These symbols are located in the margin of the FWP and indicate the following:

(a) (R) = Steps requiring verification or inspection as defined in reference (b).

(b) (S) = Steps in an FMA procedure requiring verification by a member of Ship's Force.

(c) (C) = Steps requiring Cleanliness Inspection by craftsman.

(d) (I) = Steps requiring inspection by a QAI or NDT Inspector.

(e) (CI) = Cleanliness Inspection by a Cleanliness Inspector.

(f) (Q) = Critical Quality Control Points (Q-Point).

(g) (V) = Steps requiring verification by a craftsman.

(h) (G) = Government notification required.

(4) Signature Requirements in FWPs and CWPs. Certain steps require positive assurance that the step was actually performed or completed in a prescribed manner. Signatures are also required for assurance of critical requirements, critical measurements, or requirements for OQE. If the step requires completion of a data form (e.g., inspection, NDT record, hydrostatic test data sheet), the signature block must be on the data form, not the procedure step. The following is a list of typical steps or examples requiring signatures:

(a) Steps which require performance of QA checks or NDT that are documented on a QA form in order to provide traceability of signatures. Personnel who sign QA forms or other OQE documents will print their name along with their signature, badge number (where applicable) and date. These types of steps must include a statement of satisfactory compliance adjacent to the signature block in the associated QA form.

(b) Completion of a strength test.

(c) Hull and backup valve blue checks of seat and disc and stack height measurements.

(d) Completion of Controlled Assembly steps.

(5) For nuclear work, Certification Signature Blocks are required where specifically called out in NAVSEA technical documents as defined in Appendix C.

NOTE: WHEN INVOKING A SMS WHEN OTHER THAN A COMPLETE COMPONENT OVERHAUL IS PLANNED, THE SMS MAY BE USED AS A GUIDE. THERE IS NO NEED TO INVOKE THE ENTIRE SMS FOR SPECIFIC REPAIRS: E.G., PUMP MECHANICAL SEAL REPLACEMENT NEED NOT INVOLVE COMPLETE BREAKDOWN AND INSPECTION OF THE PUMP.

(6) Procedure Detail. The procedure should be used to list the various tasks to be performed and the sequence in which they should be accomplished. Notes on proven craftsmanship skill techniques that significantly aid in first-time quality and are not addressed in other reference documents should be included. A well-written procedure is designed for use by trained personnel who have a requisite level of knowledge about their specialty and the work to be performed. A procedure must have sufficient detail to allow a determination of exactly what was done, material used, inspections required, and allow re-certification of the system or component.

(7) Sequencing of Work. As the work package is being prepared, the steps of the job should be placed in a logical and proper sequence. In instances where work can be performed in parallel, identify those steps by use of a sequencing note. For welded and mechanical assemblies, the sequence must ensure inside or backside surfaces receive immediate workmanship checks, required NDT, or other inspections prior to welding other joints or closing of mechanical joints when further welding, or assembly would render the surface inaccessible for testing and inspection.

(8) Q-Points. Work processes, regardless of type (maintenance, training, administrative, etc.), have critical execution points whose proper accomplishment overwhelmingly affects the ultimate first-time quality success of the process. Quality Maintenance Program work processes identify these crucial work process points as Q-Points. These concepts apply to Q-Points:

(a) Q-Points in a work process are typically characterized by requiring high-level skills, proficiency, strong knowledge, working within narrow tolerances, or difficult environmental conditions which mandate close supervision.

(b) Q-Points are determined by the organizational unit (Work Center, division, command, etc.) having cognizance over the specific work process.

(c) Maintenance managers must give strong focus to Q-Points in work scheduling, personnel assignments, and appropriate supervision.

(d) Scheduling a Q-Point to occur late at night, with tired, fatigued personnel or with less than adequate supervision places the successful execution of that Q-Point at a great risk and compromises first-time quality completion of the work process.

(e) Q-Points are annotated in FWPs whether the FWP is used as a stand-alone or as the core of CWP. Not all FWPs will require the use of Q-Points. Q-Points are process control aids and do not require signatures.

k. Tests and Inspections (required element). Only tests that are required to recertify the system or component after the repair work is complete will be listed in the test and inspection section of the FWP. Repair process tests, such as seat leakage tests or joint tightness tests performed in the shop, will be considered part of in process work and will be contained within the procedure section. If the testing results are required for OQE, then the necessary QA forms will be enclosures to the FWP.

(1) Ship to shop work and FMA work on board tended units. For FMA work on tended units where components are removed from the ship and repaired in the shop and or repaired on board the tended unit:

(a) All testing and inspections that can be performed in the shop will be performed in the shop by the FMA. The FMA will write and conduct all shop tests and inspections. Nondestructive testing is not an inspection. It is a test per the Part I, Foreword of this Volume.

(b) The FMA will provide the tended unit with all required testing and inspection requirements and QA forms for the shipboard testing needed to certify the work performed by the FMA. The FMA work package will specify the joints or components that require testing and the type of test(s) required that the tended unit must perform. The tended unit will review the test requirements and is responsible for writing the test FWP and conducting the test(s). The original completed test documents will be provided to the FMA for inclusion in their work package (FWP or CWP) for re-certification.

(c) The original completed test documents provided to the FMA will be reviewed by the FMA QAI or QAS for completeness, accuracy and will validate the test result satisfy the certification attributes or attributes required to certify the maintenance or repairs performed by the FMA.

(2) Careful planning and review prior to beginning work is needed to ensure all tests and inspections are identified before starting work. Various TWDs include tests and inspections required. Further guidance is also provided in Volume IV, Chapter 9 (System Test Check List) and Volume IV, Chapter 18 (Distressed Submarine and Salvage Inspection) of this manual, and should be consulted when preparing and performing this section for the FWP.

(3) The range, serial numbers and calibration due date of any calibrated measuring and test equipment used for conducting the test must be documented on the QA form.

l. System Restoration (required element). This section contains those steps necessary to restore the system to normal operating status. If the FWP resulted in an approved change to the equipment or component configuration (such as the performance of an approved Alteration and Improvement), this section must direct the ship to submit a Ship's Configuration Change Report (OPNAV 4790/CK) and a Fleet COSAL Feedback Report (NAVSUP 1371) to ensure accurate configuration accounting and technical or supply support are maintained. Ensure the requirements contained within Part I Chapter 8 of this volume are followed if the FWP resulted in an unapproved change to the equipment or component configuration.

m. (Submarines only) Ship's Force test FWPs for non-shipyard associated FMAs nuclear work will be provided to the Immediate Superior In Command (ISIC) for review.

2.3.3.2 Use and Transcribing of Source Documents. Retyping or scanning extensive step-by-step procedures from source documents into FWPs is discouraged. Ideally, the procedure should reference the source document. A reproduced copy of the appropriate section may be included in the work package as an Enclosure. If the source document steps are not lengthy, they may be written directly into the procedure. When work is per a referenced procedure or enclosure, specify the precise steps of the reference or enclosure that are to be performed. The applicable portion of an enclosure to be used by the craftsman must be marked or highlighted and portions not used will be marked out.

2.3.4 Formal Work Package Approval.

a. FWPs developed for a job are routed and approved prior to the performance of the work. The appropriate work authorization and reference material, (including QA documents for CWPs), to conduct the FWP must accompany this routing.

b. Review of the FWP by the Chemical RADCON Assistant or Quality Assurance Officer (QAO) may be appropriate.

c. For FMAs, the FWP is reviewed by the Planning Officer, LWC and Assist Work Centers. The FWP can be approved by the Repair Officer as the standard FWP for that work process.

d. Approval signatures are made on the FWP approval sheet (see Appendix D). Signature blocks not required will be marked NA. Signature blocks that are signed will be accompanied by a legible printed name and date.

e. For Ship's Force standardized FWPs the LPO or LWC supervisor must verify that all references are current. For FMA Standardized FWPs the Planning Officer must

perform the verification. If changes are required, the FWP must be revised and routed for approval.

f. For FWPs that are part of a CWP, see CWP approval matrix, Appendix E.

g. QAO will review all FWPs for components or systems assembled as a controlled assembly and performed as a REC or MCR exception. REC or MCR exceptions will be tracked using the REC or MCR Exception Controlled Assembly Log QA form 11A located in part I, chapter 11 of this volume.

2.3.5 Controlled Work Package Approval. When the FWP has been prepared, the following actions are required to prepare and approve the CWP:

a. For controlled (i.e., Level I, Nuclear, Scope of Certification, SFCC) or SUBSAFE work to be performed by Ship's Force only, the ship's QAO will issue the CWP or REC numbers sequentially for entry in Block 4 of the ship's QA form 9. For controlled or SUBSAFE work performed by the repair activity on, or for a tended ship, the ship's QAO will issue CWP or REC numbers sequentially to the repair activity for entry in Block 4 of the repair activity's QA form 9. For controlled or SUBSAFE work to be performed by the repair activity only (in repair activity shops and the repair activity does no work onboard the ship, examples include ship to shop work; rotatable pool assets), the repair activity's QAO will issue the CWP or REC numbers sequentially for entry in Block 4 of the repair activity's QA form 9. The format of the CWP or REC serial numbers will be the serial number followed by the year (e.g., 1-90, 123-01).

b. An MCR/REC (QA form 9) will be prepared by the planner or CWP preparer. A QA form 10 may be required as a supplement to the QA form 9.

c. CWP approval is per Appendix E.

2.3.6 Formal Work Package In Process Use. The FWP or TWD will be at the job site during the performance of work. For multiple work sites, the FWP may be copied but all signatures and data will be recorded on the original or master FWP.

2.3.7 Formal Work Package Changes.

2.3.7.1 Pen and Ink Changes. Pen and ink changes to an FWP may be made for minor administrative changes that do not change the scope or intent of the FWP. Changes of this nature include additions or deletions of a Work Center assigned to a step, typographical or editorial errors, amplifying additional information to clarify a step, or a change in the sequence of steps.

a. Pen and ink changes to an FWP will be made with the approval of the LPO or LWC Supervisor or Division Officer responsible for the affected step in the FWP.

b. Pen and ink changes to the QA forms in a CWP must be made with the approval of QAO, QAS or QAI. Examples are: Additions or deletions of Work Centers assigned on a QA form, correction of typographical or editorial errors on a QA form, addition of information to clarify a QA form.

c. Pen and ink changes must be accomplished by drawing a single line through the portion to be changed, and entering the necessary change adjacent to that portion. The person making the change will initial, date, and print the name of the approving

authority for the change. If the change is per verbal direction, the name or title of the person authorizing the change will be annotated (per telcon with Division Officer, Repair Officer, etc.).

d. Technical pen and ink changes are used to correct a technical error and must be approved by the department head. The same process will be used as in a non-technical pen and ink change except that it is documented in the "instructions for entering revision" area of the FWP revision sheet.

e. When an error is made in the data recorded on a QA form (e.g., Craftsman records the wrong NSN), it will be corrected by the craftsman or individual who created the error by drawing a single line through the error, recording the correct entry, initialing, dating and printing the name of the person making the correction. A counter signature by a QAI, QAS or QAO is not required unless the correction is made after a QAI or QAS or QAO has signed the QA form.

2.3.7.2 Rework Addendum. Rework is the unplanned repetition of a step, or a series of steps in a CWP or FWP. A rework addendum specifies which steps must be repeated in a CWP or FWP and may be used in lieu of a revision when rework is required and the scope of the original work will not be changed. Any additional actions that were not included in the originally approved CWP or FWP constitute a change in scope or work boundaries and must be issued as a revision to the CWP or FWP. All rework must be documented.

a. The craftsman doing the work must stop the work and notify the LPO or Work Center Supervisor (WCS) that rework is required.

b. Clear directions on which steps are to be repeated must be provided. Reproducing QA forms may be required. All original and rework QA forms will be retained with the CWP. In addition to the page numbering format used in the TWD, documents and QA forms reproduced to perform rework will be annotated with the term "REWORK" and associated numbering or lettering used in the LOEP at the top of the documents or form(s) (for example - REWORK A, or REWORK 1.1).

c. An updated LOEP is required when rework requires additional QA forms.

d. A rework addendum is approved by the Division Officer (for CWPs, concurrence is obtained from the Production Officer or QA Officer).

e. When rework is identified following signing blocks 17 and 18 of the QA-9, new signature and date blocks for blocks 17 and 18 must be documented on QA form 10.

2.3.7.3 Revisions. Revisions are any change to a CWP, FWP or TWD that meets the criteria listed in this paragraph. Revisions require formal review and approval.

a. Reasons requiring a revision to a FWP or TWD:

(1) Scope of the work changes (e.g., replace software changed to machine the valve).

(2) Boundary of the work changes (e.g., change location of or additional disconnected joints).

(3) Change in test requirements unless authorized by a Departure from Specification.

(4) Any change in material requirements, which result in a change in testing requirements.

(a) The LWC Division Officer or LWC Planner may add materials after the FWP is open that do not change testing requirements.

(b) For FWPs executed as a part of the CWP, the QAO or QAS will concur with the addition of material. Concurrence will be by initialing the new line item.

(c) At job completion the material list must accurately reflect new materials installed in the system or component.

(5) If RADCON is insufficient for the work, based on actual conditions at the worksite, and to change the type of contamination enclosure specified for the work (e.g., to use a drape in lieu of glove bag as specified in the FWP).

(6) MCR/REC form must be revised.

b. Steps for making a revision to a CWP, FWP or TWD:

(1) Work must stop immediately and the LPO or WCS must be notified when the need for a revision is identified.

(2) The revision is then initiated.

(a) For Surface Force Ships, an FWP revision is initiated by the originating Work Center and reviewed by the Division Officer responsible for the work associated with the revision.

(b) For submarines and aircraft carriers, an FWP revision is initiated by the originating Work Center Maintenance Planner and reviewed by the Division Officer responsible for the work associated with the revision.

(c) For Surface Force Ships, a CWP revision is initiated by the LWC and approved per the requirements of Appendix E of this chapter.

(d) For submarines and aircraft carriers, a CWP revision is initiated by the LWC Maintenance Planner and approved per the requirements of Appendix E of this chapter.

(3) A revision is normally made by page substitution. Revisions must be lettered consecutively starting with "A" with the revision letter entered on all affected sheets of the FWP. Revised portions of the FWP must be marked with a vertical line and the revision letter in the margin. New or replacement sheets may be added by labeling the added sheet with the number of the preceding page and a sub-letter (e.g., Page 5A of 15). Superseded pages (without signatures or recorded data) must be retained until the FWP is closed out.

(4) A cover sheet for the revision is attached. The FWP revision sheets will be placed on top of the previous cover sheet with the most current cover sheet on top.

(5) Routing and authorization of the FWP or TWD is performed.

(a) The revised FWP or TWD must be routed only to and reviewed by the divisions affected by the revision process.

(b) For an FWP concurrence with the revision is obtained from the Department Head prior to executing the revision. A revision, as a minimum, must be approved by the same level of personnel who approved the original FWP.

(c) CWP revisions must be approved by the QAO and officer(s) who approved the original (e.g., Repair Officer, Department Head and Commanding Officer).

c. Other guidance on making revisions to an FWP or TWD.

(1) Revisions to issued FWPs may include non-technical modifications (e.g., lineouts). In addition, the following instructions are those permitted to be made in the Instructions for Entering Revisions area of Appendix D.

(a) Remove: Physically take out the page(s) as specified in the change instruction.

(b) Replace: Physically take out the page(s) specified in the change instruction. Put the replacement page(s) provided by the revision in place of the removed page(s) as specified.

(c) Insert: Physically insert the page(s) specified in the change instruction into the FWP as specified.

(2) A revision will not remove pages with or QA forms from the CWP, FWP or TWD with signatures or recorded data. The portion not yet complete on pages with signatures or data, including QA forms, will be lined out.

(3) Each activity affected will ensure that revisions are made and accounted for in an exact manner. The following intent will be adhered to regarding the revision process:

(a) All revisions will be entered into the body of the original FWP or will be added as an enclosure or attachment to the original FWP.

(b) Revisions must be numbered such that accountability is maintained.

(c) The LOEP will be modified each time a change is made.

2.3.7.4 Attachment. If additional work must be added to the FWP and it is relatively extensive but does not require a change in plant conditions or work boundary, it can be accomplished by using an attachment to the FWP. In this case, the attachment would be written and added to the FWP after the enclosures using the revision process (at a minimum, as a technical pen and ink change). This page would have an additional step that directs performance of the attachment. It would also indicate work sequence, for example whether the attachment would be worked in series or parallel with original FWP work. The composition of an attachment is identical to an addendum except it is prepared after the FWP is issued based on an unexpected problem.

Example: Upon disassembly of a valve, it is determined the back seat of the bonnet must be repaired. This repair could be accomplished by attachment.

2.3.7.5 Supplement. Where additional work is required that is similar to or greater in scope to that on the original FWP or involves changes in plant conditions, testing, or major support equipment changes, a supplement could be used. A supplement is another stand-alone FWP containing detailed instructions to perform the additional work. A supplement will comply with the requirements of paragraph 2.2.3 of this chapter. The original FWP should indicate the additional work accomplished in the supplement, if required, to make the original FWP continue to stand alone.

Example: Recovery from loss of cleanliness where work boundaries are increased, additional components opened to obtain flush paths, etc. The original FWP would direct work to the supplemental FWP for recovery and then direct resumption of work per the original FWP. Once cleanliness is reestablished, the original work would continue. In this case, it is necessary to indicate satisfactory completion of the supplement, so that it is clear the condition is corrected.

2.3.7.6 Voiding. There are times during the performance of an FWP where events occur that render the rest of the FWP unnecessary. In this case, a revision would be issued to the FWP providing instructions such as directing work to a new FWP and would void the remainder of the original FWP. For a CWP traceability will be provided to the replacement REC. The document being voided must maintain traceability to the new activity's repair procedure when RECs are being transferred to another activity. Voided CWPs must retain traceability or continuity to the follow-on procedure.

Example: During the repair of a valve, defects are discovered that cannot be repaired, requiring the valve to be replaced instead of repaired as originally intended. Once it is determined the repair is no longer necessary, the repair instructions would be voided.

2.3.7.7 Formal Work Package Closeout. FWPs are reviewed and approved for closing by the LPO or LWC supervisor and designated assist LPO or WCSs for satisfactory completion. Signatures will be accompanied by a legibly printed name and date. The closeout review verifies these attributes:

a. Maintenance was completed as specified in the FWP.

b. Required signatures were made and names printed.

c. Cleanliness requirements were satisfactorily met.

d. Correct materials were used.

e. Post-maintenance testing was properly completed.

f. Equipment and systems were restored to normal conditions and configurations.

g. Data was recorded properly and within specifications.

2.3.7.7.1 Completed Formal Work Packages. FWPs executed as stand-alone documents are not required to be retained following:

a. Completion of the availability in which the work was performed.

b. Completion of closeout reviews as required by paragraph 2.3.7.7.

c. Recording of all required data (e.g., Material History).

2.3.7.8 Controlled Work Package Closeout. Upon completion of the maintenance task, each of the cognizant work centers and the QAO will perform a comprehensive review of CWP documentation for correctness and completeness. Once a satisfactory review is completed, CWPs will be closed out subject to the following guidance:

NOTE PROPULSION PLANT OR AT-SEA OPERATIONS MAY BE LEFT OPEN WITH THE DEPARTMENT HEAD AND COMMANDING OFFICER'S CONCURRENCE.

a. CWPs required to support reactor plant or propulsion plant startup (including critical heat up), equipment startup or ship's underway will normally be closed prior to the event with the following exceptions:

(1) CWPs for spare equipment.

(2) equipment requiring reactor plant or propulsion plant operations to test.

(3) equipment requiring retest at sea or for equipment not required for reactor plant.

b. Additional guidance for Nuclear CWPs performed by maintenance activities which require critical heat up or critical operations to accomplish system or component retest:

(1) Prior to reactor plant or propulsion plant startup or ship's underway, any activities performing controlled maintenance on the ship will provide the status of maintenance to the ship (ISIC for submarines).

(2) When critical operations or at sea testing is required to complete the task the following procedures will be used:

(a) The testing must be required by an approved NAVSEA procedure (e.g., Maintenance and Replacement Instruction).

(b) All open CWPs will be logged and tracked in the CWP REC log.

1 All deferred (follow-on) actions will be annotated in the CWP REC Log of the tended ship.

2 The CWP must include documented transfer of responsibility for accomplishment of deferred actions from the FMA to the tended ship and must be signed by the Commanding Officer, Reactor Officer or Engineer Officer of the tended ship.

3 The closeout review of the CWP will verify that the required documentation is contained in the CWP for all deferred actions.

d. In the event a CWP is prepared, the job is planned to be accomplished, but for some reason the job is cancelled or deferred the following actions should be taken:

(1) If work was authorized to start, the CWP must be revised to reflect that no work was accomplished and then administratively closed. The QA form 11 log will be annotated to show that the job was "Cancelled".

(2) If work was not authorized to start, and the job was cancelled, annotate the remaining blocks of the QA form 9 with "N/A" and note that the CWP was cancelled and no work was accomplished. Blocks 20 (and 21 if the CWP has an REC) will be signed to formally cancel the CWP. If the CWP was prepared by a Repair Facility, a copy of the QA form 9 will be provided to the Tended unit. If a Certification Continuity Letter is required, the cancelled CWP must be provided with the Certification Continuity Letter. The QA form 11 log will be annotated to show that the job was "Cancelled".

(3) If work was not authorized to start and the job is deferred to a future maintenance period, the CWP is not required to be cancelled. The QA form 11 log will be annotated as "Deferred". This is not considered to be an open CWP REC.

e. There are no retention requirements for a CWP if work was not authorized to start and the job was cancelled.

f. The closed CWP will be retained by the QAO per Part I, Chapter 10 of this volume.

2.3.7.9 Emergent Controlled Work. On those occasions when a component fails and the normal practice of processing a CWP would preclude meeting the ship's operational commitment, work may begin without formal approval of the CWP, provided the concurrence of the FMA Repair Officer (if an FMA is involved), and the ship's Commanding Officer and ISIC (if an FMA is involved) is obtained. The following is required:

a. The MCR REC must be properly approved and, to the maximum extent possible, a CWP will be prepared prior to commencement of work.

b. The task must be continuously monitored and all actions taken recorded by:

(1) QAS, if an FMA is involved or

(2) Ship's Work Center LPO and a QAI, if the LPO is not a qualified QAI.

c. All OQE must be completed and inspected as required by Part I, Chapter 5 of this volume.

d. All records must be reviewed and verified complete and correct.

e. Departure from Specification will be processed per Part I, Chapter 8 of this volume for any specifications not met during the repair.

2.3.7.10 Standardized Formal Work Package.

a. FWPs, which have been performed and proven, may be retained on file to lessen the effort in preparing for a future task of a similar nature.

b. Standardized FWPs can be used to accomplish the same maintenance task without routing for approval provided the LPO or LWC supervisor and Planning Officer (if assigned) verify that no changes to the reference documents have been issued since initial approval. When initially routed for approval as a standardized FWP, the RADCON OFFICER or Chemistry and Radiological Controls Assistant (CRA) will determine the need for evaluating RADCON for future maintenance actions. If the RADCON OFFICER or CRA determined it is necessary to evaluate RADCON for

each future maintenance action the RADCON OFFICER or CRA will check "YES" in CHOP FOR FURTHER USE. When "YES" is checked RADCON personnel are required to review the standardized FWP prior to each instance of use to verify RADCON controls in the standardized FWP are appropriate for the work. If the RADCON OFFICER or CRA determined it is not necessary to evaluate RADCON for each future maintenance action the RADCON OFFICER or CRA will check "NO" in CHOP FOR FURTHER USE? When "NO" is checked no additional RADCON review is required prior to use of the standardized procedure. If the LPO or LWC supervisor or RADCON personnel (when required) determine the FWP requires a change, it must be routed for approval as a revision to the FWP.

c. Standardized FWPs developed by FMAs may be used by Ship's Force. Implementation requires Division Officer recommendation and Department Head approval.

d. Standardized FWPs developed by an FMA may be used at any FMA. Implementation requires Planning Officer recommendation and Department Head approval.

e. Use of standardized FWPs requires a system to ensure the FWP is current.

(1) Maintain a master listing of standardized FWPs by name and revision number.

(2) Once approved as a standard FWP the cover sheet will be removed, the FWP will be annotated as the master copy, and retained on file.

(3) A copy of the approved master cover sheet will be attached to the standard FWP when work is in progress.

(4) All revision cover sheets will be retained with the previous master cover sheet.

2.3.7.11 Lost Controlled Work Packages Following Controlled Work Package Approval.

a. Formally inform the ISIC and Type Commander.

b. Conduct a formal critique for CWPs approved or opened and not closed, and provide a copy to the ISIC and Type Commander.

c. Initiate corrective action using a QA form 14.

2.4 TROUBLESHOOTING.

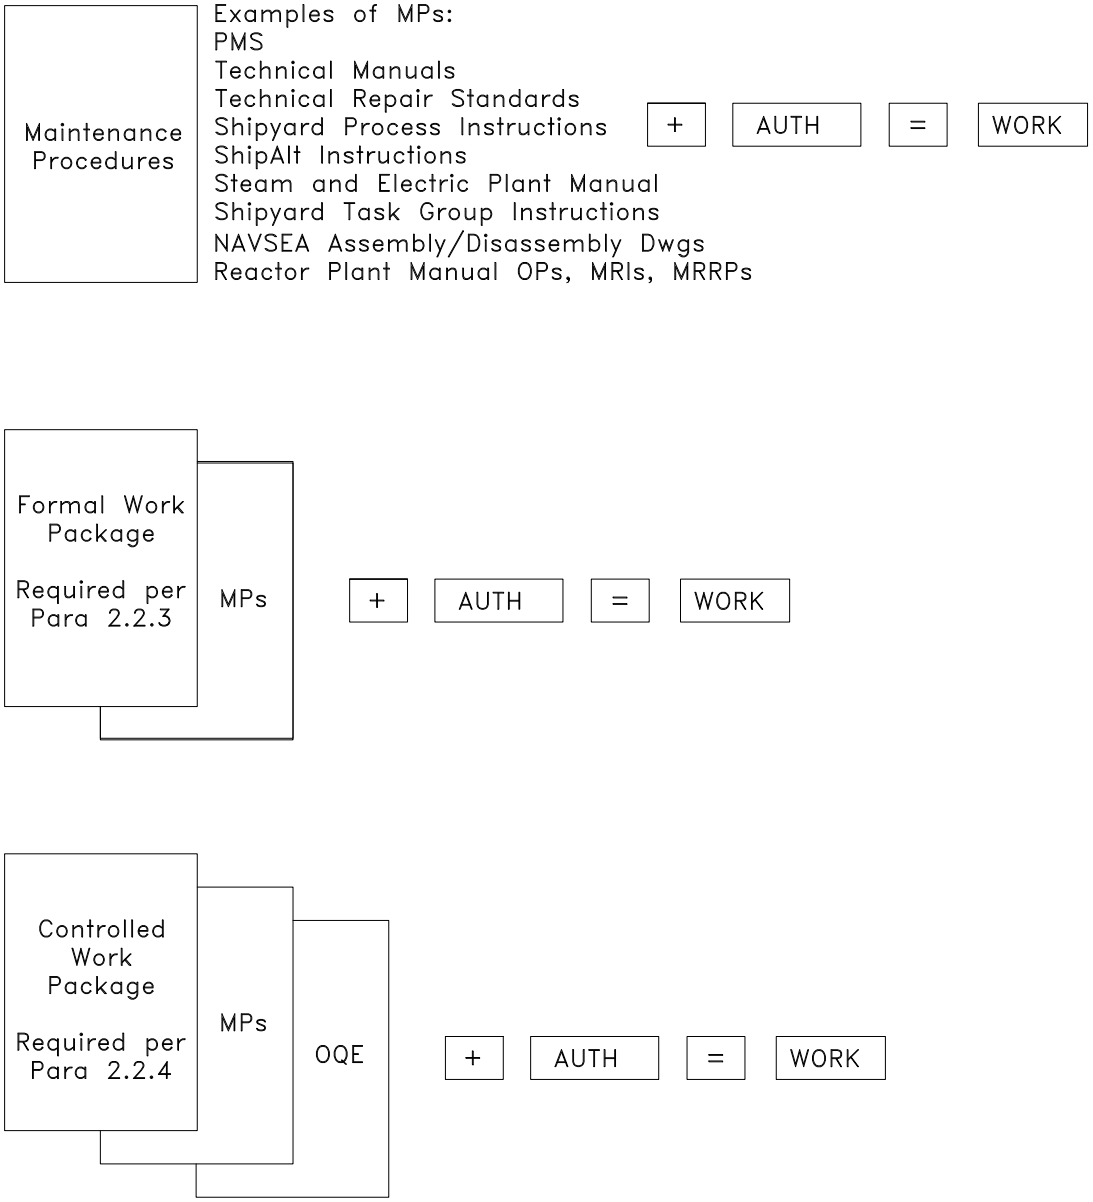
a. Troubleshooting a system which is being operated following the normal ship's operating procedures in normal operation in response to a request for on-site Fleet Technical Assistance does not require an FWP provided the troubleshooting is non-obtrusive (i.e., visual inspection or observations only) and intended to evaluate the nature of the reported problem. Any manipulation of the system outside normal operating conditions requires an FWP.

b. Troubleshooting equipment normally controlled by using an FWP or TWD, whether done by Ship's Force or by an outside activity, can seldom be precisely defined at the start of corrective maintenance. An FWP for troubleshooting must include well-defined initial conditions, boundaries and stop points within which troubleshooting can be accomplished. Detailed procedural steps are not required. Troubleshooting procedure may require some form of trial and error process of elimination. In order to

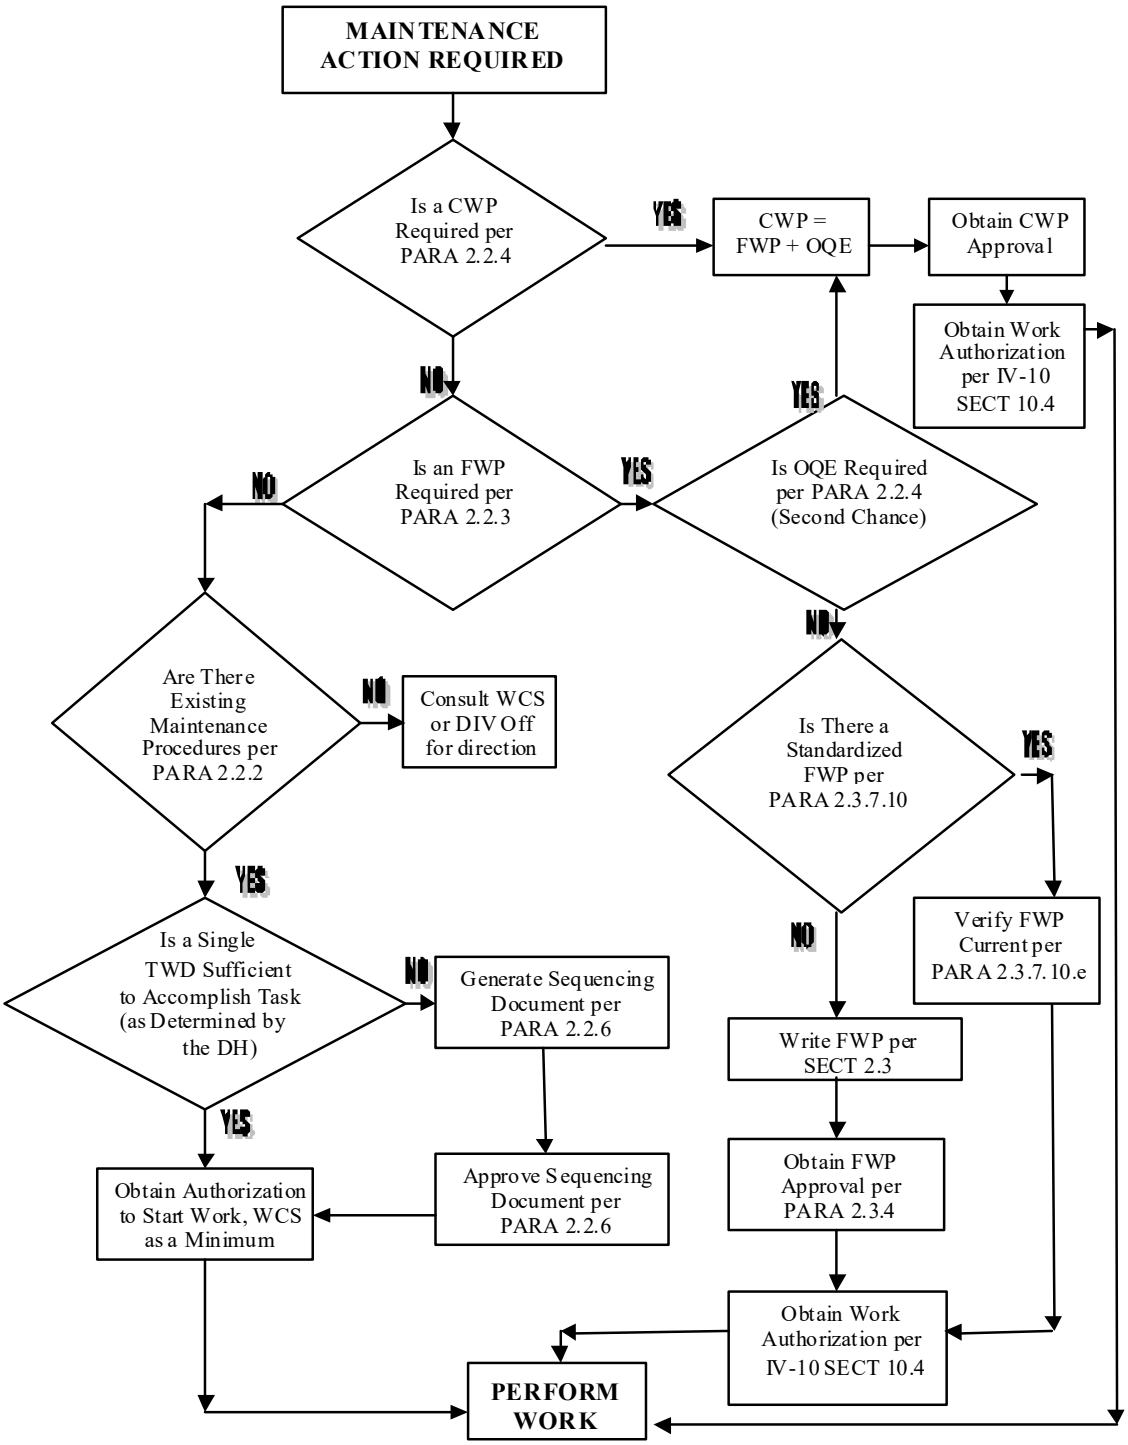
determine the proper tests following troubleshooting, a record of actions performed must be kept. Once the problem is identified, the FWP must be revised to properly repair and test the affected equipment.

APPENDIX A

TECHNICAL WORK DOCUMENT ILLUSTRATION



APPENDIX B
WORK PACKAGE DECISION PROCESS



APPENDIX C

CERTIFICATION SIGNATURE REQUIREMENTS FOR REACTOR PLANT, NUCLEAR SUPPORT FACILITY AND CONTROLLED INDUSTRIAL FACILITY WORK

1. General Requirements. This appendix lists the instances when a signature is required to certify data or accomplishment of maintenance items. All attributes will be certified by verification or inspection. Appendix C is meant to be comprehensive. However, there could be a maintenance item performed by forces afloat and not listed in this appendix where a NAVSEA document requires a verification with a certification signature; in that event, the certification signature requirement should be met following the NAVSEA document.

   a. Certification signatures in Nuclear Controlled Work Packages, required by this chapter, that record OQE must be documented on QA forms and kept as required by references (t) and (u), as applicable. Certification signatures listed in this appendix, which are not required to be documented on QA Forms, are not OQE and have no specific retention requirement.

   b. Items that require inspection or verification documented in TWDs other than a CWP will require a certification signature only and are not OQE. Therefore, they do not need to be kept after the maintenance is complete and accepted.

   c. Where it is convenient to use a locally generated form to accomplish specific certifications, the CWP must refer to the form and the signatures will be on the form. These forms need not be kept unless a record is required.

   d. Indicate the individual responsible for performing the certification and the specific attributes being certified at the signature block.

   e. Certification signature statements must be referenced on each page, or in the General Information element of the associated locally prepared TWD, where a certification signature is required using references (t) and (u), as applicable, for reactor plant and Nuclear Support Facility maintenance respectively:

      (1) "Direct report from watch standers" may be deleted from the second (**) Certification Signature Block statement for work where such an option would not be applicable.

