JOINT FLEET MAINTENANCE MANUAL
VOLUME IV
TESTS AND INSPECTIONS

CHAPTER 1 - INTRODUCTION
1.1 Purpose ........................................................................................................................... IV-1-1
1.2 Scope .............................................................................................................................. IV-1-1
1.3 Changes and Corrections ............................................................................................... IV-1-2

Appendices
A List of Acronyms ........................................................................................................ IV-1A-1

CHAPTER 2 - FLEET MAINTENANCE ACTIVITY ASSESSMENT
2.1 Purpose ........................................................................................................................... IV-2-1
2.1.1 Scope .................................................................................................................... IV-2-1
2.1.2 Applicability ........................................................................................................ IV-2-2
2.2 Assessment Areas ........................................................................................................ IV-2-2
2.3 Assessment Results ..................................................................................................... IV-2-2
2.4 Responsibilities .......................................................................................................... IV-2-2
2.4.1 Type Commander ............................................................................................... IV-2-2
2.4.2 Fleet Maintenance Activity ................................................................................ IV-2-3
2.5 Assessment Findings or Corrective Action ................................................................... IV-2-4
2.5.1 Immediate Corrective Action Required ............................................................... IV-2-5
2.5.2 Corrective Action Required ................................................................................ IV-2-5

Appendices
A Typical Core Capability Assessment Areas ..................................................... IV-2A-1
B Typical Core Capability Assessment Projects .................................................. IV-2B-1
C Sample FMA Assessment Report ..................................................................... IV-2C-1
D FMA Assessment Deficiency Format ............................................................... IV-2D-1

CHAPTER 3 - BOILER INSPECTION
3.1 Purpose ........................................................................................................................ IV-3-1
3.2 Types of Boiler Inspections ....................................................................................... IV-3-2
3.3 Responsibilities .......................................................................................................... IV-3-2
3.3.1 Naval Sea Systems Command ................................................................. IV-3-2
3.3.2 Naval Surface Warfare Center, Carderock Division .................................. IV-3-2
3.3.3 Fleet Commander ......................................................................................... IV-3-3
3.3.4 Regional Maintenance Center ................................................................. IV-3-3
3.3.5 Regional Maintenance Center Commanding Officers ................................ IV-3-3
3.3.6 Immediate Superior In Command .......................................................... IV-3-3
3.3.7 Ship Commanding Officer, Officer In Charge or Maintenance Team .......... IV-3-4
3.3.8 Regional Maintenance Center Senior Inspector ....................................... IV-3-4
3.3.9 Steam Generating Plant Inspector ............................................................ IV-3-4

3.4 Inspection Scheduling .................................................................................. IV-3-5

3.5 Boiler Safety Procedures ............................................................................... IV-3-6

3.6 Boiler Inspections and Requirements ............................................................ IV-3-7
  3.6.1 Routine Inspection .................................................................................. IV-3-7
  3.6.2 Pre-start of Availability Inspection ........................................................ IV-3-8
  3.6.3 Start of Availability Inspection ............................................................... IV-3-8
  3.6.4 Strength and Integrity Inspection ............................................................ IV-3-8
  3.6.5 Industrial Support Visit Inspection ........................................................ IV-3-8
  3.6.6 Completion of Availability Inspection ................................................... IV-3-9
  3.6.7 Inactivation or Reactivation Inspection ................................................... IV-3-9
  3.6.8 Engineer Officer Inspection .................................................................... IV-3-9
  3.6.9 Special Inspection ................................................................................... IV-3-9
  3.6.10 Operational Assessments ...................................................................... IV-3-9

3.7 Boiler Inspection Guidelines and Reports ...................................................... IV-3-9
  3.7.1 Guidelines ............................................................................................. IV-3-9
  3.7.2 Reports .................................................................................................. IV-3-10

3.8 Boiler Inspection Preparation ......................................................................... IV-3-11

3.9 Boiler Inspection ........................................................................................... IV-3-11
  3.9.1 Boiler Inspection Form .......................................................................... IV-3-11
  3.9.2 Boiler Inspection Areas ......................................................................... IV-3-11
  3.9.3 Completion of Inspection ...................................................................... IV-3-13

3.10 Automatic Boiler Control Systems and Online Verification Guidelines ........ IV-3-13

3.11 Boiler Flexibility Tests ................................................................................ IV-3-14

3.12 Certified Boiler Water and Feedwater Tester Requirements ....................... IV-3-14

3.13 Operating and Casualty Procedures .............................................................. IV-3-14

Appendices
  A Sample Boiler Inspection Request Message ............................................... IV-3A-1
  B Sample Inspection Confirmation Message ................................................ IV-3B-1
  C Summary of Boiler Inspection Scheduling and Responsibilities .................. IV-3C-1
  D Sample Boiler Inspection Report Cover Letter ......................................... IV-3D-1
  E Sample Boiler Inspection – RBO and Severely Degraded Deficiencies
    Message ....................................................................................................... IV-3E-1
  F Sample RBO Rescission Message .............................................................. IV-3F-1
  G Sample 30 Day Update Message .............................................................. IV-3G-1

CHAPTER 4 - DIESEL ENGINES

4.1 Purpose ....................................................................................................... IV-4-1
4.2 Diesel Engine Inspector Certification ................................................................. IV-4-1
4.3 Diesel Inspections ............................................................................................. IV-4-3
  4.3.1 Diesel Engines Requiring Inspections ......................................................... IV-4-3
  4.3.2 Periodicity of Inspections .......................................................................... IV-4-3
  4.3.3 Inspection Scheduling ............................................................................... IV-4-6
  4.3.4 Inspection Phases ...................................................................................... IV-4-7
  4.3.5 Preparation for Diesel Engine Inspection .................................................. IV-4-7
  4.3.6 Inspection Findings .................................................................................. IV-4-8
4.4 Reporting Requirements .................................................................................... IV-4-10
4.5 Operation and Maintenance ............................................................................. IV-4-11
4.6 Compliance ........................................................................................................ IV-4-13
4.7 Subject Matter Expert in the Repair and Maintenance of Diesel Engines .... IV-4-14

Appendices
  A Diesel Maintenance Strategy for Surface Forces ........................................ IV-4A-1

CHAPTER 5 - MARINE SANITATION DEVICES
5.1 Purpose ............................................................................................................... IV-5-1
5.2 Certification ........................................................................................................ IV-5-1
5.3 Responsibilities.................................................................................................. IV-5-2
  5.3.1 Type Commander/Immediate Superior In Command ................................ IV-5-2
  5.3.2 Commanding Officer/Officer In Charge .................................................... IV-5-2
5.4 System Maintenance and Inspection ................................................................. IV-5-2
5.5 Technical System Assessment ........................................................................ IV-5-3
5.6 Training ............................................................................................................. IV-5-3

CHAPTER 6 - OXYGEN AND NITROGEN SYSTEMS
6.1 Purpose ............................................................................................................... IV-6-1
6.2 Precautions ........................................................................................................ IV-6-1
6.3 Aviators Breathing Oxygen Testing ................................................................. IV-6-2
6.4 Operations and Maintenance ........................................................................ IV-6-2

CHAPTER 7 - ACCOUNTABILITY AND CERTIFICATION OF NUCLEAR PROPULSION
  PLANT TEST AND SUPPORT EQUIPMENT
7.1 Purpose ............................................................................................................... IV-7-1
7.2 Nuclear Test Equipment Categories ............................................................... IV-7-1
7.3 Action ................................................................................................................ IV-7-2
7.4 Procurement ...................................................................................................... IV-7-2
7.5 Nuclear Test Equipment Certification ................................................................. IV-7-2
  7.5.1 Electronic and Electrical Test Equipment ..................................................... IV-7-2
  7.5.2 Mechanical Test Equipment .......................................................... IV-7-3
  7.5.3 Recertification Following Reference Revision ........................................... IV-7-3
  7.5.4 Certification Documentation .................................................. IV-7-3

7.6 Accountability ........................................................................................................ IV-7-3
  7.6.1 Lost or Damaged Test Equipment .............................................................. IV-7-4
  7.6.2 Cleanliness and Foreign Material Exclusion ............................................ IV-7-5
  7.6.3 Stowage ............................................................................................... IV-7-5
  7.6.4 Inventory ......................................................................................... IV-7-5

Appendices
  A Nuclear Test Equipment Check-Out and Check-In Form ........................ IV-7A-1
  B Nuclear Support and Test Equipment Certification Record ....................... IV-7B-1

CHAPTER 8 - WEAPONS AND CARGO ELEVATOR ASSESSMENTS
8.1 Purpose ........................................................................................................ IV-8-1
8.2 Elevator Support Unit ................................................................................ IV-8-1
8.3 Ship's Force Assessment Responsibilities ................................................... IV-8-1
8.4 Elevator Support Unit Evolutions ............................................................... IV-8-1
  8.4.1 Material Condition Assessment Visit ................................................ IV-8-2
  8.4.2 Repair Visit .................................................................................... IV-8-2
  8.4.3 In Process Review .......................................................................... IV-8-2
  8.4.4 On-Board Maintenance Training ..................................................... IV-8-3
  8.4.5 Integrated Logistics Support ............................................................. IV-8-3
8.5 Visit Scheduling ........................................................................................... IV-8-3
8.6 Reports .......................................................................................................... IV-8-3

CHAPTER 9 - SYSTEM TEST CHECK LIST
9.1 Purpose ........................................................................................................ IV-9-1
9.2 General Instructions .................................................................................... IV-9-2
9.3 Record Retention ........................................................................................ IV-9-2

Appendices
  A Nuclear Test Rig Determination and Inspection Check List ................... IV-9A-1
  B Non-Nuclear Test Rig Determination and Inspection Check List ............. IV-9B-1
  C Nuclear and Non-Nuclear Pre-Test Inspection Check List ....................... IV-9C-1
  D Nuclear and Non-Nuclear Performance of Test Check List ...................... IV-9D-1

CHAPTER 10 - WORK AUTHORIZATION AND CONTROL
10.1 Purpose ........................................................................................................ IV-10-1
10.2 Work Authorization .................................................................................... IV-10-1
10.3 Work Authorization Control

10.4 Work Authorization System

10.4.1 Administration

10.4.2 Work Authorization Procedure

10.4.3 Transfer of Non-Nuclear Systems and Nuclear Instrumentation and Control Systems (Depot availabilities only)

10.4.4 Work Authorization Form Revisions

10.4.5 Centralized Work Control Procedures

10.4.6 Equipment Tagout Procedures

10.4.7 Barrier Criteria

10.4.8 Safety of Ship Maintenance Item Identification, Listing and Control (Submarines only)

10.4.9 Ship in Dry Dock (Submarines Under Joint Fleet Maintenance Manual Controls)

10.5 Final Certification, Close-Out and Re-entry of Submarine Spaces, Tanks and Voids

11.1 Purpose

11.2 Shipboard Technical Document Management

11.3 Technical Libraries

11.4 Index of Technical Publications and Ship's Drawing Index

11.5 Maintenance Support Centers (Aircraft Carriers only)
CHAPTER 12 - HULL INSPECTION OF SHIPS AND CRAFT

12.1 Purpose ......................................................................................................................... IV-12-1

12.1.1 Scope ....................................................................................................................... IV-12-1

12.1.2 Discussion ........................................................................................................... IV-12-1

12.2 Action ........................................................................................................................... IV-12-3

12.3 Reports ......................................................................................................................... IV-12-3

Appendices

A Sample Layout of Inspection Areas ........................................................................ IV-12A-1
B Hull Reporting Format ........................................................................................ IV-12B-1

CHAPTER 13 - WEIGHT HANDLING EQUIPMENT TESTING AND INSPECTION

13.1 Purpose ........................................................................................................................ IV-13-2

13.2 Naval Sea Systems Command Afloat Requirements ................................................ IV-13-2

13.2.1 Definitions ........................................................................................................ IV-13-2

13.2.2 Procedure ......................................................................................................... IV-13-3

13.2.3 Load Test Types and Duration ....................................................................... IV-13-4

13.2.4 Load Test Periodicity ....................................................................................... IV-13-5

13.2.5 Crane Certification Program ........................................................................ IV-13-6

13.2.6 Daily Inspections ............................................................................................. IV-13-6

13.2.7 Use of Nylon Straps ......................................................................................... IV-13-7

13.2.8 Weight Test Procedure Matrix .................................................................. IV-13-7

13.2.9 Identification of Equipment ........................................................................ IV-13-8

13.2.10 Record Keeping ............................................................................................. IV-13-8

13.2.11 Crane Material Condition Assessments .................................................. IV-13-9

13.3 Naval Facilities Engineering Command Ashore Requirements ................................ IV-13-9

13.3.1 Certification Program ................................................................................... IV-13-10

13.3.2 Operator Licensing Program ....................................................................... IV-13-10

13.3.3 Inspections ..................................................................................................... IV-13-10

13.3.4 Test Procedures ............................................................................................. IV-13-10

13.3.5 Special Purpose Service ........................................................................... IV-13-10

13.4 Slings ......................................................................................................................... IV-13-10

13.5 Crane Rigging Gear and Miscellaneous Equipment ........................................ IV-13-10

CHAPTER 14 - MAGAZINE SPRINKLER INSPECTION REQUIREMENTS

14.1 Purpose ......................................................................................................................... IV-14-1

14.2 Responsibilities ........................................................................................................ IV-14-1

14.2.1 Commanding Officers .................................................................................. IV-14-1

14.2.2 Verification Activity ....................................................................................... IV-14-2