      (2) Single asterisk (*) or double asterisk (**) must be used at each Certification Signature Block to indicate the type of certification that is expected.

2. Specific Requirements.

   a. Cleanliness. Nuclear propulsion plant cleanliness, foreign material, and detrimental material control must be according to Table 2.4-6.1 of reference (v). Cleanliness certification signatures are not required to be documented on QA Forms.

      (1) Reactor Plant:

         (a) Inspection following entry into clean hardware where dirt producing (e.g., machining or grinding) or potentially dirt producing operations

(e.g., clean cuts of pipes) are used.

(b) Inspection prior to final closure of each opening in clean hardware where the closure will prevent visual access to surfaces which contact system fluid.

(c) Inspection during any operation in which a loss of cleanliness could occur that is not easily detected and corrected.

(d) Inspection for re-verification of hardware cleanliness per section 2.6 of reference (v).

(e) Final inspection following fabrication of hardware or dirt producing modification to hardware.

(f) After removal of a controlled product as defined in reference (w) for internal surfaces of installed hardware and internal surfaces of hardware that contains crevices and inaccessible areas. (Applicable to shipyards and Nuclear Regional Maintenance Departments only.)

(g) Following the cleaning of internal surfaces when crevices or inaccessible areas are exposed.

(h) During assembly or disassembly of joints with thread sealant downstream of cleanliness filters to verify there is no visible thread sealant on internal surfaces following assembly.

(i) Following dirt-producing modification to hardware with crevices and inaccessible areas.

(j) The following require certification by a craftsman qualified to perform the verifications and will be documented by the craftsman by signing a certification signature. An independent inspection is not required.

1 Verification of cleanliness following entry into clean hardware, except entry that is dirt producing (e.g., machining, grinding) or potentially dirt producing (e.g., clean cuts of pipe).

2 Verification of cleanliness prior to and during assembly (including assembly that creates crevices).

3 Verification of cleanliness prior to thermal treatment.

4 Verification of cleanliness after any test that uses soft metal probes or tips; for example, alloy identity testing.

5 Verification of cleanliness following cleaning except when performed for paragraphs (a) through (c) of this paragraph or when crevices or inaccessible areas are exposed.

6 Verification of cleanliness following tape removal.

7 Verification of cleanliness prior to closure of support system openings and connection of a clean support system to clean hardware.

8 Verification of final review of the accountability log.

9 Verification of cleanliness prior to installation of support equipment to any vent and drain valve, other than a pressurized discharge.

10 Verification of final cleanliness of cleanliness plugs provided the plugs are assembled from clean parts or sub-assemblies without crevices or inaccessible areas and if the assembly occurs in a clean room or clean area.

(2) Steam Plant. Verification of cleanliness whenever cleanliness has been lost.

b. Welding and Brazing. The following signature requirements apply:

(1) Inspections where records are required by reference (x) with the exception of in-process visual inspections, which may be verifications. These inspections will be documented on QA forms.

(2) Inspections where records are required by reference (y) with the exception of in-process visual inspections, which may be verifications. Inspection that gaskets, O-rings, or seals are either removed or scored as required before welding, so that they no longer function as a seal. These inspections will be documented on QA forms.

(3) Inspections for parameters or data where records are required by sections of reference (x) involving welding, with the exception of in-process visual inspections, which may be verifications. This information will be documented on QA forms.

(4) Inspections, where records are required, associated with reactor plant welds on piping systems and on components which are nuclear Level I or non-level piping system applications when welds are qualified, performed and inspected according to NAVSEA Nuclear Propulsion Directorate (08) documents other than those included in paragraphs 2.b.(1), (2) and (3) of this paragraph, with the exception of in-process visual inspections, which may be verifications. These inspections will be documented on QA forms.

(5) Inspections required by reference (j) for class P-3a brazed joints in nuclear Level I piping systems, where records are required. These inspections will be documented on QA forms.

(6) Verification that proper purge path is established before welding, both inlet and exit.

c. Shielding. Inspections to verify the proper replacement of permanent shielding according to reference (b) or (z), as applicable.

d. Mechanical Joint Assembly.

(1) Verification of the following applicable attributes is required if maintenance is accomplished using a FWP or CWP.

(a) Joint identification.

(b) Condition of flange faces, O-ring grooves, and other sealing surfaces.

(c) Joint alignment.

(d) Installation of O-rings or gaskets.

(e) Lubrication of fasteners.

(f) Thread engagement and standout.

(g) Final torque on fasteners.

(h) Gasket compression and flange parallelism.

(2) For joints in Nuclear Level I systems, inspection of the following applicable attributes is required whether the maintenance is accomplished by a CWP or FWP.

(a) Final torque on fasteners when a torque is specified.

(b) Gasket compression and flange parallelism. (Gap measurement is only required when mating surfaces are not in contact).

e. Pipe Bending. For pipe bending according to reference (aa), the following signature requirements apply:

(1) Inspection (NDT) of bent pipe. These inspections will be documented on QA forms.

(2) Visual inspections of bent pipe.

f. Freeze Seal Operations. For freeze sealing according to reference (ab) the following signature requirements apply:

(1) Verification of dimensional measurements before and after freeze seal operations.

(2) Verification that the variation between before and after dimensional measurements does not exceed the allowed tolerance.

(3) Verification that the freeze seal is established.

g. Hydrostatic Testing. The following signature requirements apply: Inspections required during hydrostatic testing according to reference (g) and the applicable reactor plant manual. The results of these inspections will be documented on QA forms.

h. Locking devices. The following signature requirements apply:

(1) Internal locking devices. The proper installation of locking devices inside the pressure boundary of components containing primary coolant and all locking devices (internal and external) associated with reactor vessels, closure heads, and control rod drive mechanisms must be confirmed by inspection. The results of such inspection, including dimensions and clearances measured to confirm proper installation, will be documented on QA forms.

(2) Verification of the proper installation of other reactor plant component locking devices. This verification is by the craftsman unless the component drawing requires an inspector to perform the check.

i. Valve Repair. The following signature requirements apply:

(1) Inspection of the final measurement of the bellows restraint gap "x-dimension" of pilot actuated relief valves where required by applicable technical manuals.

(2) Verification of the final blue check of the disc-to-seat.

j. Valve Testing. The following signature requirements apply to inspection during post installation testing and periodic testing of primary, steam generator, and charging pump relief valves:

(1) Proper blocking (gagging) and subsequent return to normal service.

(2) Locking devices, if required, on manual lift mechanism, locked.

(3) Manual lift mechanism removed, if so designed, after testing.

k. Miscellaneous. The following signature requirements apply:

(1) Inspections required before, during, or after repair to remove surface discontinuities according to reference (u), (ac) or (ad), as applicable. Document these inspections on QA forms.

(2) Inspections required on reactor plant air flasks according to reference (ae).

(3) Inspections required for determining reactor plant material acceptability according to the specifications requirements when the inspections specify reference (af) or reference (ag).

(4) Inspection of penetrations in tanks to ensure all temporary plugs have been removed and the penetrations are free from obstruction, if maintenance has been performed in the tank.

(5) Inspections required by Article 114 of reference (z) or Appendix D of reference (b), as applicable.

(6) Verification of removal of installed temporary reactor plant support equipment.

(7) Verification of satisfactory completion of reactor compartment closure tests including tests on individual penetrations.

(8) Verification of the Reactor Plant Work Accomplishment Report by designated officers.

Notes:

1. R = Review (May require signature on FWP Cover Sheet, QA-9, or both),
   A = Approve (Approval Signified by signature on FWP Cover Sheet, QA Form 9, or both),
   S = Acknowledgement signature noting that the REC or CWP has been opened **or** closed by the approving authority. For opening, this signature also grants permission for work to be conducted. Review or Approval signifies the following:
   - The FWP is correct both in sequence and requirements to satisfactorily accomplish the maintenance.
   - The CWP provides the correct technical specifications or requirements (e.g., torque values, dimensions, NDT inspections, cleanliness requirements, critical inspections, recertification tests) for certification attributes on the appropriate QA form.

2. For FWPs previously approved by the Department Head, the FWP may be authorized and issued as a standardized FWP per paragraph 2.3.7.10 of this chapter.
3. (Nuclear aircraft carriers only) The Reactor Officer will sign.
4. For items requiring Department Head approval the following signature requirements must apply:
   FMA - Repair Officer (unless formally delegated for Other and LI)
   SF - Cognizant Department Head (Principal Assistant for aircraft carriers)
5. Entries are to be signed by the Ship's Engineer only.
6. (Submarines only) ISIC Material Officer will review SF CWPs for retesting FMA accomplished nuclear work.
7. This block is not applicable for FMA only MCR RECs.
8. Accomplished by WC Supervisor.
9. Nuclear Repair Officer if assigned.
10. Applicable to Fleet I-Level activities only. Does not apply to I-Level activities controlled by Naval Shipyards.
11. QAO will review opening and closing of all FWPs for components or systems assembled and performed as a REC MCR exception.
12. (Submarines only) This signature is REQUIRED to complete certification of Re-Entry into SUBSAFE, Scope of Certification and Fly-by-Wire systems and components.

LISTING OF APPENDICES.

A NAVEDTRA 43523 Qualification Matrix
B Outlines of Typically Effective Training Topics
C Recommended Training Topics for Selected Positions

3.1 PURPOSE. To define the requirements and guidance necessary to establish a standard qualification and training program for personnel who plan, perform, inspect or supervise the maintenance tasks listed in part I, chapter 2, of this volume.

3.2 GENERAL. Personnel who screen, plan, perform, inspect and supervise the maintenance performed to the following requirements must be trained and qualified per this volume and reference (a).

a. Maintenance requiring a Technical Work Document per part I, chapter 2, paragraph 2.2.1 of this volume.

b. Maintenance listed as Material Certification Record (MCR) exceptions per part I, chapter 2, of this volume.

c. Maintenance listed as Re-Entry Control (REC) exceptions per part I, chapter 5, of this volume.

NOTE: A CONTINUING TRAINING AND QUALIFICATION PROGRAM IS ESSENTIAL FOR ALL MAINTENANCE PERSONNEL TO ACHIEVE A MAINTENANCE PROGRAM WITH HIGH STANDARDS OF QUALITY. PERSONNEL INVOLVED IN THE APPROVAL, SUPERVISION, PLANNING OR PERFORMANCE OF SHIPBOARD MAINTENANCE WILL BE PARTICIPANTS IN THE TRAINING AND QUALIFICATIONS ASSOCIATED WITH THIS VOLUME.

3.3 QUALIFICATION. Qualification procedures established herein must be formal, and designed to heighten awareness of those tasked with the responsibility of administering, managing and executing the Fleet Quality Maintenance (QM) program.

a. Each organization must maintain a personnel qualification list per part I, chapter 10, of this volume.

b. Each organization must maintain a list of personnel authorized to sign off portions of reference (a).

c. Maintenance personnel must be qualified through completion of formal qualification programs (e.g., Job Qualification Requirements or Personnel Qualification Standard (PQS), written exams, oral boards and formal schools). Reference (a) provides the standard PQS for the majority of QM qualifications. Appendix A provides a qualification matrix for maintenance personnel PQS requirements.

d. All personnel performing the maintenance identified in Part I, Chapter 2, paragraph 2.2.1 of this volume must be 3-M 301 qualified and Craftsman 301 qualified or an equivalent Quality Assurance (QA) qualification for non-naval personnel.

3.3.1 Re-qualification. Personnel with prior documented qualifications may be re-qualified by written exam or oral board as directed by Quality Assurance Officer (QAO) or Department Head. Personnel found to be deficient in level of knowledge will be required to complete an upgrade program established by the QAO prior to re-qualification.

3.3.2 Required Service Record Entries. Record of qualification will be inserted in the individual's service record.

3.4 QUALIFICATION REQUIREMENTS.

3.4.1 Ship’s Quality Assurance Officer.

a. Should be a commissioned officer with engineering or repair experience.

b. (Submarines only) Submarine officer must have completed submarine qualification and for nuclear powered ships should be nuclear trained.

c. Designated in writing by the Commanding Officer.

d. QA Officer course requirements are:

(1) A surface ship QAO must be a qualified Quality Assurance Supervisor (QAS) and must be a graduate of a QAO course.

(2) A submarine QAO must be a graduate of the Submarine Officers’ and Supervisors’ Quality Maintenance course, F-4H-0182. No other formal PQS qualification is required.

(3) An aircraft carrier QAO must be a graduate of the 5-week Quality Assurance Officer Course (S-4H-0001) for CVN officers. No other formal PQS qualification is required. With a formal waiver (Naval message or letter) endorsed by the ISIC and approved by the TYCOM, this requirement can be temporarily waived but the waiver may not exceed 6 months. The waiver must list the interim QAO and qualifications, the perspective QAO and graduation date from S-4H-0001 or the report date.

e. (Submarines only) Complete an oral interview with the ISIC or submarine support component QAO.

f. (Submarines only) Only an officer meeting the QAO qualification requirements of sub-paragraph d. may sign documents requiring a QAO signature.

(1) A qualified QAO must be onboard during underway operations.

(2) A qualified QAO must be onboard (i.e. not TAD or on leave) any time Quality Maintenance is being performed when in port.

(a) The QAO may be TAD in the same geographic location as the ship as long as they can still perform all responsibilities assigned per part I, chapter 1, paragraph 1.5.12 of this volume, and when in port, or when in port available by phone (i.e. not TAD or on leave) when Quality Maintenance is being performed.

(b) If the QAO cannot perform these duties while TAD or on leave, an acting QAO meeting the requirements of sub-paragraphs a. through e. must be assigned except as exempted here.

(i) The Ship's Commanding Officer may waive the sub-paragraph d.(2) requirement to a period of time up to but not exceeding 2 calendar weeks to allow the QAO leave or short duration TAD.

(ii) With a formal waiver (Naval message or letter) endorsed by the Immediate Superior In Command (ISIC) and approved by the Type Commander (TYCOM), the sub-paragraph d.(2) requirement can be temporarily waived by the TYCOM but the waiver may not exceed 6 months. The waiver must list the interim QAO and qualifications, the perspective QAO and graduation date from F-4H-0182 or the report date.

3.4.2 Ship's Assistant Quality Assurance Officer.

a. Normally E-6 or higher with engineering or repair experience.

b. Designated in writing by the Commanding Officer.

c. (Submarines only) Complete an oral interview with the ISIC or Submarine Support Component QAO.

3.4.3 Immediate Superior In Command.

a. Quality Assurance Officer.

(1) Should be a commissioned officer, but may be a civilian with engineering or repair experience.

(2) Should be a graduate of a QAO course. No other formal PQS qualification is required.

(3) Designated in writing by the ISIC.

b. Assistant Quality Assurance Officer.

(1) Military personnel will be an E-7 or higher, but could be a senior civilian with engineering or repair experience.

(2) Should be a graduate of a QAO course.

(3) Qualified as QAS. QAS qualification is not required if the individual is a graduate of the Norfolk Naval Shipyard Fleet Maintenance Support Branch QAO course.

(4) Designated in writing by the Commanding Officer. The duties assigned, including signature authority, must be clearly delineated.

3.4.4 Regional Maintenance Center or Fleet Maintenance Activity Quality Assurance Officer.

a. Should be a commissioned officer, but may be a civilian with engineering or repair experience.

b. Will not be assigned collateral duties or responsibilities that divert attention from primary duties of QM.

c. Should be a graduate of a QAO course. No other formal PQS qualification is required.

d. Designated in writing by the Commanding Officer.

3.4.5 Regional Maintenance Center or Fleet Maintenance Activity Assistant Quality Assurance Officer.

a. Military personnel will be an E-7 or higher, but could also be a senior civilian with engineering or repair experience.

b. Qualified as QAS or a graduate of a QAO course.

c. Designated in writing by the Commanding Officer.

3.4.6 Quality Assurance Supervisor.

a. Normally E-6 or higher, but may be a civilian.

b. Complete PQS for QAS, and pass a written examination and oral board.

c. QAS is a mandatory qualification for Fleet Maintenance Activities (FMA). Qualification of QAS for ships is at the TYCOM's discretion.

3.4.7 Quality Assurance Inspector.

a. Normally a petty officer, but may be a civilian.

b. Complete PQS for Quality Assurance Inspector (QAI) and pass a written exam and oral board.

c. The qualification card may be split into separate nuclear and non-nuclear QAI qualifications. If this is done, the command must ensure QAIs do not inspect areas excluded from their qualifications.

3.4.8 Controlled Material Petty Officer or Controlled Material Handler.

a. Normally a petty officer, but may be a civilian.

b. Complete PQS for Controlled Material Petty Officer (CMPO) or Controlled Material Handler (CMH), and pass a written exam and oral board.

c. Activities may modify the qualification card to allow CMPO or CMH qualification for specific materials only. If this is done, commands must have a method to ensure CMPOs or CMHs do not handle material excluded from their qualification.

3.4.9 Gas Systems Cleanliness Inspector **or** Certifier.

a. Normally a petty officer, but may be a civilian.

b. Satisfactorily complete an Oxygen Clean Worker course of instruction per reference (b).

3.4.10 Oxygen Clean Instructors. An Oxygen Clean Instructor will be certified per reference (b). Oxygen Clean Instructors will re-qualify every three years. If an individual is scheduled for transfer within six months after the expiration of qualification, it is permissible to extend the qualification until transfer. The local command may exempt the senior instructor from re-qualification.

3.4.11 Ship's and Fleet Maintenance Activity Oxygen Clean Workers. Oxygen Clean Workers will be certified per reference (b). Oxygen Clean Workers will re-qualify every three years. If an individual is scheduled for transfer within six months after the expiration of qualification, it is permissible to extend the qualification until transfer.

3.4.12 Oxygen Calibration Technicians. Oxygen Calibration Technicians qualify to perform oxygen instrument cleaning and calibration by satisfactory completion of Oxygen Calibration School at the direction of the Naval Sea Systems Command (NAVSEA) Metrology and Calibration (METCAL) Quality Manager. Naval Sea Systems Command certifies successful candidates for two years following a report of satisfactory completion of Oxygen Calibration School. Local Regional Maintenance Center re-certifies Oxygen Calibration Technicians during the calibration capability reviews of FMAs or Strategic Systems Program Office capabilities and proficiency evaluation of SSBN and SSGN FMAs.

3.4.13 Work Center Supervisors and Planners. The qualification of QA Maintenance Planners and QA Work Center Supervisors is required in all work centers that perform maintenance tasks outlined in Part I, Chapter 2, paragraph 2.2.1 of this volume. Work Center Supervisors and Maintenance Planners will, as a minimum, complete the applicable qualifications of reference (a) prior to performing any unsupervised maintenance tasks. QA Maintenance Planners prerequisite fundamentals (QAI and Cleanliness Inspector) may be deleted in work centers that do not perform controlled work. Activities with separate planning organizations are exempt from having planners assigned to individual work centers. (Submarines Only) For work centers requiring a QA Work Center Supervisor, either the 3-M Work Center Supervisor or Leading

Chief Petty Officer must be qualified QA Work Center Supervisor and have completed 3M PQS NAVEDTRA 43241 for Work Center Supervisor.

3.4.14 Qualification Requirements for Submarine Nuclear Propulsion Plant Operator Welders (Navy Enlisted Classification Code 3351 and Supervisor Welders 3361).

NOTE: INFORMATION ON THIS SUBJECT IS SAFEGUARDED PER REFERENCE (c). SPECIFIC PROGRAM REQUIREMENTS ARE IDENTIFIED IN REFERENCES (d) AND (e).

3.4.15 Qualification Requirements for Submarine Fly-By-Wire Ship Control System Maintenance Technician. Must be a graduate of the Ship Control System Maintenance Technician School (A-623-0118 for SSN 21 Class, A-623-0131 for SSN 774 Class).

3.5 TRAINING.

3.5.1 Maintenance Personnel Training. All personnel involved with planning, performing and supervising maintenance specified in paragraph 3.2 will be trained using the following guidance:

a. Appendices B and C of this chapter provide information on program elements normally contained in effective maintenance training programs. Appendix B is applicable to Ship's Force whereas Appendix C is applicable to Fleet Maintenance Activities (e.g., mechanics, Nondestructive Test (NDT) technicians, welders and planners). All appendices identified in this paragraph are provided as information only and are not to be considered mandatory listings.

b. Findings from QA form 14s, audits, assessments and surveillance should be included, when appropriate, to re-emphasize the most recent problems experienced in the department.

c. Include the training with existing topics where possible (i.e., CMPO training held with Repair Parts Petty Officer training or Steam Plant Cleanliness training held in conjunction with Machinery Divisions training on the Steam Plant). However, some areas may require separate training to be held.

d. Joint training between departments and organizations is acceptable. The Department Head will coordinate with the QAO on training concerning QM. It is not the intent to create a separate training program, nor is the intent to hold one annual training session that covers all of the topics.

e. In order to assess the effectiveness of the training program, the QAO should:

   (1) Periodically monitor training.

   (2) Assess knowledge level retention in conjunction with the conduct of annual QA and welder training and qualification program audit required by reference (a), Part I, Chapter 9 paragraph 9.3.1 of this Volume.

3.5.2 Requirements. The QAO will create a Long Range Training Plan (LRTP), approved by the Executive Officer, to track topics desired to be given on a periodic basis. Reference (f) provides guidance on effective training planning and LRTP use.

a. For personnel qualified 301 (craftsman) and above, in accordance with reference (a), the QAO will include applicable training topics using Appendices B and C of this

chapter as a guide. These topics must be reviewed and updated annually or whenever a new long-range training plan is generated.

b. For personnel responsible for planning, approving, inspecting or supervising maintenance on systems or equipment included in the QM Program, the QAO will include the following items in the LRTP.

(1) Requirements and generation of a controlled work package and formal work package including objective quality evidence, required inspections and critical QM points.

(2) Material certification, control and stowage requirements.

(3) In-process control including torquing, controlled assembly, system cleanliness requirements for specific systems (e.g., air systems, hydraulic systems) and common mistakes noted in completed QA forms.

(4) Testing.

(5) Departure from specifications.

c. The Ship's Supply Officer will ensure supply department personnel receive training on nuclear and non-nuclear controlled material certification, procurement, receipt inspection and LI/SOC stock program material, SW, VU and NRP stowage requirements.

3.5.3 Submarine Safety Awareness Training (Submarines and Submarine Repair Facilities only). All hands must receive Submarine Safety (SUBSAFE) awareness and Fly-By-Wire Ship Control (if assigned to, work on or over-see 21 Class or 774 Class submarines) training during initial indoctrination and annually thereafter, not to exceed 12 months. Personnel at Submarine Repair Facilities who supervise or manage SUBSAFE, Deep Submergence System-Scope of Certification or Fly-By-Wire-Ship Control System work will receive training on parent requirements to include (at a minimum) references (g), (h), (i) and (j). ISIC and TYCOM staff members that routinely review SUBSAFE and Fly-By-Wire Ship Control (if assigned to, work on or over-see 21 Class or 774 Class submarines) objective quality evidence, make determinations on SUBSAFE Departures from Specifications and perform other SUBSAFE work oversight will receive annual SUBSAFE awareness training to keep knowledge and proficiency levels high.

** Noted in the PQS as Command Specific. For these items, the necessity for the pre-requisites will be determined by the type of work the individual or command performs and that individual's PQS should be tailored accordingly.

APPENDIX B

OUTLINES OF TYPICALLY EFFECTIVE TRAINING TOPICS

1. Work Authorization.
   a. Topic.
      (1) Work authorization forms.
      (2) Tag-outs.
      (3) Safety requirements.
      (4) Ship responsibility for outside activity maintenance.
   b. Reference: COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume V.
2. Formal Work Package **or** Controlled Work Package documentation.
   a. Topic.
      (1) Record retention requirements.
      (2) Mandatory documents.
      (3) Routing of documents and signature documents.
      (4) Test requirements for FMA work.
   b. Reference: COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume V.
3. In Process Control.
   a. Topic.
      (1) Torquing.
      (2) Controlled assembly.
      (3) Cleanliness requirements for:
         (a) Air systems.
         (b) Hydraulic systems.
         (c) Reactor plant (nuclear powered ships only).
         (d) Steam plant (non-nuclear and nuclear powered ships).
         (e) Oxygen **or** Nitrogen systems.
         (f) Seawater systems.
         (g) Lubricating systems.
         (h) Gas Turbine systems.
         (i) Fuel systems.

(j) Diesel systems.

(4) Use of formal work packages.

(5) Control of fasteners. (Include avoidance of carbon steel in seawater systems.)

(6) Material control.

(7) Re-work.

(a) Administration.

(b) Root cause and corrective action.

(8) Revisions: Administration.

(9) Critical QM points.

(10) Procedural compliance.

(11) Submarine antenna work including mast clamps.

(12) Departure from specifications.

(13) Submarine Flight Critical Components

b. References.

(6) NAVSEA S9AA0-AB-GOS-010/020/030); General Specifications for Overhaul of Surface Ships (GSO); AEGIS Supplement.

5. Material Certification.

a. Topic.

(1) Level I material requirements.

(2) Level I material exceptions.

(3) Use of drawings for Quality Assurance Lists.

(4) Submarine antenna material.

(5) Upgraded systems to Level I requirements.

(6) Upgrading components to meet Level I and SUBSAFE requirements.

(7) Submarine Flight Critical Components requirements.

b. References.

(1) SUBSAFE Certification Boundary Book.

(2) Joint Identification Plans or Mapping Plans.

(3) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume V.

(4) Ship's Coordinated Shipboard Allowance List (COSAL).

(5) NAVSEA 0948-LP-045-7010; Material Control Standard (Non-Nuclear).

(6) NAVSEA/NAVSUPINST 4855.1; Quality Assured Submarine Antenna Material: Policy and Procedures for Control and Implementation.

(7) Applicable Class Material Identification and Control of Piping Systems Boundary Book.

(8) NAVSEA T9044-AD-MAN-010 - Requirements Manual for Submarine Fly-By-Wire Ship Control Systems.

6. Material Procurement or Receipt Inspection.

a. Topic.

(1) SUBSAFE, Level I or Submarine Flight Critical Component material.

(2) Material substitution.

(3) Stowage requirements for controlled material.

(4) Ship's COSAL.

b. References.

(1) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume V.

(2) NAVSEA 0948-LP-045-7010; Material Control Standard (Non-Nuclear).

(4) NAVSEA 0948-LP-103-6010; Level I Stock Program Catalog, (Part I - Submarine Items, Part II - Surface Ship Items).

(5) Applicable Class Material Identification and Control of Piping Systems Boundary Book.

(6) NAVSEA T9044-AD-MAN-010 - Requirements Manual for Submarine Fly-By-Wire Ship Control Systems.

7. SUBSAFE.

a. Topic.

(1) Determination of SUBSAFE **or** Hull Integrity boundaries.

(2) Use of QA forms and tags.

(3) Torquing of hull integrity fasteners.

(4) Generation of an MCR/REC.

(5) Unrestricted Operation or Periodic Maintenance Requirement.

(6) Departure from Specification requirements.

(7) REC exceptions.

(8) Positive material identification requirements for hull integrity fasteners.

b. References.

(1) SUBSAFE Certification Boundary Book.

(2) NAVSEA 0924-062-0010; Submarine Safety (SUBSAFE) Requirements Manual.

(3) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume V.

(4) Applicable Unrestricted Operation Maintenance Requirement Card program technical manual.

8. Audit and Surveillance (for personnel performing).

a. Topic.

(1) Audit or surveillance requirements.

(2) Purpose of audit or surveillance program.

(3) Preparing for and conducting an audit including specific discussion of techniques to be used to make audits effective and useful to the organization.

(4) Preparing for and conducting a surveillance includes a specific discussion of techniques to be used to make surveillance effective and useful to the organization.

(5) Documenting an audit or surveillance.

(6) Root cause identification.

(7) Trends and trend analysis.

b. Reference: COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual, Volume V.

9. Additional Training Topics.

a. Weight handling equipment testing, use and safety.

b. Oxygen **or** Nitrogen plant maintenance.

c. Working aloft and Sail Safety.

d. Combat systems maintenance requirements.

e. Electrical safety.

f. Welding.

g. Brazing.

h. REC requirements on diving systems.

i. Cleanliness requirements for diving systems.

j. Controlled material requirements for diving systems.

NOTE: WHERE THERE ARE SIMILAR LECTURE TOPICS, IT IS SUGGESTED THAT THE TRAINING PRESENTED TO NUCLEAR TRAINED PERSONNEL

CONSIST OF BOTH THE INFORMATION FROM TOPICS 1-9 OF THIS APPENDIX AND THE NUCLEAR SPECIFIC INFORMATION CONTAINED IN SECTION 10.

10. Nuclear Training Topics.

a. Material Certification.

(1) This lecture should include discussion of Nuclear Level I requirements.

(2) The following references provide information on this topic:

(a) NAVSEA 0948-LP-045-7010; Material Control Standard.

(b) NAVSEAINST C9210.34; Material Identification and Control Requirements for Naval Nuclear Reactor Plant Piping Systems.

(c) NAVSEA S9213-45-MAN-000 - Naval Nuclear Material Management Manual.

(d) NAVSEA 0989-LP-037-2000; Commissioned Submarine General Reactor Plant Overhaul and Repair Specification.

(e) NAVSEA 0989-LP-043-0000; Commissioned Surface Ship General Reactor Plant Overhaul and Repair Specification.

(f) NAVSEA 0989-LP-058-1000; Destroyer Tender and Submarine Tender Nuclear Support Facilities Overhaul and Repair Specification.

(g) NAVSEA 0989-064-3000; Cleanliness Requirements for Nuclear Propulsion Plant Maintenance and Construction.

(h) NAVSEAINST 9210.23; Naval Nuclear Work at Naval Activities and Private Shipyards - Certification of Work Accomplishment and Data, Retention of Associated Records and Retention of Design Records, Requirements for.

b. Material Procurement **or** Receipt Inspection. This lecture should include discussion of:

(1) Nuclear Material.

(2) Material Substitutions. Certifying material for use to Nuclear Level I.

(3) The list of references in paragraph 10.a (2) of this appendix provides information on the topic.

c. In-Process Control.

(1) This lecture should include discussion of:

(a) Cleanliness requirement for:

1 Reactor Plant (nuclear powered ships only).

2 Steam Plant (fossil and nuclear powered ships).

(b) Requirements for a work package.

(c) Generation of a work package.

(d) Use of QA forms and tags.

(e) Setting plant conditions.

(f) Certification signature requirements.

(g) Use of material control tags.

(h) Reactor Plant Work Accomplishment Reports (RPWAR).

(2) The list of references in paragraph 10.a.(2) of this appendix provides information on the topic.

d. Testing.

(1) This lecture should include discussion of:

(a) Hydrostatic test rig requirements including calibration.

(b) Hydrostatic test forms.

(c) Conducting hydrostatic test.

(d) Setting plant conditions.

(e) Use of Reactor Plant Manual for test requirements.

(f) Weight Handling Equipment Testing.

(2) The following references provide information on this topic:

(a) Reactor Plant Manual.

(b) NAVSEA 0989-028-5000; Manual for the Control of Testing and Plant Conditions.

(c) NAVSEA 0387-LP-046-8000; System Hydrostatic Test Requirements.

(d) NAVSEA 0989-LP-058-0000; AS/AD Tender Nuclear Support Facilities Preventive Maintenance Index.

(e) NAVSEA 0989-LP-037-2000 - Commissioned Submarine General Reactor Plant Overhaul and Repair Specification.

(f) NAVSEA 0989-LP-043-0000 - Commissioned Surface Ship General Reactor Plant Overhaul and Repair Specification.

e. Final work package documentation. This lecture should include discussion of:

(1) Record retention requirements.

(2) Mandatory documents.

f. Reactor Plant Fundamentals. This should be slanted toward the worker so that the individual understands the possible consequences of faulty workmanship, loss of cleanliness, etc., in the Reactor Plant.

g. FMA Nuclear Planning Yard Basic Trade Skills Lesson Plans (when available).

APPENDIX C

RECOMMENDED TRAINING TOPICS FOR SELECTED POSITIONS

1. Experience has shown that effective training should be related to job skills required by the individual.

a. Mechanical craftsmen should cover areas like:

(1) Tools and their uses.

(2) Shop safety.

(3) Work authorization.

(4) Material identification.

(5) Rework and their causes.

(6) Valve construction and methods to perform:

(a) Stack height measurements.

(b) Blue checks.

(c) Lapping of a valve seat.

(7) Pump construction and methods to perform:

(a) Mechanical seal replacement.

(b) Alignments.

(8) Testing requirements.

(9) Cleanliness requirements.

(10) Technical manuals and their usage.

(11) Drawings and their usage.

(12) Work packaging administration.

b. NDT inspectors and welders should cover the following areas:

(1) NAVSEA S9074-AR-GIB-010/278; Requirements for Fabrication Welding and Inspection, and Casting Inspection and Repair for Machinery Piping and Pressure Vessels.

(2) NAVSEA T9074-AD-GIB-010/1688; Fabrication, Welding and Inspection of Submarine Structures.

(3) MIL-STD-1689 (for Surface Ships only); Fabrication, Welding and Inspection of Ship's Structures.

(4) NAVSEA 0900-LP-001-7000; Fabrication and Inspection of Brazed Piping Systems.

(5) NAVSEA T9074-AS-GIB-010/271; Requirements for Nondestructive Testing Methods.

(6) MIL-STD-2132; Nondestructive Examination Requirements for Special Applications.

(7) Material control.

(8) Cleanliness.

(9) Work package administration.

c. Planners should cover the following areas:

(1) SUBSAFE program.

(2) Level I program.

(3) QA forms.

(4) Welding requirements.

(5) Manufacturing specifications.

(6) Cleanliness requirements and specifications.

(7) Hydrostatic testing.

(8) Material control.

(9) Manufactured fittings specifications.

(10) Plant conditions.

(11) System flushes.

(12) NDT requirements.

(13) Testing requirements.

(14) Index of technical publications.

(15) Military standards and specifications.

(16) Selected record drawings **or** ship's drawing index.

(17) Maintenance data systems.

(18) Blueprint reading.

(19) For activities involved in Scope of Certification maintenance:

(a) NAVSEA SS800-AG-MAN-010/P-9290, System Certification Procedures and Criteria Manual for Deep Submergence System.

(b) Scope of Certification material control classification.

(c) Implodability.

(20) Submarine Flight Critical Components.

2. Proven training methods include the use of mockups and training aids that show practical application of the lecture material. Hands on mockup training, performed by the workers is the most highly effective method followed by the demonstration of skills by the instructor.

NOTE: WHERE THERE ARE SIMILAR LECTURE TOPICS, IT IS SUGGESTED THAT THE TRAINING PRESENTED TO NUCLEAR TRAINED PERSONNEL CONSIST OF BOTH THE INFORMATION FROM TOPICS 1-2 AND THE NUCLEAR SPECIFIC INFORMATION CONTAINED SECTION 3.

3. Nuclear Training Topics.

a. Job Skill Training. Each work center should determine the skill requirements and incorporate their own training requirements. Examples are:

(1) Nuclear planners should cover areas like:

(a) RPWAR.

(b) Manufactured fittings specifications.

(c) Freeze seal requirements.

(d) Plant conditions.

(e) Welding requirements.

(f) Radiological Controls.

(g) System flushes.

(h) Nondestructive Testing (NDT) requirements.

(i) Hydrostatic testing requirements.

(2) The following references provide information on the topics of section 3.a(1):

(a) NAVSEA 0387-LP-046-8000; System Hydrostatic Test Requirements.

(b) NAVSEA 0348-LP-159-1000; Freeze Sealing Manual.

(c) NAVSEA 0989-064-3000; Cleanliness Requirements for Nuclear Propulsion Plant Maintenance and Construction.

(d) Valve Manuals.

(e) NAVSEA 0989-LP-037-2000; Commissioned Submarine General Reactor Plant Overhaul and Repair Specification.

(f) Reactor Plant Manual.

(g) NAVSEA 0989-028-5000; Manual for the Control of Testing and Plant Conditions.

(h) NAVSEA 389-0317; Procedures for Maintenance and Repair of Naval Reactor Plants.

(i) NAVSEA 0989-LP-043-0000; Commissioned Surface Ship General Reactor Plant Overhaul and Repair Specification.

(j) NAVSEA 0989-LP-058-1000; Destroyer Tender and Submarine Tender Nuclear Support Facilities Overhaul and Repair Specification.

VOLUME V

4.1 PURPOSE. This chapter provides the requirements for qualification of Shipboard and Fleet Maintenance Activity Welders, Brazers, Nondestructive Testing (NDT), and Generic Material Testing personnel. Also included are qualification record requirements. The provisions of references (a) through (p) are amplified and expanded herein to ensure that all provisions of higher authority are implemented.

NOTE: ALTHOUGH THIS CHAPTER COVERS THE REQUIREMENTS FOR NAVY WELDERS, BRAZERS AND NDT PERSONNEL, THE PERFORMANCE QUALIFICATIONS FOR CIVILIAN WELDERS, BRAZERS AND NDT PERSONNEL WILL BE PER REFERENCES (b), (c) AND (d) RESPECTIVELY.

4.1.1 General Requirements. Each activity is responsible for establishing that each welder or brazer is qualified by demonstrating their ability to produce sound and satisfactory joints per references (a) through (c). References (a), (e) and (f) define welder and NDT qualifications by Navy Enlisted Classification (NEC) codes.

4.1.2 Training.

NOTE: NO WELDER WILL PERFORM QUALIFICATION OR PRODUCTION FABRICATION UNTIL AFTER RECEIPT OF THIS TRAINING AND PASS A WRITTEN EXAMINATION WITH A SCORE OF AT LEAST 75%.

a. Activities must have a training program per references (b) and (d). Activities without a Level III examiner should obtain assistance from a Fleet Maintenance Activity.

b. For those welds or brazes not frequently performed for production, proficiency should be demonstrated by satisfactory completion of a mock-up of the weld or braze prior to performing production work.

4.2 GENERAL REQUIREMENTS FOR BRAZERS AND WELDERS.

a. The extent of welder qualification resulting from tests will be governed by references (a) and (b). The extent of brazer qualification will be governed by reference (c) for piping and pressure vessel applications.

NOTE: THE REQUIREMENTS ARE TAILORED TO THOSE OF REFERENCE (c), AS QUALIFIED PIPE BRAZERS ARE ALSO CONSIDERED QUALIFIED FOR ALL OTHER BRAZING WITHIN THE SCOPE OF THEIR PIPE QUALIFICATIONS (I.E., PROCESS, MATERIAL AND THICKNESS LIMITATIONS).

b. To provide uniformity and enhance the effectiveness of the welder or brazer program the following conditions will apply:

(1) Once started, all qualifications must be completed as expeditiously as possible. Therefore, personnel attempting to qualify must be given ample opportunity to complete the qualification test in a timely manner. Qualification testing must not be assigned if anticipated workload, leave schedules, shiftwork or other controllable factors will delay test assembly completion.

(2) No more than three qualification tests per welder or brazer will be in progress at any one time.

(3) For training purposes, the Welding or Brazing Shop Supervisor must make arrangements with the NDT Supervisor to review the records (including radiographic film) of failed qualification test assemblies. The NDT Supervisor will discuss the results with the qualifier, focusing on the reasons for rejection, types and locations of defects found, and possible corrective actions. The

arrangements should include welder or brazer observation of actual test results whenever possible.

(4) Because the fact that a welder or brazer meets the qualification requirements of a particular specification or standard does not always assure their proficiency in all phases of diversified production tasks for which they are qualified. To this end, activities should strive for continual improvement, both in the qualification and proficiency of its welders and brazers.

c. Stud or Spot Welders. NEC welder or welding operator qualification is not required for operators of stud or spot welding equipment.

4.2.1 Eye Examination. Annual vision tests must be passed by each brazer and welder. Vision tests will be conducted by the medical department, cognizant NDT Examiner or delegated personnel, using standard methods for determining visual acuity. The standard for acceptance will be natural or corrected near distance acuity such that the brazer or welder is capable of reading J1 letters on a standard Jaeger type chart. Equivalent visual tests may be used. Corrective aids used during the visual test must be worn during qualification testing and production fabrication. Reference (b) contains the color test requirement for Titanium welders.

4.2.2 Brazing and Welding Procedures. Brazing and Welding procedures, qualified per references (b) or (c), as applicable, must be on hand for all applications for which performance qualification is intended. Although not specifically required, the brazer or welder should use the procedural requirements for training and familiarity purposes during qualification testing.

4.2.3 Brazing and Welding Personnel Knowledge. Each brazer and welder must receive documented training on the workmanship and detailed visual inspection requirements of fabrication documents used by the activity.

4.2.4 Brazer and Welder Identification Numbers. Upon meeting the requirements of this section, brazers and welders receive a unique identification number, issued by the respective Division Officer, for identification of brazing or welding performance.

a. Brazer and Welder Identification Number Log. The Division Officer must maintain a log of unique identification numbers assigned to brazers or welders. The number assigned must be alphanumeric as illustrated in the following example:

A -12 -B or W.

Where: A = First letter in a brazer or welder's last name.

12 = Sequential number alphabetical in list of personnel.

B or W = B for brazer or W for welder.

b. Each entry must contain the date the number was assigned, the brazer or welder's name and signature, the identification number, the date the brazer or welder completed the initial training specified in paragraph 4.2.3 of this chapter and the brazer or welder's projected rotation date.

4.2.5 Validation of Qualification. All brazer or welder qualifications, re-qualification and maintenance of qualification will be valid only if original qualification is recorded in the individual's service record per reference (a). A service record entry (NAVPERS 1070/613) must be made upon initial qualification, annually (not to exceed 12 months) and before transfer. This service record entry must include all subsequent re-qualifications and the most current vision test results. The brazer or welder's Division Officer will be responsible for ensuring these entries are made.

4.2.6 Qualification Records.

4.2.6.1 Individual Brazer or Welder Qualification File. In order to achieve proper monitoring of brazer or welder qualifications, the individual's Division Officer will maintain an auditable file for each brazer or welder assigned. This file is to be maintained for each brazer or welder for as long as the individual is to be retained for 3 years after the individual transfers from the command. A copy of this record shall be is assigned to a command and transferred with the welder or brazer to their next command. These files must include all information required by references (a), (b) and (c) and include the following:

a. Brazer or Welder identification number (name, rate, individual identification number).

b. Test date or Use of process date.

c. Qualification test number, process, position, base material type, filler material type and size, or brazing alloy type and size.

d. Test results (i.e., Accept or Reject). A statement as to the cause of rejection will be entered, if appropriate.

e. Record of omission of space restriction when not used on pipe tests.

f. Workmanship and visual inspection requirements examination results per reference (b).

g. Certifying signature (Division Officer or designated representative).

h. Vision test form:

(1) Identification.

(2) Test date.

(3) Test description.

(4) Test results.

(5) Corrective aids as required.

(6) Certifying signature (medical department, cognizant NDT Examiner or delegated personnel).

4.2.6.2 Maintenance of Qualification. Detailed records of maintenance of qualification need only be retained for the current and preceding six month period. In order to ensure proper maintenance of brazer or welder qualifications, a log will be maintained by each Division Officer. This log must include items a., b., d. and g. of paragraph 4.2.6.1 of this chapter. In addition, this log will also include the brazing or welding process (i.e., H-101, SMAW, GTAW, etc.) used during maintenance of qualification. This maintenance of qualification log may be a

separate log from the brazer or welder file or it may be incorporated into the brazer or welder file as part of the file itself.

NOTE: FOR WELDERS AND BRAZERS, THE VERIFICATION OF PROCESS FOR USE WILL BE DONE BY THE DIVISION OFFICER, OR THEIR REPRESENTATIVE, AND DOCUMENTED.

4.2.6.3 Method of Qualification Maintenance. Brazers and welders should maintain their qualifications on production jobs. If production work is unavailable, a brazing test assembly or test assembly weld joint meeting the requirements of reference (b) for welders and reference (c) for brazers may be used. Only joints meeting all applicable acceptance criteria will be used for this purpose. Surface Ships lacking NDT personnel may only allow the brazer or welder qualification to lapse with Type Commander approval. If a joint is assembled by personnel whose qualifications have lapsed or without the support of qualified NDT personnel, a Departure from Specification must be submitted and the joint must be reassembled using qualified personnel during the next maintenance support opportunity.

4.2.6.4 Renewal of Qualification. Renewal of qualification will be per reference (b) for welders and reference (c) for brazers.

4.2.7 Effective Date of Qualification. Effective date of qualification must be from the date that the test assembly brazing or welding is complete. Initial qualification is effective only after the final NDT is completed but the date of qualification is the date the weld or braze was completed. For re-qualification the re-qualification is only effective after the final NDT is completed but the effective qualification date will be the day the weld or braze was completed. The NDT Supervisor will ensure that:

a. Qualification results are forwarded to the brazer or welder Division Officer.

b. Each test assembly is marred, marked, or otherwise identified so as to preclude its re-use.

4.3 BRAZER QUALIFICATIONS.

4.3.1 Prerequisite. Prior to performing any qualification or production brazing the brazer must have successfully completed training in workmanship and detailed visual inspection requirements and passed a written examination with a grade of no less than 75%. The training and examinations for all brazers will be based on the requirements set forth in reference (c).

4.3.2 Qualification Test. A brazer qualification will be per reference (c) for piping and pressure vessels.

4.3.3 Limitations. Limitations will be per reference (c).

4.3.4 Test Assembly Evaluation. Test assemblies must be visually and ultrasonically inspected or a peel test may be conducted as specified in reference (c).

4.3.5 Maintenance of Qualification. Each command must ensure that each brazing qualification is maintained by verifying at least one use of each process qualified per reference (c) (i.e., command certification of the use of manual torch brazing, induction brazing, etc.) within six months after the month of the person's last documented use of the process.

4.3.6 Qualification Renewal. A brazer must renew their qualifications per reference (c).

4.3.7 Transfer of Qualification. Qualifications may be transferred from one activity to another when the requirements of reference (c) are met.

4.4 QUALIFICATION REQUIREMENTS FOR WELDERS.

4.4.1 Navy Enlisted Classification Code Achievement. To achieve a welding NEC the welder must successfully meet all the requirements of reference (a).

4.4.2 Specific Qualifications. Qualifications for specific additional welding processes, filler metal groups and welding positions may be obtained per reference (a).

4.4.3 Aluminum, Metal Boat and Craft Qualifications. Qualifications for aluminum welders, and boat and craft welders will be obtained in accordance with applicable fabrication documents.

4.4.4 Maintenance of Qualification. For each qualified process, qualification will be maintained per reference (b), with at least one verification of process use within 6 months after the month the person last used the process. In addition, for titanium welders and welding operators, verification of process used on titanium base metal within the 6-month period will also be maintained.

4.4.5 Qualification Renewal. A welder must renew their qualifications per reference (b).

4.4.6 Transfer of Qualification. Qualifications may be transferred from one activity to another when the requirements of reference (b) are met.

4.5 ASSEMBLIES WHERE THE POSSIBILITY OF FAILURE IS REMOTE AND WOULD NOT RESULT IN DANGER TO SHIP PERSONNEL, SHIP, BOAT, CRAFT, PLANT, OR STRUCTURE.

4.5.1 Authorization. Navy Enlisted Classification code is not required for welding performance per reference (a) and welding performance qualification tests may be omitted per reference (b).

4.5.2 Requirements. Assemblies where the possibility of failure is remote and would not result in danger to ship personnel, ship, boat, craft, plant, or structure are defined and specific qualification requirements are identified, per the applicable fabrication documents listed below.

a. Shipboard structure and specific non-structural components as listed in reference (g).

b. Submarine minor structure as defined in reference (h).

c. For machinery, piping, and pressure vessels, weldments made principally of sheet metal, welds on vents, overflows and drains, and as otherwise defined in reference (i).

d. Metal boat and craft hulls, when specifically approved, per reference (j).

e. Aluminum hull boats and craft as defined in reference (k).

f. Landing Craft, Air Cushion (LCAC) component welding requires qualification per reference (l).

g. Patrol Costal (PC) class craft structure and specific non-structural components as listed in reference (m).

h. Watertight/Airtight door repair and wedge welding per reference (n).

i. CG-47 aluminum structure welding shall be in accordance with reference (o).

4.6 QUALIFICATION REQUIREMENTS FOR NONDESTRUCTIVE TEST PERSONNEL.

4.6.1 Purpose.

a. To provide guidance on the procedures that must be followed to maintain NDT qualifications or attain NDT re-qualification per references (d) and (f).

b. Naval NDT personnel are qualified by being examined by an NDT Examiner per references (d) and (f).

4.6.2 Levels of Certification. NDT personnel are certified per references (d) or (f). Military personnel certified per reference (f) will be assigned NECs per reference (e).

a. Level I (NDT Operator): An individual certified to NDT level I is qualified to carry out NDT operations following written instructions and under the supervision of level II or level III personnel. The individual must have the skills and knowledge to properly perform specific calibrations, specific tests, set up equipment, carry out specific inspections, record the results obtained, classify the results following written criteria and report the results. NDT Operator must not be responsible for the choice of the test method, technique to be used or for the final assessment of the test results.

b. Level II (NDT Inspector): An individual certified to NDT level II is qualified to perform and direct non-destructive testing following established or recognized techniques. The individual must be competent to choose the test techniques to be used; to set up and calibrate equipment; to interpret and evaluate results following applicable codes, standards and specifications; to carry out all duties for which a level I individual is qualified; to organize and report the results of non-destructive tests. The individual must also be familiar with the scope and limitations of the methods for which the NDT Inspector is qualified, and be able to exercise assigned responsibility for on-the-job training and guidance of trainees and level I personnel.

c. Level III (NDT Examiner): An individual certified to NDT level III must be capable of assuming full responsibility for a test facility and staff; establishing techniques and procedures; interpreting codes, standards, specifications and procedures; and designating the particular test methods, techniques and procedures to be used. Must develop NDT procedures per reference (d), adapted to the problems that are the subject of an NDT inspection; and to prepare written instructions. The individual must have the competence to interpret and evaluate results following existing codes, standards and specifications; have a sufficient practical background in applicable materials, fabrication and product technology to select methods, establish techniques and to assist in establishing acceptance criteria where none are otherwise available; have general familiarity with other NDT methods and have the ability to train level I and level II personnel.

4.6.3 Certification of Nondestructive Test Personnel. Only those individuals who have successfully completed the Naval NDT of Metals course or commercial equivalent for civilian personnel can be certified by an NDT Examiner. NDT Inspectors will re-certify per reference (d) or (f).

4.6.4 Renewal of Certification. NDT Examiners will re-certify per reference (d) or (f).

4.6.5 Maintenance of Qualification.

a. NDT personnel will maintain qualification per reference (d).

b. NDT testing personnel must pass an annual vision test per reference (d).

4.6.6 Qualification Administration.

a. Command NDT Examiners must be designated in writing.

b. Service Record Entries. Each NDT Inspector will have their service record updated to reflect current qualifications annually, as a minimum, and immediately prior to transfer. These periodic service record updates will be accomplished by entry on (NAVPERS 1070/613).

c. NDT Examiner or Division Officer, as appropriate, will maintain an individual NDT personnel record per reference (d) for each NDT Examiner and Inspector.

4.6.7 Approval of Nondestructive Testing Qualification Examinations. An NDT Examiner must approve the NDT Inspector Qualification Examinations and visual test materials.

4.6.8 Transfer of Qualification. Qualifications being transferred from one naval facility to another must be evaluated to the satisfaction of the NDT Examiner of the new facility.

4.6.9 Nondestructive Testing Personnel Records. NDT Inspector or Operator records will be maintained by the NDT Examiner per reference (d) and will consist of:

a. All qualification documentation must be per reference (d) (e.g., training and qualification documents).

b. Copy of current eye examination.

4.6.10 Nondestructive Testing Qualification Log. The NDT Supervisor will maintain an NDT personnel qualification log that will be used to record and maintain qualifications for each individual assigned. Each operator or inspector will have a separate section in the NDT qualification log that satisfies the requirements of paragraph 4.6.9 of this chapter. The NDT Supervisor or designated representative will update the NDT personnel qualification log. This will be based upon the completion of NDT performed as shown by completed NDT reports. This log may be maintained either as a hard copy or electronic copy.

4.6.11 Qualification of Generic Material Identity Testing Personnel. Personnel who perform generic materials identity testing will be qualified as required by local procedure which will include the following minimum requirements:

a. An eye examination satisfying the requirements of reference (a).

b. Training on the procedures of reference (p).

c. Training on the procedures for materials not in reference (p) used by the command.

d. Training on standard requirements.

e. Training on safety precautions associated with generic testing.

f. Training on reagent requirements and shelf life.

g. Testing requirements and designation of who performs the examinations.

h. Certification by the Quality Assurance Officer.

i. Re-qualification or qualification updating requirements.

j. For other than chemical testing programs, qualification will be per applicable equipment technical manuals.

4.6.11.1 Qualification Administration. Command Generic Material Identity Examiners must be designated in writing and must approve Generic Material Identity Test Inspectors qualification examinations and test materials.

4.6.11.2 Transfer of Qualification. Generic Material Identity Testing Personnel. Since qualification is by local procedure, testing personnel must perform at a level of proficiency which is satisfactory to the Test Examiner at the new activity.

LISTING OF APPENDICES.

A Determining Software Usability
B Format for Submarine Certification Continuity Report
C Format for Fleet Maintenance Activity Certification Report to Tended Submarine
D Format for Non-Fleet Maintenance Activity Certification Report to Tended Submarine
E RPCCR Cover Letter for SHIPALTS (Sample)
F NESD Customer Service

5.1 PURPOSE. To provide the requirements or direct the user to the appropriate references to ensure that maintenance performed during the ship's life cycle (new construction through decommissioning) supports certification at all times. All material used within any nuclear and non-nuclear submarine pressure hull must be certified for use per reference (a).

5.2 TEST, MEASUREMENT AND DIAGNOSTIC EQUIPMENT.

5.2.1 General Requirements. Test, Measuring and Diagnostic Equipment (TMDE) for in-process work must be properly selected and used. TMDE requiring periodic calibration must be within its calibration periodicity when in use. All TMDE should be selected ensuring the equipment is of the proper range to perform the test, inspection or repair. The craftsman and Quality Assurance Inspector (QAI) should inspect all TMDE prior to use and reject questionable equipment. When inspections or measurements using TMDE are performed with the results documented on a Quality Assurance (QA) form, the type of equipment, range, serial numbers and calibration due dates for TMDE used will be recorded on the QA form as part of the Objective Quality Evidence (OQE).

5.2.2 Torque Wrenches.

NOTE: THE FOLLOWING APPLIES TO TORQUE WRENCHES USED ABOVE WATER OR SUBMERGED IN WATER (FRESH WATER OR SALTWATER).

a. Selection. Torque wrenches should be selected in such a manner that the required final torque falls within 20% to 90% of the torque wrench maximum value. For example:

(1) A torque wrench with a maximum indicating value of 100 ft-lbs can be used for a maximum torque of 90 ft-lbs and a minimum torque of 20 ft-lbs.

(2) A torque wrench with a maximum indicating value of 250 ft-lbs can be used for a maximum torque of 225 ft-lbs and a minimum torque of 50 ft-lbs.

b. Calibration. Calibration should be verified to be within the required periodicity (based on due date on the calibration label) prior to use. Most Navy torque wrenches are calibrated for use in one direction only. These tools will have a label affixed stating, "Use Clockwise Only" or "Use Counterclockwise Only". The tool can be used only in the direction indicated. Torque tools calibrated for bi-directional use will bear a

yellow "SPECIAL CALIBRATION" tag or label indicating that the tool was calibrated for use in both directions. Navy torque wrenches can be calibrated for bi-directional use only if specifically authorized by model number in the latest Naval Sea Systems Command (NAVSEA) OD 45845.

c. Micrometer adjustable torque wrenches. To ensure acceptable performance of micrometer adjusted torque wrenches, users must adhere to the following requirements:

(1) Exercise the wrench (apply pressure until snap mechanism activates) six times at approximately 60 percent of the rated maximum value before each use. This procedure minimizes the erratic readings often experienced with this type of wrench during the first few activations.

(2) Micrometer-type wrenches to be used in counterclockwise applications should be calibrated in the counterclockwise direction and marked as such.

(3) Some micrometer "click" type torque wrenches do not accommodate torque values down to 20 percent of the maximum rated capacity. Requests to use a specific torque wrench or meter, outside of the ranges specified in sub-paragraph a. of this paragraph, require an engineering evaluation and written authorization from a technical warrant.

d. Extensions or Adapters. Torque wrenches are calibrated based on the specific length of the wrench as established by the wrench manufacturer. Use of an extension changes the effective length of the wrench. The actual torque being applied to the fastener will be different than that indicated on the wrench dial. Any time extensions are used, the following mathematical formulas should be used to determine the wrench dial reading required for the required applied torque:

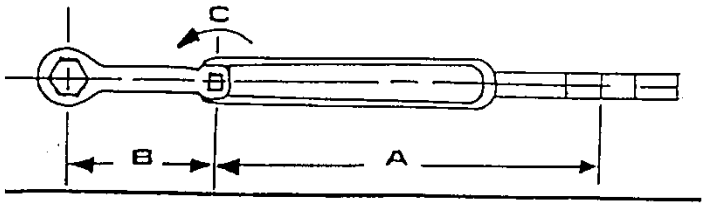
NOTE: EXTENSIONS CAN SIGNIFICANTLY AFFECT THE APPLIED TORQUE TO INDICATED TORQUE RELATIONSHIP. ANY EXTENSION OTHER THAN A DIRECT ATTACHMENT (I.E., CROWSFOOT) MUST BE TAKEN INTO ACCOUNT.

$$T_{ind} = \frac{T_{act} \times L_1}{L_1 + L2}$$

Where:	T_{act}	=	Applied torque required
	T_{ind}	=	Torque indicated on dial
	L_1	=	Length of torque wrench
	$L_1 + L_2$	=	Length of torque wrench plus length of extension

When an adapter or extension is used on a torque wrench, it increases the torque range of the wrench. The formula for computing torque when using an adapter or extension is explained in Figure 5-1 of this chapter.

Figure 5-1 Use of Torque Wrench Adapters



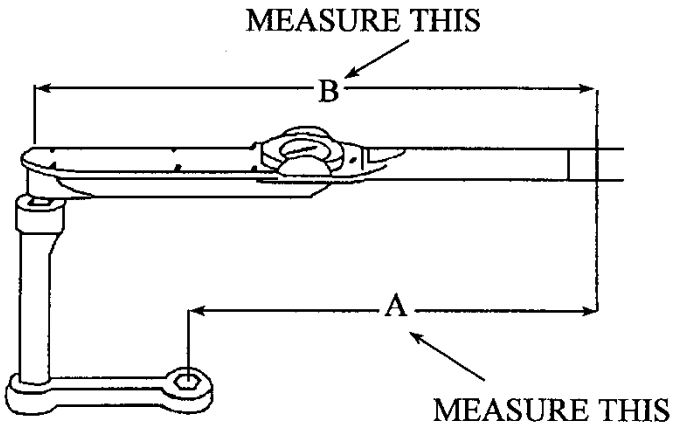
FORMULA FOR USING ADAPTERS

C = ACTUAL TORQUE APPLIED TO WRENCH
B = LENGTH OF ADAPTER
A = DISTANCE FROM DRIVE TO PULLER'S HANDGRIP
T = TORQUE REQUIRED FOR FASTENER

FORMULA: $C = \frac{A \times T}{A + B}$

PROBLEM: $\frac{28 \times 200}{28 + 9} = \frac{5600}{37}$ $C = 150$

ADAPTER REQUIRING REVERSE CORRECTION



A = TOTAL LENGTH = 18" **B = TORQUE WRENCH LENGTH = 24"** **C = CORRECTION FACTOR = A ÷ B = 18 ÷ 24 = 0.75**

T = TORQUE REQUIRED FOR FASTENER

FORMULA FOR USE OF CORRECTION FACTOR

D = Actual Torque Applied to Wrench **C = Correction Factor = A ÷ B**

Formula: $D = \frac{T}{C}$ **Problem:** $\frac{200}{.75} = 266$

5.2.3 Gauges.

a. General. Gauges used for in-process functions, whether installed in the system or temporary, must be verified to be within calibration periodicity prior to use. Craftsmen should ensure the appropriate calibration information is recorded on the QA form.

b. Non-Nuclear Hydrostatic Testing. Master test gauges and backup gauges used for hydrostatic testing must be selected and the calibration verified current per reference (b) and Volume IV, Chapter 9 of this manual.

5.3 TORQUE.

5.3.1 General Torque Requirements. Care must be used when torquing fasteners or plugs. Special attention is required to select the proper torque specification for a given application or specification as it is specifically selected to reduce the tendency for the fastener to loosen in service and to improve the fastener fatigue life.

5.3.2 Actual Torque Requirements. Torque requirements found in drawings, Submarine Maintenance Standards (SMS) or technical manuals, etc. will be used in preference to general guides for torquing. If no specific torque requirement exists, references (c), (d), (e), (f) or reference (g) may be used as guidance but ensure that the information applies exactly to the system and fastener type being torqued.

5.4 INSPECTIONS.

5.4.1 General Requirements. This section provides the minimum requirements and guidance for the performance of inspections. Inspections during the performance of maintenance form one of the fundamental elements essential in assuring that the task is completed properly and in compliance with all specifications. Inspections occur during the in-process phase of repair or maintenance (disassembly, repair, and re-assembly) and the re-certification phase (testing). Inspections serve to provide a careful and critical examination of the areas being inspected and form one of the cornerstones of a successful QA Program. Use of inspections have and will continue to establish the OQE necessary for ensuring compliance to technical requirements.

5.4.2 Inspection Records. Inspection records provide a lasting record that the inspection was performed and completed according to the applicable specifications. Inspection records will be maintained when required for OQE and will be documented on appropriate QA forms contained in this volume, or as Certification Signature Blocks in the Formal Work Package (FWP).

5.4.3 Critical Inspections. An inspection on any system or component, which by its nature is so critical to the successful completion of the task, that the inspection requires verification by a separate individual, other than the craftsman, qualified as an inspector. These inspections will be annotated in the written work procedure by the presence of an (I) or circle I, or in the case of Cleanliness Inspections (CI) or circle CI in the margin next to the applicable paragraph requiring the inspection and will be documented either as a Certification Signature Block (for those nuclear work items in Part I Chapter 2 Appendix C of this volume) or signature, as applicable, in the FWP or on the appropriate QA form.

NOTE: THESE ARE CONSIDERED MINIMUM REQUIREMENTS FOR USAGE OF AN INDEPENDENT INSPECTOR DURING THE PERFORMANCE OF

CONTROLLED WORK. IT MUST BE UNDERSTOOD THAT THE REQUIREMENTS FOR AN INDEPENDENT INSPECTOR DO NOT NECESSARILY MEAN THAT THE DATA PROVIDED IS RETAINABLE AS OQE. VARIOUS SOURCE DOCUMENTS ADDRESS RECORD RETENTION AND MUST BE FOLLOWED FOR ENSURING THE PROPER OQE IS RETAINED.

a. Critical Inspections applicable to all platforms are:

(1) Inspections performed for all acceptance testing (e.g., hydrostatic testing, drop tests, joint tightness tests, weight tests) for certification of work completed under a Controlled Work Package (CWP). (Nuclear and non-nuclear manually operated valves which have adjustable packing do not require certification by an independent inspector.)

(2) Inspections performed to verify permanent markings of Level I material (those which the Fleet Maintenance Activity (FMA) manufacture, upgrade, or transfer to smaller pieces of controlled material). These inspections may also be performed by a Controlled Material Petty Officer.

(3) Mechanical measurements used to verify wall thickness of components for work performed using a CWP.

(4) Inspections performed for post machining of any Level I component.

(5) All sealing surface inspections for work performed as a Controlled Assembly.

(6) Inspections for oxygen, nitrogen, and hydrogen systems cleanliness as required by reference (h). These independent inspections are performed by personnel qualified as Oxygen Clean Workers per reference (h).

(7) Material receipt inspection. These inspections may also be performed by a Controlled Material Petty Officer.

(8) Weight testing to certify or re-certify shipboard cranes when repairs are performed per reference (i).

(9) Performance of Emergent Controlled Work per Part I, Chapter 2 of this volume.

(10) Verification of body bound stud standout measurements and break away torque for stud installations in Submarine Safety (SUBSAFE) and Level I systems.

b. Additional Critical Inspections applicable to submarines only.

(1) Sealing surface inspections for all SUBSAFE Hull Integrity joints.

(2) Hull Integrity joint body fastener inspections as identified in reference (r). For new stud installations, this includes stud standout measurements and break away torque verification. For studs that were not removed and are to be reused, this includes verification of markings of significance (K or KM) or completion of generic material identification check.

(3) Final torque verification of SUBSAFE Hull Integrity joints.

(4) Verification of new controlled material installed into the SUBSAFE boundary.

(5) Verification of proper software installation in SUBSAFE Hull joints.

(6) Stack height measurement verification for hull packing installation (e.g., periscope, rudder, planes).

(7) Seat tightness tests of SUBSAFE hull and backup valves.

c. Visual inspection of submarine structure in between Unrestricted Operations (URO) MRC 003 Inspections.

NOTE: NOT APPLICABLE TO SUBMARINES AT SEA OR SHIP'S FORCE MAINTENANCE ACTIONS OUTSIDE A SCHEDULED REFIT, FLEET MAINTENANCE AVAILABILITY OR CHIEF OF NAVAL OPERATIONS AVAILABILITY. THE SHIP MUST REPORT ANY UNUSUAL, UNEXPECTED OR POTENTIALLY DANGEROUS CONDITIONS OR LARGE PRESERVATION FAILURES TO THE TYPE COMMANDER (TYCOM) AS SOON AS POSSIBLE. CURRENT SHIP'S MAINTENANCE PROJECT ENTRIES MUST DOCUMENT DEFICIENCIES FOUND AND DEPARTURES FROM SPECIFICATION (DFS) MUST BE WRITTEN IF SO DIRECTED BY TYCOM.

(1) Inspection, scheduling and reporting of inspection of URO MRC 003 structure which is not otherwise due for a URO MRC 003 inspection must be per reference (j) sections 1.j and 1.k. Defects identified during the Unscheduled Visual Inspection must be evaluated and corrected or adjudicated by the cognizant Technical Authority.

(2) Inspection, scheduling and reporting of normally wetted, previously obscured URO MRC 003 structure must be per reference (j) sections 1.j and 1.k. Defects identified during the Unscheduled Visual Inspection must be evaluated and corrected or adjudicated by the cognizant Technical Authority.

5.4.4 Cleanliness Inspections. Cleanliness controls are required to prevent the entry of foreign material which could interfere with the operation of any system or component. Cleanliness controls are essential during maintenance with the degree of control depending upon the system and work to be accomplished. Steam plant system cleanliness controls are necessary to minimize corrosion of steam plant materials and prevent the entry of foreign materials into the steam plant. Improper cleanliness controls can result in damage to operating machinery, chloride contamination, or fouling of system components. The time spent making sure the work site is clean and system openings are properly controlled will help prevent premature component failure and rework.

a. Cleanliness Inspectors are individuals who are trained and qualified to perform CI required by work procedures for systems or components requiring cleanliness controls. At the TRIDENT Refit Facilities, they are called Cleanliness Certifiers.

NOTE: ALL SYSTEMS REQUIRE VARYING DEGREES OF CLEANLINESS CONTROLS, BUT MAY NOT REQUIRE AN INDEPENDENT INSPECTOR. CRITICAL QUALITY CONTROL POINT INSPECTIONS BY SUPERVISORY PERSONNEL SHOULD BE USED WHERE APPROPRIATE.

b. Acceptance inspections of cleanliness by an independent inspector (Cleanliness Certifier or Inspector) are required for the following as a minimum:

(1) Oxygen, nitrogen, and hydrogen systems per reference (h).

(2) Naval Nuclear Propulsion systems as required by reference (l).

c. Results of cleanliness acceptance inspections required by paragraph 5.4.4.b must be documented in the Technical Work Document and certified by a signature for those inspections requiring independent inspection.

d. There are no specific requirements for independent cleanliness inspection acceptance by a Cleanliness Certifier or Inspector, during steam plant (nuclear or fossil fuel) system maintenance. However, for maintenance involving steam plant (nuclear) systems, the cleanliness requirements for steam plant (nuclear) systems from Chapters 1 and 3 of reference (l) apply. For steam plant (fossil fuel) or general shipboard systems listed in paragraph 5.4.6, the cleanliness requirements must be determined during the work-planning phase. Many jobs may be performed using craftsman to verify cleanliness vice requiring independent Cleanliness Inspector presence. When the risk or consequence of loss of cleanliness is minimal during a maintenance action, such as work requiring bonnet removal from a small steam valve, maintenance of cleanliness may be verified by the craftsman. When the risk or consequences of loss of cleanliness is significant, such as when removing the bonnet from a main steam root valve, work involving opening of turbine throttles, or when the type or quantity of detrimental materials (e.g., cutting oils) pose a significant risk, the use of an independent inspector to verify maintenance of cleanliness should be considered by the Department Head, Quality Assurance Officer (QAO) and Planning Officer (if assigned).

e. It is the responsibility of Ship's Force to ensure the appropriate cleanliness control requirements are incorporated in any maintenance for which clear responsibility for cleanliness is not assigned.

5.4.5 Nuclear Propulsion Plant and Nuclear Support Facility General Cleanliness Requirements.

5.4.5.1 Reactor Plant. For work involving the cleanliness requirements of Chapters 1, 2 and 3 of reference (l), inspector presence is required for initial opening of a reactor plant system when the opening is accomplished using a dirt producing procedure such as a butt weld cut or pipe cut. For non-dirt producing methods, such as socket weld cuts, cuts on canopy seals and the opening of a flange, the worker may verify cleanliness without the presence of a Cleanliness Inspector. For either case, the worker will first establish a clean area and then open the system. The system will then be inspected for cleanliness by the worker or inspector depending on the method used for opening the system. The worker will then install cleanliness plugs, disestablish the clean area and perform the required repair. Upon completion of the repair, the worker will clean the area and inspector presence is again required for system inspection prior to closure of the opening.

a. Maintenance personnel and appropriate supervisors must be briefed by a QAI on applicable requirements before starting work. The brief must include at least the following:

(1) Inspection requirements.

(2) Acceptance criteria.

(3) Methods to maintain cleanliness.

(4) Required actions for a loss of cleanliness.

b. Cleanliness plugs that are locally manufactured or procured through the Navy supply system must meet the requirements of reference (l). A logbook must be kept by the appropriate work center or work center supervisor recording all cleanliness plugs by serial number. Additionally, a QAI must document that the requirements of Chapter 1 of reference (l) for Temporary Seals and Plugs have been met regardless of procurement method or each plug recorded in the logbook.

c. If a loss of cleanliness occurs as explained in reference (l), then cleanliness must be re-established according to the requirements and procedures of reference (l). Upon a loss of cleanliness, the Lead Work Center Division Officer, QAO and appropriate Department Head(s) will approve the recovery procedures.

d. Use a Tool and Material Accountability Log to document the required accountability whenever foreign material exclusion controls are established. A formal written record must be maintained for all material (e.g., tools, equipment, temporary plugs and seals and tape) taken inside the physical boundary that are small enough to fit inside the material openings in the hardware and do not have lanyards attached. The record must describe the material, where it was introduced and when it was removed. Except for eyeglasses and goggles, accountability is required for all clear plastic material regardless of size.

e. Control of tools must be as specified in reference (l) and this volume. Work center supervisors will be responsible for control of handling equipment and metal removal and finishing tools. Additionally, the following requirements consistent with reference (l) apply for metal removal and finishing tools: Except for cutting tools (drills, bits, taps, etc.), metal removal and finishing tools (files, wire brushes, grinding wheels, etc.) used on corrosion-resistant or carbon steel materials will be segregated from general work center metal removal and finishing tools and fasteners.