14.2.3 Immediate Superior In Command ............................................................... IV-14-2
CHAPTER 15 - CIRCUIT BREAKERS
15.1 Purpose......................................................................................................................... IV-15-1
15.2 Circuit Breaker Function and Acquisition on Navy Ships ........................................ IV-15-1
15.3 Circuit Breaker Overhaul Facilities and Part Procurement ........................................ IV-15-1
15.4 Submarine Circuit Breakers ......................................................................................... IV-15-2
15.5 Navy Policy on Shipboard Circuit Breaker Maintenance and Overhaul ..................... IV-15-2

CHAPTER 16 - AIRCRAFT LAUNCH AND RECOVERY SYSTEMS FOR AIRCRAFT CARRIERS ONLY
16.1 Purpose......................................................................................................................... IV-16-1
16.2 Aircraft Launch and Recovery Equipment Maintenance Program .............................. IV-16-1
   16.2.1 Applicability ....................................................................................................... IV-16-1
   16.2.2 Objectives .......................................................................................................... IV-16-1
   16.2.3 Responsibilities ................................................................................................. IV-16-1
   16.2.4 Management Team ............................................................................................ IV-16-2
   16.2.5 Assist Visits ....................................................................................................... IV-16-2
   16.2.6 Audits ................................................................................................................. IV-16-2
16.3 Aviation Certification .................................................................................................. IV-16-3
16.4 Carrier and Field Service Unit ..................................................................................... IV-16-3
16.5 Responsibilities ............................................................................................................ IV-16-3
   16.5.1 Aircraft Carrier Commanding Officer ............................................................... IV-16-3
   16.5.2 Industrial or Repair Activity .............................................................................. IV-16-4
16.6 Naval Aviation Depot .................................................................................................. IV-16-4
16.7 Naval Aviation Depot Voyage Repair Team ................................................................ IV-16-5

CHAPTER 17 - STEAM CATAPULT INSPECTION
17.1 Purpose......................................................................................................................... IV-17-1
17.2 Policy ........................................................................................................................... IV-17-1
17.3 Types of Inspections .................................................................................................. IV-17-2
17.4 Responsibilities ............................................................................................................ IV-17-2
   17.4.1 Naval Sea Systems Command ........................................................................... IV-17-2
   17.4.2 Naval Surface Warfare Center, Philadelphia Division ....................................... IV-17-2
   17.4.3 Type Commander .............................................................................................. IV-17-3
   17.4.4 Regional Support Group/Regional Maintenance Center and Fleet
       Maintenance Activity Commanding Officers ....................................................... IV-17-3
   17.4.5 Ship Commanding Officer .............................................................................. IV-17-3
   17.4.6 Regional Maintenance Center Senior Inspector .............................................. IV-17-4
   17.4.7 Steam Generating Plant Inspector ................................................................... IV-17-4
17.5 Inspection Scheduling ................................................................................................. IV-17-4
17.6 Safety Procedures ................................................................. IV-17-5
17.7 Catapult Accumulator Inspections and Requirements ............................... IV-17-5
  17.7.1 Routine Inspection ............................................................. IV-17-6
  17.7.2 Pre-Start of Availability Inspection ........................................ IV-17-6
  17.7.3 Start of Availability Inspection ............................................... IV-17-6
  17.7.4 Strength and Integrity Inspection ........................................... IV-17-6
  17.7.5 Industrial Support Visit Inspection ........................................ IV-17-7
  17.7.6 Completion of Availability Inspection ...................................... IV-17-7
  17.7.7 Inactivation or Reactivation Inspection ..................................... IV-17-7
  17.7.8 Special Inspections .............................................................. IV-17-7
17.8 Inspection Guidelines and Reports .................................................... IV-17-8
  17.8.1 Guidelines ........................................................................ IV-17-8
  17.8.2 Reports ............................................................................ IV-17-8
17.9 Catapult Accumulator Inspection Preparation ......................................... IV-17-9
17.10 Catapult Accumulator Inspection ...................................................... IV-17-9
  17.10.1 Catapult Accumulator Inspection Forms .................................... IV-17-9
  17.10.2 Catapult Accumulator Inspection Areas ..................................... IV-17-9
  17.10.3 Completion of Inspection ....................................................... IV-17-10
  17.10.4 Automatic Controls Systems Inspection Guidelines ..................... IV-17-10
  17.10.5 Operating and Casualty Procedures ........................................ IV-17-10

Appendices
  A Sample Catapult Accumulator Inspection Request ............................ IV-17A-1
  B Sample Inspection Confirmation Letter .......................................... IV-17B-1
  C Summary of Catapult Accumulator Inspection Scheduling and Responsibilities ........................................ IV-17C-1
  D1 Sample Catapult Accumulator Inspection Report Cover Letter ........ IV-17D-1
  D2 Sample 5 Year Strength and Integrity Catapult Accumulator Inspection Report Cover Letter ................ IV-17D-2
  D3 Sample Other Catapult Accumulator Inspection Report Cover Letter ........................................ IV-17D-3
  E Sample Catapult Accumulator Inspection RBO and Severely Degraded Deficiencies Message ................ IV-17E-1
  F Sample 30 Day Update Message .................................................... IV-17F-1
  G Sample Catapult Accumulator Rescission Message .......................... IV-17G-1

CHAPTER 18 - SUBMARINE SALVAGE INSPECTION

18.1 Purpose................................................................................ IV-18-1
18.2 Inspections ........................................................................... IV-18-1
  18.2.1 Periodicity ......................................................................... IV-18-1
  18.2.2 Procedures and Reports ...................................................... IV-18-1
  18.2.3 Inspection Resources ......................................................... IV-18-2
18.3 Responsibilities ....................................................................... IV-18-2
  18.3.1 Immediate Superior In Command .......................................... IV-18-2
  18.3.2 Commanding Officer or Officer In Charge ............................ IV-18-2
  18.3.3 Senior Inspecting Officer ................................................... IV-18-3
Appendices
A  SSN 21 Class Submarine Salvage Inspection Check-Off List ....................... IV-18A-1
B  SSN 688 Class Submarine Salvage Inspection Check-Off List ..................... IV-18B-1
C  SSBN/SSGN 726 Class Submarine Salvage Inspection Check-Off List ...... IV-18C-1
D  SSN 774 Class Submarine Salvage Inspection Check-Off List ..................... IV-18D-1
E  Sample Pre-Inspection Information or Certification ...................................... IV-18E-1
F  Sample Report of Salvage Inspection Forwarding Letter ............................... IV-18F-1

CHAPTER 19 - RETENTION OF MATERIAL DEFICIENCY REPORTS AND RECORDS OF EQUIPMENT CHARACTERISTICS AND TESTS
19.1 Purpose......................................................................................................................... IV-19-1
19.2 Inspection Reports ....................................................................................................... IV-19-1
19.3 Retention of Records of Equipment Characteristics and Tests........................ IV-19-1
Appendices
A  Bearing Log (Submarines Only) .................................................................... IV-19A-1

CHAPTER 20 - DIVER LIFE SUPPORT SYSTEMS, SUBMARINE RESCUE CHAMBER AND DRY DECK SHELTER MAINTENANCE AND CERTIFICATION
20.1 Purpose......................................................................................................................... IV-20-1
20.2 Diver Life Support System Maintenance and Certification..................................... IV-20-1
  20.2.1 General ............................................................................................................... IV-20-1
  20.2.2 Objective ............................................................................................................ IV-20-1
  20.2.3 United States Navy Diving and Manned Hyperbaric Systems Safety Certification ....................................................................................................... IV-20-1
Appendices
A  System Certification Requirements ................................................................ IV-20A-1

CHAPTER 21 - SUBMARINE OXYGEN GENERATING PLANTS
21.1 Purpose......................................................................................................................... IV-21-1
  21.1.1 Policy .............................................................................................................. IV-21-1
  21.1.2 Background ................................................................................................... IV-21-2
21.2 Responsibilities ......................................................................................................... IV-21-2
  21.2.1 Immediate Superior In Command ..................................................................... IV-21-2
  21.2.2 Performance Monitoring Team ........................................................................ IV-21-3
  21.2.3 Commanding Officer ..................................................................................... IV-21-3
21.3 Requirements for Shipboard Personnel Qualification ........................................ IV-21-4
  21.3.1 Training ......................................................................................................... IV-21-4
  21.3.2 Watchstanding Prerequisites ........................................................................ IV-21-5

CHAPTER 22 - SUBMARINE ANTENNA TESTING
22.1 Purpose......................................................................................................................... IV-22-1
22.2 Background .............................................................................................................. IV-22-1
22.3 Policy ..................................................................................................................................... IV-22-1
   22.3.1 Hydrostatic Pressure Testing ................................................................................ IV-22-1
   22.3.2 Fleet Maintenance ..................................................................................................... IV-22-2
22.4 Procedure ........................................................................................................................ IV-22-2

CHAPTER 23 - GAS TURBINE ENGINE INSPECTION FOR SURFACE FORCE SHIPS
23.1 Purpose ................................................................................................................................ IV-23-1
23.2 Discussion ........................................................................................................................ IV-23-1
23.3 Marine Gas Turbine Inspector ........................................................................................ IV-23-1
   23.3.1 Certification ........................................................................................................ IV-23-1
   23.3.2 Authorized Functions and Responsibilities ........................................................ IV-23-2
23.4 Gas Turbine Inspections and Requirements ................................................................... IV-23-5
   23.4.1 Applicability ....................................................................................................... IV-23-5
   23.4.2 Pre-Planned Major Maintenance Availability .................................................... IV-23-5
   23.4.3 Pre-Deployment ................................................................................................. IV-23-5
   23.4.4 Gas Turbine Bulletin Inspections .................................................................... IV-23-5
   23.4.5 Casualties ........................................................................................................... IV-23-6
23.5 Requesting Procedures ...................................................................................................... IV-23-6
23.6 Preparation for Inspection ................................................................................................. IV-23-6
23.7 Inspection Procedures ...................................................................................................... IV-23-6
   23.7.1 Post Casualty Inspections .................................................................................. IV-23-6
   23.7.2 Pre-Availability Inspections .............................................................................. IV-23-6
23.8 Inspection Criteria ............................................................................................................. IV-23-6
   23.8.1 Repair Before Operating .................................................................................... IV-23-6
   23.8.2 Severely Degraded ............................................................................................. IV-23-7
   23.8.3 Major Deficiencies ............................................................................................. IV-23-7
   23.8.4 Minor Deficiencies ............................................................................................. IV-23-8
23.9 Inspection Results .............................................................................................................. IV-23-8

CHAPTER 24 - WOOD HULLED SHIPS AND CRAFT
24.1 Purpose ................................................................................................................................ IV-24-1
24.2 Wood Decay .................................................................................................................... IV-24-1
   24.2.1 Primary Causes .................................................................................................. IV-24-1
   24.2.2 Recognition ....................................................................................................... IV-24-1
   24.2.3 Preventive Measures ........................................................................................ IV-24-1
   24.2.4 Corrective Measures ........................................................................................ IV-24-2
24.3 Deck and Hull Maintenance ............................................................................................... IV-24-3
   24.3.1 Inspection Requirements ................................................................................ IV-24-3
   24.3.2 Maintenance Policies ........................................................................................ IV-24-3
   24.3.3 Deck Covering Repairs .................................................................................... IV-24-4
   24.3.4 Caulking Techniques ......................................................................................... IV-24-4
24.3.5 Weather Deck/Planked Deck Repair ................................................................. IV-24-4
24.3.6 Underwater Planking Repairs ........................................................................ IV-24-5

(c) COMLANTFLTINST 5400.2 - U.S. Atlantic Fleet Regulations  
(d) COMPACFLTINST 5400.3 - U.S. Pacific Fleet Regulations  
(e) NAVSEAINST 4790.8/OPNAVINST 4790.4 - Ships’ Maintenance and Material Management (3-M) Manual  

LISTING OF APPENDICES.  

A List of Acronyms  

1.1 PURPOSE. To provide guidance in the execution and management for tests, inspections and assessments applicable to units of the Navy.  

a. The Foreword of this manual contains a master listing of all references used throughout the Joint Fleet Maintenance Manual. These references are arranged in alphanumeric order to facilitate their procurement for use with this manual. References used in specific chapters of this volume are listed at the beginning of each chapter in the order in which they appear in the chapter text.  

b. Acronyms are identified when they are initially used in this volume. Appendix A of this chapter contains a master listing of acronyms used throughout this volume.  

c. References (a) through (e) must be used in conjunction with this manual, however, the requirements of this manual must not take precedence over these higher authority directives, or technical directives from applicable Systems Commands. Where conflicts exist with previously issued Fleet Commander, Commander, Naval Reserve Forces (COMNAVRESFOR), Type Commander (TYCOM) letters, transmittals and instructions, other than references (c) and (d), this manual must take precedence. Conflicts must be reported to the cognizant TYCOM for resolution.  

1.2 SCOPE. This volume applies to all ships and shore activities under the cognizance of Commander, United States Fleet Forces Command (COMUSFLTFORCOM), Commander, Pacific Fleet (COMPACFLT) and COMNAVRESFOR. This volume is not intended to be all encompassing, since the guidance for many elements of the maintenance programs and their execution are issued by higher or technical authority (e.g., Naval Ships’ Technical Manuals (NSTM), Office of the Chief of Naval Operations Instruction (OPNAVINST)).  

a. This volume contains general topics, applicable to all ships and units under the cognizance of COMUSFLTFORCOM or COMPACFLT. In those cases where chapters, sections or paragraphs of chapters are not applicable to certain Forces, an applicability statement has been used for clarification.
b. Equipment under the cognizance of the Strategic Systems Programs and Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) is maintained following Strategic Systems Programs and NAVSEA 08 directives, respectively.

1.3 CHANGES AND CORRECTIONS. Changes and corrections will be issued as required. Comments and suggestions for improving or changing this volume are invited. Address comments, recommendations and requested changes to Submarine Maintenance Engineering, Planning and Procurement Activity utilizing the change request form located in the front of this manual. If changes are submitted in electronic format, facsimile or E-mail, each change request must contain the information required on the change request form.