5.4.5.2 Steam Plant. Reference (l) provides a list of applicable steam plant systems and the minimum steam plant cleanliness requirements. It applies to all steam plant work performed in naval nuclear powered ships when not at a shipyard. This chapter also applies to steam plant work performed by forces afloat when at a shipyard.

a. Nuclear powered ship steam plant maintenance affecting those systems listed in Chapter 1 of reference (l) must be assigned only to activities that have reference (l) in force.

b. The Steam Plant Manual or Steam and Electric Plant Manual must be consulted for cleanliness requirements when performing steam plant maintenance.

c. If a loss of cleanliness occurs as explained in reference (l), then cleanliness must be reestablished according to the requirements and procedures of reference (l). Additionally, upon a loss of cleanliness the QAO, the Lead Work Center Division Officer, and appropriate Department Head(s) will approve the recovery procedure.

d. Control of tools and maintenance products will be per reference (l).

e. Reference (l) cleanliness requirements for Nuclear Aircraft Carrier catapult steam and drain systems must be complied with regardless of which Department Head has responsibility for the system.

5.4.5.3 Nuclear Support Facility.

a. Reference (m) provides specific cases that invoke reference (l) and reference (n).

b. Where the references do not address a specific Nuclear Support Facility system or component, reference (l) may be used for guidance as determined to be appropriate. The component technical manuals and NSTMs should also be consulted for cleanliness requirements as appropriate.

5.4.5.4 Standard Lubricants and Penetrating Fluid. General overhaul specifications for reactor plants and Nuclear Support Facility Manuals for Submarine Tenders require the use of reference (o). Reference (l) contains requirements to control detrimental materials.

5.4.5.5 Inspectors. Only personnel qualified in accordance with the requirements of part I, chapter 3 of this Volume and who are nuclear trained or who have completed all pre-requisites marked "nuclear only," may perform cleanliness inspections on nuclear systems and components.

5.4.6 General Shipboard Steam Plant Systems Cleanliness Requirements.

5.4.6.1 Purpose. To define the general requirements for cleanliness controls during maintenance or repair of steam plant systems on Surface Force ships.

5.4.6.2 Applicability. The requirements of this paragraph are applicable to the following steam plant systems:

a. Main Steam.

b. Auxiliary Steam (Defined as steam which returns to the boiler).

c. Feedwater.

d. Condensate.

e. High Pressure Drains.

f. Reserve Feedwater.

g. Heating steam and condensate return piping from distilling units.

h. Steam drains.

5.4.6.3 Discussion. Significant contamination of boilers with chlorides or other detrimental materials has resulted from the introduction of foreign materials into steam plant systems during maintenance onboard conventionally powered ships. The guidance for foreign material exclusion and general cleanliness controls for steam plant system components (e.g., boilers, turbines, condensers) are formally published by NSTMs. However, there is no definitive NAVSEA guidance for many of the steam plant systems piping on conventionally powered ships during maintenance and repair. Therefore, the guidance for cleanliness controls provided in the following paragraphs is for those instances where there is no definitive NAVSEA guidance.

5.4.6.4 Requirements. During general maintenance that breaks the system boundaries, the following cleanliness controls will be implemented:

a. Maintenance of cleanliness.

(1) Temporary covers or plugs will be installed on all steam system piping, components, and tanks opened for work except during the time that the opening must actually be uncovered to perform the work. Covers and plugs will be designed to preclude loose pieces from entering the steam system. Covers and plugs will be rubber, metal, or rigid plastic and will be securely fastened to the component or piping.

(2) Following maintenance and prior to removing plugs or covers from inside piping or components, inspect and thoroughly clean the work area to ensure that no tools, rags, lubricants, or other foreign materials are left inside. This includes removal of loose scale and other easily removed corrosion products, as well as removal of residue from grinding, chipping, welding, or other maintenance.

b. Control of foreign material introduction.

(1) New or repaired components should be cleaned to the maximum extent practical without disassembly prior to installation into the system to ensure preservatives, desiccants, etc. are removed.

(2) Assembly and maintenance may require the use of lubricants, sealants, and other compounds. Those compounds should be used only as authorized and only applied in the flow path, if authorized by the process instruction.

(3) During all maintenance, ensure action is taken to ensure all foreign materials are removed following the maintenance and prior to system operations.

(4) Water used for cleaning or flushing steam plant systems must meet the criteria for steam plant makeup or feedwater.

c. Verification of cleanliness. When verification of cleanliness is required, verification should be accomplished by visual inspection. If configuration of the system or component precludes visual inspection, and cleanliness has not been maintained, then flushing may be used to verify cleanliness.

(1) Visual inspections will be conducted using normal reading level lighting. Mirrors and borescopes may be used provided resolution is sufficient to verify cleanliness.

(2) Components should not be disassembled just to conduct visual cleanliness verification. Instead, a flush may be used to verify cleanliness. Valves may have the visual inspection performed on the accessible portions of the flow area.

(3) Flushes will be conducted for period of not less than five minutes.

(4) Visual inspection acceptance criteria.

(a) No grease, oil, or other foreign material.

(b) For uncoated surfaces, tightly adherent corrosion products typical for the type of material (e.g., carbon steel) are acceptable. No loose corrosion products may be present.

(c) For coated surfaces, the coating must be acceptable to the process instruction used to apply the coating. No loose corrosion products may be present.

(5) Flush acceptance criteria (Visual).

(a) For water flushing, the water sample must be free of foreign material.

(b) For steam flushing, a sample of condensate downstream of the area being flushed must be free of foreign material.

(c) For lines flushed with compressed gas, place a white filter cloth at the outlet to collect debris. After flushing, the cloth must contain only light speckling or staining due to rust and dirt and must contain no readily apparent quantities of foreign materials (e.g., metal shavings, abrasive grit, oil).

(d) For piping where direct sampling of the flush effluent is not possible, the following requirements apply:

1 For lines that cannot be directly sampled during flushing (e.g., lines that discharge into a tank or condenser without drains or sample taps between the area being flushed and the tank), flush for five minutes. Sample the collected discharge from the tank, the water sample must be free of foreign material.

2 Dead-ended piping in a line being flushed by opening a mechanical connection, will have water, steam, or gas (as applicable) flushed past the dead end connection to the main stream for a minimum of five minutes at the maximum practical flow rate. When cleanliness is verified for the main stream, it is also verified for the dead-ended piping.

3 For piping which cannot be sampled because it discharges overboard, flush for at least five minutes. No acceptance criteria are applicable.

NOTE: CLASS 3 STUDS KNOWN TO BE SET WITH ANAEROBIC SEALING COMPOUND BASED UPON DRAWINGS REQUIREMENTS OR OTHER OQE MAY USE THE "IN-SERVICE ANAEROBIC STUD ROTATION" CHECKS FROM QA FORM 34 TO DETERMINE THE ACCEPTABILITY FOR USE WITHOUT RESETTING.

5.4.7 Set Stud Inspection. During disassembly or reassembly, inspect set studs to ensure no rotation is exhibited during nut loosening and tightening. Where direct visual inspection is not possible, marking the top of the stud (e.g., felt tip marker) to a reference point on the assembly may be used. Rotation of any stud during disassembly is cause for rejection (except studs known to be class 3 studs set with anaerobic sealing compound) and the stud must be reset prior to final

assembly. If marking is used, use care to not remove material markings such as material color-coding during marking removal.

5.5 SOFTWARE ACCEPTABILITY. To assist in the determination of acceptability of non-metallic packing materials (e.g., O-Rings, wall seals) for installation in non-nuclear and nuclear systems, decision aids have been developed from reference (p) and are provided in Appendix A. In case of question or conflict, the requirements of reference (p) apply. Additional guidance regarding non-metallic seals is provided in the following paragraphs.

a. It is Fleet policy that software (e.g., O-Rings, gaskets) will be reused only as a last resort. If new software is not available, software may be used after satisfactory inspection for damage, resiliency, discoloration, or cracking per reference (p).

b. In all cases, the guidance provided in applicable NAVSEA technical documents (e.g., drawings, component technical manuals, references (p) and (q) for nuclear and non-nuclear applications) will be followed.

c. Reuse of software during daily Planned Maintenance System (PMS) or other specified situations. The practice of not reusing software does not apply to items of daily PMS (e.g., drain pump strainer, lubricating oil strainers) or the Logistics Escape Trunk on submarines and, therefore, the O-Ring or gaskets may be reused provided the software has been inspected and is not damaged.

d. Software which has exceeded their recommended shelf life may be used in naval reactor plant applications provided the following criteria are met:

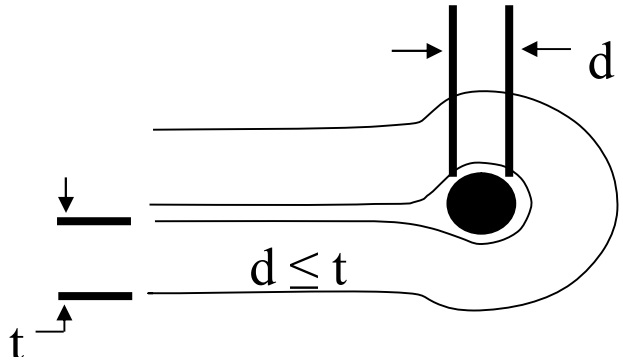
    (1) The software has been properly stored in its original package.

    (2) Software must be inspected as part of issuing the software for a job or prior to installation. Inspection by a QAI or Controlled Material Petty Officer is not required. No certification signatures are required. The user activity must define who must test software with expired shelf lives to ensure they are adequately tested.

    (3) Except for tubing, each surface of the material must be examined. For tubing, only the outside surface must be examined. The software must be resilient and show no evidence of cracking, discoloration, flaking, tackiness, brittleness, surface contaminants, or other physical damage. Further, each surface must be inspected and must exhibit no cracks under 5X magnification when it is deformed.

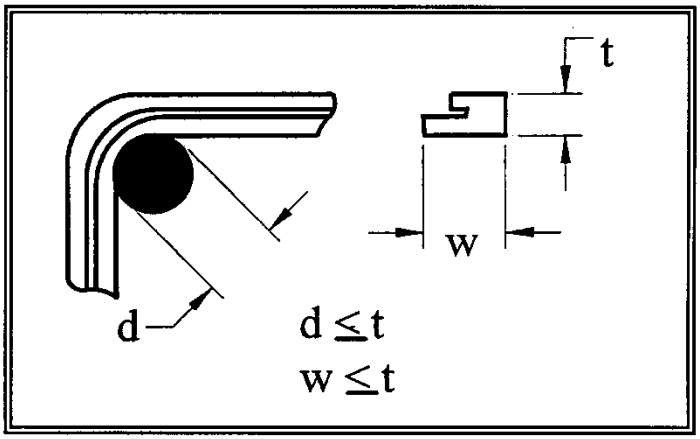
        (a) For flat pieces, strips, and O-Rings, bend material onto itself over a rod of diameter (d) no greater than the cross sectional thickness (t) as illustrated in Figure 5-2:

Figure 5-2 Simple Software Deformation Inspection



(b) For complex shapes or parts with non-uniform cross section which closely resemble flat pieces, strips, or O-Rings, bend the material at least 90 degrees over a rod of diameter (d) no greater than the maximum cross sectional thickness (t or w) as illustrated in Figure 5-3.

Figure 5-3 Complex Software Deformation Inspection



(c) For parts which do not fall into the categories and parts which are too stiff to be deformed as required, approval must be obtained on a case basis from the respective Reactor Plant Planning Yard via a Liaison Action Request per Part I, Chapter 8, Section 8.4 of this volume.

5.6 SUBMARINE SAFETY MAINTENANCE CERTIFICATION AND RE-ENTRY CONTROL, NUCLEAR AND NON-NUCLEAR.

5.6.1 Purpose. To issue the policy and procedures for:

a. Maintaining continuity of SUBSAFE certification during the operating cycle.

b. General Maintenance Certification Record administrative requirements.

(1) Reference (r) establishes the SUBSAFE certification criteria which must be accomplished on submarines in order for NAVSEA to recommend UROs to

design test depth. Once the certification criteria are satisfied, NAVSEA will make a recommendation to the appropriate TYCOM that the submarine be authorized for URO to design test depth. Based upon the NAVSEA recommendation, TYCOM will authorize the submarine to operate to design test depth, or some lesser depth depending upon specific conditions. Each TYCOM summarizes the authorized operating depths and restrictions for ships in reference (s) or (t).

(2) Continued URO to design test depth is dependent on:

(a) The positive control and re-certification of all re-entries into the SUBSAFE or hull integrity boundaries of the ship and

(b) The satisfactory and timely completion of URO MRC requirements.

5.6.2 Re-Entry Control Program.

a. Applicability. This section is applicable whenever work is accomplished within a SUBSAFE boundary as defined by SUBSAFE Requirements Manual, reference (r), and as depicted in the SUBSAFE Certification Boundary Book.

NOTE: SUBSAFE REQUIREMENTS MANUAL IS THE FINAL AUTHORITY FOR DETERMINING IF AN ITEM IS WITHIN THE SUBSAFE BOUNDARY. THE SUBSAFE CERTIFICATION BOUNDARY BOOK IS AN ILLUSTRATED REFERENCE TO AID IN THE DETERMINATION OF WHETHER AN ITEM IS SUBSAFE OR NOT.

b. General. The Re-Entry Control (REC) Program includes those elements associated with maintenance or repair necessary to maintain the certification established by NAVSEA. The program provides auditable OQE of the following:

(1) What work was accomplished, including material and components used, re-test requirements, tests performed, and test data.

(2) Why work was required.

(3) Who authorized and accepted the REC.

(4) Who did the work.

(5) When and where the work was accomplished, including the work and re-test boundaries.

c. When it becomes necessary to re-enter a SUBSAFE certified system or structure, it will be accomplished per the requirements and procedures of paragraph 5.6.4 of this chapter. Specific direction on completing the Maintenance Certification Record (MCR) (QA form 9) is contained in the instructions for QA form 9.

d. Some exceptions to RECs are allowed due to frequent entry into the certified boundary for routine operations or maintenance actions. These exceptions and administrative or operational control requirements are contained in paragraph 5.6.7 of this chapter.

e. NAVSEA SUBSAFE and FBW SCS Grams are not authorized for use by submarines, submarine ISICs, submarine Groups or maintenance activities managed by the

TYCOM. SUBSAFE and FBW SCS Grams will be engineered into the Joint Fleet Maintenance Manual where appropriate.

5.6.3 Nuclear Submarine Safety System Re-Entry. When Re-Entry of a nuclear SUBSAFE system or a portion of a nuclear SUBSAFE system is necessary, the applicable Reactor Plant Manual, reference (e), and the ship's specific Reactor Plant Work Accomplishment Report (RPWAR) will be reviewed and used to provide technical guidance. Nuclear SUBSAFE Re-Entry will be per the requirements and procedures of Section 5.7 of this chapter. Nuclear SUBSAFE RECs must be marked in Block 2 of the QA-9 as SUBSAFE and NUCLEAR. Approval to open and close the Nuclear REC will be per part I, chapter 2, Appendix E of this volume using the "NUC" review and approval matrix.

NOTE: INFORMATION ON REACTOR PLANT PLANNING YARD LIAISON ACTION REQUESTS IS SAFEGUARDED PER REFERENCE (U).

5.6.4 Re-Entry Control Administrative Procedures.

a. General. REC procedures provide a continuous, auditable record of work done on fully certified systems to provide positive assurance that they remain "certified". Continuity of Certification is mandatory throughout the operational life of the ship to ensure URO to design test depth.

b. REC. When re-entry of a SUBSAFE system or a portion of a SUBSAFE system (or component) is necessary, the work and re-certification of the work will be documented using the MCR/REC, QA form 9.

(1) An MCR/REC will be used for each re-entry of the pressure hull or each certified system, certified component or portion thereof as defined by the SUBSAFE certification boundaries.

(2) An MCR/REC will be restricted to a single system within a single mapping plan, a single component removed from a system, or a single component removed or worked that requires multiple mapping plans (e.g., trash disposal unit, Main Sea Water hull or backup valves and hydraulic actuators, modified after signal ejectors).

(3) When an MCR/REC is opened by a ship to permit removal of a component by Ship's Force for repair by an FMA as a "ship to shop" job, an MCR/REC must be opened by the FMA to cover the work and retesting of the work center work performed by the FMA.

(4) Where other certified systems must be re-entered to accomplish an MCR/REC, each system will have its own MCR/REC, except as described in paragraph 5.6.4.b.(2) of this chapter.

(5) The MCR/REC and records of MCR/REC will contain all of the OQE necessary to comply with paragraph 5.6.2.b of this chapter.

(6) The work procedures associated with an MCR/REC will contain sufficiently detailed instructions to assure that all requirements for certification are properly accomplished and documented.

(7) Work and test boundaries will be defined in terms that are unique and directly identifiable with the specific mapping plan or task involved.

(8) When work and test boundaries are different, both boundaries will be set forth. The work boundaries, test boundaries and pressure boundaries should be specified and should not be confused. Work boundaries define the limits to which work was performed. Test boundaries define the limits for testing to certify the work; these tests may involve actuators, indicators or components other than those actually repaired. Pressure boundaries define (perhaps by valve lineups) the limits of the system which were pressurized to hydrostatically test the work. The pressure boundaries and test boundaries may be the same.

(9) On a "ship to shop" job the work boundaries may be best described by system joint designators even though those joints were not "disturbed" by the FMA (e.g., rebuild a Rubber Insert Sound Isolation Coupling (RISIC), the work or test boundaries will be the end flanges that bolt up to the system, the joint identification numbers may be clearest identification of that boundary point).

(10) Previously certified hardware will be reused when certification is not affected by the re-entry, or when it can be recertified. The words "replace", "repair", and "re-install" should be used carefully. "Replace" means the use of a different or new component, while "re-install" indicates the use of the previously installed component, whether repaired or not. "Repair" indicates that some refurbishment, other than mere disassembly or cleaning, was performed.

(11) Associated supporting documents such as Nondestructive Testing (NDT) records, material certification, test data, etc., will be specifically identified and referenced on the MCR/REC.

(12) When it becomes necessary for an FMA to re-enter a certified component (periscopes, Auxiliary Sea Water pumps, Electronic Warfare Support Measures masts) which will not be returned to the ship from which it was removed, or when a component is re-entered when the ship on which it will be installed is not present, the FMA will control the work and document the re-entry using a QA form 9, MCR/REC. The MCR/REC will be initiated and closed out by the FMA. A copy of the completed MCR/REC will accompany the component when it is installed in a certified SUBSAFE submarine or shipped to another activity as proof of certification. These controls are required whether the certified component is to be installed in a SUBSAFE certified ship or stored. Each component must retain its certification. These RECs are separate from and in addition to any MCR/REC required for removal of a component from SUBSAFE system and are only necessary whenever the original component will not be returned during the current availability to the ship from which it was removed.

(13) The CWP/REC Log, QA form 11 will be established and maintained by the QAO per the detailed instructions for QA form 11 in Part I, Chapter 11 of this

volume. The QA form 11 must be reviewed by the QAO to verify all MCR/RECs are closed prior to submerged operations. The FMA QAO will maintain a log for the FMA only and one for each tended ship RECs. The QA form 11 must be reviewed by the FMA QAO to verify all FMA MCR/RECs are closed prior to underway operations of each tended ship.

(14) Revisions to the MCR/REC are required for the following:

(a) Change in work boundaries (e.g., breaking additional or new mechanical joints not previously identified on the MCR/REC). An MCR/REC revision is not required to delete undisturbed joints. Deletion of joints must be authorized by cognizant technical authority and documented in the REC package. Block 14 must be annotated to reflect joint deletions prior to signing MCR/REC Block 17.

(b) Change in NDT or test requirements (e.g., "J" vice H hydrostatic test, when "H" was originally specified). This does not include a DFS for unaccomplished testing. An MCR/REC revision is not required for NDT incidental to minor repairs as defined in paragraph 5.6.4.b.(14)(d) of this chapter. NDT results must be documented in the MCR/REC package.

(c) Scope of work changes (e.g., originally replace software changed to weld repair sealing surfaces, originally replace software changed to metallic pressure boundary part replacement).

(d) The MCR/REC does not require revision in order to conduct minor repairs in support of the original scope of work. These minor repairs must be authorized by cognizant authority and documented in the MCR/REC package, with appropriate OQE generated and added to Block 16 prior to the signing of Block 17 of the QA form 9. Hot work is not classified as a minor repair. Minor repairs authorized to be performed without a revision are:

1 Minor machining such that the machining is within the limits of the technical drawing, SMS, or technical manual (e.g., taking a skim cut on an O-Ring groove such that the final machined dimensions are within the tolerances of the technical reference).

2 Epoxy repairs.

3 Electroplate repairs.

4 Preventive coating application.

(15) A revision cannot be used when a new MCR/REC is required (e.g., different system must be entered to conduct repair).

(16) REC Cancellation and REC Administrative Closeout. In the event a CWP is prepared and the job is planned to be accomplished but for some reason it was cancelled or deferred the following actions should be taken:

(a) If work was authorized to start, the CWP/REC must be revised to reflect that no work was accomplished and the REC was revised to close administratively. The QA form 11 log will be annotated that the job was "Cancelled".

(b) If work was not authorized to start, and the job has been cancelled, annotate the remaining blocks of the QA form 9 with NA and note that the REC was cancelled and no work was accomplished. Blocks 20 and 21 will be signed to formally close the REC. If the REC was prepared by a Repair Facility, a copy of the QA form 9 will be provided to the tended unit with the Certification Continuity Letter. QA form 11 log will be annotated that the job was "Cancelled".

(c) If work was not authorized to start and the job has been deferred to a future maintenance period, the REC is not required to be cancelled. The QA form 11 log will be annotated as "Deferred". This is not considered an open REC.

(17) As a policy, RECs for work within the SUBSAFE certification boundary or test documents within the SUBSAFE Boundary must not be closed out until resolution of all actions necessary to verify certification has been maintained when any breach of the boundary has occurred. An acceptable alternative, however, is to close out a REC or test documents within the SUBSAFE Boundary by transferring remaining at sea testing actions to a separate auditable accountability system (i.e. DFS or the Deep Dive Test Procedure). All RECs closed in this manner must be annotated by the activity with the reference documents that contained the transfer actions. This policy must be verified by the activity accomplishing the work, supervising authority, submarine Commanding Officer and ISIC.

(18) Prior to every underway for submerged operations, all SUBSAFE RECs must be closed. Commanding Officers of submarines will certify and acknowledge REC closure by signing the REC and submit to Immediate Superior In Command (ISIC) a written report per paragraph 5.6.8 of this chapter. SUBSAFE certification letter is only required after an inport period in which SUBSAFE work was performed.

(19) Ship's Force is responsible for providing "Buddy" SUBSAFE, FBW-SCS or DSS-SOC REC serial numbers to outside repair activities performing SUBSAFE, FBW-SCS or DSS-SOC work on shipboard SUBSAFE, FBW-SCS or DSS-SOC systems. The Buddy REC number is issued from ship's QA-11 log and will be documented on repair activities RE-ENTRY CONTROL FORM. The use of the Ship's Force Buddy REC number is NOT required for Chief of Naval Operations or TYCOM scheduled availabilities. The issue of the Ship's Force Buddy REC is an administrative tool to make REC Log keeping easier and ensure the required certification letters are received prior to underway. The Ship's Force Buddy REC does not result in a Ship's Force REC Form, does not require Ship's Force Record Retention and does not allow Ship's Force to participate in the assigned activities work or certification

process, except performance of testing. Ship's Force will only issue Buddy RECs to SUBSAFE, FBW-SCS or DSS-SOC certified activities performing SUBSAFE Work.

5.6.5 Using a Controlled Dive Departure from Specification to Close a Maintenance Certification Record or Re-Entry Control. If a MCR/REC is closed by transferring at sea testing to a DFS (e.g., controlled dive to test depth for retest of a periscope hull gland, controlled dive for retest of a sea connected system in lieu of joint tightness test to "J" pressure of Test Pressure Drawing (TPD)), the ship will be restricted, as required by reference (r), as indicated in sub-paragraphs a through d of this paragraph.

NOTE: IF AN UNSATISFACTORY CONDITION OR SEAWATER LEAKAGE IN EXCESS OF THE SPECIFICATION IS FOUND DURING THE CONDUCT OF THE CONTROLLED DIVE TO TEST DEPTH, THE SHIP MUST CONTINUE TO TEST DEPTH UNLESS THE COMMANDING OFFICER DETERMINES IT APPROPRIATE TO ABORT THE DIVE.

a. Except for the controlled dive to test depth to retest the system or component, ship's depth will be limited to one half test depth plus fifty feet until satisfactory completion of inspections during the controlled dive. The ship will stay at test depth for the time required as detailed in the normal retest procedure (i.e., 30 minutes if the normal joint tightness test is for 30 minutes) plus adequate time to permit inspections.

b. If inspections of the system or component during the controlled dive are satisfactory, the ship is released for UROs with no immediate report required. Clearance of the DFS will be reported as required by Part I, Chapter 8 of this volume.

c. If inspections of the system or component during the controlled dive are unsatisfactory, the ship is restricted to one half test depth plus fifty feet as indicated in paragraph 5.6.5a. of this chapter, unless specific authorization is received from TYCOM approving URO or changing the depth restriction. The DFS approved to perform the controlled deep dive must be cancelled and a new major DFS for the failed testing must be initiated by the ship. An immediate report of unsatisfactory inspections will be made to ISIC and, if required, a request, including Commanding Officer's evaluation of unsatisfactory conditions and justification for request, for approval to conduct operations at depths deeper than one half test depth plus fifty feet will be made to TYCOM with information copy to ISIC and NAVSEA (07T). Deficiencies discovered that are not joints specified for inspection in the MCR/REC and DFS are dispositioned as required by Part I, Chapter 8 of this volume and are not cause for depth restrictions unless the Commanding Officer deems necessary.

d. Should the presence of an installed Dry Deck Shelter preclude a component requiring deep dive testing from seeing submergence pressure, the requirements of paragraph 5.6.5a. of this chapter must apply upon removal of the Dry Deck Shelter and must be so annotated in the approval comments of the deep dive DFS.

5.6.6 Voyage or At Sea Repairs. If emergent repairs or at-sea repairs involve REC work, the ship is limited to 200 feet or less until the ship's Commanding Officer has signed for the closed REC.

a. If equipment malfunctions (except for casualties affecting recoverability, salvage, watertight integrity, or operation of ship's control surfaces), or seawater leakage in excess of the specification is found during the conduct of the initial tightness dive or the controlled dive to test depth, the ship should continue to the required depth and execute the sea trial agenda unless the Commanding Officer determines it appropriate to abort the dive. The Commanding Officer should be particularly circumspect in the case of leakage locations not isolable by flood control or other closures (e.g., electrical hull penetrators, periscope hoist rods, etc.).

b. Following completion of the initial tightness dive and the controlled dive to test depth, SUBSAFE deficiencies which result in seawater leakage exceeding the specification for acceptance must be reported to the TYCOM, NAVSEA and info to all concerned.

c. If leakage is from an unisolable joint, ship's depth will be limited to 1/2 test depth plus 50 feet until approval from the TYCOM is received to continue trials at depths greater than 1/2 test depth plus 50 feet.

NOTE 1: REPAIR ACTIVITIES WILL NOT REQUEST THE SHIP TO PERFORM A REC EXCEPTION TO CIRCUMVENT THE REPAIR ACTIVITIES USE OF REC CONTROLS IN CONJUNCTION WITH REPAIR ACTIVITY WORK.

NOTE 2: REC EXCEPTIONS ARE NOT AUTHORIZED TO BE USED FOR THE INSTALLATION OF NEW LEVEL I HARDWARE WITHIN THE SUBSAFE BOUNDARY.

5.6.7 Exceptions to Re-Entry Control. Exceptions to Re-Entry Control (REC) are listed in reference (r). The reference includes certain systems and equipment within the certified SUBSAFE boundary which require frequent entry into the certified boundary for routine operations or maintenance actions in order to enable the ship to carry out its mission. The operational requirements for these systems and equipment have been reviewed. Inherent operational controls in the present system are considered adequate. The operational control which is considered as meeting the intent of the REC requirements is listed beside each item and must be in effect in order to use the exception. Some REC exceptions permit removal of material from the installed system to perform maintenance or testing. The original material must be reinstalled or a complete REC (controlled work package) must be used to capture the installation of new Level I material or certification testing for new material.

5.6.8 Certification Continuity Report. In order to ensure continued certification of each submarine, periodic reports are required as indicated in sub-paragraphs a through c:

a. Prior to each underway for submerged operations, all SUBSAFE RECs or REC exceptions requiring a controlled assembly must be closed. Commanding Officers of submarines will submit to ISIC (deployed ISIC, if deployed), a written certification continuity report, which addresses the status of Ship's Force SUBSAFE, Submarine Flight Critical Component (SFCC) CWPs or REC exceptions requiring a controlled assembly, testing of SUBSAFE, Fly-By-Wire Ship Control Systems (FBW SCS) systems, URO maintenance completed and RECs closed by transferring actions to a DFS. SSBN and SSGN class potable water shore service connection cap installation performed as a controlled assembly is exempt from reporting under this paragraph. Appendix B provides the minimum requirements for the letter. If no SUBSAFE,

SFCC controlled work, REC exceptions requiring a controlled assembly, testing or URO MRCs were accomplished, no report is required. Certification Continuity Reports may be delivered in person by a command representative, transmitted as a naval message, transmitted via e-mail as an electronically signed PDF, transmitted via e-mail as a signed letter scanned as a PDF.

b. Prior to the ship's underway after an FMA availability, refit or inport period when SUBSAFE, SFCC work was performed, the FMA Commanding Officer will issue a letter report to each tended submarine, with a copy to parent ISIC, which addresses the status of SUBSAFE, SFCC CWPs, testing of SUBSAFE, FBW SCS systems, URO maintenance requirements completed and SUBSAFE non-conformances (i.e., DFS and LAR). Appendix C provides the minimum requirements for the letter.

c. Prior to ship's underway, activities other than FMAs which perform SUBSAFE or SFCC maintenance on submarines will issue a letter report to the submarine with a copy to the parent ISIC, certifying that the maintenance performed meets the requirements of applicable specifications invoked by the governing document (e.g., unscheduled availabilities, contract) and the Memorandum of Agreement. Appendix D provides the minimum requirements for the letter.

5.7 REACTOR PLANT WORK ACCOMPLISHMENT REPORT (SUBMARINES ONLY).

5.7.1 Purpose.

a. The RPWAR form is a listing of those pipe and components of the reactor plant which are SUBSAFE. It is specific for each ship and is provided by the Reactor Plant Planning Yard via the TYCOM. The RPWAR consists of:

(1) Status sheet.

(2) Cover sheet.

(3) RPWAR Master Pages.

(4) Addendum Sheet.

(5) RPWAR general notes.

b. The reactor plant hull integrity area is comprised of those items on the RPWAR. Each ship must maintain the RPWAR current. Each completed RPWAR will be filed in an auditable manner along with the latest revision for the ship of the NAVSEA RPWAR status drawing. The reproducible blank RPWAR will be maintained in the same file. The ship will reproduce blanks as necessary to support reactor plant work.

c. To properly complete the RPWAR, the preparer must review the general notes of the applicable RPWAR and the instructions in reference (e).

d. To certify (or recertify) a nuclear SUBSAFE item, a RPWAR must be completed by the activity performing the maintenance (ship, FMA or shipyard) per reference (e) and forwarded as soon as possible to the Reactor Plant Planning Yard with copies to NAVSEA 08, TYCOM, ISIC and the ship. The RPWAR is to be signed in ink and the signed in ink copy should be forwarded to the Reactor Plant Planning Yard. Initials or

typed signatures are not permitted. When work is complete, submit only those pages of the RPWAR line items that certify the work accomplished.

e. The RPWAR does not, in any way, relieve the FMA or ship of its responsibility to comply with all applicable requirements specified in technical manuals, plans, and other NAVSEA documents.

f. When the FMA works in an area covered by the RPWAR, the ship's Engineer Officer will provide the FMA with a reproduced RPWAR with the number filled in, notes, applicable certification forms and addenda sheet.

g. Instructions contained in this section are in amplification of those included in reference (e) and the RPWAR drawing itself.

5.7.2 Specific Instructions for Completing Reactor Plant Work Accomplishment Report Cover Sheet.

a. The ship's hull number must be specified in the space provided (if not already pre-printed).

b. The reporting activity (ship, FMA or shipyard) must be listed.

c. The report number must be included. The report number is the next consecutive number to that indicated on the latest completed RPWAR held by the ship.

d. The report must be dated.

e. The applicable block specifying when the work was accomplished must be checked.

f. The signatures and titles of the personnel preparing, reviewing, and approving the RPWAR must be included. Each RPWAR submitted by ships is prepared by the Lead Work Center QAI, reviewed by the QAO and Engineer Officer, and approved by the Commanding Officer. Each RPWAR submitted by an FMA is prepared by the nuclear Planning and Estimating Work Center (10D), reviewed by the Nuclear Repair Officer and QAO, and approved by the Repair Officer.

5.7.3 Specific Instructions for Completing Reactor Plant Certification When New or Previously Uncertified Material is Installed in a Submarine Safety Application.

a. The applicable revision of the drawing or plan must be referenced in the "DWG. NO. AND REV" block for each item worked on.

NOTE: IF A DRAWING OR PLAN OTHER THAN THAT REFERENCED IN THE "DWG. NO. AND REV" BLOCK IS USED BY THE REPORTING ACTIVITY, THE ACTUAL DRAWING OR PLAN USED SHOULD BE SPECIFIED IN EITHER THE "REMARKS" BLOCK OR ON THE ADDENDA SHEET AS A REFERENCED NOTE. THE REASON FOR USING A DIFFERENT DRAWING OR PLAN SHOULD ALSO BE SPECIFIED.

b. The identification of the reporting activity's detailed record should be entered in the "DETAILED RECORD IDENTIFICATION" block if the inspections required by the applicable inspection category were performed by the reporting activity (ship or FMA).

NOTE: THE RECORD RETAINING ACTIVITY, IF OTHER THAN THE REPORTING ACTIVITY, SHOULD BE IDENTIFIED IN THIS BLOCK.

c. Where sufficient space does not exist for entry of information, refer to the addenda sheet in the "REMARKS" block and enter the required information on the addenda sheet.

d. The report number will be entered in "REMARKS" block for each line item worked on by the reporting activity.

e. The signature block must be completed, indicating that the corresponding line item work has been satisfactorily completed and that records substantiating this are on file.

f. Where SUBSAFE work is accomplished following an Alteration, the reporting activity will reference, for each work item, the applicable Alteration with revision number in the "REMARKS" block.

g. Waiver, if any, previously granted for each item must be identified, including reference to the NAVSEA approval letter.

NOTE: IF THE WORK PERFORMED ON THE SUBSAFE ITEM IS SUCH THAT THE PREVIOUS CERTIFICATION IS VOIDED (SUCH AS REPLACEMENT OF A SUBSAFE VALVE TAILPIECE), THE REPAIRED OR ALTERED ITEM MUST BE CERTIFIED AS NEW MATERIAL.

5.7.4 Specific Instructions for Completing Reactor Plant Certification When Previously Certified Material is Reinstalled.

a. Reinstallation of previously certified material does not require a RPWAR unless specifically called out as a line item on the RPWAR requiring torque or installation verification.

b. The fastener torque sheet is filled out in the following manner:

(1) The inspection document is the QA form 34, the FWP or CWP serial number and job sequence number.

(2) The signature block is signed by the QAI who verified the torque.

(3) If sufficient space is not available in the QA form 34, the addenda sheet should be used with the appropriate line item listed.

5.8 MATERIAL CONDITION MONITORING UNRESTRICTED OPERATIONS MAINTENANCE REQUIREMENT CARD PROGRAM (SUBMARINES ONLY).

a. The URO MRC program provides the minimum material condition requirements for URO to design test depth, with an established periodicity to accomplish. It is one of the programs required to maintain SUBSAFE certification. Accomplishment of the URO MRC will identify changes within the SUBSAFE or hull integrity boundaries of the ship, which result from the degradation caused by the service environment.

b. Administration, scheduling and reporting of the URO MRC program will be per the requirements of Chapter 25, Volume VI of this manual. A summary of URO MRC status will be reported by the submarine Commanding Officer per paragraph 5.6.8 of this chapter.

c. When performing corrective maintenance, the following guidance is provided with regard to URO MRC:

(1) When performing corrective maintenance, associated URO MRCs should be reviewed to determine if the URO MRCs should be accomplished concurrently ahead of scheduled periodicity to preclude having to disassemble equipment again to accomplish the URO MRCs. Ship's schedule or FMA resources may preclude concurrent, early accomplishment of URO MRCs.

(2) If URO MRC criteria are used, in total or in part, during corrective maintenance, and a measured parameter is found out of tolerance and not restored, a major DFS must be submitted, per Part I, Chapter 8 of this volume, even though the periodicity of the URO MRC has not expired.

(3) When performing corrective maintenance that does affect a URO MRC measured parameter, perform that portion of the applicable URO MRC. A URO MRC measured parameter is any parameter that is documented on the Data Report Form during the performance of the URO MRC. The following are examples of corrective maintenance that may affect a URO MRC measured parameter:

(a) When the retest of the corrective maintenance is a documented URO MRC measured parameter (i.e., Emergency Flood Control Accumulator Tightness Test - URO MRC 026).

(b) When maintenance (such as opening mechanical joints or replacing hardware, adjustments, tests) affects the operation of a system inspected or tested by a URO MRC (i.e., Emergency Flood Control - URO MRC 025).

d. Following installation of an alteration (Ship Alteration (SHIPALT), Alteration and Improvement, Temporary Alteration) that modifies the structure of the Ship, such that access to vital equipment is or may be impacted, the Ship must evaluate the need to perform URO MRC 029. If access to vital equipment could be restricted, the Ship must perform URO MRC 029 and provide a copy to the installing activity and the ISIC. Partial accomplishment of URO MRC 029 is acceptable if appropriate for the alteration. If partial accomplishment of the URO MRC is performed, provide a copy to the installing activity and the ISIC. If the complete URO MRC is accomplished, provide a copy to normal distribution.

5.9 SUBMARINE FLY-BY-WIRE MAINTENANCE CERTIFICATION.

5.9.1 Purpose. To issue the policy and procedure for:

a. Maintaining continuity of the FBW SCS certification during the operating cycle.

b. General Maintenance Certification Record administrative requirements.

5.9.1.1 General.

a. Reference (v) establishes the FBW SCS certification criteria which must be accomplished on all applicable submarines in order to maintain system certification throughout the operating cycle of the ship. Once a submarine FBW SCS has been

certified for unrestricted use or is accepted by the shipbuilder, all work within the FBW SCS certification boundary and testing to support that work must be accomplished, controlled and documented per reference (v).

b. All other Performance testing within the FBW SCS Boundary, for work within the FBW SCS Boundary must be accomplished to support system certification and documented using the activity's normal work control processes.

c. Work is defined as an action that actually or potentially changes (including disassembly and testing) the approved configuration of any part of the FBW SCS or SFCC Boundaries.

d. The objective of this work control process for work within the FBW SCS certification boundary is to provide maximum confidence that any work and all applicable testing is authorized, controlled, identifiable, and auditable. It provides positive assurance that all SFCC equipment and FBW SCS is restored and tested to a fully certified condition.

5.9.1.2 Applicability. The requirements in this section must apply to *Seawolf* and *Virginia* Class Submarine FBW SCSs.

5.9.1.3 Submarine Flight Critical Component Boundary. The Submarine FBW SCS Boundary must consist of electronic hardware and software within the submarine FBW Boundary (see reference (v)) that process safety critical functions and data elements.

a. Safety critical electronic components within the FBW SCS certification boundary must be determined per references (v) and (w) and must be identified as SFCCs.

b. Safety critical software units within the FBW SCS certification boundary must be determined per references (v) and (w). Safety critical software units must require additional testing or analysis, be marked, configuration managed, and controlled per the requirements in reference (v).

5.9.2 Submarine Flight Critical Component Boundary Work Control Procedures.

a. All fleet activities, In-Service Engineering Activity, repair activities or shipyards (public or private) must use REC to document the accomplishment of work within the FBW SCS certification boundary. RECs must provide greater assurance that any work accomplished is authorized, documented and executed per specifications and requirements, and is supported by OQE.

b. Some exceptions to RECs are allowed due to frequent entry into the certified boundary for routine operations or maintenance actions. These exceptions and administrative or operational control requirements are contained in reference (v).

c. Closed RECs must be retained by the work accomplishing activity and are subject to audit by cognizant activities (TYCOM, ISIC, shipyard, supervising authority or NAVSEA) during audits such as functional or certification audits.

5.9.3 Submarine Flight Critical Component Boundary Work Control Closeout.

a. All RECs for work in the FBW SCS certification boundary must be closed prior to the system being released for unrestricted use, Fast Cruise or Sea Trials. As part of the

work control procedure closeout process, RECs must receive an independent review within the activity performing the work to verify:

(1) Work was authorized and approved.

(2) Work stayed within the authorized boundaries.

(3) Post work or maintenance testing was accomplished satisfactorily.

(4) Appropriate Quality Assurance Forms are included to document Certification of Maintenance, and all forms are completed with required signatures.

b. All testing of the FBW SCS Boundary must be verified closed prior to the system being released for unrestricted use, Fast Cruise or Sea Trials.

c. As a policy, RECs for work within the FBW SCS certification boundary or test documents within the FBW SCS Boundary must not be closed out until resolution of all actions necessary to verify certification has been maintained when any breach of the boundary has occurred. An acceptable alternative, however, is to close out a REC or test documents within the FBW SCS Boundary by transferring remaining at sea testing actions to a separate auditable accountability system (i.e. DFS). All RECs closed in this manner must be annotated by the activity with the reference documents that contained the transfer actions. This policy must be verified by the activity accomplishing the work, supervising authority, submarine Commanding Officer and ISIC.

d. Prior to each underway for submerged operations, Commanding Officers of FBW SCS submarines will submit to ISIC (deployed ISIC, if deployed), a written certification continuity report, which addresses the status of Ship's Force FBW SCS REC, testing of FBW SCS, URO maintenance requirements in the format of Appendix B. If no FBW SCS controlled work or testing were accomplished, no report is required.

5.9.4 Objective Quality Evidence to Support Controlled Work on Fly-By-Wire Ship Control System Submarine Flight Critical Component. To standardize maintenance OQE, the sub-paragraphs a through c provide guidance on the key elements needed to be documented to certify the work process, whether routine maintenance, major repairs, system upgrades or alterations. Reference (v) provides OQE requirements including additional attributes to be included as part of the FBW SCS certification boundary work control process.

NOTE: THE ISIC IS ONLY RESPONSIBLE TO AUDIT FBW WORK PERFORMED BY FORCES AFLOAT OR TYCOM MANAGED ACTIVITIES.

a. Activities performing work on FBW SCS within the FBW SCS certification boundary should use this information, along with source documents, as a guide in developing OQE records that document work, inspections and tests performed within the FBW SCS certification boundary.

b. The elements listed are technical specifications and process documents required for a typical repair or system upgrade or alteration process.

c. If Upgrades, Alterations or Major Repair Work of the FBW SCS was performed, the ISIC will accomplish a 100% audit, as defined in Part I, Chapter 9 of this volume, of the work. ISIC and TYCOM will use the FBW message reporting process for

certification specified in Volume II, Part IIII, Chapter 3 of this manual, for availabilities of less than six months duration.

5.10 AIRCRAFT CARRIER MAINTENANCE DOCUMENTS.

5.10.1 Purpose. The purpose of this section is to provide amplifying or clarifying information on the processes involved and appropriate use of specific aircraft carrier maintenance related documents. Including:

a. Request for Departure from Specification (DFS), Waivers or Deviation.

b. Nuclear Liaison Action Request (LAR).

c. Nuclear Liaison Inquiry (NLI).

d. Steam Plant Action Request (SPAR).

e. Steam Plant Liaison Inquiry (SPLI).

f. Reactor Plant Configuration Change Report (RPCCR).

g. Planned Maintenance System (PMS) Technical Feedback Reports (TFBR).

h. Tech Manual Deficiencies & Manual Change Requests.

i. Fleet Coordinated Shipboard Allowance List (COSAL) Feedback Reports.

5.10.2 Non-Nuclear Deviations, Waivers and Departure from Specifications. The terms "deviation" and "waiver" are often used synonymously. However, the principle difference is a deviation is requested prior to conducting work that will result in a non-conformance, where a waiver is requested after a non-conformance has been discovered. Requests for deviation and waivers must be retained and tracked within the DFS system by Ship's Force and the ISIC or TYCOM until permanent documentation is confirmed to reflect the specific non-conforming condition. Use of the Web Based Electronic Departure from Specification or Electronic Waiver and Deviation programs facilitate meeting these requirements. A DFS (non-nuclear system or components only) is used specifically to identify a lack of compliance with plans, procedures, instructions, or authoritative documents during a maintenance action or operations.

5.10.2.1 During a Maintenance Action. A DFS is required for any lack of compliance with cognizant documents or drawings. For an "as found" condition during maintenance, the TYCOM, the ship and the Regional Maintenance Center (if involved) must evaluate the non-compliance using the guidance of paragraphs 8.2.5 and 8.2.6, of Part I, Chapter 8 of this volume to determine if the nonconforming condition meets the criteria as a Major or Minor DFS.

NOTE: IF THE SHIP IS AT SEA THE GUIDANCE OF PARAGRAPH 8.3.8 OF PART I, CHAPTER 8 OF THIS VOLUME APPLIES.

5.10.2.2 During Operations. A DFS is required for any lack of compliance with cognizant documents or drawings. For any "as found" conditions or equipment failures that result in a non-compliance, the ship (or TYCOM if in port) must evaluate the condition or failure using the guidance of paragraphs 8.2.5 and 8.2.6 of Part I, Chapter 8 of this volume to determine if the nonconforming condition meets the criteria as a Major or Minor DFS.

a. If the nonconforming condition does not meet the criteria as a Major or Minor DFS, no DFS is required and the nonconforming condition will be entered in the ship's

Current Ship's Maintenance Project (CSMP). This CSMP entry must include the DFS serial number, On-Site Analysis Report serial number (if applicable) or other technical references documenting or tracking the non-conformance.

b. If a DFS is required, the request should be processed as soon as possible to enable an engineering evaluation of the non-conformance and subsequent approval or disapproval issued without disrupting ship's operations.

c. Requests for DFS will be submitted, approved and cleared per paragraph 8.3.7 or 8.3.8 of Part I, Chapter 8 of this volume. Use of the Web Based Electronic Departure from Specification and Electronic Waiver and Deviation programs are acceptable unless directed otherwise by TYCOM.

d. If a DFS is approved as "temporary" and requires rework to correct the discrepant condition at a later date, a new CSMP entry for correction of the discrepant condition will be initiated by the ship. This CSMP entry must include the DFS serial number, On-Site Analysis Report serial number (if applicable) or other technical references documenting or tracking the non-conformance. The ship's QAO must ensure this action is accomplished.

e. The QAO must verify that an active Job Control Number (JCN) exists for all active temporary DFSs at the completion of all scheduled maintenance availabilities or at least quarterly and must ensure that an auditable record of such verification is maintained until superseded.

f. For all DFSs, deviations or waivers that have been adjudicated, the approving activity is required to provide a copy of the DFS, deviation or waiver to the ship's QAO for retention and tracking per Part I, Chapter 8, paragraph 8.3.1.e of this volume.

5.10.3 Liaison Action Requests – Nuclear Cognizant Areas.

5.10.3.1 Technical Responsibilities. A memorandum of agreement exists between NAVSEA Nuclear Propulsion Directorate (08) and NAVSEA PMS 312/335 that details the division of responsibilities within the propulsion plants of nuclear powered ships. If a nuclear powered ship is unable to comply with specifications for reactor plant systems or components and also those systems identified as nuclear by the appropriate nuclear or non-nuclear interface diagram, then a review of NAVSEA 08 requirements must be requested via a LAR. A formal resolution of all LARs is generally required prior to reactor plant or propulsion plant startup.

5.10.3.2 Technical Resolution. In general, technical resolution to questions or problems for reactor plant systems or components requires the submission of a LAR for nuclear powered surface ships per the requirements set forth in Appendix 4 (Liaison Services) of reference (d).

a. Request for DFSs for nuclear systems will neither be requested nor approved. If a ship has a question, problem, or is unable to comply with any nuclear specification, a request for technical resolution will be made using a LAR.

b. A LAR should not be submitted for cases of out of specification seat leakage of nuclear valves following repairs. The Reactor Plant Planning Yard and Reactor Plant Prime Contractors do not have the authority to waive valve leakage specifications. When valve seat leakage exceeds reactor plant manual specification after attempted

Ship's Force or FMA repairs, the guidance of Part I, Chapter 8, paragraph 8.4.2.c. of this volume may be used to defer any rework to a later date and close out the CWP.

c. A LAR is also never used for removing or reprogramming work, to or from, an Availability Work Package (AWP).

(1) AWPs for Chief of Naval Operations availabilities are developed or changed per Section 5.1.1 and Appendix D or F of the Aircraft Carrier Class Maintenance Plan (ACCMP).

(2) The ACCMP can be found on the Carrier Team One web site under "Resources/Library".

d. An auditable LAR file must be maintained by the originating activity. A copy of the status of all liaison actions LAR must be kept as part of this file with a copy maintained in the applicable Controlled or Formal Work Package, as required.

5.10.4 Nuclear Liaison Inquiry – Nuclear Cognizant Areas. Refer to reference (d) for Nuclear Liaison Inquiry information.

NOTE: INFORMATION ON THIS SUBJECT IS SAFEGUARDED PER REFERENCE (U).

5.10.5 Steam Plant Action Request - Non-Nuclear Cognizant Areas. In 2003, the Propulsion Plant Engineering Activity (PPEA) was formed as an additional resource for assisting operational aircraft carriers with technical or operational issues, not associated with Ship Alteration Installation or configuration control.

a. The Steam Plant Action Request (SPAR) is designed to allow the fleet and maintenance activities to submit requests for technical assistance on non-Ship Alteration related issues. The Carrier Engineering Team (CET) will assist in providing solutions which satisfy specification requirements, supply a technical evaluation or the basis for concurrence or non-concurrence with a deviation or proposed change. Where sufficient information is not available to resolve the problem, the CET may request additional information in a reply. Each SPAR will be categorized based on the type of action taken in the proposed reply.

b. As with a LAR, if a ship or FMA has a question or technical problem or is unable to comply with a non-nuclear specification, technical assistance is available from the In-Service CET. CET Liaison services are requested using the SPAR discussed in detail in Appendix 4 of reference (d).

5.10.5.1 Usage. SPARs requesting changes or deviations from specification must not be submitted or approved by the CET. The SPAR is not a substitute for a Request for DFSs described in Part I, Chapter 8 of this volume.

a. SPAR should be submitted by the ship or FMA to the PPEA to address technical, logistical or operational problems with the steam and electric plant systems. It is the intent of these requirements to ensure consistency between fleet units and overhaul and repair activities in the content, format and completeness of SPAR submissions. The SPAR is not intended to replace Ship's Force and Overhaul or Repair Yard communication with the CVN68 class Engineering Configuration Manager for

drawing and Ship Change Document or ShipAlt installation and configuration control issues using LARs prepared per reference (x).

b. Examples of when generation of a SPAR is appropriate are:

(1) Receipt of spurious De-Aerating Feed Tank level alarms during maneuvering transients that the performance of available preventive maintenance and technical manual troubleshooting does not correct.

(2) Failure of the Emergency Diesel Generator to parallel across the Emergency Diesel Generator output breaker during a normal Emergency Diesel Generator feedback per the Steam Plant Manual and troubleshooting do not correct or identify the cause of the failure.

(3) Failure of a normal seeking Automatic Bus Transfer to transfer to its normal source upon a return of the normal power supply and Ship's Force is unable to identify the cause through available troubleshooting methods.

c. The SPAR is not intended to replace:

(1) The CSMP for work requests or candidates.

(2) TFBRs for discrepancies with the PMS System.

(3) Technical Manual Feedback for identifying discrepancies in technical manuals.

(4) Reporting changes to ship's configuration as a result of the Navy Modernization Program.

d. A SPAR is also never used for removing or reprogramming work to or from an AWP.

e. AWPs for Chief of Naval Operations availabilities are developed per Section 5.1.1 and Appendix D or F of the ACCMP. The ACCMP can be found on the Carrier Team One web site under the "Resources/Library" tab.

5.10.5.2 Validation. Upon receipt of a SPAR, the PPEA makes a determination, with NAVSEA concurrence as needed, as to whether the SPAR is a valid request. Once validated, the PPEA will route the SPAR to the appropriate cognizant engineering activity for resolution. If the appropriate activity is not clear, i.e. in the case of overlapping areas of cognizance, NAVSEA 05V will determine which organization will provide resolution. SPAR responses meeting the following criteria DO NOT require NAVSEA approval and the PPEA has the authority to provide a final resolution to the requesting activity.

a. The request concerns a PPEA cognizant system or component as defined in Enclosure (1) to PPEA-1.

b. The request does not change:

(1) Engineering System Diagrams.

(2) System diagram attributes, such as system design or performance characteristics, material, pipe size, etc.

(3) Steam Plant Manual.

(4) Component Procurement Specifications.

(5) Component Technical Requirement documents.

(6) Component technical manuals.

(7) System testing requirements.

(8) GSO requirements.

c. The request has no impact on Reactor Plant systems or components.

5.10.5.3 Categories. Actionable SPARs fall into one of four categories: Emergency, Urgent, Routine, and Date Needed By. Informational SPARs typically do not require a response. Emergency, Urgent, Routine and Date Needed By SPARs require an approved response delivered to the originator as indicated here:

a. Routine – within 20 business days.

b. Urgent – within 5 business days.

c. Emergency – within 1 business day (24 hours).

d. Date Needed by: Date specified by the originating activity to support upcoming evolutions or ship's schedule.

5.10.5.4 Coordination. Once a CVN SPAR response is developed, it is subsequently forwarded to NAVSEA 05V for approval. NAVSEA 05V1 coordinates the review and approval process for the various NAVSEA agencies. Any NAVSEA comments to the SPAR response are communicated directly to the responding activity during the approval process and then adjudicated. The approved SPAR response is returned to PPEA, who distributes the response to the ships and appropriate activities. The PPEA provides record retention services for all SPAR responses.

5.10.5.5 Routing. In addition to preparing SPAR responses, the PPEA is tasked as the Process Manager for both the SPAR and SPLI Programs. This involves dispositioning SPARs received, routing to the appropriate activity for resolution, routing of responses to NAVSEA for approval and distribution of approved responses to the requestor and other activities as appropriate.

5.10.5.6 Status. The EFORMS application maintains the status of all SPARs. This application includes the date the SPAR was received, the date the responding activity approved the response, the date the SPAR response was sent to NAVSEA, the current responsible party and current routing status. Reports listing all outstanding and completed SPARs for a desired time period can be retrieved from the application via the search engine function.

5.10.5.7 Software. Naval Sea Logistics Center is responsible for maintaining the EFORMS application that tracks SPAR status from receipt to completion, maintaining a historical file of completed SPARs, and having the ability to provide CET and PPEA management with meaningful statistics on SPAR processing.

5.10.5.8 Process Map. The PPEA SPAR Process Map is shown in detail in Figure 5-4 of this chapter.

5.10.6 Steam Plant Liaison Inquiry – Non-Nuclear Cognizant Areas. SPLIs are the Steam Plant equivalent of an NLI. SPLIs are used by the CET to request information, disseminate technical information associated with the Steam Plant, or direct work that does not require a drawing change or affect system configuration control, to the Fleet and overhaul activities. This

document is intended to be a data collection tool only, and in general will not direct Forces Afloat to accomplish any repair, modification, or alteration to systems or components. Following NAVSEA approval, a SPLI is issued to the applicable TYCOM(s), who will forward the request to the appropriate ships via official letter. Each activity must maintain an auditable file, containing all information associated with each incoming and outgoing (answered) inquiry. A SPLI may be necessary to obtain specific data and other information from Forces Afloat during development of SPAR responses and other CET products.

5.10.6.1 Process Manager. In addition to preparing SPLI's, the PPEA is tasked as the Process Manager for both the SPAR and SPLI Programs. Additionally, the PPEA is responsible for maintaining an SPLI logbook or database and providing a historical file of completed SPLIs.

a. The PPEA is responsible for keeping track of SPLIs in routing for concurrence, SPLIs issued to the fleet for accomplishment and ensuring the logbook is updated as SPLIs are completed.

b. The PPEA will route a copy of all SPLI responses received to the SPLI originator and other parties as applicable. If a SPLI request has exceeded the requested due date without the required response, the applicable CET representative must contact the TYCOM to establish a revised due date. The final status of an SPLI must be noted in the SPLI logbook or database.

c. The status of outstanding SPLIs will be reported monthly. The activity's report will be maintained by the PPEA SPAR or SPLI Process Manager and will list only those SPLIs which require a response.

5.10.6.2 Amplifying Information. Amplifying information is provided in the NLI or SPLI Process Map (Figure 5-5 of this chapter).

5.10.7 Reactor Plant Configuration Change Report. RPCCRs are used to report any and all changes to the configuration of any NAVSEA 08 cognizant space. This includes SHIPALTs, Ship Class Drawings, NLIs or any other form of authorized change. Addresses can be found in reference (d) or obtained through the TYCOM as needed.

a. Formal instructions for completion of RPCCRs is found in Appendix 11 of reference (d). Blocks 1 - 30 (31 if needed) must be filled out per the instructions found in Appendix 11.

b. Commanding Officers are directed to forward RPCCR(s) to NAVSEA 08 by official letter, similar to the sample in Appendix E of this chapter, using ship's letterhead with copies to the TYCOM, ANSTR Pittsburgh and A4W/A1G RPPY. The command is responsible to utilize the appropriate distribution, destruction control statements and markings to the RPCCR.

Figure 5-4 - PPEA SPAR Process Map

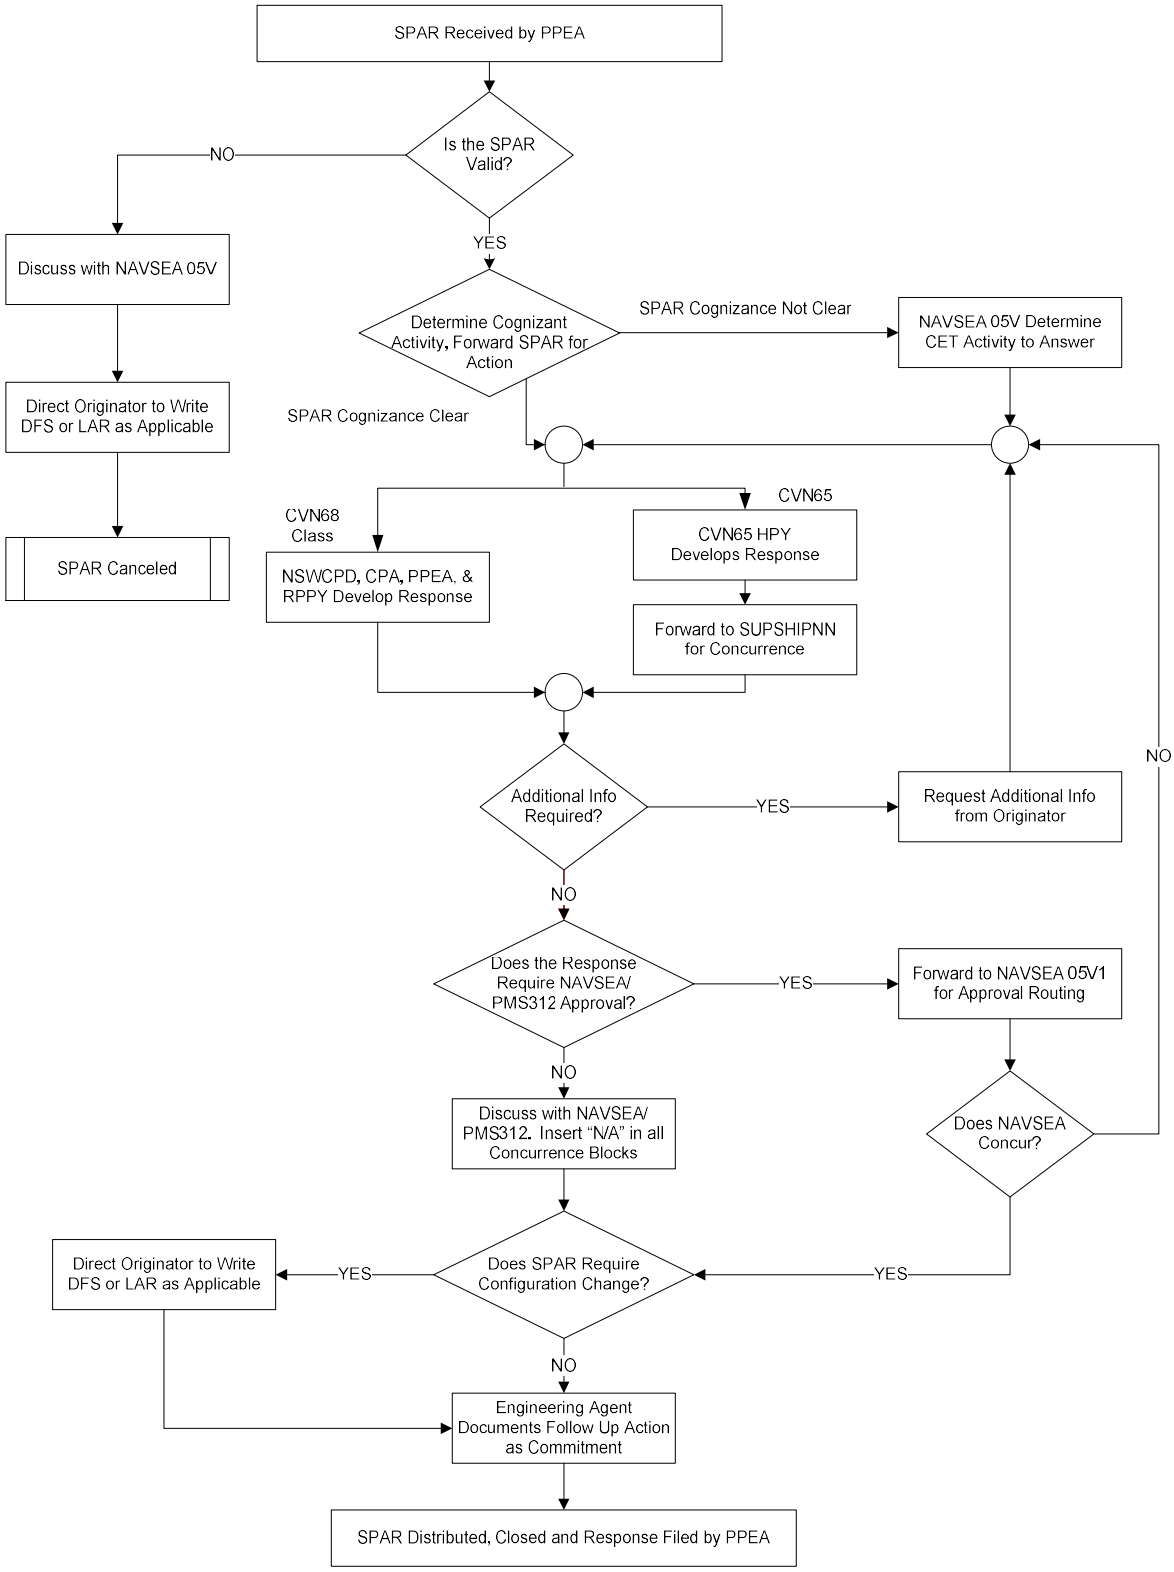


Figure 5-5 Overall NLI or SPLI Process Map

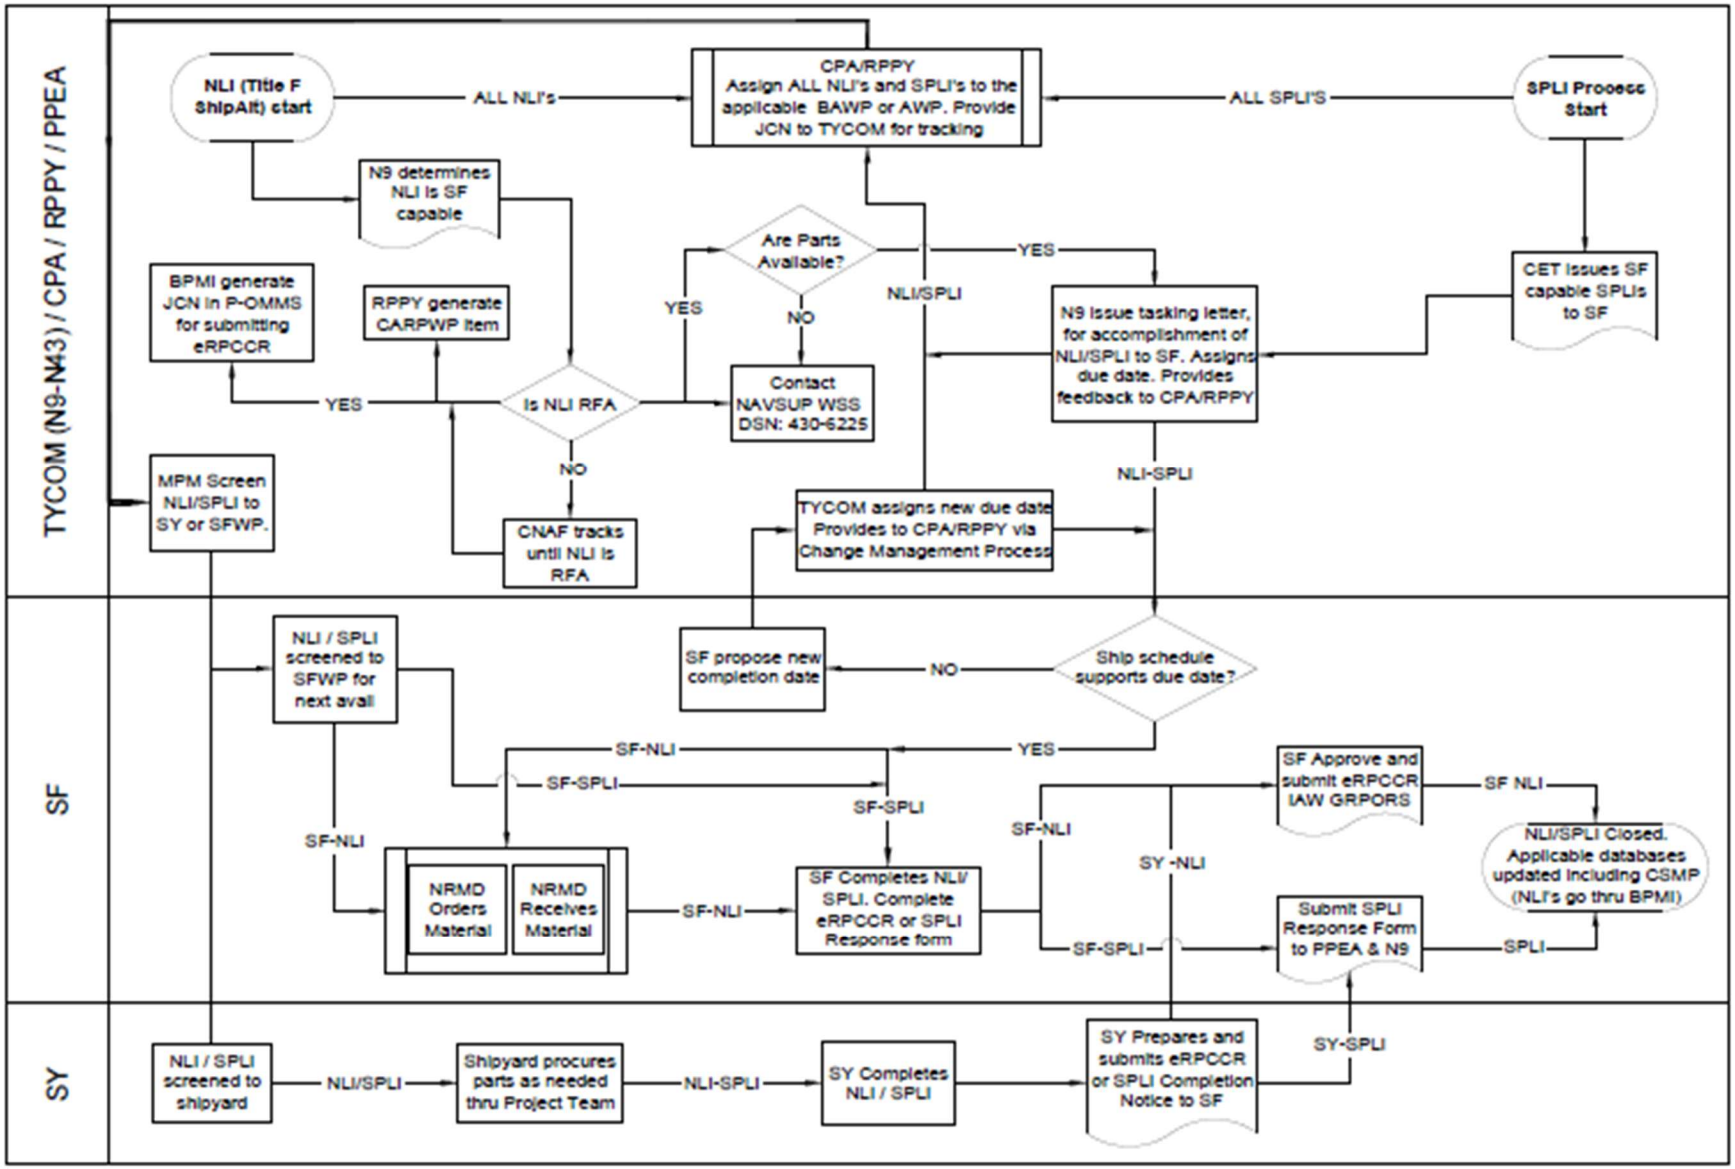

5.10.8 Technical Manual Deficiencies and Manual Change Requests.

5.10.8.1 Technical Manual Maintenance. Technical Manuals (TM) must be maintained current at all times. TMs associated with hardware must reflect current hardware configurations. Changes to hardware accordingly, must be accompanied by changes or revisions to the TMs. TMs must also be changed or revised to correct known deficiencies in the technical content in instances not related to hardware modifications.

5.10.8.2 Technical Manual Feedback Reporting. A TM Feedback is used to report deficiencies to Naval Sea Systems Command (NAVSEA) TMs and Technical Publications Deficiency Reports (TPDRs) are used to report deficiencies to Naval Air Systems Command (NAVAIR) TMs. For NAVSEA and NAVWAR TMs, deficiencies are reported by submitting a TM Feedback. The use of the TM Feedback is limited to routine, non-emergency problems. A Naval message shall be sent in those instances where a TM deficiency constitutes an urgent problem, (i.e., involves a condition, which if not corrected, could result in injury to personnel, damage to the equipment, or jeopardy to the safety or success of the mission).