LISTING OF APPENDICES.

A Typical Core Capability Assessment Areas
B Typical Core Capability Assessment Projects
C Sample FMA Assessment Report
D FMA Assessment Deficiency Format

2.1 PURPOSE. The purpose of this chapter is to provide guidance for conducting a Fleet Maintenance Activity (FMA) Assessment, including areas to be assessed, responsibilities for conducting the assessment and deficiency correction and reporting requirements.

2.1.1 Scope. Fleet Maintenance Activity assessments will be conducted by the Type Commander (TYCOM) or Fleet Commander with cognizance over the FMA. For assessments conducted by the cognizant TYCOM, the assessment team will be comprised of members from each TYCOM that the FMA performs repairs for, with the senior member from the cognizant TYCOM. For assessments conducted by the cognizant Fleet Commander, the assessment team will be comprised of members from each TYCOM that the FMA performs repairs for, with the Fleet Commander, or Fleet Commander assigned TYCOM representative as the senior member of the assessment team. Assessments will be conducted per references (a) through (g) using the Quality Assurance assessment areas prescribed by Volume V, Part I, Chapter 9 of this manual.

a. Assessments of Afloat FMAs will be performed annually, not to exceed 18 months.

b. Assessments of shore based FMAs will be performed every 18 months, not to exceed 24 months. (TYCOM Quality Assurance assessments, explained in Volume V, Part I, Chapter 9 of this manual, will be accomplished concurrently with FMA assessments when scheduled in the same calendar year.)
c. (Regional Maintenance Centers only) The following Regional Maintenance Centers (RMC) will be assessed every 18 months not to exceed 24 months. Areas may be assessed more frequently based upon results of previous assessments. These assessments encompass all functions of the RMC standard departments as listed in Commander, Naval Regional Maintenance Center Ship Organization and Regulation Manual:

Mid-Atlantic Regional Maintenance Center (MARMC)
Southeast Regional Maintenance Center (SERMC)
Southwest Regional Maintenance Center (SWRMC)
Pearl Harbor Naval Shipyard and Intermediate Maintenance Facility
Puget Sound Naval Shipyard and Intermediate Maintenance Facility
Forward Deployed Regional Maintenance Center (FDRMC)

d. Assessments are to evaluate the ability of the FMA to execute maintenance following applicable technical directives and specifications. The assessment of FMAs encompasses Repair Department Work Centers (WC) and the direct repair WC support functions performed by other departments.

2.1.2 Applicability. The assessments described in this chapter are applicable for non-nuclear work only. This chapter does not apply to nuclear work and systems; they are addressed separately in Volume V, Part I, Chapter 9 of this manual.

2.2 ASSESSMENT AREAS.

a. FMAs are expected to maintain a broad spectrum of capabilities at full readiness. The FMA can expect that many of these capabilities will be observed and evaluated during the course of the assessment. The Assessment Team will place primary emphasis on the essential core capabilities, utilizing the guidelines of references (a) and (b).

b. Core capability craftsman demonstration areas are shown in Appendices A and B of this chapter. These represent the typical areas to be assessed and, as time permits, the team leader may observe other areas or projects. Observation of “in process work” is preferred to the assignment of projects or mockups in core capability areas. The team leader will make all decisions regarding the assignment of projects.

2.3 ASSESSMENT RESULTS. An overall grade of satisfactory or unsatisfactory will be assigned based on the FMA’s compliance with higher-level requirements and governing technical documents.

2.4 RESPONSIBILITIES.

2.4.1 Type Commander.

a. Promulgate an assessment schedule by 30 November for the following calendar year.

b. Forward a precepts letter, or a message, to the FMA’s Commanding Officer at least two weeks prior to the assessment. This letter should include:

(1) The date of the assessment.

(2) Assessment Team member’s security clearance information.
(3) Core capability areas for the observation of in process work.
(4) Logistic support requirements.
(5) Additional information as appropriate.

c. Conduct an inbrief and outbrief with the Immediate Superior in Command (ISIC) (if assigned), FMA’s Commanding Officer and designated personnel. A preliminary copy of the Assessment Report will be provided to the FMA at the outbrief.

d. Issue the Assessment Report (Appendix C of this chapter) to the FMA via the ISIC within 15 calendar days following completion of the assessment.

2.4.2 Fleet Maintenance Activity.

a. Forward team security clearance information to the local base security office and to all units who are or will be in availability during the period of the assessment.

b. Designate an Assessment Coordinator to act as the point of contact between the Assessment Team and the command. Notify the appropriate TYCOM of the name and phone number of the Assessment Coordinator upon receipt of the assessment precepts letter.

c. Ensure the following assessment support is provided:

(1) Access to all industrial areas within the FMA.
(2) An adequate and dedicated administrative work area to allow the Assessment Team to assemble.
(3) Parking for the Assessment Team.
(4) A telephone with off-ship and long distance capability.
(6) Clerical personnel to assist. These personnel will report to the Assessment Team Leader for assignment of working hours and duties.
(7) Copying services.
(8) Access to all Controlled Work Packages (CWP) and standard Formal Work Packages (FWP), including the index of FWPs.
(9) Access to selected Repair Department training records and the departmental weekly training schedule for the week of the assessment.
(10) A list of all non-nuclear Technical Work Documents performed since the last assessment.
(11) A list of key personnel and telephone numbers.
(12) A list of capabilities required per references (a) and (b), but not held.
(13) A list of all critical path jobs scheduled during the assessment.
(14) A list of all production or management meetings scheduled during the assessment.
(15) In the Assessment Team work area, provide:

(a) One desk top computer and a laser printer.

(b) A copy of the following reference documents:

1. The previous TYCOM or Fleet Assessment report with corrective actions.
2. Equipment out of commission lists.
3. All FMA instructions and notices, including those pertaining to safety, production and repair functions, and the Command Availability Guide (if applicable).
6. FMA Capabilities (currently titled IMA Capabilities) and WC Validation Reports for all applicable WCs.
8. TYCOM Training Manual.
9. Repair Department Equipment Status Log.
10. FMA Audit and Surveillance Program records.
11. FMA self-assessments.
12. Departure from Specification files.

d. Initiate action to systematically correct each assessment deficiency finding (Appendix D of this chapter) per paragraph 2.5.1 and 2.5.2 of this chapter.

2.5 ASSESSMENT FINDINGS AND CORRECTIVE ACTION.

a. For each noted deficiency in an assessment area, a finding will be written and classified as either “Immediate Corrective Action Required” or “Corrective Action Required”.

b. Audit cards must clearly “stand on their own” and indicate if certification is or is not impacted by the finding when the audit card deals with SUBSAFE, Deep Submergence Systems or Fly-By-Wire deficiencies. All audit cards annotating a certification issue will be classified as “Immediate Corrective Action Required”.

c. The FMA will annotate in the corresponding assessment report enclosure, the corrective actions taken for each finding.

d. The Commanding Officer will also submit a findings status report to the TYCOM via the administrative chain of command within 60 days following receipt of the official assessment report.

e. Unless a delay is specifically authorized by the TYCOM, all findings will be corrected within the time limits specified in paragraphs 2.5.1 and 2.5.2 of this chapter.
2.5.1 **Immediate Corrective Action Required.** A deficiency that poses a significant safety hazard or results in a total loss or extreme degradation of the FMA’s readiness to perform work or provide a service within an area of required capability. Findings classified as “Immediate Corrective Action Required” require the immediate attention of the Commanding Officer and must be corrected within 15 days following the date of the assessment out-brief. Additionally, the TYCOM may direct the immediate suspension of work in any area(s) pending resolution of critical deficiencies.

2.5.2 **Corrective Action Required.** A deficiency which poses a potential hazard to personnel safety or has a significant impact on the FMA’s readiness to perform work or provide a service within an area of required capability. Findings classified as “Corrective Action Required” require the prompt attention of the Commanding Officer to preclude them from developing into “Immediate Corrective Action Required” deficiencies and must be corrected within 60 days following receipt of the official assessment report.
APPENDIX A

TYPICAL CORE CAPABILITY ASSESSMENT AREAS

1. Safety or Navy Occupational Safety and Health.
2. Repair Training Effectiveness.
4. Maintenance Data System Management.
5. Calibration - Production or WC Management.
6. FWPs (Volume V, Part I, Chapter 2 of this manual).
7. Tool or Equipment Control Programs.
8. Corrosion Control Program (as applicable).
9. Welding and Brazing Programs.
15. Hull Repair.
16. Machinery Repair.
17. Electrical Repair.
18. Electronics Repair.
19. Ordnance Repair (as applicable).
21. Weight Handling or Rigging.
22. Diving or Diver Life Support Systems (as applicable).
23. Regional Repair Center Capabilities (as applicable).
APPENDIX B
TYPICAL CORE CAPABILITY ASSESSMENT PROJECTS

1. Butt Weld (pipe).
2. HY-80 Weld Process.
4. Silver Braze.
5. Tube Bend.
6. Flex Hose Manufacture & Testing.
7. Electroplating.
8. Hydraulic Control Valve Repair.
9. Weight Handling Sling Manufacture and Weight Test.
10. Valve Lap and Hydrostatic Test.
11. Other projects as necessary.
APPENDIX C

SAMPLE FMA ASSESSMENT REPORT

From: TYCOM (as appropriate)
To: Commanding Officer, FMA
Via: ISIC (as appropriate)
Subj: FMA ASSESSMENT
Ref: (a) COMUSFLTFORCOMINST 4790.3; Joint Fleet Maintenance Manual
(b) Precepts letter
Encl: (1) FMA Assessment Findings
(2) FMA Assessment Project Summary

1. Per Volume IV, Chapter 2 of reference (a) and reference (b), an FMA Assessment was conducted onboard FMA (Name of assessed command), during the period (Dates of Assessment).

2. The Assessment Team reviewed selected areas as prescribed in reference (a) and their findings and comments are contained in enclosures (1) and (2). Any required corrective actions should be initiated per Volume IV, Chapter 2, paragraph 2.5.1 and 2.5.2 of reference (a).

3. Overall Observation: (A brief summary of the results of the assessment including an overall evaluation of satisfactory or unsatisfactory).

4. (Subsequent paragraphs should briefly comment on major areas of concern found during the assessment).

G  Sample 30 Day Update Message

3.1 PURPOSE. To establish policy and provide procedures and inspection requirements for the inspection of all conventional steam generating plants in surface force ships and training sites including schedules, preparations for inspection, inspection guidelines and reporting. Periodic standardized inspections are required of all non-nuclear propulsion, auxiliary, waste heat and training site boilers by a certified Steam Generating Plant Inspector (SGPI) or Naval Surface Warfare Center, Philadelphia Division (NAVSURFWARREN PD), as applicable. The maximum interval between boiler inspections and other occasions requiring boiler inspections, including responsibilities for continuation and standardization of the boiler inspection program, are formally assigned in reference (a).
3.2 **TYPES OF BOILER INSPECTIONS.**

a. Routine Inspection.
b. Pre-start of Availability Inspection (PSAI).
c. Start of Availability Inspection (SAI).
d. Strength and Integrity Inspection.
e. Industrial Support Visit (ISV).
f. Completion of Availability Inspection (CAI).
g. Inactivation or Reactivation Inspection.
h. Engineer Officer Inspection.
i. Major Repair Inspection.
j. Special Inspection.
k. Operational Assessments.

3.3 **RESPONSIBILITIES.**

3.3.1 **Naval Sea Systems Command.** NAVSEA must provide technical authority oversight over all main, auxiliary, waste heat and training site boiler systems and associated equipment. The designated NAVSEA Technical Warrant Holder must:

a. Assure safe and reliable system operation.
b. Set and enforce all technical requirements.
c. Approve all major Departure from Specifications (DFS).
d. Provide technical oversight and management of the SGPI and NSWCPD programs:
   (1) Establish and enforce requirements for SGPI certification and recertification.
   (2) Ensure periodic SGPI seminars are conducted.
   (3) Ensure periodic technical audits of all Integrated Logistics Support documentation and Training.
   (4) Maintain the Boiler Inspection and Repair Management Information System (BIRMIS).
   (5) Routinely evaluate and ensure state of the art inspection, maintenance and repair tools and techniques are used.

3.3.2 **Naval Surface Warfare Center, Carderock Division.** NSWCCD must:

a. Provide support to NAVSEA for the SGPI and NSWCPD programs. Ensure that the required technical documentation to support the SGPI or NSWCPD Inspector programs is maintained current.
b. Establish and monitor the requirements and standards for routine and industrial inspections of steam generating plants.
c. Develop, implement and maintain a program to train and certify NSWCPD Inspectors per reference (a).

d. Ensure that inspections of newly constructed ships and ships undergoing major overhaul or conversion are conducted per this instruction.

e. Conduct periodic technical audits of the SGPI Training Course per reference (a).

f. Provide management of technical data, boiler history and the associated repair management information database system.

g. Provide technical support to the semi-annual seminars.

h. Maintain a roster of all certified SGPIs by name, rating, duty station, date of certification and expiration date of certification. Revoke inspector certification and initiate action to decertify inspectors who fail to comply with requirements of reference (a).

i. Ensure that the requirements for SGPI certification, recertification and certification extensions are met prior to final approval.

3.3.3 Fleet Commander. The Fleet Commander must:

a. Identify and designate those fleet activities which have inspection responsibilities and maintain a base of certified SGPIs within those activities.

b. Ensure the availability of “school ships” to support SGPI or NSWCPD Inspector training. Student certification must be conducted on “D” type boilers.

c. Host the semi-annual SGPI seminars on an alternating coast basis.

3.3.4 Regional Maintenance Center. The Regional Maintenance Center (RMC) must:

a. Provide certified SGPIs to perform inspections per section 3.6 of this chapter.

b. Review the guidelines and inspection requirements for all boiler inspections required by this instruction and ensure that each inspection report is recorded and updated into BIRMIS.

c. Schedule and coordinate inspections of all steam generating plants required by this instruction with the appropriate technical activities to avoid the unnecessary opening of boilers.

d. Provide a qualified SGPI when requested by the ship, Immediate Superior in Command (ISIC) or Type Commander (TYCOM).

3.3.5 Regional Maintenance Center Commanding Officers. RMC Commanding Officers must:

a. Coordinate inspections in cognizant maintenance areas.

b. Maintain an up-to-date status of required steam generating plant inspections which must include the latest inspection for all ships assigned to RMCs in their respective area of responsibility.

3.3.6 Immediate Superior In Command. The ISIC must:
a. Maintain overall cognizance of the Steam Generating Plant Inspection Program within their area of responsibility to ensure requirements and standards are met.

b. Schedule routine steam generating plant inspections in coordination with the cognizant RMC.

c. Arrange for the availability of an SGPI during the SAI and CAI in coordination with NSWCSD and the cognizant RMC.

d. Monitor the follow-up action required to correct noted discrepancies by randomly sampling the ship’s deferred maintenance action file and most recent boiler inspection report.

e. Assist Commanding Officers in arranging for the corrective action of items beyond the capability of Ship’s Force, when requested.

3.3.7 Ship Commanding Officer, Officer In Charge or Maintenance Team. Ship Commanding Officers, Officers In Charge or Maintenance Team must:

a. Request boiler inspections via Naval Message using the format in Appendix A of this chapter.

b. Prepare for scheduled inspections to include required operational testing per references (b) and (c).

c. Review inspection results and initiate corrective action for those items within Ship’s Force capability. Initiate requests for the correction of items beyond Ship’s Force capability. If any of the discrepancies of paragraph 3.9.2 of this chapter cannot be corrected within 72 hours following completion of the inspection, or if said discrepancies will impact the ship’s operational schedule, initiate a Casualty Report (CASREP) for the affected boiler(s) per reference (d).

d. Assess the impact (if any) of corrective action on operating schedules and advise the operational commanders. Decide (with repair activities) the optimum timing of repair actions to minimize impact on operating schedules.

e. Submit reports per paragraph 3.7.2 of this chapter.

f. Schedule boiler inspections as required by appropriate Planned Maintenance System (PMS) or Class Maintenance Plan item.

3.3.8 Regional Maintenance Center Senior Inspector. RMC Senior Inspectors must:

a. Ensure all assigned SGPIs maintain current certifications per reference (a).

b. Perform steam generating plant inspections per section 3.9 of this chapter, when directed.

c. Review and submit reports per paragraph 3.7.2 of this chapter.

d. Send inspection confirmation messages using Appendix B of this chapter.

e. Administer an SGPI pre-test for SGPI training school candidates per reference (a).

3.3.9 Steam Generating Plant Inspector. The SGPI must:

a. Maintain SGPI certifications per reference (a).
b. Perform steam generating plant inspections per section 3.9 of this chapter, when directed.

c. SGPIs are part of the technical authority chain-of-command and are accountable to the NAVSEA Technical Warrant Holder for the performance of their inspection duties.

d. The shipboard SGPI must:
   (1) Monitor all repairs conducted on the boilers, such as tube replacements, casing or refractory work, burner settings, hydrostatic test, etc., and annotate findings in Boiler Water or Feedwater log.
   (2) Observe PMS performed on the boilers to include MLOCs (burner front checks), greasing of sliding feet, setting safety valves, high and low static checks, flex tests and auxiliary support equipment safety and governor settings.
   (3) Accomplish special inspections and repairs on boilers after boiler casualties while underway and report in BIRMIS. Also, accomplish operational assessments on ship’s boiler auxiliary support equipment prior to upcoming availabilities and report in BIRMIS and in ships Current Ship’s Maintenance Project (CSMP), if repairs are required.

e. It is recommended that the shipboard SGPI be assigned as the LCPO of the Oil Lab in order to monitor the boiler water chemistry, boiler lay-ups and the Boiler Water or Feedwater Program (not to be assigned as Ships Oil King).

NOTE: THE SHIP’S FORCE SGPI CAN ONLY ACCOMPLISH SPECIAL INSPECTIONS AND OPERATIONAL ASSESSMENTS ON THEIR OWN SHIP, AS DESCRIBED IN PARAGRAPHS 3.6.9 AND 3.6.10 OF THIS CHAPTER. THE SHIP’S FORCE SGPI WILL ASSIST THE RMC SGPI OR NSWCPD INSPECTOR DURING ROUTINE AND AVAILABILITY RELATED INSPECTIONS. THE SHIP’S FORCE SGPI MAY NOT INDEPENDENTLY CONDUCT ROUTINE, STRENGTH AND INTEGRITY, PSAI, SAI, ISV, CAI INSPECTIONS ON THEIR OWN SHIP.

3.4 INSPECTION SCHEDULING. Commands will coordinate boiler inspections with the Maintenance Team or ISIC to include operational testing. Commands must ensure the inspection scheduling complies with the following:

   a. Boiler inspections are actively managed by SURFMEPP utilizing the Class Maintenance Plan. All routine, Pre-Availability, Start of Availability, Completion of Availability, Strength, Integrity and Ultrasonic Test Inspections will be pushed by SURFMEPP into the maintenance screening and brokering system as part of the Baseline Availability Work Package. SURFMEPP will also push non-routine boiler inspections as requested by TYCOM or the Maintenance Team.

   b. Once the Work Notification is available in the maintenance screening and brokering system, Ship’s Force and the Maintenance Team may coordinate and execute the inspection.

   c. Inspections should coincide with the required routine waterside and fireside maintenance.
d. Boiler inspection services must be coordinated by geographic areas for maximum utilization of SGPIs and NSWCPD Inspectors. ISICs will combine inspection requests and schedule inspections.

3.5 **BOILER SAFETY PROCEDURES.** The safety of personnel must be given the highest priority. Observance of good engineering practices and careful control of boiler water chemistry will reduce the frequency of pressure vessel entry.

a. Ensure “idle boiler condition” is accomplished per the provisions of the Engineering Operational Sequencing System (EOSS) and reference (b). Where conflicts occur, an EOSS feedback form should be submitted for resolution.

b. Do not enter any part of a boiler or De-Aerating Feed Tank (DFT) until it has been fully ventilated and certified by a Naval Maintenance Facility Gas Free Engineer or National Fire Protection Agency marine chemist as safe for entry per references (e) and (f), as applicable, and Chapter 25 of this volume.

c. Ensure the idle boiler is tagged out (valves wired shut and danger tagged). Observe two-valve protection per reference (g) where applicable. Open to the atmosphere the drain connections on all dead interconnecting piping to observe drainage.

d. The use of unshielded or non-approved portable lighting in an open boiler is prohibited. Portable lighting must be watertight. (National Stock Number (NSN) 9S-6230-00-701-2947 applies.)

e. Ensure all precautions cited in Section 2.24 of reference (b) are followed before entering an idle boiler.

f. There must be a safety observer outside the boiler entrance to provide assistance whenever personnel are inside a boiler (steam drum, water drum, firebox or smoke pipe).

g. Maintain an inventory log for accountability of all items taken into a boiler. The pockets of all personnel working in a boiler must be emptied and all jewelry removed. The removal of all items from the boiler must be verified from the inventory log prior to the close-up inspection. The Chief Engineer or his designated representative must inspect the boiler prior to final closeout.

h. Cleaning of firesides or repairs conducted to the pressure vessel exterior of a boiler is acceptable with a steaming boiler in the same space provided the precautions cited in Section 2.7 of reference (b) are observed. Water washing of the firesides is not authorized without NAVSEA approval.

i. Requiring personnel to enter the steam or waterside of a boiler with an adjacent steaming boiler is considered an unnecessary risk and will be avoided unless operations dictate otherwise. The decision to override normal safety precautions will be made by the Commanding Officer or Officer In Charge and will be reported to the TYCOM by message.

j. Keep the area under the boiler clean and dry.
Place signs warning that personnel are working in the boiler at the Boiler Console Operating station in the boiler operating space. The sign must remain there until the work has been completed and personnel are clear of the secured boiler.

3.6 **BOILER INSPECTIONS AND REQUIREMENTS.** Main propulsion, auxiliary, waste heat and training site boiler inspections conducted per the requirements of this chapter must fulfill all other requirements for comprehensive inspections of propulsion, auxiliary and waste heat boilers. All boiler inspections, including pre- and post-operational assessments, should be scheduled for coincidental performance. Appendix C of this chapter is a summary of boiler inspection scheduling and responsibilities. Propulsion, auxiliary and waste heat boilers will be inspected by a certified SGPI at the following intervals:

3.6.1 **Routine Inspection.** Routine Inspections will be conducted at least once every Fleet Readiness Training Cycle. For newly constructed ships, the period will begin at the completion of the Board of Inspection and Survey (INSURV) Acceptance Trials. For LHD-1 Class ships, the normal interval between routine boiler inspections will be 24 months. For LCC-19 and CG-47 Class ships, the normal interval between routine boiler inspections will be every 18 months. To provide scheduling flexibility, boiler inspections may be performed as early as 6 months before or as late as 6 months after the required inspection date. However, extensions beyond 24 months for LHDs or 18 months for LCC-19 and CG-47 class ships, require Type Commander approval via minor DFS. Such extensions must not result in the inspection interval exceeding 30 months for LHDs or 24 months for LCC-19 and CG-47 class ships. Any boiler which exceeds the inspection interval may be placed out of commission until inspected by a certified SGPI. A major DFS submitted from the TYCOM to NAVSEA Boiler and Condenser Technical Warrant Holder for adjudication is required to operate a boiler beyond 30 months for LHD-1 Class ships and beyond 24 months for LCC-19 and CG-47 Class ships without a Routine Boiler Inspection. The Completion of Availability Inspection (CAI) or Strength and Integrity required inspections fulfill the requirements of a routine inspection.

a. A Safe-to-Steam Assessment will be performed when a DFS request for inspection periodicity extension is submitted for:
   1. LHD-1 Class - Minor and Major
   2. LCC-19 Class - Major
   3. CG-47 Class - Minor and Major

b. A Safe-to-Steam Assessment performed by an SGPI that is not part of Ships Company must be included with the periodicity extension request. Safe-to-Steam Assessments are scheduled by the TYCOM via the ISIC. Minimum requirements for a SGPI Safe-to-Steam Assessment are:
   1. Boiler-water and Feed-water program review per guidance provided in NAVSEA S9221-D2-MMA-010, Steam Generating Plant Inspection (Non-Nuclear) Manual: para 9.2 and Appendix F for LHD and LCC Classes; para 11.7 and Appendix F for CG-47 Class.
   2. Operational inspection per guidance provided by NAVSEA S9221-D2-MMA-010, Steam Generating Plant Inspection (Non-Nuclear) Manual: Appendix E and Figure E-6 for LHD and LCC Classes; Appendix E and Figure 11-2 for
CG-47 Class. Demonstration of PMS that will become due during the requested extension timeframe along with any other PMS that has already been complete may be requested by the SGPI conducting the Assessment.

3. All Safe-to-Steam Assessment results must be reported in BIRMIS.
   c. The boiler inspection will be scheduled by the cognizant ISIC.
   d. The boiler inspection will be performed by the RMC SGPI.
   e. The TYCOM may utilize PSAIs, CAIs, and Strength and Integrity Inspections which are documented in BIRMIS, to satisfy the pressure vessel portion of a routine boiler inspection. This will reduce the number of boiler openings. A Routine Inspection will not be considered completed until an SGPI has certified all items required in NSTM 221-2.1.2.3 Ship’s Pre-inspection Checklist For Up-coming Routine Boiler Inspection by U.S. Navy Steam Generating Plant Inspector and reference (c), Appendix E, F and Figure E-6 addressing Operational Assessments has been accomplished. Once completed, this resets the periodicity required for the next inspection to 24 months not to exceed 30 months for LHD-1 Class and 18 months not to exceed 24 months for LCC-19 and CG-47 Classes.

3.6.2 Pre-start of Availability Inspection. The PSAI may be required at the discretion of the TYCOM to support early bid specification and work package development.
   a. The PSAI will be scheduled by the ISIC, as approved by the cognizant TYCOM.
   b. The PSAI will be performed by the NSWCPD Inspector and the RMC SGPI.

3.6.3 Start of Availability Inspection. The SAI may be required to be accomplished at the beginning of an overhaul or availability to better define or re-evaluate the boiler bid specifications or work items at the discretion of the ISIC with TYCOM concurrence.
   a. The SAI will be scheduled by the ISIC, as approved by the cognizant TYCOM.
   b. The SAI will be performed by the NSWCPD Inspector and the RMC SGPI.

3.6.4 Strength and Integrity Inspection. The normal interval between Strength and Integrity Inspections will be 60 months. Strength and Integrity Inspections may be performed as early as 48 months or as late as 72 months after the last Strength and Integrity Inspection to provide scheduling flexibility. Inspections that exceed the 60-month interval will require a minor DFS to the TYCOM with recommendation from NSWCPD. Strength and Integrity Inspections may not exceed 72 months since the last inspection. Any boiler which exceeds the inspection interval will be placed out of commission until inspected by an NSWCPD Inspector and a certified SGPI. A major DFS with NAVSEA Technical Warrant Holder approval is required to operate a boiler beyond 72 months without a Strength and Integrity Inspection.
   a. The Strength and Integrity Inspection will be scheduled by the cognizant ISIC.
   b. The Strength and Integrity Inspection will be performed by an NSWCPD Inspector and the cognizant RMC SGPI.