5.10.8.3 Urgent Feedbacks. An urgent feedback is one that involves the safety of personnel, the ability of the crew to operate and maintain the system or equipment, or possible damage to or degradation of the equipment.

a. A standard Joint Message Form (DD Form 173) shall be submitted to report urgent deficiencies. As appropriate, send a message to the TYCOM, Systems Command (i.e., NAVSEA for NAVSEA TMs), In-Service Engineering Agent (ISEA), and Technical Manual Manager (TMM). The following required information must be included in the message:
   (1). Publication or TM number
   (2). TM volume and part number (if applicable)
   (3). TM publication date (effective date of TM, revision, or change)
   (4). System and equipment nameplate nomenclature (MK, Mod, or A/N) to which the TM applies
   (5). TM title
   (6). Deficiency Report Control Number UIC - YY (Unit Identification Code and Year) and any four numbers, e.g., N46678-03-0001
   (7). Deficiency location (page, paragraph, line, and or figure number, etc.)
   (8). Recommended change (corrective action required) (narrative)
   (9). Originator’s name, work center, code, title, rank, rate or grade
   (10). Year, month and day the deficiency report is prepared
   (11). DSN, commercial and FAX number of originator (if possible)
   (12). Ships’ hull number or activity name and address
   (13). Originator’s and/or supervisor’s or Department Head’s e-mail address

b. For users with a MBPS account, the most expedient manner of TM Feedback submission is directly in MBPS. See para 5.10.8.4 for details to submit via MBPS. There are attributes on TM Feedbacks in MBPS for identifying Urgent/Safety feedbacks.

5.10.8.4 Routine Feedbacks. TM Feedbacks can be submitted via the following methods:

a. The preferred method is to submit directly into Model Based Product Support (MBPS); https://mbps.navseaplm.navy.mil/Windchill/ To request a MBPS account submit a ticket to the National Help Desk (NHDSM), https://nhdsm.navair.navy.mil/ (DoD PKI Certificate required). This method allows the originator to submit the feedback directly into MBPS including uploading attachments.

b. Submit a ticket via NHDSM. When submitting the ticket include a completed copy of NAVSEA 4160/1. All data submitted via NHDSM will be unclassified only.

c. Email a completed copy of NAVSEA 4160/1 to nav_helpdesk.fct@navy.mil. All data submitted will be unclassified only.

d. For non-help desk account holders submit the feedback via the following link (CAC or ECA Cert Required): https://nhdsm.navair.navy.mil/HEAT/default.aspx . When submitting the ticket include a completed copy of NAVSEA 4160/1. All data submitted will be unclassified only.

e. For U-NNPI and Classified data continue to use the paper copy of NAVSEA 4160/1 and submit using the current process. This process includes creating a record in MBPS or the Help Desk, the TM Feedback ID number should be referenced in the paper submittal.

5.10.8.5 TM Feedback Responses. The originator of a TM Feedback can expect a response from the TMM within 30 calendar days for a routine TM Feedback. The response will cite the corrective action, the appropriate scheduled time frames, future action planned by the TMM, or other pertinent information. In addition, the TM Feedback Originator can track progress directly in MBPS.

5.10.9 Fleet COSAL Feedback Report.

5.10.9.1 Usage. This report is used specifically to call attention to and seek correction of any technical deficiencies found on Allowance Parts Lists (APL) or Allowance Equipage Lists (AEL), including those covered under P-OMMS. For example:

a. The part or item is not listed on the APL or AEL, but is considered to be a “maintenance significant item”.

b. APL is incomplete or is missing information, such as characteristics data, technical manual number, etc.

c. Incorrect part or item listed on APL or AEL.

d. Allowed quantity insufficient for PMS requirements.

e. Part number in technical manual does not agree with APL.

f. Non-allowed part required for PMS.

g. APL technical problem such as incorrect Minimum Replacement Unit assignment.

h. Source, Maintenance and Recoverability Codes and Allowance Note Codes noted on APL or AEL are not defined in any publication held.

i. Suspected error in code assignments, e.g., Source, Maintenance and Recoverability Codes, Note Codes, etc.

j. Circuit symbol number in Electronics APL (Section B) crosses to incorrect reference number or stock number.

5.10.9.2 Misuse. This report is not to be used to:

a. Address any matters relating to Nuclear Reactor Plant COSAL ("Q" COSAL). Matters relating to Q-COSAL should be addressed by LAR through A4W RPPY

b. Report equipment configuration changes. Ship's Configuration Change Form, OPNAV 4790/CK, is to be used for this purpose. RPCCR for nuclear cognizant systems.

c. Request changes in allowance for repair parts or equipage. Use NAVSUP Form 1220-2, except in cases when the allowance problem is caused by technical deficiencies in the COSAL, such as incorrect Minimum Replacement Unit assignment, PMS requirement not reflected in Standard Navy Stock List or Installation Sequence List etc. See reference (y) for further details concerning this form.

5.10.9.3 Form Location. An editable Fleet COSAL Feedback Report (NAVSUP Form 1371) can be downloaded from Navy Forms Online web site at https://forms.documentservices.dla.mil/order/ and submitted hardcopy or completed online from the Navy Enterprise Service Desk (NESD). Service Offering https://nesd-dwp.onbmc.mil/dwp/app/#/catalog/category/11902/SBE/SBE. Refer to Appendix F. Distribution of the form should be:

a. Original to NAVSEALOGCEN Code N42.

b. Copy to Ship's Supply Officer.

c. Copy retained by Originator.

5.11 ADDITIVELY MANUFACTURED PART MAINTENANCE ACTION REPORTING AND GUIDANCE.

a. Purpose. Additively manufactured (AM) parts installed in shipboard equipment, systems and or used on board naval vessels must be documented. Previously this was accomplished by using a departure from specification. NAVSEA specified the use of Ship's Maintenance Action Form, OPNAV 4790/2K (2-Kilo),to meet the requirement of documenting AM materials on board naval vessels.

b. Process. Table 1 outlines details to be included when reporting that an AM part has been installed and includes instructions on how to request that manufacture of AM parts by a supporting activity. When preparing the 2-Kilo, complete all the data specified if known. It is understood some information may be unavailable or unknown.

Table 1 Required Information for Additively Manufactured Part Installation Reporting

2-Kilo Field Entries [4, 5]		AM Part Produced by Ship		AM Part Produced by Support Activity	
	Part Approved? [1]	Yes	No	Yes	No
	APL-AEL	APL or AEL of part being replaced			
	Equipment Identification Code (EIC)	EIC or next higher assembly			
	Action taken	2Z or 2	2Z or 2	1 or 2	2
	Remarks and Description: 1. Problem Description	Lead time, failure frequency, cost, availability, etc.	Lead time, failure frequency, cost, availability, etc.	Lead time, failure frequency, cost, availability, etc.	Lead time, failure frequency, cost, availability, etc.
	2. Recommended Solution	Part number to install from AM Technical Data Package (TDP), NIIN, or NSN of part being replaced.	Description of unapproved part to be installed, NIIN, or NSN of part being replaced.	Part number to be produced by supporting activity and installed from AM TDP, NIIN, or NSN of part being replaced.	Description of unapproved part to be produced by supporting activity and installed, NIIN, or NSN of part being replaced.
	3. Actual Solution [3]	"3DAM/PA/(Part Name)", printer make and model, material used, part number from AM TDP.	"3DAM/N/(Part Name)", Departure from specification (DFS) number that authorized part install, printer make and model, material used, 3D model file name.[2]	"3DAM/PA-O/(Part Name)", printer make and model, material used, part number from AM TDP.	"3DAM/O/(Part Name)", DFS number that authorized part install, printer make and model, material used, 3D model file name.[2]

Note 1: AM parts that have been approved by NAVSEA are listed on the Joint Technical Data Integration (JTDI).

Note 2: AM part files (e.g., 3D CAD file, test results, etc.) shall be transferred via JTDI system or email to NAVSEA 05 (NAVSEA_AM@us.navy.mil), with a reference to the associated Job Control Number (JCN).

Note 3: "Part Name" should be listed in the approved TDP title block, or a short description of the part for unapproved AM parts.

Note 4: Use AM work center (W/C) for Repair W/C or Asst. Repair W/C, where applicable. Units will annotate 3DAM in the beginning of applicable work center 2-Kilo CSMP Summary and in the problem and solution blocks (block 35 and block 37).

Note 5: For parts manufactured in the field, marking the part is required. Parts should be permanently marked in accordance with the TDP, if available. If not, parts should be marked with the JCN initiating the AM W/C support request.

APPENDIX B

FORMAT FOR SUBMARINE CERTIFICATION CONTINUITY REPORT

From: USS (*Ship's Name*)
To: ISIC _____ (Note 1) Deployed ISIC (If applicable)
Info: Parent ISIC (Applicable in all cases when deployed)
Additional Addees (Note 2)

Subj: CERTIFICATION CONTINUITY

Ref: (a) COMUSFLTFORCOMINST 4790.3 - Joint Fleet Maintenance Manual, Volume V
(b) NAVSEA 0924-062-0010 - Submarine Safety (SUBSAFE) Requirements Manual
(c) NAVSEA T9044-AD-MAN-010 - Requirements Manual for Submarine Fly-By-Wire Ship Control Systems

1. Per reference (a) and (b), all work performed within the SUBSAFE Boundary has been completed and satisfactorily retested except as noted in paragraph 2. There are no outstanding RECs for equipment or systems required for underway operations.

2. The following Controlled Work Packages or RECs were closed by transferring the remaining at-sea testing to a Departure from Specifications.

CWP/REC Serial No.	DFS Serial No.	Type	Component

3. All URO MRC mandatory tests or inspections have been successfully accomplished within the required periodicity. The following URO MRC requirements which have become due since the last underway period or which would have become due during this scheduled at-sea period have been completed during the preceding inport period as indicated or require at-sea operations and will be accomplished prior to the listed due date:

URO MRC	Component Ident	Next Due (MO/YR)

4. A copy of Ship's Force completed URO MRC completion letters and data report forms have been provided to the ISIC.

5. Per reference (a) and (c), all work performed within the Submarine Fly-By-Wire Ship Control System Boundary has been completed and satisfactorily retested. There are no outstanding MCRs for equipment or systems required for underway operations.

NOTE 1: THIS CERTIFICATION REPORT MAY BE PROVIDED TO THE ISIC IN THE FORM OF A MEMORANDUM, MESSAGE, OR LETTER.

NOTE 2: ADDITIONAL ADDEES SHOULD BE ADDED AS NECESSARY BASED ON SITUATION (E.G., REPORT FOR UNDERWAY TRIALS DURING MAJOR INDUSTRIAL AVAILABILITIES WOULD NORMALLY INCLUDE SHIPYARD, NAVSEA AND TYCOM).

NOTE 3: IF NONE WAS ENTERED IN PARAGRAPH 3 THEN OMIT PARAGRAPH 4. PARAGRAPH 4 IS ONLY REQUIRED IF URO MRC ITEMS WERE COMPLETED BY SHIP'S FORCE.

NOTE 4: IF NO WORK ON THE SUBMARINE FLY-BY-WIRE SHIP CONTROL SYSTEM WAS PERFORMED, PARAGRAPH 5 IS NOT REQUIRED. PARAGRAPH 5 IS ONLY REQUIRED IF WORK ON THE SUBMARINE FLY-BY-WIRE SHIP CONTROL SYSTEM WAS PERFORMED.

NOTE 5: DELIVER THE CERTIFICATION CONTINUITY REPORT VIA ANY MEANS SUITABLE FOR OFFICIAL CORRESPONDENCE AGREED TO BY THE ISIC.

APPENDIX C

FORMAT FOR FLEET MAINTENANCE ACTIVITY CERTIFICATION REPORT TO TENDED SUBMARINE

Ser

From: Commanding Officer, (FMA)
To: Commanding Officer, (Tended Submarine)

Subj: CERTIFICATION CONTINUITY OF USS (*Tended Submarine*)

Ref: (a) COMUSFLTFORCOMINST 4790.3 - Joint Fleet Maintenance Manual, Volume V
(b) NAVSEA 0924-062-0010 - Submarine Safety (SUBSAFE) Requirements Manual
(c) NAVSEA T9044-AD-MAN-010 - Requirements Manual for Submarine Fly-By-Wire Ship Control Systems

Encl: (1) Copies of completed Re-entry Controls (REC)
(2) Copies of approved Departures from Specification (DFS) and Liaison Action Requests (LAR)
(3) Copies of completed MCRs for Submarine Fly-By-Wire Ship Control System

1. Per reference (a), (b) and (c), certification of those SUBSAFE or Fly-By-Wire Ship Control Systems or portions of SUBSAFE or Fly-By-Wire Ship Control Systems, on which the FMA performed maintenance, has been sustained by the FMA. All required re-certification of the maintenance has been completed except as noted in paragraphs 2 and 3.

2. All CWPs for SUBSAFE or Fly-By-Wire Ship Control Systems opened by the FMA for maintenance have been closed and a copy of each completed REC/MCR is forwarded as enclosures (1) and (3) respectfully:

CWP Serial No.	Task Description	Reason Deferred

3. The following Departures from Specifications (DFS) and Liaison Action Requests (LAR) for deviations from specification were approved as part of FMA maintenance in the SUBSAFE or Fly-By-Wire Ship Control System boundary. Copies of each are provided as enclosure (2):

CWP Serial No.	DFS or LAR Serial No.	Type	Component

4. The following URO maintenance requirements were satisfied and are reported as complete by the FMA. The original data report forms will be mailed to SUBMEPP with copies to your ISIC within 30 days.

URO MRC	EGL (if applicable)	Component Identification	JCN

Copy to:
Parent ISIC for ship
Parent ISIC for FMA

APPENDIX D

FORMAT FOR NON-FLEET MAINTENANCE ACTIVITY CERTIFICATION REPORT TO TENDED SUBMARINE

From: Commander, <Activity Name>
To: Commanding Officer, <USS *Ship Name* and Hull Number> Commander <Squadron Number>

Subj: CERTIFICATION CONTINUITY OF USS <Ship Name and Hull Number>, <Availability Number>

Ref: (a) NAVSEA 0924-062-0010 <Insert Rev>, Submarine Safety (SUBSAFE) Requirements Manual

(c) NAVSEA T9044-AD-MAN-010 <Insert Rev>, Requirements Manual for Submarine Fly-By-Wire Ship Control System (FBW SCS)
(d) COMUSFLTFORCOMINST 4790.3 <Insert Rev>, Joint Fleet Maintenance Manual

Encl: (1) List of Closed Re-Entry Controls <optional>
(2) List of Approved Departure From Specification (DFS) <optional>
(3) List of Scheduled URO-MRCs or HIPs Accomplished by the Activity <optional>

1. Per references (a), (b), (c) and (d), certification of SUBSAFE, DSS or FBW SCS systems on which <Activity Name> performed maintenance has been sustained. All required recertification of the maintenance has been completed as noted in paragraphs 2 through 6.

2. All REC/MCRs for SUBSAFE, DSS or FBW SCS (SFCC) systems opened by <Activity Name> for maintenance have been closed as noted:

REC/MCR Serial No	Task Description

<See enclosure (1) if needed>

3. The following Departures from Specifications (DFSs) for SUBSAFE, DSS or FBW SCS (SFCC) systems were approved as part of <Insert Activity Name> maintenance:

DFS Serial No.	Type	Component

<See enclosure (2) Part A if needed>

4. In addition to the DFSs listed in paragraph 3, the following DFSs were generated for work accomplished by <Activity Name> for the purpose of testing at Sea. If at sea testing is required, request Ship's Force report via naval message and inform <Maintenance Activity> of the results of at sea testing.

DFS Serial No.	Type	Component

<See enclosure (2) Part B if needed>

5. The following Scheduled URO-MRCs or HIPs were completed. URO-MRC or HIP data will be forwarded by <Activity Name> to SUBMEPP:

URO-MRC or HIPs	EGL (if applicable)	Component ID	JCN

<See enclosure (3) if needed>

6. <**Note: This paragraph is only applicable to those activities acting as an NSA or LMA**> Per reference (d) <Activity Name>, as Naval Supervisory Authority, reports that certification of SUBSAFE, DSS or FBW SCS systems for work accomplished by outside activities has been maintained based on the SUBSAFE, DSS or FBW SCS Certification Continuity letters as identified here:

APPENDIX F

NESD CUSTOMER SERVICE

NESD is the Navy point of entry for technical support and should be the first source of support utilized for technical assistance. NESD provides Fleet users with a centralized source for receiving and routing support requests and is available 24/7/365. NESD issues a tracking number to the requester, coordinates assistance with the appropriate Subject Matter Experts (SME), and monitors the issue until it is successfully resolved.

The NESD Digital Workplace (DWP) is the end user-facing Self-Service (Tier 0) solution to guide users to resolve issues on their own by utilizing Knowledge Articles and is the preferred method of trouble ticket entry. This platform enables user self-sufficiency, multiple communication channels – email, chat, and web form, and is simple to use. Follow the steps below to submit a trouble ticket:

Contact: Navy Enterprise Service Desk (NESD)

DWP: https://nesd-dwp.onbmc.mil (Search Knowledge Article/Ask for help)

Chat: https://nesd-dwp.onbmc.mil *(Select Chat with agent)*

Email: nesd@nesd-mail.onbmc.mil

Phone: 1-833-NESDNOW (637-3669)

DSN: NESD main menu is: 647-6373

SIPR Email Support: nesd.fct@navy.smil.mil

6.1 PURPOSE. To define responsibility and provide guidance for material control which includes procurement, receipt inspection, stowage, issue, in-process control, and records for controlled material used in maintenance.

6.1.1 Discussion. Controlled material is the term used in this manual to describe those materials designated for use in or removed from Submarine Safety (SUBSAFE), Level I (LI), Scope of Certification (SOC), Submarine Flight Critical Components (SFCC), and Nuclear LI systems which are in the custody of the end-user work center, division Controlled Material Petty Officer (CMPO) or are undergoing receipt inspection, have been certified for use and are tagged with the appropriate Quality Assurance (QA) forms of this manual. In this manual, material in the

custody of the Naval supply system, which includes the supply departments onboard ships and Fleet Maintenance Activities (FMA), is identified as LI stock program materials or nuclear repair parts. Reference (a) provides the special administrative and technical requirements that are levied by Naval Sea Systems Command (NAVSEA) for materials from fabrication to final installation for non-nuclear and nuclear controlled material, respectively. Section 6.3 of this chapter for non-nuclear material control provides direction for implementation of higher authority requirements pertaining to material control. Reference (b) and Part III, Chapter 6 of this volume provide specific requirements for receipt inspection and control of SOC material.

6.2 NUCLEAR.

NOTE: INFORMATION ON THIS SUBJECT IS SAFEGUARDED IN ACCORDANCE WITH OPNAVINST N9210.3.

6.2.1 Controlled Material Determination. This section describes the use of the specific references used to identify proper material for repair work. It is important that the difference between system and part Level of Essentiality be understood. A system may be LI, but this does not mean that every part in the system will be LI. This section also provides references and guidance necessary to obtain this understanding and to determine if controlled material is required, and if so, the proper level of control.

6.2.1.1 General Requirements. In order to determine the correct material to be installed in a ship and to properly certify the material prior to installation, the work center responsible for the specific area of the ship must first gather the appropriate reference material:

a. Drawings that specifically define the system and component.

b. System or Component Technical Manual.

c. Applicable Allowance Parts List (APL) from the ship's Coordinated Shipboard Allowance List (COSAL).

d. Component replacement manuals, etc.

e. NAVSEA Instructions.

f. Military Standards.

6.2.1.2 Determination of Required Repair Parts. Using the reference materials, the required repair parts will be determined by comparing the appropriate part number from the technical manual or drawing (if no technical manual) to the part numbers listed in the APL and therefore obtaining the National Stock Number (NSN) with associated Special Material Identification Code (SMIC), if assigned or listed on the APL.

NOTE: THE USE OF NUCLEAR REPAIR PARTS (NRP) WILL BE RESTRICTED TO THOSE SPECIFIC APPLICATIONS WHERE REQUIRED.

6.2.1.3 Determination of Level of Control. The next step is to determine if the material identified by the NSNs in paragraph 6.2.1.2 of this chapter is certifiable, if required, as controlled material for the system or component. In order to determine level of control required for the parts, the Level of Essentiality for the system and component must be determined for nuclear systems. Controlled material is used in systems designated with a Level of Essentiality per reference (c) for Nuclear LI.

NOTE: A SMIC (E.G., X1, X2, X3, X4, X5, X6, X7), IS ADDED TO THE END OF THE NSN. IT IS ASSIGNED TO SELECTED COMPONENTS AND REPAIR PARTS BY THE NAVAL SUPPLY SYSTEM AND IS USED FOR CONTROLLING THE ISSUANCE AND STOCKING OF THESE COMPONENTS AND REPAIR PARTS WITHIN THE NAVY SUPPLY SYSTEM. IT SHOULD NOT BE CONFUSED WITH THE LEVEL OF ESSENTIALITY. A SMIC IS AN ADMINISTRATIVE TOOL FOR THE SUPPLY SYSTEM. LEVEL OF ESSENTIALITY IS A TECHNICAL DESIGNATION APPLICABLE TO SPECIFIC PIPING SYSTEMS.

6.2.1.4 Nuclear Material Level Determination. The following can be used to assist in determining the required "Level of Essentiality" for the material:

a. Determine if the system to be repaired is nuclear. References (f) or (g) provide the process to determine if a system or component is considered part of the reactor plant and provide a listing of all nuclear and non-nuclear interface drawings.

b. Determine if the nuclear system and repair part is Nuclear LI by reviewing reference (c) and the piping system drawing. If the drawing designates the component as LI, or II, the component is equivalent to LI. Systems, material, or components designated as Nuclear Level III should be considered non-Level. In the absence of specific level designations, or if questionable or conflicting Levels of Essentiality exist, refer to references (a) and (c) for proper determination.

6.2.2 Controlled Material Procurement. This section provides general guidance for procurement of nuclear controlled material. It should be noted that NAVSEA and Naval Supply Weapon Systems Support (NAVSUP WSS) have adequate programs in place for procurement of controlled material for nuclear applications. Therefore, ships and repair activities should always obtain controlled material from the Navy supply system. This section also provides:

a. Background regarding NAVSEA and NAVSUP WSS controlled material procurement programs.

b. Summary of or reference to the NAVSEA and NAVSUP WSS requirements for nuclear controlled material procurement.

6.2.2.1 General Requirements.

a. NRP are procured by several Nuclear Material Procurement Programs and certified, when required by certain NAVSEA specifications (e.g., reference (e) for 2S-X1 components). NRP are generally identified in the supply system by SMIC codes X1, X2, X3, X4, X5, X6 and X7.

b. Nuclear LI material which meets acceptance criteria will be marked with a permanent Material Identification and Control (MIC) code when required by reference (a). A manufacturer's marking which provides traceability may be used in lieu of a MIC number.

6.2.2.2 Controlled Material Procurement.

a. Material for Nuclear Level I applications should be procured per references (a), (c) and (e). For reactor plant components and equipment, identified by a "2S" cognizance

NSN and "X1" SMIC, requisitions should include supplementary information required by reference (e). When substitute material must be used because the original material is no longer available, refer to references (f) and (g). Section 9020-0 of reference (f) for Submarines and Chapter 5 of reference (g) for Surface Ships identifies the Reactor Plant Replacement Component Technical Manual for each reactor plant.

b. When ordering nuclear material, the Q-COSAL and reference (e) should be used.

c. Nuclear Material Procured Outside the Supply System. Reference (e) states, "Fleet activities will not locally procure material for use in NRP applications. If non-stocked items are required, activities must submit non-standard requisitions to NAVSUP WSS according to Naval Supply Systems Command (NAVSUP) P-485". Requisitions for NAVSUP WSS managed NRP material must be prepared according to NAVSUP P-485 and applicable Type Commander (TYCOM) directives. Requisitions for NAVSEA Nuclear Propulsion Directorate (08) managed 2S/X1 components must be prepared according to reference (e).

6.2.3 Receipt Inspection of Nuclear Controlled Material. This section provides the guidance and procedures for forces afloat and FMAs to conduct and document receipt inspections to certify controlled material as acceptable for installation.

6.2.3.1 General Requirements. Once the material ordered for use in LI systems is received, the material must be receipt inspected per reference (a). Receipt inspection of this material is required to establish positively that the material is the correct material for the job.

NOTE: THE TECHNICAL INSPECTION REQUIREMENTS OF THE APPLICABLE TECHNICAL MANUAL, DRAWING OR OTHER TECHNICAL REFERENCE AND PIPING SYSTEM MATERIAL REQUIREMENTS (E.G., CLEANLINESS, DIMENSIONS, SURFACE FINISH) ARE THE RESPONSIBILITY OF THE END-USER (WORK CENTER SUPERVISOR OR CRAFTSMAN) TO ACCOMPLISH PRIOR TO INSTALLATION AND ARE NOT PART OF THE RECEIPT INSPECTION OF THIS MANUAL.

a. Reference (a) provides the controls and certain testing requirements that are levied by NAVSEA to cover the material from fabrication to final installation for nuclear material.

b. For Nuclear LI material, the unique requirement for "traceability" is invoked, meaning that a marking system is employed which links the material to Objective Quality Evidence (OQE). OQE for the material is the quantitative and qualitative data proving that the material conforms to specified requirements. To meet the requirements for traceability, the following requirements are instituted:

(1) Receipt inspection of the material.

(2) Use of QA tags in association with the item(s).

(3) Segregated stowage for Nuclear LI.

(4) Custody by CMPOs, Controlled Material Handlers (CMH), Quality Assurance Inspectors (QAI) or qualified craftsman.

(5) Use of material verification procedures, as required by reference (a), during installation of the material.

c. For Nuclear LI material, all signatures made on QA-form 2 (Material Identification and Control Tag) are considered to be certification signatures as defined in reference (h). The individual responsible for performing the certification must be indicated in each signature block on the QA form 2 and that person must understand their signature to indicate the following: "The person designated to sign for an action verifies, based on personal observation, and certifies by their signature that the action has actually been performed following the specified requirements."

6.2.3.2 Quality Assurance Forms for Receipt Inspections. The QA forms necessary to complete and document receipt inspections (QA form 1 and QA form 2) are addressed in paragraph 6.2.3.5 of this chapter.

6.2.3.3 Nuclear Receipt Inspection. The receipt inspection requirements for NRP as required by reference (a) are provided in paragraph 6.2.3.5, and will be used for the receipt inspection of Nuclear LI material.

6.2.3.3.1 Receipt Inspection of Nuclear Material. Controlled material for nuclear applications is designated as Nuclear LI. Reference (c) discusses the Nuclear Systems and the associated Level of Essentiality as either Nuclear LI or Level-none. Project Target Ready for Issue (RFI) tag (NAVSEA 9210/2, Figure 6-1 of this chapter or NAVSEA 9210/2, Figure 6-2 of this chapter) will be attached to all SMIC X1, X2 or X4 Nuclear LI RFI material. X1 material components and repair parts furnished by NAVSEA 08 prime contractor may not have RFI tags attached; however, this material is considered pre-certified and ready for use. The RFI tags depicted in Figure 6-3 and Figure 6-4 of this chapter will be attached to Nuclear LI or non-LI material, respectively, previously inspected by a Naval shipyard. SMIC X6 components and repair parts will not have RFI tags attached. X6 includes material formerly classified as X3 and X5 items that were procured as LI Material per NAVSEA 0900-070-6010. Additionally, material may be received with other tags (e.g., hydrostatic test tags per reference (i)).

a. Project Target is a NAVSEA nuclear material procurement program.

b. NAVSEA Prime Contractor. Material supplied by NAVSEA prime contractors may or may not have an RFI tag attached, but such material should be receipt inspected and handled the same as material received with an RFI tag. Material supplied by NAVSEA prime contractors is identified by a 2S cognizance or X1 SMIC NSN and N00024 in the contract number.

c. It should be noted that reference (a) only contains requirements for nuclear piping system MIC. Nuclear piping system material requirements (e.g., cleanliness, dimensions, surface finish) and requirements to perform technical inspections per the applicable material technical manuals are not included in reference (a).

6.2.3.4 General Requirements for Nuclear Material.

a. Supply departments of Fleet activities will perform the basic receipt inspection required by the appropriate NAVSEA, NAVSUP WSS instruction prior to placing the material into stock inventory. QA forms of this manual are not required to be completed or placed on the material by supply department personnel.

b. Material identification must remain on or with the material throughout all stages of stowage, fabrication and installation.

c. Material awaiting or undergoing receipt inspection will be segregated from accepted material.

d. If guidance in addition to that specified in paragraph 6.2.3.5 of this chapter is required, reference (a), Section 3.4 and reference (e), specifies the certification and receipt inspection requirements for Nuclear LI material.

e. The certification of the material, or verification the material is certified for use, will be accomplished by the end-user.

f. New Construction Ships. During outfitting, Nuclear LI material may be received without an RFI tag. The Supervisor of Shipbuilding must provide a "by-serial-number" list of NAVSEA Prime Contractor SMIC X1 components provided to the shipbuilder directly by the prime contractor. Additionally, the letter should state that since the material is from a prime contractor, it is exempt from the requirements to perform a generic material identity verification. A copy of this letter must be kept on file for reference by the ship and this letter should be treated as a permanent record.

g. Unit of Issue. QA form 2 (Material Identification or Control tag) will be attached to each accepted unit of issue (e.g., a valve, can of weld wire, length of barstock).

h. Package Alteration Kits. Package alteration kits should not normally be opened until the ship or FMA is ready to proceed with the installation, provided that a certification of the contents and a copy of the installation instructions are in the envelope on the outside of the box. When the ship or FMA is ready to proceed with the installation, the lead work center CMPO will open the kit and perform the receipt inspection.

6.2.3.5 Nuclear Material Receipt Inspection Procedures. The following tables are to be used as a guide in conducting a proper receipt inspection per reference (a). Disassembly of the item is not required or intended by any of these procedures.

a. Navy supply system material requisitioned for Nuclear LI applications.

NOTE: SHIP'S FORCE IS NOT REQUIRED TO USE A QA FORM 1 TO DOCUMENT RECEIPT INSPECTION OF NUCLEAR LI MATERIAL TO BE IMMEDIATELY INSTALLED FOR A SPECIFIC MAINTENANCE ACTION. A QA FORM 2 WILL BE USED TO DOCUMENT RECEIPT INSPECTION OF MATERIAL TO BE IMMEDIATELY INSTALLED.

Procedure	Responsibility
Visually check for damage.	CMPO or CMH
Visually check the item to ensure the item is what was specified or ordered and retain any supplied OQE (None is required to be provided).	CMPO or CMH
Check markings or nameplate on the item for correct correspondence with the shipping papers (or Ready for Issue Tag, NAVSEA 9210/2). (Figures 6-1, 6-2 and 6-3 of this	CMPO or CMH

chapter).

FMA assistance is required or another activity with a LI Certifying Activity Designator: If the Nuclear LI item has no permanent markings, (serial number, heat lot or batch number, etc.), the FMA will mark the item with a FMA nuclear MIC marking to allow traceability.	CMPO, QAI or CMH
Fill out QA form 1.	CMPO or CMH
Fill out and attach a QA form 2 to the item.	CMPO or CMH

NOTE: THE RFI TAG AND QA FORM 2 MUST REMAIN ON THE MATERIAL UNTIL INSTALLATION.

Procedure	Responsibility
If the item does not pass the receipt inspection, attach a QA form 3 (Material Reject tag) to the material and reject the material.	CMPO or CMH
Verify that the item is what is required for intended use and has satisfactorily completed receipt inspection and is certified for use. Complete the appropriate blocks on the QA form 2 and print name and sign the QA form 2. Turn over the material to a craftsman for fabrication or installation or stow in a controlled material storage area.	CMPO or CMH
Forward QA form 1 to QA Office when material is issued for installation.	CMPO or CMH

b. Material supplied from the NAVSEA Prime Contractor received by the ship at new construction.

Procedure	Responsibility
Visually check for damage.	CMPO or CMH
Visually check the item to ensure the item is what was specified or ordered and retain any supplied OQE. (None is required to be provided).	CMPO or CMH
Visually check the material to ensure that material is as stated on the Supervisor of Shipbuilding supplied list including verification of serial number if provided.	CMPO or CMH
Fill out QA form 1. Attach all supporting documentation.	CMPO or CMH
Fill out and attach a QA form 2 to the item.	CMPO or CMH
Fill out applicable portion of QA form 2.	CMPO or CMH
If the item does not pass the receipt inspection, attach a QA form 3 (Material Reject Tag) to the material and reject the material.	CMPO or CMH

Verify that the item is what is required for intended use and has satisfactorily completed receipt inspection and is certified for use. Complete the appropriate blocks on the QA form 2, print name and sign the QA form 2. Turn over the material to craftsman for fabrication or installation or stow in a controlled material storage area.	CMPO or CMH
Forward QA form 1 to QA Office when material is issued for installation.	CMPO or CMH

c. Nuclear LI material procured from a shipyard. (Does not include Naval supply system material with NSN and SMIC X1, X2, X4 or X6 material). Material which was procured or manufactured by a shipyard and which is then transferred to another activity may be accepted for use by the receiving activity if the shipyard provides certification that the material passed receipt inspection requirements (i.e., a tag or form that is equivalent to the NAVSEA 9210/2 (Figures 6-1 and 6-2) is acceptable proof of receipt inspection per reference (a)).

Procedure	Responsibility
Check item received to ensure that it is the one ordered or specified. Retain any OQE received.	CMPO or CMH
Check markings or nameplate data for correct correspondence with shipping papers.	CMPO or CMH
Fill out QA form 1. Attach all supporting documentation.	CMPO or CMH
Fill out and attach a QA form 2 to the item.	CMPO or CMH
Verify that the item is what is required for intended use and has satisfactorily completed receipt inspection and is certified for use. Complete the appropriate blocks on the QA form 2, print name and sign the QA form 2. Turn over the material to craftsman for fabrication or installation or stow in a controlled material storage area.	CMPO or CMH
Forward QA form 1 to QA office when the material has been issued for installation.	CMPO or CMH

6.2.4 Marking of Nuclear Repair Parts.

6.2.4.1 General Requirements. SMIC X1, X2, X4 and X6 NRP (except for SMIC X1 material provided by a prime contractor to the installing activity), passes from the manufacturers into the Navy supply system by way of Navy receipt inspection activities, which examine the material and subject it to a number of tests. Nuclear LI material which meets acceptance criteria is marked with a permanent MIC number. In some cases, the manufacturer's marking is used for material identification.

a. The purpose of MIC marking is:

(1) To denote that the marked material has been inspected, verified and accepted.

(2) To provide traceability from the installed material to OQE.

(3) To preclude complete re-inspection of material accepted by an approved activity.

b. Two problems arise in application which can defeat the purpose of the MIC marking.

(1) Internal components of an assembly which is MIC marked on the exterior, are usually not marked individually, and can lose their identity as NRP if separated during disassembly. Strict adherence to "bag and tag" requirements, using Fleet QA forms, overcomes this problem. Any part which becomes separated from its QA form (a loss of traceability), must be treated as uncontrolled material.

(2) Reference (a) permits the use of shortened MIC numbers in cases where the entire marking cannot be applied due to space limitations.

This problem is circumvented by a tag affixed by the receipt inspection activity directly to the material or to its container, which lists the complete MIC number. The complete MIC marking is recorded during receipt inspection. Although the complete MIC marking would not be visible once the item was installed, traceability is maintained through the retained QA paperwork and tags associated with the job, which will list the full MIC number.

c. The MIC markings are in addition to the required manufacturer's marking.

d. Altering of a MIC marking is prohibited except to make documented corrections.

e. Method of Marking Controlled Material. Nuclear physical marking methods are described in reference (j).

f. Items not physically capable of being marked. Nuclear items such as small parts are packaged in homogeneous lots (i.e., same heat, batch or melt; and same vendor traceability) and the package is marked. If the package is opened, the individual items removed must be tagged with a QA form 2. The remaining items in the package will be controlled by the use of a single QA form 2 attached to the package.

6.2.4.2 Marking Requirements for Nuclear Repair Parts.

a. Nuclear LI material is permanently marked by the manufacturer with the following information:

(1) The manufacturer's name, trademark or symbol.

(2) Kind of material. Normally the generic material designations contained in the Material Designator Catalog, Volume II of reference (a).