3.6.5 Industrial Support Visit Inspection. The ISV inspection should be scheduled during the availability, but may be waived by the TYCOM for availabilities of short duration.
3.6.6 Completion of Availability Inspection. The CAI will be conducted before reinstallation of steam drum internals and de-superheater for the Strength and Integrity Inspection.

a. The CAI will be scheduled by the industrial activity or Supervising Authority, as applicable, and may be conducted in conjunction with a Routine Inspection.

b. The CAI will be performed by an NSWCPD Inspector and the cognizant SGPI.

3.6.7 Inactivation or Reactivation Inspection. The Inactivation or Reactivation Inspection must be conducted on all boilers prior to completion of the inactivation or reactivation.

a. The Inactivation or Reactivation Inspection will be scheduled by the industrial activity, Supervising Authority or Inactive Ship Facility as applicable.

b. The Inactivation or Reactivation Inspection will be performed by an NSWCPD Inspector and the cognizant SGPI.

3.6.8 Engineer Officer Inspection. The Engineer Officer Inspection will be conducted per PMS and situational requirements of references (b) and (c), but does not qualify as a Routine Inspection described in paragraph 3.6.1 of this chapter. This inspection will be scheduled and performed by the ship’s Engineer Officer. All results are to be documented in the Boiler or Water Feedwater logs and the Engineering Logs.

3.6.9 Special Inspection.

a. A special inspection must be conducted whenever major repair work as defined by references (b) and (g) is accomplished. This inspection is arranged by the ISIC in coordination with the TYCOM and the RMC and performed by an SGPI.

b. Additionally, SGPIs are authorized to conduct special no-notice inspections at their discretion to assess operational, chemistry and maintenance related problems.

3.6.10 Operational Assessments. An operational assessment must be accomplished prior to and at the completion of all Chief of Naval Operations (CNO) scheduled maintenance availabilities. These assessments are part of the Routine and Strength and Integrity Inspection requirements. These assessments will include both cold and hot plant import safety checks and an operational evaluation. Detailed assessment requirements and checklists are available in reference (c), Figure E-6.

3.7 BOILER INSPECTION GUIDELINES AND REPORTS.

3.7.1 Guidelines.

a. Routine Inspections of boilers will be conducted by certified SGPIs.

b. Only an SGPI with a current certification may issue a Repair Before Operating (RBO) deficiency. All RBO items must be corrected prior to boiler operation and reinspected by a certified SGPI or NSWCPD Inspector, as applicable, and preferably the same SGPI or NSWCPD Inspector who originally inspected the boiler. RBO discrepancies
include those for which continued unrestricted operation could endanger personnel. RBOs may not be departed via DFS. If there is not an immediate or near future danger to personnel, the discrepancy must be assigned as SEVERELY DEGRADED with major operational restrictions.

c. An SGPI-designated discrepancy discovered per reference (c) and paragraph 3.9.2 of this chapter which is assigned as severely degraded with major operational restrictions, and is considered for a DFS submission, is a major DFS and must be brought forward to the attention of the NAVSEA Boiler and Condenser Technical Warrant. A Major DFS must be forwarded for NAVSEA review and approval with accompanying engineering analysis recommendations from the originator. A severely degraded discrepancy per this chapter must be corrected or repaired prior to boiler operation unless it has been properly approved as a Major DFS.

d. The status of a boiler related DFS will be verified by the SGPI during the inspection for conformance with the requirements of this manual prior to placing the boiler into operation.

3.7.2 Reports.

a. The SGPI must provide an oral critique and preliminary report to the ship’s Commanding Officer or his designated representative. The report will contain the findings of the inspection, with special note of recurring discrepancies from previous inspections. The SGPI must ensure a maintenance ready 2-Kilo for every discrepancy found during the inspection is entered into the Current Ship’s Maintenance Project. Document the assessment finding of maintenance ready work notification (2-Kilo) per Volume VI, Chapter 42, paragraph 42.5.5 of this manual.

b. The Senior Inspector will forward a copy of the BIRMIS report with cover letter per the sample shown in Appendix D of this chapter to the ship’s Commanding Officer no later than ten days after satisfactory clearance of all discrepancies.

c. The SGPI must report deficiencies discovered during the inspection by message within 24 hours, using the message format of Appendix E of this chapter. This message must contain both RBO and severely degraded deficiencies as described in paragraph 3.7.1 of this chapter.

d. The cognizant SGPI must report by message, using the format in Appendix F of this chapter, the correction and re-inspection of all RBO deficiencies prior to lighting off an inspected boiler.

e. The ship’s Commanding Officer must submit a copy of the Current Ship’s Maintenance Project to the SGPI for verification of downloaded 2 Kilos.

f. The ship’s Commanding Officer must report corrected deficiencies, by message, to the ISIC and TYCOM using the format in Appendix G of this chapter, within 30 days of the completed inspection and at 30-day intervals thereafter until all deficiencies are corrected or deferred to a CNO Maintenance Availability. The TYCOM is the sole authority for deferral of deficiencies. Update messages must list the BIRMIS item number and 2K Job Sequence Number of those items which have been completed.
since the last update message. A corrected BIRMIS report will be provided to the ship after BIRMIS status codes are updated.

g. The ship’s Commanding Officer must notify the ISIC (as applicable) or TYCOM when a scheduled steam generating plant inspection cannot be conducted by submitting a DFS request. State the reason why the inspection cannot be conducted and recommend a revised date.

3.8 **BOILER INSPECTION PREPARATION.**

a. Conduct the operational assessment before disassembling the boiler for inspection. Detailed assessment requirements are reported in reference (c).

b. Prepare the boiler using the guidance provided in reference (b).

c. Keep air passages, including the air box beneath the boiler and uptake spaces, clean and dry.

d. Wire shut and danger tag all steam and water valves to the boiler per the ship’s Tag Out Users Manual. Open to the atmosphere the drain connections on all dead interconnecting piping to observe drainage.

e. The ship’s Engineer Officer must ensure all Ship’s Force responsibilities are complete using the guidance provided in reference (c).

f. Open DFT for inspection.

3.9 **BOILER INSPECTION.**

3.9.1 **Boiler Inspection Forms.** Boiler inspections will be conducted using the appropriate BIRMIS forms. Include specific comments on the state of preservation and material condition of the boiler, hull structural members beneath the boiler and the effectiveness or ineffectiveness of the boiler water chemistry program.

3.9.2 **Boiler Inspection Areas.** A discrepancy is classified as an RBO when, if left uncorrected, it could endanger personnel safety. All RBO items must be corrected prior to boiler operation and re-inspected by a certified SGPI or NSWCCD LCEM Inspector as applicable, and preferably the same SGPI or NSWCPD Inspector who originally inspected the boiler. As inspected by an SGPI inspector, RBO discrepancies may include but are not limited to the following:

a. Active oxygen attacking the boiler watersides.

b. Hard scale or baked sludge.

c. Significant lube oil or fuel oil contamination of watersides.

d. Inoperative, misadjusted or missing safety devices.

e. Refractory deterioration which allows heat penetration to casings or causes incomplete combustion.

f. Ship’s Force Boilerwater or Feedwater certifications, chemical inventory and shelf life not within requirements in reference (h).

g. Inability to maintain water chemistry within limits. Ineffective Boilerwater or Feedwater program based on log review which, if left uncorrected, may result in
severe degradation of the boiler watersides. Inoperative or degraded treatment, sampling and blow-down systems.

h. Excessively fouled or tacky firesides, fireside deposits built up on the crown of the water drum.

i. Sliding feet that do not accept grease or do not show indication of movement.

j. Lack of maintenance and preservation of the boiler, resulting in deterioration and weakening of boiler and hull structural members. This includes deterioration in the air casing which allows water and combustion air or gasses into the space.

k. Lube oil contamination of Automatic Boiler Control (ABC) Systems.

l. Fire hazards, safety hazards (fuel or lube oil in the machinery room), deteriorated or missing flange shields. Oil soaked lagging and insulation.

m. Inoperative or missing firefighting equipment.

n. ABC equipment inoperable or failed cold or hot checks.

o. Steam smothering system inoperative (plugged nozzles, deteriorated or improperly installed piping).

p. Deteriorated boiler smoke pipes which allow stack gas to escape. Clogged or deteriorated stack drains.

q. Incorrectly adjusted burners or inoperative air registers. Safety Shut-off Devices which do not meet the leakage criteria of reference (b). Insufficient amount of sprayer plates, burner barrels and go-no-go gages to meet main space requirements as specified in reference (b).

r. Boiler that does not pass design hydrostatic test.

s. Non-deferrable defects or indications in the pressure vessel and piping boundary.

t. Damaged or deteriorated internals.

u. Defective tubes such as blistered, excessively warped or married tubes which prevent proper gas passage. Cracked tube bells.

v. Ultrasonic test results on soot blower heads or pressure vessel piping that are currently or projected to be at or below minimum requirements, out of periodicity, or when visual inspection dictates replacement before the next scheduled ultrasonic inspection.

w. Out of periodicity, in-operative temperature or pressure measuring instruments.

x. In-operative, out of adjustment Forced Draft Blower counterweight shutters.

y. Non-functioning DFT components or defects in the pressure vessel.

z. In-operative fuel and steam systems remote isolation devices.

aa. Valve tightness integrity and operation which limits its ability to perform its intended function and exceeds the criteria of reference (i).

ab. Non-conformance of electrical safety and deteriorated or damaged wiring or components.
ac. Any other discrepancy deemed by the SGPI which would cause injury to personnel.

NOTE: A severely degraded designation is assigned to a deficiency that is not an immediate or near future danger to personnel, but will have major operational restrictions. A severely degraded discrepancy per this chapter must be corrected or repaired prior to boiler operation unless it has been properly approved as a major DFS.

3.9.3 Completion of Inspection. An oral critique and a preliminary inspection report, including a summary of restrictive deficiencies, will follow the inspection. Paragraph 3.7.2 of this chapter identifies official reporting requirements.

3.10 AUTOMATIC BOILER CONTROL SYSTEMS AND ONLINE VERIFICATION GUIDELINES.

a. ABC Systems, which include Automatic Combustion Controls, Boiler Feedwater Level Controls, and Automatic Feed Pump Controls and DFT Level Controls have been designed and installed for the purpose of permitting steady and transient operation with the least variation possible. Proper utilization and maintenance of these systems will also allow a reduction of watch standers on station thereby enabling engineering personnel to devote more time to routine maintenance of machinery and upkeep of spaces, as well as providing the ship with instant response to signaled engine orders.

b. The following guidelines must be adhered to regarding any or all ABC Systems installed:

(1) Ships must use the controls at all times while steaming. Manual operation at the control panel or console (remote manual) must be used when lighting off or securing the boiler. ABCs should be cut out and the boiler controlled in local manual only when required for casualty control, maintenance of equipment, or training of personnel. When ABCs cannot be operated in automatic, this fact must be reported by a CASREP message.

(2) Installed multi-element feedwater regulators must be cut in and used at all times except for periods devoted to training operators in the manual operation of feed check valves. Prime reliance for the control of water level in the boiler steam drum must be placed on the automatic regulator. When any indicator, alarm or feedwater regulating valve is not functioning properly, or is out of commission, a qualified checkman must be assigned. He or she must have no other duties as directed by temporary standing orders.

(3) Prior to boiler light off, all ABCs must be tested per EOSS.

(4) Maintenance and calibration of the ABC Systems must be accomplished by qualified technicians following the direction provided in applicable PMS, reference (j) and the manufacturer’s technical manuals.

c. Online Alignment Verification procedures provide a set of checks to verify proper performance of each of the sub-systems or control loops within the automatic
combustion, feedwater and feed pump control systems. Online Alignment Verification must be accomplished using the periodicity and procedures in PMS and applicable ABC ship specific technical manuals.

3.11 BOILER FLEXIBILITY TESTS. PMS and Online Alignment Verification procedures contain the necessary procedures for a boiler flexibility test. The periodicity is provided by and included in the PMS scheduling. The applicable Maintenance Requirement Card contains the NAVSEA guidelines governing the performance level of the boiler flexibility tests. Level I is the desired boiler flexibility performance level. Boilers with performance levels of II and III are considered safe to steam and safe for the conduct of Engineering Casualty Control Exercises. Boilers which cannot achieve a minimum level III flexibility are unsafe to steam and the ABC System should be reported by CASREP per the requirements of reference (d).

3.12 CERTIFIED BOILER WATER AND FEEDWATER TESTER REQUIREMENTS. All personnel who are required in the course of their duties to test, treat or manage boiler water or feedwater programs must be certified as specified in reference (k).

3.13 OPERATING AND CASUALTY PROCEDURES. Each ship with steam generating plants will have approved Steam Generating Plant Operations Procedures in the format prescribed by their respective TYCOM. They must contain detailed procedures and precautions for:

a. Normal operations including startup and shutdown.

b. Infrequent operations such as initial steam generating plant light-off following an availability.

c. Operating parameters, limitations, alarms and set points.

d. Casualty conditions including indications, immediate and supplementary actions.

e. Propulsion fuel economy per references (l) and (m).

f. JP-5 for use as boiler fuel.

g. Management of boiler water and feedwater.

h. Quality Assurance (QA) requirements for boiler repairs.

i. Maintenance and storage of boiler burner atomizers.

LISTING OF APPENDICES.

A  Diesel Maintenance Strategy for Surface Force Ships

4.1 PURPOSE. To provide guidance for the conduct of diesel engine inspections, timely correction of discrepancies and the general operation and maintenance of diesel engines.

4.2 DIESEL ENGINE INSPECTOR CERTIFICATION. The Diesel Engine Inspector (DEI) Program Manager is Naval Surface Warfare Center Philadelphia Division (NSWCPD). The Regional Maintenance Center (RMC) is the administrative manager for their respective region. DEI certification and certification extension requirements as outlined in reference (a), are amplified as:

a. Initial Certification. All DEI candidates that have satisfactorily completed the required Certification course, Service School Command A-652-0311, must receive an Interim Navy Enlisted Classification (NEC). The DEI candidate will have a period of one year from course completion date to satisfactorily perform two diesel inspections.
under instruction from a certified DEI. Upon completion of the second, successful inspection, the candidate must submit a request to be assigned the DEI NEC 4314, through his chain of command to the appropriate RMC for their review. The RMC will forward their endorsement to the Type Commander (TYCOM) for their endorsement, if required, and then to NSWCPD, who initiates the process of assigning the 4314 NEC. Initial qualification to perform diesel inspections will be for a period of 36 months. The requesting letter must contain:

(1) A copy of the two completed inspection reports performed under the observation and supervision of a DEI.

(2) Date of graduation from the certification course of instruction.

b. Transfer of the DEI will not require re-designation or re-qualification, as long as the DEI has maintained his qualifications per paragraph 4.2.c. of this chapter.

c. Maintaining Certification. All DEIs must maintain up to date knowledge of approved inspection practices and policies. Certification will be maintained by:

(1) Successfully conducting a minimum of two inspections annually per reference (b).

(2) In each calendar year, attending one of the semi-annual inspector seminars. DEIs unable to meet this requirement may obtain a waiver from the Program Manager.

(3) Extending Qualification. Qualified inspectors may request to extend their initial or subsequent qualifications, in 36 month increments, providing that the requirements in paragraph 4.2.c. of this chapter are met. To extend qualification:

(a) The DEI must submit a letter to the RMC requesting qualification extension that includes a brief description of the inspector’s duties during the qualification period, specify the date of the latest seminar attended and provide as enclosures a copy of the two most recent inspection report cover letters performed by the inspector.

(b) The RMC must endorse the letter and forward it to the Diesel Program Manager.

(c) The TYCOM may require endorsement on these extension requests.

d. Revoking Certification. If an inspector has not maintained the qualification requirements of paragraph 4.2 of this chapter, the RMC may submit a request to the Program Manager to have the DEI NEC4314, removed from the inspector. The TYCOM requires endorsement on this action.

e. Reinstatement of Expired or Revoked Certification. A DEI whose certification either expired or was revoked may request reinstatement of his certification by submitting a letter to the Program Manager via his chain of command and the RMC. The letter must contain:
(1) A brief description of the DEI’s duties during and following the certification period.

(2) Copies of the two most recent inspections performed. If the DEI’s certification has been expired for more than six months prior to the request or was revoked, the two most recent inspections must be completed under the instruction of a certified DEI.

4.3 DIESEL INSPECTIONS.

NOTE: FOR THE ASSESSMENT OR INSPECTION OF MAIN PROPULSION DIESEL ENGINES (MPDE) AND SHIP SERVICE DIESEL GENERATORS SEE APPENDIX A.

4.3.1 Diesel Engines Requiring Inspections.

a. All diesel engines, including main propulsion, ship service and emergency diesel generators onboard ships and submarines must be inspected per references (a) and (b).

b. All small boat diesel engines, including main propulsion, ship service and emergency diesel generators that are 400 Brake Horsepower and above, unless otherwise determined by TYCOM, must be inspected per references (a) and (b). TYCOMs may exempt diesel engines on small boats and craft from inspection requirements where the engine or boat configuration provides insufficient access to accomplish the inspection.

4.3.2 Periodicity of Inspections. Diesel engines must be inspected per references (a) and (b) on the following events:

a. Routine and Pre-Availability Inspections.

(1) Once during the unit’s cycle, not to exceed 24 months. The normal interval between routine diesel inspections is 18 months. Routine and Pre-Availability Inspections may be performed as early as 12 months or as late as 24 months to allow for maximum scheduling flexibility and utilization of assessment findings. The TYCOM, Immediate Superior in Command (ISIC) and other Fleet Maintenance Managers must ensure the Routine and Pre-Availability Inspection is scheduled to allow adequate time prior to availabilities to utilize the inspection and assessment results to plan work on the diesel. As per reference (a), in no case must the interval between Routine Inspections exceed 24 months. A Routine or Pre-Availability Inspection normally consists of all three phases as discussed in paragraph 4.3.4 of this chapter. For Emergency Diesel Generators (EDG) onboard nuclear powered vessels, industrial activity work on the diesel engine(s) or its support systems will not normally be approved except during a Chief of Naval Operations (CNO) Availability. The TYCOM or ISIC must ensure that adequate upkeep time is made available prior to the availability to ensure there are a sufficient number of diesel engines with no outstanding discrepancies to provide the required standby power during the availability.

(2) For Submarine CNO Availabilities greater than six months.
(a) The Pre-Availability Inspection must be integrated into the Shipyard’s work definition period and must be considered the material health assessment for the EDG.

(b) SUBMEPP must enter this Pre-Availability Inspection in the applicable 000-Series SWLIN as a material health assessment assigned to Forces Afloat.

(c) The DEI must include the Executing Shipyard (Code 260) and the Supervisor of Shipbuilding or NAVSEA Shipyard Representative’s Office, as applicable, on distribution for all DEI reports conducted as a Pre-Availability Inspection or during the availability.

(d) As Lead Maintenance Activity, the executing shipyard will work with the TYCOM to assign all deferred inspection deficiencies to the appropriate repair activity for repair.

(e) The Shipyard’s technical review of this inspection report may satisfy the Pre-Availability technical assessment requirement of reference (c).

b. Post Casualty or Pre-Overhaul. When major internal engine malfunctions have occurred or are suspected (e.g., crankcase explosion, major bearing, blower or crankshaft failure), or there are indications that the engine is in need for overhaul. Extent of disassembly or inspection is at the discretion of the DEI based on the casualty or observed indications. For Post Casualty Inspections, the DEI must determine the full extent of damage and the cause, along with recommendations for repairs. For Pre-Overhaul Inspections, the TYCOM may require the DEI confirm that an overhaul is required and determine the scope of the overhaul. Partial inspections do not satisfy the requirement for a complete Routine Inspection and this fact will be annotated in the DEI’s written report.

c. Post Overhaul or Repair. When an engine has been overhauled or significant maintenance or repair has been completed. A Post Overhaul or Repair Inspection must be conducted by a DEI prior to continuous operation. The DEI will make the final determination of whether the overhaul or repair was extensive enough to warrant a Post Overhaul or Repair Inspection. The inspection must consist of a review of actions taken to complete the overhaul or repair, external visual inspection, tests of safety devices, review of required readings or clearances and a Phase III operational test. Unless there are indications of internal discrepancies, Phase II (internal inspection) is waived and the Routine Inspection periodicity requirement in paragraph 4.3.2.a of this chapter will be considered complete and valid. The Post Overhaul or Repair inspection should be an integral part of the overhaul or repair vice a separate inspection. Specifically, the Phase III operational test should be part of the final operational testing of the overhaul or repair vice a separate operational test.

(1) For contractor accomplished work, the contractor specification will contain requirements for the contractor to document required readings or clearances on applicable forms and have appropriate check points made by a DEI or Industrial Subject Matter Expert (SME) during the overhaul or repair. If there is evidence of poor workmanship, use of improper parts, discrepancies in
reassembly or test documentation or missing information as part of the repair process or during the inspection, the DEI or Industrial SME will advise the Repair Project Manager of the quality issues and required actions. The Repair Project Manager will coordinate required actions with the RMC Technical Authority and Maintenance Team. The RMC must liaise with the TYCOM and obtain TYCOM concurrence on all required actions and must advise the TYCOM of all potential cost and schedule impacts.

(2) For Ship’s Force or Fleet Maintenance Activity accomplished engine overhauls, a Post Overhaul or Repair Inspection will be conducted by a DEI prior to starting the engine. The scope of the inspection will be as specified in paragraph 4.3.2.c of this chapter. Commanding Officer (or designated representative) permission is required to perform Phase II (internal inspection) when requested by the DEI.

d. New Construction (Acceptance Inspection).

(1) Prior to the delivery of a newly constructed ship, when requested by the Board of Inspection and Survey. An acceptance inspection will normally be conducted in conjunction with the open-and-inspect phase of Board of Inspection Survey acceptance trials. The acceptance inspection does not satisfy the requirements of a routine inspection.

(2) The initial Routine Inspection on a new construction unit must occur prior to initial startup by Ship’s Force. The cognizant Supervisor of Shipbuilding should incorporate the DEI as part of the Government Test Plan or Acceptance Plan. The cognizant Supervisor of Shipbuilding must notify the DEI for new construction acceptance test prior to Ship’s Force accepting responsibility of the diesel engine. This will ensure that an inspection baseline is established and construction discrepancies are identified and corrected early in the life of the unit.

(3) For submarine and CVN construction programs, the initial Routine Inspection on a new construction unit must occur prior to initial startup by Ship’s Force. For ships with temporary systems in place or less than 95 percent load available, the Phase I (see paragraph 4.3.4a of this chapter) and Phase II (see paragraph 4.3.4b of this chapter) inspections must occur in conjunction with crew Operational Control Transfer including an operational test at available load. The Phase III (see paragraph 4.3.4c of this chapter) inspection must occur prior to ship delivery when sufficient loading is available. Any as found conditions requiring corrections must be adjudicated via the normal shipyard Operational Control Transfer inspections adjudication process. The routine diesel inspection periodicity must commence upon completion of all three diesel engine inspection phases.

e. Reactivation of Engines in Inactive Equipment Maintenance. Prior to the first operation of engines which have been placed in Inactive Equipment Maintenance. The inspection consists of a complete review of the administrative records associated with the diesel engine including: actions taken to place the engine in and out of lay-up
status, a review of repairs accomplished since the last inspection, visual inspection, test of safety devices and an engine performance test. If sufficient load cannot be attained, a 1-hour operational test at maximum available load must be accomplished. Based on the administrative review and visual inspection, further internal inspections may be accomplished at the discretion of the DEI. This inspection should be requested far enough in advance of the first key event requiring use of the diesel. This will ensure any significant discrepancies found can be corrected prior to the start of the key event. This inspection does not satisfy the requirements of a routine inspection as per paragraph 4.3.2.a of this chapter unless a complete 3-phase inspection is accomplished. If a complete 3-phase inspection is not accomplished and administrative, visual and operational inspections are satisfactory, the reactivation inspection report letter or cover letter should provide revised dates for the next required inspection that account for the time in Inactive Equipment Maintenance status. The revised date for the next routine inspection must be equal to the completion date of the previous routine diesel inspection plus the number of whole months the engine was in Inactive Equipment Maintenance status plus 12, 18 and 24 months respectively for the earliest, normal interval and latest dates.

4.3.3 Inspection Scheduling.

a. (SURFACE SHIPS ONLY) Diesel inspections are actively managed by SURFMEPP utilizing the Class Maintenance Plan. All routine diesel inspections will be pushed by SURFMEPP to the ship’s Current Ships Maintenance Project as part of the ship’s BAWP. SURFMEPP will also push non-routine inspections as requested by TYCOM or the Maintenance Team. As part of this process, the Maintenance Team must contact the local RMC or ISIC Diesel Inspector to coordinate the diesel inspection 120 days prior to the desired inspection date.

b. Diesel inspections are scheduled by the ship with RMC, via ISIC when appropriate, per reference (a) and the Planned Maintenance System (PMS). As part of this process, units must contact the local RMC or ISIC Diesel Inspector to schedule the diesel inspection 120 days prior to the desired inspection date and submit a work request (OPNAV 4790/2K) to the appropriate RMC a minimum of 90 days in advance of the desired dates to allow for DEI scheduling.

c. It is the responsibility of the Fleet Maintenance Managers (the ship, ISIC, and Ashore Ships Maintenance Managers, as appropriate) to schedule the diesel inspection with the RMC during a period where the inspection’s condition assessment can be best utilized for repair planning. The inspection may require that each engine being inspected normally be placed out of commission for five to seven days at the minimum. This time frame may increase when significant Repair Before Operating (RBO) discrepancies are discovered that require extensive repairs. Sufficient time must be allowed for the performance of the operational phase of the inspection which requires specific load testing as defined by PMS. SSDGs normally have the operational phase performed inport, whereas operational assessment of MPDEs requires the ship to be underway for a minimum of one day. Units with MPDEs must allot underway time to allow the DEI to complete the operational phase. The operational phase of the inspection must be completed within 90 days of the start of
the inspection. If the operational phase cannot be completed within these 90 days, a TYCOM approved Departure From Specification (DFS) per Volume V, Part I, Chapter 8 of this manual is required. Without a DFS, the inspection will be terminated and rescheduled. Ships should integrate the operational phase of the inspection into the Fleet Response Training Plan underway schedule.

d. A Diesel Inspection must be accomplished by an ISIC or RMC DEI. It is encouraged that persons holding the DEI NEC that may be assigned to the ship being inspected be part of this inspection.

4.3.3.1 Inspection Deferrals. Surface and Carrier Forces must submit a minor DFS for approval by the respective TYCOM for diesel inspections in the 18 to 24 month window. When an inspection cannot be accomplished within 24 months, Surface, Carrier and Submarine units must submit a DFS request to the TYCOM no later than the 23rd month since the last inspection, that includes satisfactory operating trend data reviewed by a DEI confirming that the engine is in sound operating condition. For inspection deferrals of greater than 24 months, the TYCOM will forward endorsement to NAVSEA 05Z for approval of the DFS.