(3) Traceability information. The traceability information enables the manufacturer to trace a LI component back to the chemical and physical test results which prove that the material fabricated meets procurement specifications.

b. If the entire manufacturer marking cannot be affixed due to space limitations, then the following priority applies:

(1) Kind of material.

(2) Traceability code number.

(3) Manufacturer's name, trademark or symbol.

c. Navy receipt inspection activities, which are primarily shipyards in the case of NRP, add their own marking to Nuclear LI items they accept. This MIC mark consists of:

(1) Kind of material.

(2) Traceability number.

(3) Activity identification letter.

d. If a complete receipt inspection MIC mark cannot be affixed due to space limitations, then the following priority applies:

(1) Kind of material.

(2) Traceability number.

(3) Procurement identification letter.

e. RFI Material.

(1) NRP, which have the SMICs X1, X2, and X4 associated with the NSN, are tagged as RFI once accepted by Navy receipt inspection activities. The RFI tag clearly marks the item as properly receipt inspected and RFI. Receipt inspection by end user is still required by reference (a).

(2) The X1 SMIC identifies high value reactor plant components. The X2 SMIC applies to pipe, tubing, fittings, flanges, barstock, welding consumables and some LI fasteners that are used in reactor plants. The X4 SMIC covers high pressure components used in reactor plant applications.

(3) There are four types of RFI tags. NAVSEA 9210/2 (Figure 6-1 of this chapter) is attached to all Nuclear LI RFI material except that which is SMIC coded X4. Nuclear LI RFI material coded X4 is tagged with NAVSEA 9210/2 (Figure 6-2 of this chapter). Nuclear LI material previously inspected by a Naval shipyard is tagged with the RFI tag depicted in Figure 6-3 of this chapter. Non-LI nuclear material previously inspected by a Naval shipyard is tagged with the RFI tag depicted in Figure 6-4 of this chapter.

f. Sample MIC Markings.

(1) IN-804-8801-C 159 (N)

IN Generic Material Designation	804 Lot Number	8801 Date of Inspection	C Certifying Activity	159 Inspection Lot	(N) Nuclear

NOTE: ADDITIONAL INFORMATION, SUCH AS INSPECTION LOT NUMBER, IS PERMITTED TO BE PART OF THE MIC MARK.

(2) CSA-(4-056-001)-N

CSA CSA Material Code	4-056-001 Receipt Inspection Package Number (traceability number)	N Inspection Activity (Norfolk Naval Shipyard)

(3) 7150-001-A-VBA

7150 Julian Date of Inspection	001 Lot #	A CAD	VBA Material

(4) ST-00259-A01-S

ST ST Generic Type	00 Year	259 Julian Date	A01 Lot # (A for Nuclear LI)	S Inspection Activity (PSNS)

6.2.4.3 Assignment of Material Identification and Control Numbers for Items Manufactured from Certified Raw Materials. Nuclear LI items manufactured using certified Nuclear LI raw material (e.g., barstock, plate, forged shape) may be assigned the same MIC markings as the raw stock provided no work is done on the base material that would alter its chemical, physical or mechanical properties (machining and welding may be done).

6.2.5 Nuclear Repair Parts Downgrading. It is recognized that occasionally NRP and controlled material must be downgraded in order to support training or production work due to the unavailability of non-certified material. In order to maintain accountability of the end use of NRP and controlled material, the following procedure is required:

Procedure	Responsibility
Obtain written authorization to downgrade the material from the Quality Assurance Officer (QAO).	Leading Petty Officer or Work Center Supervisor
Remove all MIC markings from the controlled material as well as all controlled material tags and forms. The QA forms with RFI tag will be forwarded to the QAO (ship) or QA office (FMA) with the approved authorization.	CMPO or CMH

6.2.6 Storage, Issue and Handling of Nuclear Repair Parts.

6.2.6.1 Storage Requirements.

a. The Supply Department onboard an FMA or a ship will stow, handle and issue NRP as required by the governing NAVSEA, or NAVSUP WSS instruction.

NOTE: NRP BECOMES CONTROLLED MATERIAL, FOR THE PURPOSES OF THIS MANUAL, WHEN THE MATERIAL HAS BEEN RECEIVED BY THE CMPO or CMH OF THE WORK CENTER OR DIVISION.

b. Nuclear controlled material in the custody of customers (ship or FMA work centers) will be segregated by a physical barrier, in clearly marked dry, secure, clean stowage and handling areas.

NOTE: THE SEGREGATION AND PHYSICAL CONTROL REQUIREMENTS OF PARAGRAPHS 6.2.6.1.b.(1), (2), and (3) OF THIS CHAPTER DO NOT APPLY TO NUCLEAR COMPONENTS WHICH ARE NOT SUBJECT TO MIX UP NOR TO NUCLEAR MATERIAL WHILE IT IS CLEARLY MARKED OR TAGGED TO INDICATE ITS LEVEL OF ESSENTIALITY AND GENERIC MATERIAL TYPE.

(1) Use of separate boxes, shelves, roped off or marked (e.g., painted lines) areas are acceptable methods of segregation or stowage, provided they are clearly marked, allowing separation of the following materials:

(a) Nuclear LI.

(b) Material staged for a specific job or process.

(2) These materials must be segregated from each other and from other materials. Segregation will be maintained from receipt through staging. Access to controlled material will be positively controlled.

(3) Within a given level of material, different generic materials will be segregated from each other physically such that similar appearing materials of different generic types are not mixed.

(4) Unidentified material or rejected material will be segregated from acceptable controlled material.

(5) Material waiting receipt inspection will be segregated from controlled material and from rejected material.

c. Controlled material will be handled and stored in a manner to prevent damage and be sealed for cleanliness when applicable.

d. Material received not meeting the receipt inspection requirements of paragraph 6.2.3 of this chapter will be rejected, tagged with QA form 3, and placed in segregated stowage to await disposition.

e. CMPOs or CMHs will inspect controlled material storage areas of their work center, quarterly as a minimum to ensure:

(1) Material is in designated area.

(2) Material is properly identified.

(3) Material properly marked and tagged.

(4) Material is protected from damage.

(5) Material is kept clean.

(6) Material segregated as required.

6.2.6.2 Staging Requirements. Controlled materials of different Levels of Essentiality and non-controlled material may be co-located when staging material for a specific job provided that:

a. All QA forms or identification tags attached to the material are annotated with the same Job Control Number and

b. Material is segregated from material staged for other jobs or processes.

6.2.6.3 Issue of Nuclear Controlled Material. Nuclear controlled material should be issued for only those specific applications for which the nuclear material is required.

6.2.6.4 Handling of Nuclear Controlled Material. All controlled material received by a work center, whether received from the supply department as onboard stock, work center stores or from a tended ship must be controlled as required by reference (a).

a. Controlled material must at all times be in physical custody of either the work center CMPO or CMH, QAI, a craftsman or stowed in a work center controlled material stowage area.

b. Lots of material (e.g., box of bolts) broken down for end use, will maintain the same identification and control as the parent controlled item using QA form 2 as appropriate.

c. The QA form 2, or any other identification (e.g., RFI tag), must stay with the material at all times until it is installed or reinstalled in the system.

d. Transfer of MIC marking during issue of barstock or pipe will be accomplished by transferring the MIC to a new location on the piece to be sectioned, prior to sectioning, and be verified by the work center CMPO or CMH or a QAI before the original marking is lost.

e. If, during fabrication, the original piece must be broken down (such as cutting off a piece of barstock) or the MIC marking will be lost by machining, welding, etc., the proper MIC markings will be transferred to the piece(s) prior to cutting or to the container, in case of small parts, and a QA form 2 as appropriate will be attached to each new piece.

f. On completion of shop or ship fabrication or assembly stage, the QAI will check the finished product against the attached material identification tags for required material markings. The QAI will inspect the finished product for conformance to specifications. If satisfactory and if the required markings are present, the QAI will print name and sign the QA form 2 as applicable.

g. If for any reason at any time the product fails inspection, the QAI will reject the material, attach a QA form 3 and inform the QAO.

h. The lead work center will be responsible for installation and the final acceptance block on all QA forms associated with a particular product. Assist work centers or divisions will be responsible for control of material which they use on a job.

i. Material consumed (e.g., welding electrode, brazing alloy) in the fabrication process must have its identity (MIC number) recorded on the appropriate QA form that documents the weld or braze (e.g., QA form 18, QA form 20).

j. Existing parts of certified Nuclear LI systems, retain their certification provided their traceability is maintained.

k. All material, parts or components from controlled systems which are removed from the ship by Ship's Force, to be worked on by the FMA, must have a QA form 2

properly filled out and attached. If it is necessary for the FMA to disassemble such components, identification must be retained on each part which is controlled material using additional QA forms 2. The original QA form 2 will remain with the part or component until it is re-installed in the ship and then be removed and filed until final Controlled Work Package closeout. The QA-2 may then be disposed of.

l. Each controlled component removed from a ship's system in order to allow repair or maintenance will be tagged with a QA form 2 as appropriate to maintain identification and traceability. If a nuclear component is further disassembled, each pressure boundary part will be tagged with a QA form 2. Controlled components (e.g., valves and valve bonnets, pumps, etc.) disassembled and reassembled in a temporary controlled jobsite (established in a workspace or at a jobsite) do not require individual QA tags to be filled out and attached to each controlled component (controlled components are defined in reference (a)), provided that:

(1) Access to the temporary controlled jobsite is controlled by a physical boundary and is marked with a posted sign stating "Temporary Controlled Jobsite".

(2) Rejected material must be identified, tagged with QA form 3 and removed from the area.

(3) Work must be actively in progress and not be longer than a shift or one normal working day on a job site vice in a FMA repair shop.

m. Damaged existing material removed from a nuclear or reactor plant systems which will not be repaired or reused, and is immediately disposed of as trash, does not require a QA form 2 or QA form 3 to be attached. All MIC markings on damaged material that meets this criterion must be removed prior to disposal to prevent inadvertent reuse. If there is any potential for repair or re-use of the removed material, then paragraph 6.2.6.4.j of this chapter applies and QA form 2 must be attached. Do not remove MIC numbers from controlled material that is required to be turned in. Damaged controlled material that is required to be turned-in, such as depot level repairable items, must be rejected using the QA form 3 process. In view of stringent controls for the disposal of radioactive waste, and in order to minimize radiological work, nuclear propulsion plant components or equipment to be disposed of as radioactive waste need not have markings removed or obliterated.

FIGURE 6-1

Tags similar to those shown in Figure 6-1 and Figure 6-2 were previously used to identify material receipt inspected and certified RFI. Therefore, material received with RFI tags similar to Figures 6-1 and 6-2 is acceptable for use without re-tagging.

6.3 NON-NUCLEAR.

6.3.1 Controlled Material Determination. This section describes the use of the specific references used to identify proper material for repair work. It is important that the difference between system and part Level of Essentiality be understood. A system may be LI, but this does not mean that every part in the system will be LI. This section also provides references and

guidance necessary to obtain this understanding and to determine if controlled material is required, and if so, the proper level of control.

6.3.1.1 General Requirements. In order to determine the correct material to be installed in a ship and to properly certify the material prior to installation, the work center responsible for the specific area of the ship must first gather the appropriate reference material:

a. Drawings that specifically define the system and component.

b. System or Component technical manual.

c. Applicable APL from the ship's COSAL.

d. Ship's SUBSAFE Certification Boundary Book.

e. LI Boundary Book.

f. Military Standards (MIL-STD).

g. Applicable ship class Fly-By-Wire Ship Control System Certification Boundary Book, per reference (k).

6.3.1.1.1 Determination of Required Repair Parts. Using the reference materials, the required repair parts will be determined by comparing the appropriate part numbers from the drawing to the part numbers or drawings listed in the APL and thereby obtaining the NSN with associated SMIC, if assigned or listed on the APL.

NOTE: THE USE OF LI STOCK PROGRAM MATERIALS AND CONTROLLED MATERIAL WILL BE RESTRICTED TO THOSE SPECIFIC APPLICATIONS WHERE REQUIRED.

6.3.1.1.2 Determination of Level of Control. The next step is to determine if the material identified by the NSNs in paragraph 6.3.1.1.1 of this chapter is certifiable, if required, as controlled material for the system or component. In order to determine level of control required for the parts, the Level of Essentiality for the system and component must be determined for non-nuclear systems:

a. Controlled material is used in systems designated with a Level of Essentiality per reference (a) for LI. The definitions of LI systems and material per reference (a) are provided to the users of this manual as paragraph 6.3.1.3 and 6.3.1.4 of this chapter.

b. The applicable LI material control boundary book provides an interpretation of the latest reference (a) requirements.

NOTE: A SMIC (E.G., S1, SB, LI, C1, VIRGINIA CLASS COMPONENT (VU), SEAWOLF CLASS COMPONENT (SW)), IS ADDED TO THE END OF THE NSN. IT IS ASSIGNED TO SELECTED COMPONENTS AND REPAIR PARTS BY THE NAVAL SUPPLY SYSTEM AND AIDS IN CONTROLLING THE ISSUANCE OF THESE COMPONENTS AND REPAIR PARTS WITHIN THE NAVY SUPPLY SYSTEM. SMIC IS AN ADMINISTRATIVE TOOL FOR THE SUPPLY SYSTEM. LEVEL OF ESSENTIALITY IS A TECHNICAL DESIGNATION APPLICABLE TO SPECIFIC PIPING SYSTEMS.

6.3.1.2 Non-Nuclear Material Level Determination. The crux of the controlled material program at the maintenance level is establishing the required Level of Essentiality for repair

parts, to include determination of whether a specific part is LI. This is important for three reasons:

a. To serve as a partial check that the supply system has provided the correct part.

b. To determine record-keeping requirements. This is particularly important in the case of alterations, where drawings may provide no Level of Essentiality for the parts and systems involved, and also on older ships, where the drawings may reflect no Level of Essentiality information at all or may use previous revisions of references (a) or (l).

c. To determine the correct SMIC in the case of non-nuclear repair parts where the COSAL and the applicable drawing conflict over the required Level of Essentiality.

6.3.1.2.1 Systems and Components. Paragraph 6.3.1.3 of this chapter provides the LI systems and paragraph 6.3.1.4 of this chapter provides the LI components of reference (a).

6.3.1.2.2 Emergent Situation Upgrading. Upgrading the Level of Essentiality of a repair part provided by the supply system may become necessary during the course of maintenance and can be done in emergent situations using the procedures specified in reference (a) and paragraph 6.3.5 of this chapter.

6.3.1.3 Non-Nuclear Level I Systems and Boundaries.

a. Submarines.

(1) Air, nitrogen and other gas systems, except oxygen and hydrogen, with design pressures of 1500 psig and above. Oxygen and hydrogen systems with a design pressure of 100 psig and above.

(2) Feedwater system with a design pressure of 600 psig and above.

(3) Main steam system, and all branch piping from this system which is designed to the main steam system design pressure, up to and including the first valve downstream of pressure reducing valves and their by-pass valves. Included will be high-pressure steam drains up to and including the first valve downstream of the trap or orifice.

(4) Hydraulic systems for any steering or diving control surface, failure of which would cause loss of both the normal and emergency modes of operation for the control surface. Exceptions are internal wrenching bolts per reference (m), and Naval Aerospace Standard cap screws with NAS 1347, Type IV identification need not be to LI requirements.

(5) All circulating seawater systems (e.g., main seawater, auxiliary seawater, shaft seal water), or portions thereof, continually open to the sea below 200 feet. The brine and seawater feed portion of the distilling or reverse osmosis system which provides the through path of the shaft seal water to the main or auxiliary seawater system.

(6) All seawater and sea connected systems or portions thereof, which are intermittently subject to submergence pressure below 200 feet, and which are within the SUBSAFE Certification Boundary as defined by reference (l).

(7) Torpedo, signal ejector, launcher and trash disposal unit tubes. Included are the breech and muzzle doors and associated piping system components installed between the breech and muzzle doors that form part of the pressure boundary, up to and including the inboard joint of the backup closure.

b. Surface Force Ships.

(1) Gaseous oxygen systems above 100-psig design pressure except for both the diver's recompression chamber and the diver's surface supplied oxygen systems, which are excluded from LI unless specifically invoked by NAVSEA in writing.

(2) Gaseous oxygen piping from the oxygen and nitrogen producer plant, storage tanks and fill station above 100 psig design pressure, including low pressure gaseous oxygen vent piping which is or can be cross-connected with high pressure gaseous oxygen piping.

(3) Surface Force. Main steam and all branch piping designed for temperatures above 775°F. Included will be high-pressure steam drains up to and including the last valve downstream of the trap or orifice designed for temperatures above 775°F.

c. Aircraft Carriers.

(1) Feed systems with design pressure of 600 psig and above.

(2) Main steam, catapult steam (including the trough heating system), and reboiler systems, and all branch piping connected to these systems designed for main steam system design pressure. Included will be high-pressure steam drains up to and including the last valve downstream of the trap or orifice designed for main steam system design pressure.

(3) Gaseous oxygen systems above 100-psig design pressure except for both the diver's recompression chamber and the diver's surface supplied oxygen systems, which are excluded from LI unless specifically invoked by NAVSEA in writing.

(4) Gaseous oxygen piping from the oxygen and nitrogen producer plant, storage tanks and fill station above 100 psig design pressure, including low pressure gaseous oxygen vent piping which is or can be cross-connected with high pressure gaseous oxygen piping.

d. Submarine, Aircraft carrier and Surface Force Ship Requirements. The LI boundary requirements listed in this paragraph apply to new construction, repairs, modifications, alterations and conversions for all submarines and surface ships regardless of the material identification and control requirements invoked, or not invoked, by the original shipbuilding specifications or system diagrams and component drawings.

NOTE: IT IS NOT THE INTENT TO REMOVE NON-LI MATERIAL SOLELY FOR THE PURPOSE OF INSTALLING LI MATERIAL. LI MATERIAL MUST BE INSTALLED IN NEW LI SYSTEMS OR COMPONENTS OR WHEN REPLACING MATERIAL INCIDENT TO THE REPAIR OR

REFURBISHMENT OF A LI SYSTEM COMPONENT(S).

e. LI Designated Systems. Cognizant NAVSEA technical codes are responsible for determining any additional scope and boundary of individual systems, including the components and parts of components, that are to be controlled as LI material.

6.3.1.4 Level I Components.

a. Pressure Boundary Parts. Pressure boundary parts of components within LI systems must be controlled. LI pressure boundary parts include piping, tubing and the following:

(1) Bodies. In general, these are the parts of a component that are the pressure boundaries of the component, including end connections. Examples are:

(a) Valve bodies.

(b) Strainer bodies.

(c) Cylinders (flasks, reservoirs).

(d) Pipe fittings (elbows, tees, couplings, union assemblies, separately furnished union tailpieces).

(e) Trap bodies (housings).

(f) Orifice plates.

(2) Covers. In general, these are component parts which act as pressure boundaries for the bodies listed and other items. Examples are:

(a) Valve bonnets.

(b) Valve caps.

(c) Strainer caps.

(d) Closure plates for cylinders.

(e) Oxygen and nitrogen valve cartridges.

(3) Plugs. All plugs, including submarine zinc anode plugs, set screws, adjusting screws and vent and drain plugs which form a part of the LI pressure boundary, or otherwise opened to the sea below 200 feet.

(4) Fasteners. Bolts, nuts, studs, stud-bolts, and screws used when joining two pressure boundary parts. All hull integrity fasteners must be LI. Fasteners used for joining non-LI machinery or equipment to LI material must be LI when the component is located within the LI boundary.

(5) Extension Pieces. In general, these are branch systems connecting “bodies” and “covers” which are subject to piping system pressures and temperatures. In many cases, they are furnished with end connections for installing into either main or branch system piping. Examples are:

(a) Blowdown or drain nipples (e.g., pipe, including pipe fittings or flanges).

(b) Union tailpieces when part of a component end connection (including flange union connections).

(c) Separate bosses (attached to “bodies” or “covers” and providing connections for external piping).

(6) Miscellaneous.

(a) Portions of submarine pressure hull penetrations, excluding hull structure items, which isolate seawater from the submarine atmosphere. Examples of hull penetrations are: hull fittings (electrical and fiber optic), rodmeters, periscopes, and periscope hoist cylinders, radar masts and antennas, main propulsion shaft seal housings, floating wire and towed array shear valve assemblies, and lubrication distribution valves.

(b) Brazing alloys and welding filler metals, including consumable inserts.

(c) Union nuts (both bonnets and end-connection unions).

(d) Hose assembly end fittings and the nipple, flange, and body of sound isolation couplings (e.g., Rubber Insert Sound Isolation Couplings (RISIC)) which form a part of the pressure boundary.

(e) All submarine seawater or sea connected hull and backup valve internal metallic pressure containing parts that serve to directly isolate seawater from the atmosphere or downstream connected system(s) (e.g., balls, disks, flappers, and poppets).

(f) Valve stems which penetrate the pressure boundary.

(g) Oxygen charging lines and assemblies.

(h) In-line instrumentation components and parts:

INSTRUMENTS	LEVEL I PARTS
Temperature	Thermowell (welded and flanged bare bulb)
Flow	Meter casing
Liquid level	Tank penetration fitting
Pressure	Root valve of pressure instrument piping
Gage column (MIL-I-20037)	Isolation valve

(i) Propulsion shafts for submarines.

(j) Through hull operating shafts for submarines.

(k) Fasteners and plugs for the components listed in paragraph 6.3.1.4.b.(9) of this chapter, and LI systems as defined in paragraph 6.3.1.3 of this chapter, which satisfy the description of a LI pressure boundary part.

b. Exclusions. Items and components specifically excluded from the classification of LI are:

(1) Packing gland assemblies located in the systems and their components identified in paragraph 6.3.1.3 of this chapter and stuffing boxes. This includes their associated flanges, fasteners, followers, and retainers.

(2) Pressure seal rings, gaskets, O-Rings, packing and similar sealing members used in conjunction with joining two pressure boundary parts.

(3) Silver braze flux.

(4) Flexible hoses and RISIC rubber elements.

(5) Gages, gage valves, pressure indicators, measuring instruments, and their associated piping installed downstream of root valves in instrumentation piping or that which does not form a part of the pressure boundary.

(6) Pipes, fittings, mufflers and Quiet Pressure Release Devices for the high pressure air system etc., continuously open to ambient conditions and only transiently subjected to pressures in excess of paragraph 6.3.1.3 of this chapter criteria (e.g., open-ended ballast tank piping outboard of the pressure hull penetration, open-ended vents and drains).

(7) Valve yokes and bonnet retainers restrained by the body inside diameter that do not directly form the pressure boundary, but retain parts that do form the pressure boundary, unless otherwise specified.

(8) Items not permanently installed (portable) and designated only for dockside use.

(9) Pumps, distilling plants, compressors, heat exchangers, oxygen generators, steam turbines, condensers, hydraulic accumulators and dehydrators.

(10) Washers.

(11) Valve stem retaining nuts that do not come in direct contact with system fluid and serve no other function than to retain the stem.

(12) Valve seat retainers and other internal parts that are totally enclosed within the pressure boundary except for those parts described in paragraph 6.3.1.4.a.(6)(e) of this chapter.

(13) Non-consumable weld backing rings.

(14) Piping system sleeves.

(15) Non-pressure boundary parts (e.g., label plates, locking devices, lockwire, lock-tabs, etc., that are attached to external portions of a pressure boundary, piping hangers, mechanical operators such as handwheels, wrenches, reach rods, gears, motors, etc.).

6.3.2 Quality Assurance List (Submarines only). Quality Assurance Lists (QAL) on NAVSEA drawings specify Nondestructive Test (NDT) requirements for items scheduled for installation within the SUBSAFE boundary during new construction. The QALs should only be utilized for guidance subsequent to ship's commissioning, since they will not necessarily reflect current NDT requirements.

6.3.3 Controlled Material Procurement. This section provides general guidance for procurement of controlled material. It should be noted that NAVSEA and Naval Supply Weapon Systems Support (NAVSUP WSS) have adequate programs in place for procurement of controlled material for non-nuclear applications. Therefore, ships and repair activities should always obtain controlled material from the Navy stock system. This section also provides:

a. Background regarding NAVSEA and NAVSUP WSS controlled material procurement programs.

b. Summary of or reference to the NAVSEA and NAVSUP WSS requirements for controlled material procurement.

6.3.3.1 General Requirements.

a. The LI material procurement program procures and certifies materials that are generally identified in the supply system by SMIC SB, LI, C1, D1, S1, etc. Stock system or installed items that fall under the SUBSAFE category are generally restricted to castings and fasteners. Stock system or installed items that fall under the LI category are generally restricted to metallic pressure boundary parts and components.

b. The SFCC material procurement program procures and certifies materials that are identified in the supply system by SMIC VU and SW. Stock system or installed items that fall under SFCC are generally electronic circuit cards with embedded software.

c. LI stock program material pass from the manufacturers into the Navy supply system by way of Navy receipt inspection activities, which examine the material and subject it to a number of tests. LI material which meets acceptance criteria is marked with a permanent MIC code as required by reference (a). Not all material within the SUBSAFE boundary supplied by the shipyard during new construction is **required to be marked. SUBSAFE castings receive a permanent LI marking. The MIC markings are in addition to the required manufacturer's marking, which need not be maintained after the MIC marking is added, except in the case of non-nuclear fasteners.**

NOTE: PER REFERENCE (l), ANY LI STOCK SYSTEM SUPPLIED ITEMS WITH LI 1990 OR LATER MIC ARE ACCEPTABLE FOR USE WITHIN THE SUBSAFE CERTIFICATION BOUNDARY WHEN THE APL OR DRAWINGS INDICATE LI SMIC MATERIAL IS REQUIRED. SS SMIC CODED ITEMS CURRENTLY IN STOCK MAY BE USED IN SUBSAFE APPLICATIONS WITHOUT FORMAL DOWNGRADING.

6.3.3.2 Controlled Material Procurement.

a. Material Procurement. Requisitioning of LI or SFCC controlled material is done per standard supply instructions. Determination of the systems that require the use of LI or SFCC material is addressed in paragraph 6.3.1 of this chapter.

b. Stock System LI or SFCC Material. Stock system LI or SFCC materials will be requisitioned per normal supply department procedures ensuring that the SMIC is identified, if assigned to the item.

c. (Submarines only) Submarine Antenna Quality Assured Material (SAQAM) will be requisitioned per normal supply procedures with the additional guidance from references (n), (o) and (p). The supply and QA standards are discussed in references (p) and (q).

d. Other Controlled Material. Material procured for structural repairs, modifications or fabrication will be compatible with existing structure as specified in applicable plans and MIL-STDs.

e. LI material to be procured outside the supply system.

(1) Requisitions for non-nuclear LI stock program material must be prepared according to reference (q) and other applicable NAVSUP documents.

(2) Reference (q) states in part:

(a) "Local purchases or manufacture of non-nuclear LI Stock Program stock numbered material, not available from the supply system, will be reported to NAVSUP WSS for demand recording purposes. The local purchase or manufacture action will be reported via a Demand Only Transaction (DOC ID DHA) per the procedures established in NAVSUP 437. A DHA will not be submitted when the original requisition was submitted with advice code 2C or 5C since NAVSUP WSS records demand for 2C/5C requisitions returned for local action."

NOTE: THERE ARE NO LI STOCK PROGRAM ITEMS THAT ARE CODED FOR LOCAL PURCHASE.

(b) "Local purchases or manufacture of LI Stock Program non-stock numbered material will be reported to NAVSUP WSS to record demand and usage to determine whether the item should be stock numbered. The local purchase or manufacture action will be reported via a Report of Local Purchase for Non-stock Numbered Items (DOC ID BHJ) per the procedures established in NAVSUP 437. A BHJ will not be submitted when the requisition for a non-stock numbered item is submitted to a stock point or to NAVSUP WSS for supply action."

(3) Procurement of non-nuclear LI material from other than the Navy stock system is not permitted except in emergent situations as discussed in Section 3 of reference (a). Such procurement will be through NAVSUP WSS Mechanicsburg only. Requisitions to NAVSUP WSS will include all of the information listed here:

(a) If material certification requirements of reference (a) call for destructive tests, enough material must be procured in the lot for performance of such testing.

(b) Complete specifications must be provided for all LI material requisitions for non-Navy stock system material. These specifications must include:

1 Marking requirements, if applicable.

2 Material designation.

3 Military or federal specifications, that must be met (e.g., ultrasonic testing inspection of a fitting).

4 Grade, class, type, form and manufacturing process (e.g., plate, class B, Type I, hot forged).

5 American Society for Testing and Materials, American Iron and Steel Institute, Society of Automotive Engineers (whether item is procured in whole or in part).

6 Request for a certification of compliance or detailed analysis if required.

7 All ordering data required by applicable military or federal specifications or industry standards or specifications must be provided in the requisition.

(c) Descriptive language on all documents will be clear and detailed so that no choice is left, either to the vendor or the activity concerned, as to what material is to be furnished.

(d) The vendor will also be required to provide the following documentation with the material, to enable the material to be certified for "Level" application.

1 Chemical: Quantitative analysis for principal constituent elements according to reference (a).

2 Physical: Mechanical properties (e.g., yield strength, tensile strength, elongation or hardness testing) as specified in reference (a).

3 Fabrication: Documented compliance with fabrication procedures including NDT (e.g., seamless tubing).

6.3.4 Receipt Inspection of Controlled Material. This section provides the guidance and procedures for forces afloat and FMAs to conduct and document receipt inspections to certify controlled material as acceptable for installation.

6.3.4.1 General Requirements. Once the material ordered for use in SUBSAFE and LI systems is received, the material must be receipt inspected per reference (a). Once the material ordered for use within the submarine Fly-By-Wire Ship Control System Certification Boundary is received, the material must be receipt inspected per reference (k). Receipt inspection of these materials is required to establish positively that the material is the correct material for the job.

NOTE: THE TECHNICAL INSPECTION REQUIREMENTS OF THE APPLICABLE TECHNICAL MANUAL, DRAWING OR OTHER TECHNICAL REFERENCE AND PIPING SYSTEM MATERIAL REQUIREMENTS (E.G., CLEANLINESS, DIMENSIONS, SURFACE FINISH) ARE THE RESPONSIBILITY OF THE END-USER (WORK CENTER SUPERVISOR or CRAFTSMAN) TO ACCOMPLISH PRIOR TO INSTALLATION AND ARE

NOT PART OF THE RECEIPT INSPECTION OF THIS MANUAL.

a. Reference (a) provides the controls and certain testing requirements that are levied by NAVSEA to cover the material from fabrication to final installation for LI material. Reference (k) provides the controls and certain testing requirements that are levied by NAVSEA to cover the material from certification to final installation for SFCCs.

b. For LI and SFCC material, the unique requirement for "traceability" is invoked, meaning that a marking system is employed which links the material to OQE. OQE for the material is the quantitative and qualitative data proving that the material conforms to specified requirements. To meet the requirements for traceability, the following requirements are instituted:

(1) Receipt inspection of the material.

(2) Use of QA tags in association with the item(s).

(3) Segregated stowage for LI or SFCC stock program material, and controlled material.

(4) Custody by CMPO or CMHs, QAIs or qualified craftsman.

(5) Use of material verification procedures, as required by reference (a), during installation of the material.

6.3.4.2 Quality Assurance Forms for Receipt Inspections. The QA forms necessary to complete and document receipt inspections (QA form 1 and QA form 2) are addressed in paragraphs 6.3.4.5.p and 6.3.5 of this chapter.

6.3.4.3 Receipt Inspection and Certification of Valve Balls. New stock system LI balls are certified for use prior to placing a "LI" SMIC on them. Refurbished Teflon coated valve balls also are certified for use according to the indicated SMIC ("LI", "Q3" or "QA").

a. Balls received with a SMIC code "LI" are acceptable for use in SUBSAFE or LI system applications as specified by the applicable APL or drawing without further tests prior to installation.

b. Balls received with a SMIC code "QA" or "Q3" are acceptable for use in SUBSAFE or LI system applications unless required to be LI per paragraph 6.3.1.4.a.(6)(e) of this chapter.

c. Balls received with a SMIC code "QA" or "Q3" may be certified as acceptable for use in SUBSAFE or LI system applications defined in paragraph 6.3.1.4.a.(6)(e) of this chapter by either:

(1) Request certification papers from NAVSUP WSS code 9752 based on the heat and lot data etched in the fluid flow path of the ball, if available, and based on the certification papers and satisfactory receipt inspection locally assign a MIC number or

(2) If certification papers are not available or heat and lot data is not present in fluid flow path, conduct a generic material identity test, hardness test, perform applicable NDT and obtain TYCOM approval of a major Departure from Specification (DFS) per Part I, Chapter 8 of this volume.

d. Balls certified as acceptable for use per paragraph 6.3.4.3.c of this chapter must be marked with a locally assigned MIC marking in the fluid flow path of the ball per paragraph 6.3.7.1 of this chapter, providing traceability to applicable certification papers, test documentation, and approved DFS.

6.3.4.4 Level I and Submarine Flight Critical Component Receipt Inspection. The receipt inspection requirements for LI material from reference (a) are provided in paragraph 6.3.4.5 of this chapter and will be used for the receipt inspection of SUBSAFE and LI material. The receipt inspection requirements for SFCC material from reference (k) are provided in paragraph 6.3.4.5 of this chapter and will be used for the receipt inspection of SFCC material.

6.3.4.5 General Requirements for Level I and Submarine Flight Critical Component Material.

a. Traceability for LI material is to be maintained from the material back to its certification records. Material losing its identity will be considered unsuitable for use until identification can be positively re-established. It will be segregated from other controlled material, tagged and handled as rejected material. Traceability for SFCCs having a SMIC code of (VU) or (SW) is to be maintained from the material back to its certification records. Material losing its identity will be considered unsuitable for use until identification can be positively re-established. It will be segregated from other controlled material, tagged and handled as rejected material. Upon determination that the SFCC is nonconforming and unusable for Fly-By-Wire Ship Control Systems (FBW SCS) Flight Critical applications, the SFCC must be clearly identified as rejected with a QA Form 3 tag.

b. Supply departments of Fleet activities will perform the basic receipt inspection required by the appropriate NAVSEA, NAVSUP WSS, or NAVSUP instruction prior to placing the material into stock inventory. QA forms of this manual are not required to be completed or placed on the material by supply department personnel.

NOTE: LI OR SFCC STOCK PROGRAM MATERIAL BECOMES CONTROLLED MATERIAL, FOR THE PURPOSES OF THIS MANUAL, WHEN THE MATERIAL HAS BEEN RECEIVED BY THE CMPO OF THE WORK CENTER OR DIVISION.

c. Material identification must remain on or with the material throughout all stages of stowage, fabrication and installation. SFCC Certification OQE must be kept with the SFCC until the part is installed in the system.

d. Material awaiting or undergoing receipt inspection will be segregated from accepted material.

e. Material which met specifications at the time of procurement, but cannot be used in the system for which it was procured because of a change in requirements occurring after submission of material requests, will be returned to the supply department with a QA form 3.

NOTE: SUBSAFE PERISCOPE OR ANTENNA PARTS RECEIVED PRIOR TO 31 JULY 1979 WERE MARKED "SER 1991-921A <SS>" BY PORTSMOUTH NAVAL SHIPYARD OR "SER 1991-921A-061 <SS>" BY NAVAL SURFACE

WARFARE CENTER, CARDEROCK DIVISION (SUBMARINE ANTENNA ENGINEERING DIRECTORATE).

f. LI. Material NAVSUP WSS procured for the LI Stock Program which meets the required SUBSAFE attributes will be inscribed with a MIC number which provides traceability back to the certification documents or certifying activity.