4.3.4 Inspection Phases. The diesel inspection consists of a detailed records check, internal material condition inspection and observation of engine operating characteristics. During all phases of an inspection, all safety precautions with the engine and space must be strictly adhered to. The degree of the inspection must be decided by the DEI based on the results of reference (b) mandatory checkpoints, TYCOM directed check points, if any, operating data and other records maintained on the diesel engine. The inspection will include the following phases (See Appendix A):

a. Phase I - Administrative Inspection. This is a complete review of the administrative records associated with the diesel engine(s).

b. Phase II - Secured Inspection (partial disassembly). Based on the results of Phase I, the inspector will decide the degree of disassembly and will conduct a thorough evaluation of the internal condition of the engine as warranted by Phase I and Phase II findings. Per reference (b), disassembly of the engine will be minimized. Submarines must have a complete Phase II Inspection per reference (b).

c. Phase III - Operation Inspection. The DEI will observe and analyze operating data on all inspected engines per reference (b) and PMS Maintenance Requirement Card (MRC) for performance testing or troubleshooting the engine. If no PMS guidance exists, then 100 percent or maximum attainable load on all inspected engines should be achieved.

4.3.5 Preparation for Diesel Engine Inspection.

a. The DEI must meet with the inspected ship’s Commanding Officer or his designated representative, Engineer Officer and a diesel system expert prior to the start of the inspection. Where appropriate, either the Reactor Officer or the Engineer Officer may fulfill this role. This visit will ensure that Ship’s Force is aware of the extent of the inspection, what PMS is to be accomplished, required support to be provided to the DEI and interference to be removed to allow access to the diesel engine. Coordination between the ship and the DEI can significantly reduce the time the diesel will be out of commission for inspection purposes and maximize the training to Ship’s Force.
Ship’s Force will perform diesel engine disassembly, reassembly and operation, as well as correcting Ship’s Force capable discrepancies concurrent with the inspection. It is the responsibility of Ship’s Force to order all software and repair parts for Ship’s Force capable work, to include all gaskets, lockwire, etc., for engine reassembly. Discrepancies beyond Ship’s Force capability will be scheduled to be corrected through the Fleet Maintenance Managers, utilizing the Current Ship’s Maintenance Project. At all times during the inspection, safety precautions with the engine and the space will be strictly adhered to. The DEI will meet with the Main Propulsion Assistant or Engineer Officer on a daily basis to ensure the unit’s leadership is informed and produce optimal coordination efforts.

b. The ship will:

1. Prepare the diesel engine for inspection.
2. Provide the DEI with dedicated time and the appropriate personnel to conduct the inspection. The inspection will be structured to maximize training of shipboard personnel. The ship should ensure continuity of personnel is maintained during the inspection or assessment.
3. Assign a Job Control Number for accomplishing the inspection and record all parts usage through the Maintenance and Material Management system.
4. Ensure all equipment directly associated with the engine(s) is operable.
5. Ensure all records are available and in good order.
6. Ensure that the tools listed on the appropriate MRCs, technical manuals, and DEI check sheets are available for use during the inspection.
7. Ensure that all applicable MRCs and technical manuals for the engine and related support systems are available.
8. Test diesel engine lubricating oil following the applicable Lube Oil Quality Management program, as defined by PMS, prior to the inspection. In most cases, this requires Navy Oil Analysis Program results of recent oil sample be available.
9. Test jacket water treatment following PMS prior to the inspection.
10. For SSN, SSBN and SSGN Class Submarine EDGs, the unit should evaluate existing conditions of battery capacity, propulsion plant status and shore power reliability. Based upon this evaluation, if conditions warrant, the ship will submit a request for a stand-by generator for emergency power during the diesel inspection.

4.3.6 Inspection Findings. The inspection will report “as found” conditions. Discrepancies found will be noted on the Administrative Review Sheet and the Engine Discrepancy Sheet as required by reference (b). Categorize discrepancies as Repair Before Operate (RBO), Severely Degraded, Major and Minor.

4.3.6.1 Repair Before Operating. An RBO condition is any condition existing that, if left unattended, would pose an immediate or near term hazard to personnel safety. Only a DEI that
is currently certified may issue an RBO. RBO deficiencies require re-inspection by a DEI that is currently certified after repairs and before the diesel engine is operated. A DFS will not be approved for RBOs. Discrepancies that may cause a finding of RBO include but are not limited to:

a. Any condition existing that if left unattended, would definitely pose an immediate or near term hazard to personnel safety.

b. Evidence of serious internal failure (bearing, connecting rod, crankshaft or piston failure).

c. Uncontrollable lube oil, fuel oil or exhaust leaks. Reference (d) provides guidance for defining leaks.

d. Malfunctioning overspeed governor or trip.

4.3.6.2 Severely Degraded. A finding of Severely Degraded will be assigned to a discrepancy which does not present an immediate or near term danger to personnel but does present risk to the equipment. A Severely Degraded finding will include specific operational restrictions. Severely degraded items must be corrected and re-inspected prior to operation or must have an approved major DFS. Discrepancies that may cause a finding of Severely Degraded include but are not limited to:

a. Inoperative alarms or safety devices.

b. Low lube oil pressure.

c. Readings that exceed the limits of PMS or manufacturer specifications that during unrestricted operation would present a hazard to equipment.

d. Lube oil fuel dilution above safe levels.

4.3.6.3 Major Discrepancy. This finding is made when major problems exist, but the engine is still operable with restrictions approved by the TYCOM. Any deficiency that has been noted as major, which has not been corrected by the end of the inspection shall have a JCN assigned. Discrepancies not corrected within 30 days shall be reported by Naval message in accordance with paragraph 4.4.b(3) of this chapter. This requirement does not alter the normal Casualty Reporting or DFS reporting requirements. In accordance with references (a) and (b), major deficiencies include, but are not limited to:

a. Engine unable to maintain rated load.

b. Automatic equipment inoperative or not functioning properly.

c. Critical components exceed prescribed limits but do not meet the Severely Degraded criteria.

d. Temperature and/or pressure between cylinders are not within specification.

e. Either Remote or Local engine starting (one of two must be operational) or remote securing devices are inoperative.

f. Excessive blower clearance readings.

g. Air box exhaust belt/muffler is excessively dirty or oil laden.
h. Clogged valves or ports.
i. Malfunctioning fuel injection system.
j. Jacket water treatment out of specification.

4.3.6.4 Minor Discrepancy. Categorize all other deficiencies as minor.

4.3.6.5 Re-inspections. Discrepancies assigned a grade of RBO must be re-inspected by a DEI prior to operation. A Departure from Specification will not be approved in the case of an RBO discrepancy. Discrepancies assigned a category of Severely Degraded require correction and re-inspection prior to operation or an approved Major Departure from Specification. Repairs to Major and Minor discrepancies may be approved at the unit command level and do not require re-inspection.

4.3.6.6 Recurring Discrepancies. A recurring discrepancy from previous inspections will be specifically noted in the inspection report.

4.3.6.7 Component Certification. (Aircraft Carriers only). With the exception of RBOs, deficiencies identified in the course of diesel engine inspections performed prior to or during a CNO availability do not necessarily affect component certification to support readiness conditions identified in references (c) and (d). Evaluation of specific deficiencies by Ship’s Force and Naval Supervisory Authority/project team personnel is necessary to determine system readiness conditions are met. An emergency diesel generator is considered certified for operation per references (c) and (d) provided the diesel inspection and all required PMS are within periodicity, including completion of a satisfactory performance test.

4.4 REPORTING REQUIREMENTS.

a. Casualty Reporting (submarines only).

(1) Purpose. To provide guidance for Casualty Reporting (CASREP) requirements for submarine diesel generators. CASREPs are in addition to, and do not replace the reporting requirements of other documents (e.g., Naval Reactors Technical Bulletins, Operational Orders, Mishap Reports, etc.).

(2) Background. The significance of a submarine’s emergency and backup power supplies cannot be overstated. Reference (e) defines the CASREP types, requirements and format. CASREP requirements of Out of Commission power generating or storage equipment require additional clarification.

(3) SSBN and SSGN Class Submarine EDGs. Report EDG casualties by message as allowed by operational constraints.

b. The ship’s Commanding Officer must:

(1) Ensure that each inspection or assessment is entered in the applicable machinery history with a brief description of any RBO conditions found at the conclusion of the assessment or inspection.

(2) All maintenance actions and parts usage as the result of the inspection or assessment are properly documented per reference (f).

(3) Report by Naval message 30 days after the conclusion of an engines inspection and each 30 days thereafter the status of any discrepancy assigned a category
of Major or Minor that has not been corrected or brokered to a repair activity. Discrepancies not corrected or brokered will be identified by JCN. The message will be sent action to NSWC Philadelphia and the servicing Regional Maintenance Center. Information addressees are the ISIC, TYCOM N43, the applicable TYCOM Readiness Code for the ship class, and NAVSEA 05Z. The message will include the engine number, date of inspection, the type of inspection and the name of the inspector.

c. The DEI must:

(1) The DEI shall ensure a maintenance ready 2-Kilo for every discrepancy is entered into the ships CSMP by M0001 file upload using the software approved by the DEI Program Manager and in accordance with the file upload procedures defined in Volume VI Chapter 42, paragraph 42.5.5 of this manual. The DEI will verbally report the findings of the inspection to the Commanding Officer or a designated representative upon completion of the inspection.

(2) Ensure the inspection report, prepared in accordance with reference (b), is signed, serialized and transmitted within 30 days of the inspection completion date. When applicable the inspector shall include in the report the likely cause or condition that resulted in discrepancies rated Major or above and any actions taken during the inspection to correct any discrepancies. The Inspector shall upload a copy of the signed, serialized cover letter as the final enclosure to the report in the Report Generator. The appropriate Supervisor shall then approve the report in the Report Generator and upon approval, the inspection report is considered complete.

(3) Utilize the Diesel Inspection Management Information System using the DEI report generator for classes of ships that are currently in use. For classes of ships that are not yet in the system, use the current guidance that is in reference (b). This inspection must be reviewed by the RMC or parent command prior to forwarding the report to the Commanding Officer of the inspected ship, with information copies to the ISIC, TYCOM, Fleet Maintenance Managers, the cognizant Shipyards (Code 260) and Supervisors of Shipbuilding or NAVSEA Shipyards Representative’s Office (Pre-Availability and during Availability Inspections only) and In Service Engineering Agent.

(4) Open the report in the Diesel Inspection Management Information System on the day of starting the inspection or assessment and will send an email to the DEI Program Manager that an inspection or assessment has started. Discrepancies found during the inspection or assessment shall be entered into the open report on a daily or weekly basis and AWRs shall be uploaded weekly.

4.5 OPERATION AND MAINTENANCE. This section does not supersede existing engine, ship or ship class specific guidance and is only meant to provide guidance where currently none exists.
a. Per reference (g), the light loading of a diesel engine (less than 60 percent) should be avoided. Consistently light loading a diesel engine will cause one or more undesirable conditions, depending on specific engine design:

(1) A loss of cylinder compression due to glazed cylinder walls, leading to an unnecessary premature engine overhaul.

(2) Carryover of engine lube oil into the exhaust, causing excessive exhaust smoke and creating conditions for a possible exhaust stack fire.

(3) Fuel oil dilution of lube oil, leading to frequent oil changes.

(4) Carbon formation on exhaust valves, leading to valve failure.

In situations where light loading of a diesel engine is unavoidable, arrangements should be made to operate the engine at 60-80 percent rated load capacity for a minimum of thirty minutes, preferably three hours, unless other guidance exists specific to the engine’s application. This can help offset the detrimental effects of light loading; however, it is not to be considered a suitable alternative to the avoidance of light loading. Further details are provided in Appendix A.

b. Per reference (h), diesel engines that have online purification capability must operate the purifier continuously while the diesel engine is operating. On installations where multiple engines are serviced by one purifier, the purifier alignment should be shifted periodically within a 24-hour period to ensure all engines receive adequate oil purification and maintain satisfactory oil condition. Each engine’s operating hours and oil condition should be considered when scheduling purification of several engines on a rotational basis.

c. Per reference (i) and PMS, diesel engine jacket water treatment must be tested and maintained to ensure proper corrosion control and freeze protection, as applicable.

d. Diesel engine operating hours since engine commissioning, engine overhaul and lifecycle maintenance requirement completions (PMS or Class Maintenance Plan requirements), at a minimum, must be maintained on all MPDEs, SSDGs, and EDGs. The hours must be documented and recorded in the appropriate machinery history records in order to assist with scheduling of overhauls and lifecycle maintenance requirements. An overhaul typically includes rebuilding or replacing, as complete sets to new criteria the following components: cylinder heads, piston rings, cylinder liners, main and connecting rod bearings. If one of these sets is not rebuilt or replaced, the repair is generally not considered an overhaul and engine operating hours since overhaul must not be zeroed, however, machinery history will be updated and lifecycle operating hours since the significant repairs must be tracked. A certified DEI must make the final determination if the extent of the work accomplished constitutes an engine overhaul for a particular engine or not during execution of the Post Overhaul or Repair Inspection detailed in paragraph 4.3.2(c) of this chapter.

e. For any corrective maintenance action accomplished on the engine, an entry should be made to the diesel maintenance history log including date, engine hours and a brief narrative that provides the reason for and description of maintenance. The
maintenance history log should be reviewed periodically by the division officer and Department Head, as appropriate.