NOTE: NON-LI STOCK PROGRAM MATERIAL WILL NOT BE MARKED WITH A LI SMIC.

g. Transfer of LI and SFCC Material Between Activities. Material which is procured or manufactured and certified by an authorized certifying activity and which is then transferred to another activity may be accepted for use by the receiving activity after satisfactory receipt inspection per paragraph 6.3.4.5.p of this chapter.

h. Non-Standard Stock Certification Documentation. Material procured from non-government sources or shipped direct from the manufacturer and not certified by the LI stock program must be receipt inspected per paragraph 6.3.5.1 of this chapter.

i. Accepted Material. Each acceptable unit of issue (e.g., valve, fitting, can of welding rod) will have a Material Identification/Control Tag (QA form 2) attached.

j. New Construction. The acceptable certification for LI and SFCC material provided to new construction ships by shipbuilders as on board repair parts consists of a written statement from the cognizant Supervising Authority. The letter will certify that the material is acceptable and has been proven by a sampling audit. The letter will also list the certified material furnished. A copy of this letter will be kept by the ship as a permanent record. After receipt of the initial letter during new construction and delivery of the ship, additional material will not be accepted without a letter being provided with or prior to receipt of the items. SUBSAFE, LI and SFCC on board repair parts, received with Certificates of Conformances after the start of Fast Cruise, do not require additional certification letters from the Supervising Authority.

k. Package Alteration Kits. Package alteration kits should not normally be opened until the ship or FMA is ready to proceed with the installation, provided that a certification of the contents and a copy of the installation instructions are in the envelope on the outside of the box. When the ship or FMA is ready to proceed with the installation, the lead work center CMPO will open the kit and perform the receipt inspection.

l. Installed material or upgraded existing material on a ship originally built or upgraded to SUBSAFE or LI standards involved in a repair will be assumed acceptable.

CAUTION: MATERIAL REMOVED FROM A SHIP UNDERGOING INACTIVATION CANNOT BE REINSTALLED IN A LI APPLICATION WITHOUT FOLLOWING THE GUIDELINES IN REFERENCE (a).

m. Reuse of Previously Certified LI or SFCC Material. Material removed from a ship originally built or upgraded to LI or SFCC certified, which is subsequently installed in another ship, will be assumed acceptable provided control (traceability) is available in FMA or ship records proving the item was removed from a ship built or upgraded to LI or SFCC certified and verification of the following:

(1) The level of certification of the system in the ship from which the part was removed is the same as the level of certification required for end use.

(2) DFS log (for the ship from which the material is removed) does not identify any outstanding DFS against the item that would preclude end use. Copies of outstanding DFS must be provided with the material. Those outstanding DFS for the material on the supplying ship will be cleared and the receiving ship will process new DFS on board per Part I, Chapter 8 of this volume.

(3) The files of DFS approved as permanent repairs (for the ship from which the material was removed) have been reviewed and copies of applicable DFS provided with the material.

(4) Ship's plans (for the ship from which the material was removed) do not identify any drawing differences from the ship's plans for the ship onto which the material will be installed.

(5) End use installation is consistent with the previous service parameters such as the design pressure rating, design temperature rating, or system applicability of the component.

CAUTION: MATERIAL REMOVED FROM A SHIP UNDERGOING INACTIVATION CANNOT BE REINSTALLED IN A SUBSAFE APPLICATION WITHOUT FOLLOWING THE GUIDELINES IN REFERENCE (L).

n. Reuse of Previously Certified SUBSAFE Material. (For commissioned ships only) Material removed from a ship originally built or upgraded to SUBSAFE, which is subsequently installed in another ship, will be acceptable under the following conditions:

(1) A Maintenance Certification Record or Re-Entry Control is used to document removal from the supplying ship. The supplying ship must be SUBSAFE certified and re-entry control must be in effect.

(2) All DFS (active and those accepted as permanent repairs that are not yet reflected in ship's selected record drawings or data or technical variance documentation), applicable technical variance documentation, the last accomplishment date and category of all applicable Unrestricted Operation (URO) Maintenance Requirement Card (MRC) inspections, and all legible component markings will be documented and supplied to the receiving activity along with a copy of the supplying ship's Maintenance Certification Record or Re-Entry Control. This documentation will be maintained and filed with the SUBSAFE Controlled Work Package that installed the component on the receiving ship. Those outstanding DFS for the material on the supplying ship will be cleared and the receiving ship will process a new DFS on board per Part I, Chapter 8 of this volume.

(3) The receiving activity will conduct material inspection to verify the following conditions:

(a) Received component came from a ship that has been previously SUBSAFE certified and for which Re-Entry Control has been

maintained since initial certification.

(b) Material marking on hardware matches material marking on supporting documentation.

(c) Applicable URO MRC inspections are current for the intended end use.

(d) End use installation is consistent with the previous service parameters such as the design pressure rating, design temperature rating, or system applicability of the component.

(4) Receiving activity will update applicable technical data to document information and records provided by paragraph 6.3.4.5.n.(2) of this chapter (e.g., ship's drawing index for drawing revision, date of last URO MRC periodicity accomplishment, and documentation of outstanding DFS) into ship's Current Ship's Maintenance Project and other records.

(5) Material which does not meet the requirements of paragraph 6.3.4.5.n.(3) of this chapter will be acceptable for use under the following conditions:

(a) For material which does not meet the requirements of paragraph 6.3.4.5.n.(3)(c) of this chapter, the material will be subjected to and comply with the applicable URO MRC inspections required for the receiving ship's end use application.

(b) For material which does not meet the requirements of paragraph 6.3.4.5.n.(3)(d) of this chapter, the material will be subjected to and satisfy the pressure and operability tests that would be required for a new component installed in the receiving ship, provided the design rating is consistent with the intended end use.

o. Reuse of material in the previously certified SUBSAFE work control boundary from a ship whose SUBSAFE certification has lapsed by virtue of inactivation availability commencement, must be per reference (l). Reuse of SFCC material from inactivated ships must be per reference (k).

p. Material received from Navy stock system. LI or SFCC material received from the Navy supply system will be receipt inspected by the CMPO using the following procedure:

Procedure	Responsibility
Visually inspect the material.	CMPO or CMH
Check that quantity received is same quantity ordered.	CMPO or CMH
Check for completeness (i.e., are all parts of a component present); disassembly is not required or desired.	CMPO or CMH
Verify item has MIC number and MIC number is correct per paragraph 6.3.7 of this chapter (reference (k), Appendix E for SFCC).	CMPO or CMH

For Fasteners: Document the markings from the fastener to include either: (1) The color code and the heat or lot number, material type and manufacturer's symbol (for nuts containing a self-locking insert, the color of the insert is the manufacturer's symbol). (2) The MIC number (when MIC number is on the fastener or on the individual tag for some small fasteners).	CPO or CMH
For Flight Critical Components, verify that the SFCC certifying activity identified on the accompanying OQE is traceable to one of the NAVSEA approved activities listed in paragraph 2.4.1 of reference (k).	CMPO or CMH
For Flight Critical Components, ensure applicable SMIC marking is listed on supply documentation or component.	CMPO or CMH
For TRIPER Program Components, verify that the TRIPER Serial # identified on the component and TRIPER Program issued QA Form 2 match and that the material identified on associated Supply document(s) matches the component on-hand.	CMPO or CMH

NOTE: MORE THAN ONE MIC NUMBER MAY BE ON A COMPONENT (E.G., VALVE BODY MAY HAVE ONE MIC NUMBER AND THE BONNET MAY HAVE ANOTHER MIC NUMBER). IF THE COMPONENT HAS A SHORTENED MIC MARKING, ENSURE THE FULL MIC MARKING IS AVAILABLE ON THE SHIPPING DOCUMENTS, TAGS, OR PACKAGING. VERIFY THAT THE SHORTENED MIC MARKING IS CORRECT PER PARAGRAPH 6.3.7 OF THIS CHAPTER AND REFERENCE (a).

For LI material, verify MIC number including proper "LI'' markings.	CMPO or CMH
Check that the MIC number is traceable to a NAVSEA authorized certifying activity, (e.g., Is there an "A'' for Portsmouth Naval Shipyard?). See paragraph 6.3.6 of this chapter for list of authorized certifying activities and paragraph 6.3.7.2 of this chapter for additional guidance on MIC marking.	CMPO or CMH
Check NSN on part and verify that it is the NSN ordered.	CMPO or CMH
For oxygen clean material, verify that the package is sealed and marked with a certified oxygen clean tag.	CMPO or Cleanliness Inspector or CMH
Fill out QA form 1 and attach the shipping papers, if provided.	CMPO or CMH

NOTE: QA FORM 1 IS NOT REQUIRED FOR SHIP'S FORCE WHEN PERFORMING RECEIPT INSPECTION OF MATERIAL TO BE

IMMEDIATELY INSTALLED FOR A SPECIFIC JOB. IF ALL MATERIAL IS NOT UTILIZED IN THE ONGOING JOB, QA FORM 1 MUST BE FILLED OUT PRIOR TO PLACING THE MATERIAL IN A STOWAGE LOCKER OR AREA.

NOTE: IF THE COMPONENT HAS A SHORTENED MIC MARKING, ENSURE THE FULL MIC MARKING FROM THE SHIPPING DOCUMENTS, TAGS, OR PACKAGING IS ENTERED ON QA FORM 1 AND QA FORM 2.

Procedure	Responsibility
Fill out and attach QA form 2 to each unit of issue accepted.	CMPO or CMH
If material fails any of the steps, reject and attach QA form 3.	CMPO or CMH
Verify that the item is what is required for intended use and turn the material over to craftsman for fabrication or installation or stow in a controlled material storage area.	CMPO or CMH
Forward QA form 1 to the QA office when the material has been issued for installation.	CMPO or CMH

NOTE: LI MATERIAL RECEIVED FROM THE NAVY SUPPLY SYSTEM WITH PROPER MATERIAL MARKINGS DO NOT REQUIRE "H" PRESSURE TESTING AFTER RECEIPT INSPECTION.

q. FBW Diagnostic and Maintenance Computers (DMAC) will be receipt inspected per sub-paragraph p. of this paragraph. The following are unique requirements specific to the DMAC:

(1) A QA form 1 will be used to document the DMAC receipt inspection.

(2) A QA form 2 is not required for the DMAC during or after receipt inspection.

(3) A QA form 3 is required for a DMAC that fails receipt inspection or is out of commission.

(4) The QA form 1 must be completed per the QA form 1 instructions in Part 1 Chapter 11 of this volume. The QA form 1 must be retained in the ship Re-Entry Control exception folder until superseded by a new DMAC receipt inspection.

r. SFCCs may be downgraded for use in non-SFCC, however, the component must not be subsequently reinstalled into any SFCC application if it was ever installed in a non-SFCC application. The SMIC markings on the SFCC must be obliterated and the certification records for the item annotated to indicate the item is no longer a certified SFCC prior to being installed.

6.3.5 Receipt Inspection of Open Purchase (Non-Supply System) or Locally Manufactured Material or Upgrading Supply System Material to Level I (Fleet Maintenance Activity only).

6.3.5.1 Uncertified Material Required for Level I Applications. For uncertified material required for use in a LI application, the item must comply with the requirements of reference (a).

Fleet activities must not certify open purchase (non-supply system or no NSN) materials to LI requirements without specific authorization from TYCOM or NAVSEA. Additionally, unless authorized in advance, a major DFS per Part I, Chapter 8 of this volume must be processed.

a. Uncertified material (supply system or NSN assigned) received or used as a starting material for a manufactured part for LI requirements must be receipt inspected per reference (a) by a certifying activity (e.g., shipyard, FMA).

b. Upon completion of the requirements of reference (a) the following procedure will be used:

Procedure	Responsibility
Review vendor data (if provided with material), MIL-STD, or FMA manufacturing and test data to ensure that it all matches. See note at end of this table regarding vendor data.	FMA QAO
Place certifying FMA MIC markings on the item.	FMA CMPO, CMH, QAI
Fasteners will be appropriately marked and color-coded if required.	FMA CMPO, CMH, QAI
Fill out QA form 1 to document the receipt inspection.	FMA CMPO, CMH, QAI
File QA form 1 with all applicable documents.	FMA Quality Assurance Supervisor
Verify that the item is what is required for intended use and turn the material over to craftsman for fabrication or installation or stow in a controlled material storage area.	FMA CMPO, CMH, QAI
Forward QA form 1 to QA Office when the material has been issued for installation.	CMPO or CMH

NOTE: VENDOR DATA - MATERIAL RECEIVED DIRECTLY FROM THE MANUFACTURER REQUIRES THE FOLLOWING CERTIFICATION DOCUMENTATION AS A MINIMUM:

(1) CHEMICAL: QUANTITATIVE ANALYSIS FOR PRINCIPAL CONSTITUENT ELEMENTS PER REFERENCE (a).

(2) PHYSICAL: MECHANICAL PROPERTIES (YIELD STRENGTH, TENSILE STRENGTH, ELONGATION OR HARDNESS TESTING) AS SPECIFIED IN REFERENCE (a).

(3) FABRICATION: DOCUMENTED COMPLIANCE WITH FABRICATION PROCEDURES INCLUDING NDT (E.G., SEAMLESS CONDITION OF TUBING).

c. If all testing required by reference (a) cannot be accomplished, then, as a minimum, a generic materials identity test, hardness test, and visual inspection will be accomplished and a major DFS must be processed per Part I, Chapter 8 of this volume.

6.3.5.2 Uncertified Material Required for SUBSAFE Applications. For uncertified material required for use in a SUBSAFE application and requiring an "LI" certification, the item must first comply with the requirements for LI discussed and the requirements of reference (l). Fleet activities must not certify non-level materials to SUBSAFE requirements without specific authorization from TYCOM or NAVSEA and, unless authorized in advance, a major DFS per Part I, Chapter 8 of this volume must be processed.

6.3.5.3 Uncertified Material Required for Submarine Flight Critical Component Applications. Fleet activities must not install non-certified SFCC materials within the FBW SCS certification boundary without specific authorization from TYCOM or NAVSEA and, unless authorized in advance, a major DFS per part I, chapter 8 of this volume must be processed. Upon completion of the requirements of reference (k) the following procedure will be used:

Procedure	Responsibility
Fill out QA form 1 to document the receipt inspection	FMA CMPO, CMH, QAI

NOTE: QA FORM 1 IS NOT REQUIRED FOR SHIP'S FORCE WHEN PERFORMING RECEIPT INSPECTION OF MATERIALS TO BE IMMEDIATELY INSTALLED FOR A SPECIFIC JOB. IF ALL MATERIAL IS NOT UTILIZED IN THE ONGOING JOB, QA FORM 1 MUST BE FILLED OUT PRIOR TO PLACING MATERIALS IN A STORAGE LOCKER OR AREA.

File QA form 1 with all applicable documents	FMA Quality Assurance Supervisor
Verify that the item is what is required for intended use and turn the material over to craftsman for installation or stow in a controlled material storage area.	FMA CMPO, CMH, QAI
Forward QA form 1 to QA Office when the material has been issued for installation.	CMPO or CMH

6.3.6 Authorized Material Certification Activities. NAVSEA 05R periodically issues a letter which provides a list of those activities that are currently authorized or have been authorized previously to receipt inspect and accept LI controlled materials. The most recent letter can be found at the JFMM website, www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/TYCOM/. This letter is to be used as a reference when performing the receipt inspections of paragraph 6.3.4.

6.3.7 Marking of Level I Stock Program Material and Controlled Material.

6.3.7.1 General Requirements. LI Stock Program Material passes from the manufacturers into the Navy supply system by way of Navy receipt inspection activities, which examine the

material and subject it to a number of tests. LI material which meets acceptance criteria is marked with a permanent MIC number. SUBSAFE material supplied by the shipyard as onboard repair parts during new construction is required to be MIC marked. On older ships, the SUBSAFE material supplied as onboard repair parts during new construction may not have been MIC marked, but will be listed on the Supervisor of Shipbuilding's letter of certified material.

a. The purpose of MIC marking is four-fold:

(1) To denote that the marked material has been inspected, verified and accepted.

(2) To verify the material in hand by comparing it to the applicable drawings, plans, ordering requirements, and installing documents.

(3) To provide traceability from the installed material to OQE.

(4) To preclude complete re-inspection of material accepted by an approved activity.

b. Two problems arise in application that can defeat the purpose of the MIC marking:

(1) Internal components of an assembly which is MIC marked on the exterior, are usually not marked individually, and can lose their identity as LI material, if separated during disassembly. Strict adherence to "bag and tag" requirements, using fleet QA forms, overcomes this problem. Any part that becomes separated from its QA form (a loss of traceability) must be treated as uncontrolled material.

(2) Reference (a) permits the use of shortened MIC numbers in cases where the entire marking cannot be applied due to space limitations. It is possible that some LI material will lack the traceability number providing the critical link to the OQE, which in turn serves as the basis for the designation "LI material or controlled material". This problem is circumvented by a tag affixed by the receipt inspection activity directly to the material or to its container, which lists the complete MIC number. The complete MIC marking is recorded during receipt inspection. Although the complete MIC marking would not be visible once the item was installed, traceability is maintained through the retained QA paperwork and tags associated with the job, which will list the full MIC number.

c. SUBSAFE castings and aluminum bronze components receive a permanent LI marking.

d. The MIC and SUBSAFE markings are in addition to the required manufacturer's marking.

e. Altering of a MIC marking is prohibited except to make documented corrections.

f. Method of marking controlled material. Physical marking methods are described in references (a) and (j).

g. Items not physically capable of being marked. Items such as small parts are packaged in homogeneous lots (i.e., same heat, batch or melt; and same vendor traceability) and the package is marked. If the package is opened, the individual items removed must

be tagged with QA form 2. The remaining items in the package will be controlled by the use of a single QA form 2 attached to the package.

6.3.7.2 Level I Material. LI material has a MIC marking affixed to it by the activities which certify the material for the Navy supply system. The activities are listed in paragraph 6.3.6 of this chapter. Authorized FMAs may apply a MIC marking to a component prior to installation in a ship. MIC markings will be applied per reference (a). The following paragraphs provide general guidance regarding MIC marks and marking:

a. Elements of the MIC Marking. The normal MIC marking consists of three elements:

(1) Material designator. The material designation comes from Volume II of reference (a) with the two or three letter code (e.g., KMA).

NOTE: MIC MARKINGS ON OLDER STOCK PIPING MATERIAL, VALVES, FITTINGS, ETC., RECEIVED FROM THE SUPPLY SYSTEM MAY CONTAIN FOUR LETTER MATERIAL DESIGNATORS. FOUR LETTER MIC MARKING MATERIAL DEFINITIONS ARE CONTAINED IN VOLUME II OF REFERENCE (a).

(2) Traceability number. The traceability number is used by the marking activity to relate the piece to inspection records and consists of the last two digits of the year, Julian date when the material was inspected, a hyphen and lot number (e.g., 89364-043).

(3) Certifying Activity Designator (CAD). The CAD denotes the activity that performed the certification testing and marking. The CAD indicates acceptance of the material. Only the government activities and private shipyards which are authorized by NAVSEA to certify inspect and mark LI material are assigned CADs. NAVSEA periodically issues a letter containing the list and identity code of government activities and private shipyards authorized to certify LI material. A listing of those activities authorized to certify LI material is provided in paragraph 6.3.6 of this chapter.

b. If all the markings cannot be affixed because of space limitations, then they are affixed per reference (a).

c. Sample MIC Markings. Three marking systems are in effect. Samples of MIC marks affixed to non-nuclear LI material from each of the marking systems follow:

(1) <u>CNB-91301-123 A</u> (LI material, new marking system)

CNB Material code. 70/30 copper nickel (from the Material Designator Catalog)	91301 Julian date of inspection	123 Inspection lot number (3 digits maximum)	A Inspection Activity (Portsmouth Naval Shipyard)

(2) KMD-90204-123 A (LI material, new marking system)

KMD Material code. K Monel (from the Material Designator Catalog)	90204 Julian date of inspection	123 Inspection lot number (3 digits maximum)	A Inspection Activity (Portsmouth Naval Shipyard)

(3) 7150 001 A VBA (LI material, old marking system)

7150 Julian Date of inspection	001 Inspection lot number	A Inspection activity (Portsmouth Naval Shipyard)	VBA Material code. Valve bronze alloy

(4) 7100 005 CNB (LI material, old marking system)

7100 Julian date of inspection	005 Inspection lot number	CNB Material code. Copper nickel alloy

(5) SER 1991-921A LI (Marked by Portsmouth Naval Shipyard)

SER 1991-921A-061 LI (Marked by Naval Surface Warfare Center, Carderock Division Ship Systems Engineering Station (Submarine Antenna Engineering Directorate) (now NSWCPD))

d. Examples of LI MIC marks for periscope and antenna parts marked prior to 31 July 1979:

(1) NCD 8249-584 QQ LI

NCD Material code Nickel copper alloy	8249 Julian date of inspection	584 Inspection lot number (3 digits maximum)	QQ Inspection Activity (Naval Surface Warfare Center, Carderock Division)

(2) SER 1991-921A-AS18

FMA marking applied to previously unmarked antenna, mast or periscope parts within the SUBSAFE boundary documented by receipt inspection record (QA

form 1) as being received prior to 31 July 1979 or are parts removed from an antenna, mast or periscope from an in-service SUBSAFE certified submarine.

(3) Fasteners are identified and color-coded per Appendix C of reference (a).

6.3.7.3 Assignment of Material Identification and Control Numbers for Items Manufactured from Certified Raw Materials.

NOTE: HEADED FASTENERS (CAPSCREWS, BOLTS, MACHINE SCREWS, ETC.) MANUFACTURED FROM LI MATERIAL REQUIRE ADDITIONAL TESTING (i.e., WEDGE TENSILE OR AXIAL TENSILE TESTING AND HARDNESS TESTING).

a. LI items manufactured using certified LI raw material (e.g., barstock, plate, forged shape) except fasteners with heads may be assigned the same MIC markings as the raw stock provided no work is done on the base material that would alter its chemical, physical or mechanical properties (machining and welding may be done).

b. Headed fasteners will be assigned a unique MIC marking following local manufacture from existing LI material and satisfactory completion of certification testing. A DFS is required if certification testing is not completed.

NOTE: A NEW MIC MARKING MUST BE ADDED WHENEVER LI MATERIAL IS HEAT TREATED OR WORKED IN SUCH A WAY AS TO ALTER CHEMICAL, PHYSICAL OR MECHANICAL PROPERTIES. THE NEW MIC NUMBER MUST PROVIDE TRACEABILITY TO THE ORIGINAL MIC NUMBER AND RECERTIFICATION TEST REPORTS FOR CHEMICAL, PHYSICAL OR MECHANICAL PROPERTIES.

c. The following procedures will be used by a FMA authorized to certify and assign MIC markings, per reference (a), to items manufactured from certified raw material that have had their chemical, physical or mechanical properties altered:

(1) Prepare a new QA form 1 for each new item.

(a) Complete Blocks 1, 2, 5, and 6 of QA form 1.

(b) Blocks 7 and 8 of QA form 1 will be marked “NA”.

(c) In Block 9 of QA form 1, check “no”, then print name, sign and date.

(d) Enter the appropriate codes for the required tests and inspections in Block 10 of QA form 1.

(e) Enter signed and dated statements in Block 11 of the QA form 1 that provides:

1 The MIC number of the raw material and Controlled Work Package serial number used in manufacture, inspection and test of the item.

2 The results of the tests and inspections designated in Block 10 of QA form 1

(f) Check the appropriate boxes in Blocks 12, 13 and 14, print name and

sign Block 15 of QA form 1.

(g) If the item was found to be acceptable and certified to the appropriate Level of Essentiality, assign a new MIC number in the format shown in paragraphs 6.3.7.2.c.(1) or (2) of this chapter for non-nuclear material.

1 Volume II of reference (a) should be consulted for the material designator since the fabrication processes may have altered the material.

2 The date will be the date that the MIC number is assigned.

3 Each item manufactured will be assigned a lot number and the appropriate test and inspection records for that item will be annotated with the lot number to ensure traceability.

(2) Complete the new QA form 2 using the new MIC number.

(a) Mark the certified material with the new MIC markings per paragraph 6.3.7.2 of this chapter. Block 5 of QA form 2 will be N/A.

(b) Remove the original QA form 2 with the raw stock MIC number. Enter a statement in the installation block that the item has been certified and the new MIC number that was assigned. The tag should then be filed with the new QA form 1.

6.3.8 Level I Submarine Flight Critical Component Stock Program Material Downgrading.

NOTE: MATERIAL CODED AS "SS" DOES NOT REQUIRE DOWNGRADING FOR USE IN LI APPLICATIONS.

6.3.8.1 Material Downgrading. Occasionally LI or SFCC Stock Program controlled material must be downgraded in order to support training or production work due to the non-availability of uncertified material. In order to maintain accountability of the end use of LI or SFCC Stock Program controlled material, the following procedure is required:

Procedure	Responsibility
For LI or SFCC, obtain written authorization to downgrade the material from the QAO.	Leading Petty Officer or Work Center Supervisor
Remove all MIC markings from the LI material and SMIC and SFCC markings from SFCC material as well as controlled material tags and forms. The QA forms will be forwarded to the QAO (ship) or QA office (FMA) with the approved authorization.	CMPO or CMH

6.3.9 Storage, Issue, and Handling of Level I, Scope of Certification and Submarine Flight Critical Component Stock Program Material.

6.3.9.1 Storage Requirements.

a. The supply department onboard the FMA or a ship will stow, handle and issue LI, SOC or SFCC stock program material as required by the governing NAVSEA, NAVSUP WSS, or NAVSUP instruction.

NOTE: LI, SOC AND SFCC STOCK PROGRAM MATERIAL BECOMES CONTROLLED MATERIAL, FOR THE PURPOSES OF THIS MANUAL, WHEN THE MATERIAL HAS BEEN RECEIVED BY THE CMPO OF THE WORK CENTER OR DIVISION.

b. Controlled material in the custody of customers (ship or FMA work centers) will be segregated by a physical barrier, in clearly marked, dry, secure, clean stowage and handling areas.

(1) Use of separate boxes, shelves, roped off or marked (e.g., painted lines) areas are acceptable methods of segregation or stowage, provided they are clearly marked, allowing separation of the following materials:

(a) Material within the SUBSAFE boundary.

(b) LI.

(c) SFCC.

(d) SOC MCD-A and MCD-B.

(e) Material undergoing receipt inspection.

(f) Rejected materials.

(g) Material staged for a specific job or process. Controlled materials of different Levels of Essentiality and non-controlled material may be co-located when staging materials for a specific job as long as all identification tags attached to the material are annotated with the same Job Control Number.

(2) These materials must be segregated from each other and from other materials. Segregation will be maintained from receipt through staging. Unidentified material or rejected material will be segregated from acceptable controlled material. Access to controlled material will be positively controlled.

(3) LI materials of different material types, grades or condition must be segregated through physical separation unless readily differentiated by other attributes, such as size or physical appearance. When physical segregation cannot be accomplished, an alternative positive system of control must be used. The method used must assure that different materials that appear to be similar are not mixed (unless the materials are approved alternates for each other as indicated by part or stock number).

c. Controlled material will be handled and stored in a manner to prevent damage and be sealed for cleanliness when applicable (e.g., Oxygen Clean).

d. Material received, or modified after receipt, not meeting the receipt inspection requirements of paragraph 6.3.4 of this chapter will be rejected, tagged with QA form

3, and placed in segregated controlled stowage to await disposition. Disposition examples:

(1) Disposal.

(2) Repair.

(3) Retention of components for future use.

e. Material awaiting receipt inspection will be segregated from material accepted or material rejected.

f. CMPOs and CMHs will inspect controlled material storage areas of their work center, quarterly, as a minimum, to ensure:

(1) Material is in designated area.

(2) Material is properly identified.

(3) Material is properly marked and tagged.

(4) Material is protected from damage.

(5) Material is kept clean.

(6) Material is segregated as required.

g. The QAO will, at a minimum of frequency of semi-annually, assign a surveillance of all work center controlled material storage areas.

6.3.9.2 Staging Requirements. Controlled materials of different Levels of Essentiality and non-controlled material may be co-located when staging material for a specific job provided that:

a. All QA forms or identification tags attached to the material are annotated with the same Job Control Number.

b. Material is segregated from material staged for other jobs or processes.

6.3.9.3 Issue of Level I, Scope of Certification and Submarine Flight Critical Component Controlled Material. LI or SOC controlled material issue will be restricted to those specific applications that have controlled material requirements. SFCC controlled material may be issued for non-Flight Critical applications without written authorization but must not be subsequently installed into components within the SFCC Certification Boundary.

6.3.9.4 Handling of Material. All controlled material received by a work center, whether received from the supply department as onboard stock, work center stores or from a tended ship must be controlled as required by reference (a) for LI, reference (b) for SOC or reference (k) for SFCC.

a. Controlled material must at all times be in physical custody of either the work center CMPO, QAI, a craftsman or stowed in a work center controlled material stowage area.

b. Lots of material (e.g., box of bolts) broken down for end use, will maintain the same identification and control as the parent controlled item using QA form 2 as appropriate.

c. The QA form 2, or any other identification must stay with the material at all times until it is installed or reinstalled in the system or returned to the custody of Ship's Force.

d. Transfer of a MIC marking during issue of barstock or pipe will be accomplished by transferring the MIC to a new location on the piece to be sectioned, and be verified by the work center CMPO, CMH or a QAI before the original marking is lost.

e. If, during fabrication, the original piece must be broken down (such as cutting off a piece of barstock) or the MIC marking will be lost by machining, welding, etc., the proper material identification markings will be transferred to the piece(s) prior to cutting or to the container, in case of small parts, and QA form 2 will be attached to each new piece.

f. On completion of shop or ship fabrication or assembly stage, the QAI will check the finished product against the attached material identification tags for required material markings. The QAI will inspect the finished product for conformance to specifications. If satisfactory and if the required marking is present, the QAI will print name and sign the QA form 2.

g. If for any reason at any time the product fails inspection, the QAI will reject the material, attach QA form 3 and inform the QAO.

h. The lead work center will be responsible for installation and the final acceptance block on all QA forms associated with a particular product. Assist work centers or divisions will be responsible for control of material that they use on a job.

i. Material consumed (e.g., welding electrode, brazing alloy) or installed (e.g., studs, valve ball) in the repair process must have its identity (MIC number, type or grade of the material) recorded on the appropriate QA form (e.g., QA form 18, QA form 20, QA form 34).

j. For previously installed material in a SUBSAFE, LI, SOC or SFCC system which is removed and is to be re-installed, positive control and identification of the material must be maintained from removal through reinstallation by use of a QA form 2. Non-controlled material will be tagged with a QA form 2 or other positive means of traceability until reinstallation.

k. Damaged existing material removed from a SUBSAFE, LI, SOC or SFCC system which will not be repaired or reused, and is immediately disposed of as trash, does not require a QA form 2 or QA form 3 to be attached. All MIC markings on damaged material that meets this criterion must be removed prior to disposal to prevent inadvertent reuse. If there is any potential for repair or re-use of the removed material, then paragraph 6.3.9.4.j applies and QA form 2 must be attached. Do not remove MIC numbers from controlled material that is required to be turned-in. Damaged controlled material that is required to be turned-in, such as depot level repairable items, must be rejected using the QA form 3 process. Damaged controlled material removed from a contaminated or potentially contaminated system and dispositioned for disposal as radioactive waste at the job site using an accountability tag in accordance with the applicable Radiological Controls Manual does not require additional tagging or removal of MIC numbers.

l. All material, parts or components from controlled systems which are removed from the ship by Ship's Force, to be worked by the FMA, must have a QA form 2 properly filled out and attached. If it is necessary for the FMA to disassemble such components, identification must be retained on each part which is controlled material using additional QA form 2. The original QA form 2 will remain with the part or component until it is re-installed in the ship.

m. Material control tags (i.e., QA forms 2) must be used to positively identify controlled material in transit to avoid unauthorized movement, co-mingling and improper use.

n. Each controlled component removed from a ship's system in order to allow repair or maintenance will be tagged with QA form 2 to maintain identification and traceability. Controlled components (e.g., periscopes, valves and valve bonnets, pumps, etc.) disassembled and reassembled in a temporary controlled jobsite (established in a work space or at a jobsite) do not require individual QA tags to be filled out and attached to each controlled component (controlled components are defined in reference (a)), provided that:

(1) Access to the temporary controlled jobsite is controlled by a physical boundary and is marked with a posted sign stating "Temporary Controlled Jobsite".

(2) Rejected material must be identified, tagged with QA form 3 and removed from the area.

(3) Work must be actively in progress and not be longer than a shift or one normal working day on a job site vice in a FMA repair shop.

6.3.9.5 Maintaining Accountability. All controlled material received by a work center and stored in a controlled material locker must have an attached QA form 2 and may have an associated QA form 1. The following process must be used when issuing material:

Procedure	**Responsibility**
Issuing a lot (single or multiple items) with no material remaining:	
Update original existing QA form 2 to annotate the Name of the craftsman and work center or shop or organization the material is issued to.	CMPO
Update associated QA form 1 (if applicable) per QA form 1 instructions. Submit the associated QA form 1 with zero amount remaining to the QAO.	CMPO
Issuing a portion of a lot with material remaining:	
Initiate a new QA form 2 for each quantity less than the entire lot of material to be issued specifically annotating the amount to be issued. Annotate the Name of the craftsman and work center or shop or organization the material is issued to. Do not modify the original QA form 2.	CMPO
Issuing a portion of a lot with material remaining:	

Procedure	Responsibility
Quantity less than the entire lot of material to be issued specifically annotating the amount to be issued. Annotate the Name of the craftsman and work center or shop or organization the material is issued to. Do not modify the original QA form 2.	CMPO
Update associated QA form 1 to annotate amount issued and amount remaining in accordance with QA form 1 instructions.	CMPO
When the last material of a lot is issued, destroy the original QA form 2 with zero amount remaining. Submit the associated QA form 1 with zero amount remaining to the QAO.	CMPO

LISTING OF APPENDICES.

A Testing Requirements for Surface Ship Systems

B Testing Requirements for Submarine Systems

7.1 GENERAL.

7.1.1 Key Element. Testing is a key element in the certification process of work accomplished by Ship's Force, Fleet Maintenance Activities (FMA), shipyards and private organizations on ships or submarines. It is the final physical check that the system or component has been returned to its normal operational state and will function as designed. Excessive re-testing of system components will cause unnecessary cycling stresses on system components and is not desired. Test only what has been repaired.

NOTE: THE PRESSURE TEST REQUIREMENTS FOR REACTOR PLANT FLUID SYSTEMS ARE DELINEATED IN REFERENCE (a).

7.1.2 Testing Requirements for Systems, Portions of Systems and Components. Research is necessary to determine all applicable test requirements prior to conducting repairs. It is important to note that all required tests may not be identified by a single source (e.g., a fitting or component that has been manufactured locally will have to satisfy both the testing required by the original manufacturing specifications as well as any installation tests). Unless specific guidance to the contrary is given, the following requirements will be followed:

a. Shipboard (in place) testing. The following requirements apply:

(1) All valve lineups and operations necessary to meet the testing requirements and performance of the test will be accomplished by Ship's Force to include the generation and approval of a Formal Work Package detailing the test procedure.

(2) The FMA will provide the test equipment required for in place testing, if requested.

(3) For testing to recertify FMA work, the FMA will provide Ship's Force with the test requirements, Quality Assurance (QA) data forms for Controlled Work Packages (CWP) only, and list of affected joints (if applicable). The FMA will review the test records to verify the satisfactory accomplishment of the test(s) and maintain the original Objective Quality Evidence (OQE) in the FMA CWP for testing to re-certify work.

(4) The System Test Check List of Volume IV, Chapter 9 of this manual will be used in the preparation, conduct, and recovery from hydrostatic tests and tests above normal operating test pressure when an external pressure source is required.

b. Shop or bench testing. To the maximum extent possible, all components to be installed in a ship's system will be work center or bench tested and inspected prior to installation, when required. This includes weld joint radiography, strength tests of welds or manufactured pressure boundary parts, valve seat leakage tests, etc. This results in a reduced number of cyclic stresses on the systems. The applicable portions of the System Test Check List of Volume IV, Chapter 9 of this manual will be used in preparation, conduct, and recovery from shop hydrostatic testing. QA form 28 will be used to document the OQE for shop testing.

c. Hydrostatic or pneumatic testing. A QA form 26 will be used to document the OQE that the hydrostatic or pneumatic testing was completed satisfactorily. Nuclear hydrostatic or joint testing will be per reference (a) and paragraph 7.5.1 of this chapter. Non-nuclear hydrostatic, joint or pneumatic testing will be per reference (b) and (c) and Section 7.2 of this chapter.