4.6 COMPLIANCE.

a. All ships, submarines and craft must comply with the procedures herein for the operation, maintenance and inspection of installed diesel engines.

b. Ship’s Commanding Officers must ensure all diesel records are readily available for the inspector’s review and Ship’s Force use, including:

   (1) Engine operating logs.
   (2) Navy Oil Analysis Program test results, or, for submarines, the applicable oil analysis results.
   (3) Onboard lube oil testing logs.
   (4) Diesel Maintenance and history records to include all maintenance and significant items accomplished on the engine since last engine overhaul.
   (5) Diesel operating and maintenance documents, including Engineering Operational Sequencing System, Steam Plant Manual, Ship System Manual (Submarines only), PMS, Engineering Standing Orders, etc., as appropriate.
   (6) Engine hours’ log.
   (7) Diesel inspection reports since last overhaul and associated Naval message on the status of discrepancies.
   (8) Fuel Oil Quality Management records.
   (9) Diesel Engine Technical Manuals.
   (10) References (g), (h) and (i).
   (11) Appropriate diesel-related Training records.
   (12) Jacket water logs.

c. The TYCOM or ISIC must ensure that assigned ships operate and maintain diesel engines following the procedures in references (a), (b), (g), (h) and (i). Specifically, they must:

   (1) Ensure ships are complying with all required instructions by observation of diesel engine operations during shipboard visits.
   (2) Conduct follow-up action to ensure that any unsatisfactory conditions found are correct at the earliest possible date.
   (3) Maintain a library of technical material and appropriate visual aids for use by assigned ships in training diesel operations.

d. (Submarines only) Ensure the induction and exhaust systems are inspected following the appropriate Maintenance Requirement, or Maintenance Requirements for continued Unrestricted Operation.
e. The Diesel Inspection Program Manager shall audit the diesel inspection programs of each Regional Maintenance Center and other DEI inspection activities annually. The audit report will be debriefed to the highest level available at the conclusion and copy of report will be provided to the Commanding Officer and NAVSEA 05.

4.7 SUBJECT MATTER EXPERT IN THE REPAIR AND MAINTENANCE OF DIESEL ENGINES. The SME provides technical oversight on all scheduled and emergent work performed by the RMC personnel, and contractor, as required. The SME ensures work packages include proper repair procedures and are used with maintenance standards and appropriate technical documentation related to the diesel engine assessment or inspection. The SME must have direct communication with the RMC Engineering Department regarding resolutions of repairs that do not meet Original Equipment Manufacturer specifications.
APPENDIX A

DIESEL MAINTENANCE STRATEGY FOR SURFACE FORCES

1. OBJECTIVE. This document is applicable only to non-nuclear surface force ships and craft. The objective of the Diesel Maintenance Strategy (DMS) is to baseline the class maintenance plan by technically validating Life Cycle Maintenance requirements. This provides guidance for Long-Range Maintenance Schedule provisioning and supports the management of Engineering Core Maintenance documentation (e.g., CMP, Technical Foundation Paper, and Ship Sheets). DMS is designed to improve the accuracy of work specifications and provide a closed loop work product evaluation and improvement process. DMS supports the Surface Maintenance Engineering Planning Program (SURFMEP) end-to-end maintenance philosophy throughout the Optimized Fleet Response Plan, reference (j), in accordance with the DMS Standard Operating Procedure, reference (k), through the following:

   a. DRS continuous assessment process including engine performance and lube oil and jacket water data in accordance with reference (l).
   b. Through direct engagement with ships force personnel.
   c. By evaluating engine material history for the purpose of validating technical documentation.
   d. Review of Integrated Condition Assessment System and Continuous Maintenance Assessment System data.
   e. Diesel Inspection Reports.

2. DIESEL MAINTENANCE STRATEGY MANAGEMENT. DMS Management is the responsibility of the In-Service Engineering Agent (ISEA) located at Naval Surface Warfare Center Philadelphia PA. The ISEA will manage the maintenance strategy on a ship class and engine type basis. The ISEA will report to the technical warrant holder in NAVSEA 05 for all DMS related technical matters. The ISEA DMS Manager is responsible for providing SURFMEPP with all technical requirements for diesel propulsion or power generation plant maintenance. The Diesel Lifecycle Engineering Representative (DLER) performs the ISEA Waterfront Technical Support function under the DMS organization.

3. DIESEL MAINTENANCE STRATEGY CORE ELEMENTS.

   a. Life Cycle Maintenance Branding Report. The Life Cycle Maintenance (LCM) Report aids the Maintenance Team in deconflicting maintenance plans by publishing major diesel maintenance for the upcoming O-FRP cycle and identifies long lead-time material requirements in accordance with references (m) and (n). Major maintenance is determined by the review of each class maintenance plan task against availability records, task history, and assessment reports. This report will also include routine maintenance based on ISEA LCM recommendations and the vessel’s next availability date. This ensures critical life cycle maintenance tasks, mandatory assessment tasks, any active departures from specification and life-cycle impacting class advisories are identified early and incorporated into the availability work package. In addition to the LCM Branding Report an updated master Life Cycle Maintenance Matrix and 4790/2-Kilo Bulk Upload listing are provided via formal
letter to SURFMEPP, TYCOM, Maintenance Team, Ships Force, and the local Regional Maintenance Center regarding mandatory diesel time-directed maintenance requirements. Logistics support is integrated during this period through the identification of long lead time and high cost material requirements. Early coordination with the Defense Logistics Agency and Navy Inventory Control Point is designed to reduce the likelihood of delay during the availability.

b. Mid-Cycle Assessment Process and Branding Report. The Mid-Cycle Assessment (MCA) is the last opportunity to assess the condition of the engines prior to submission and approval of the final availability work package. Therefore the MCA is critical to ensuring that work is scheduled, scoped, planned, provisioned and executed in a successful manner. The MCA is an assessment, not an inspection or certification, and will be performed in accordance with Volume VI, Chapter 42 of this manual. For any discrepancies that may be considered operationally limiting Volume V, Part I, Chapter 8, paragraph 8.2.b of this instruction regarding a Commanding Officers discretion at-sea applies. Deferral of the MCA requires the approval of the TYCOM.

(1) MCA Execution. The MCA is by design a non-intrusive assessment of the propulsion and power generation diesel engines overall condition including a detailed review of the Availability Work Package, Shipboard Automated Maintenance Modules (SAMM) or DRS data and a short (no more than 7 days notional) onboard assessment of engine condition and performance. High power (above 80%) tests of each main engine and Ship Service Diesel Generator with compression analysis may be performed based on the quality of existing DRS combustion analysis data. As this assessment is for the purpose of defining a work package, grooming of the engines prior to this testing is not required. This assessment may be tailored based on the completeness of the ships material history in SAMM and compliance with DRS compression testing and lube oil and jacket water test results. The assessment may even be performed virtually if there is sufficient data in SAMM to warrant that determination. The ISEA will provide a detailed schedule of events for this assessment no later than 30 days prior to the scheduled event with a complete listing of all Planned Maintenance System Maintenance Requirement Card’s to be performed during the visit. This schedule of events document will include an executive summary brief to the Commanding Officer detailing the execution of the visit, will include all points of contact. The schedule of events will define the team and will assign the team leader. The MCA shall occur within the duration of the Availability Work Package Integrated Phase, prior to the 100% Package Lock milestone.
(2) MCA Reporting and Branding Report. Upon completion of the MCA the team lead shall ensure maintenance ready 4790-2K’s are provided to Ship’s Force 3MC for upload in accordance with Volume IV Chapter 42 of this manual. The MCA Branding Report will include all branded 4790-2K’s for the upcoming availability and shall be submitted within 30 days of completion but in any case prior to the 100% lock date. Completion of the MCA will be reported to the TYCOM by the ship via naval message.

c. Package Lock Branding Report. The Package Lock Branding Report identifies CBM related work candidates that were not previously included in the LCM and MCA Branding reports. Condition Based Maintenance candidates are identified using DRS data analytics, knowledge of ship’s condition and, when available and appropriate, onboard assessment/inspection results/reports. The Package Lock Branding Report may be submitted at multiple milestones as required to document Condition Based Maintenance related tasks and the final report shall be submitted no later than 30-days prior to the 100% Package Lock Milestone. The MCA Branded Tasks may be included with the Package Lock Report in lieu of a separate MCA Branding Report if the two report dates are within 60 days of each other.

d. Diesel Engine Inspection Branding Report. Periodic diesel inspections will be conducted by the Regional Maintenance in compliance with reference (b). Upon completion of the inspection, deferred maintenance requirements will be uploaded to OMMS-NG in the form of a 4790-2K. The ISEA may choose to brand specific 2K’s for accomplishment during an upcoming or future Chief of Naval Operations availability or continuous maintenance period.

e. Industrial Support Visit Report. The objective of the Industrial Support Visit (ISV) is to document, measure and analyze the impact of growth and new work, the impact of collateral work, to assess the accuracy and timeliness of material to determine the impact on cost and schedule and seeks to determine if changes may be made in the ETE process to improve future work efforts.

f. Integrated Propulsion Plant Alignment Procedure (IPPAP). The Integrated Propulsion Plant Alignment Procedure (IPPAP) is a detailed alignment procedure accomplished in accordance with the Integrated Propulsion Plant Alignment Manual for the applicable ship class, reference (o). The purpose of the IPPAP is to groom and align the main propulsion plant and the associated control system after a major maintenance period to produce the optimal plant performance to support training and deployment. IPPAP notionally begins as part of the end of availability initial light off and continues through sea trials.
4. DIESEL LIFECYCLE ENGINEERING REPRESENTATIVE

a. Role of the Diesel Lifecycle Engineering Representative. The role of the Diesel Lifecycle Engineering Representative (DLER) is outlined in reference (b). The DLER acts as the waterfront point of contact for the execution of DMS. The DLER performs the following tasks in support of DMS.

(1) Maintains and updates the Lifecycle Maintenance Workbook.
(3) Reviews and integrates condition based maintenance requirements into the availability planning process.
(4) Maintains and updates the DMS/DRS Workbooks for their assigned vessels.
(5) Submits all DMS Branding Reports required by reference (b) to support the SURFMEPP End-to-End Planning Process.
(6) Coordinates with logisticians to ensure proper ILS support for task scheduled in the Lifecycle Maintenance Matrix.
(7) Supports the technical evaluation of Departure from Specification requests on behalf of the In Service Engineering Agent.

b. Qualifications of the DLER Position. The DLER must be a senior engineering technician with a minimum requirement of 15 years of active duty U.S. Navy experience or a minimum of five years as a field service representative for a diesel engine original equipment manufacturer. Prior qualification as a Diesel Engine Inspector or prior assignment as a main engine room supervisor on a diesel ship is desired. U.S. Coast Guard Engineers license may substitute for experience.
VOLUME IV
CHAPTER 5
MARINE SANITATION DEVICES

REFERENCES.

(a) NAVSEAINST 9593.1 - Certification Program for Sewage Marine Sanitation Devices in U.S. Navy Surface Ships and Craft
(b) OPNAVINST 5090.1 - Environmental and Natural Resources Program Manual
(c) NAVSEA S9086-T8-STM-010 - NSTM Chapter 593 (Pollution Control)
(d) NAVSEA S9086-CH-STM-030 - NSTM Chapter 074 V3 (Gas Free Engineering)
(e) NWP 1-03.1 - Naval Warfare Publication Operational Report
(f) NAVEDTRA 10500 - Catalog of Navy Training Courses

5.1 PURPOSE. To provide guidance in the operation, maintenance and certification of surface ship Marine Sanitation Devices (MSD) and to specify the requirements, procedures and responsibilities applicable to those systems.

a. Sewage systems must be properly operated and maintained or serious health hazards can result. References (a) and (b) require that all MSD systems being installed on naval ships and craft be inspected and certified. The prevention of health, sanitation and safety problems associated with the various sewage handling and disposal systems must be a priority matter.

b. Environmental considerations have made the operation of shipboard sanitation systems more restrictive with regard to the discharge of sewage to navigable waters. Local and State environmental laws are generally more restrictive than the requirements of reference (b). Senior Officer Present Afloat regulations are continually reviewed and revised to comply with the laws under which the Senior Officer Present Afloat is licensed to operate sanitation systems.

c. This chapter is applicable to all surface ships, service craft and small boats on which pollution abatement sewage systems are installed, either during construction or by alteration. It includes all types of shipboard sewage handling and treatment systems or MSDs certified per reference (a) and described in Section 4 of reference (c). Reference (d) describes the procedures, equipment, and records to be used during maintenance of MSD system components where toxic or combustible gases may be present. The most common pollution abatement sewage system in use on ships and craft is the Collection, Holding and Transfer system. Other systems in use include the Pall Trinity, JERED, GATX MK1 and the Vacuum Collection, Holding and Transfer System.

5.2 CERTIFICATION. The purpose of MSD certification is to confirm that the system, as installed, meets established design requirements, that adequate logistic support is available onboard and that major installation deficiencies are corrected. A single level certification program has been implemented by Naval Sea Systems Command to supersede the older two
level system (provisional and full). Ships that presently hold a “Full” certification are considered to be certified and require no further certification inspections.

5.3 RESPONSIBILITIES. The cognizant Type Commander (TYCOM) will coordinate the operation, maintenance, and certification of MSD systems installed on all units following the procedures established by references (a) and (c).

5.3.1 Type Commander or Immediate Superior In Command. The TYCOM or Immediate Superior In Command must:

a. Ensure surface ships participate in the pollution abatement program to the maximum extent possible by utilizing their pollution control equipment when within U.S. territorial waters (three miles).

b. Ensure MSD systems are properly installed, operated and maintained and that shipboard personnel working with sewage systems are properly trained in health and sanitation procedures.

5.3.2 Commanding Officer or Officer In Charge. The Commanding Officer or Officer In Charge must:

a. Oversee the correction of discrepancies on MSD system installations per reference (a).

b. Prevent foodstuffs from being stored in areas adjacent to or below sanitation system valves, flanges or take down joints. Drip pans must be installed beneath all sanitation system valves, flanges and take down joints in health sensitive areas.

c. Log the time, duration and justification for each unavoidable discharge of prohibited sewage in restricted waters. Notify the TYCOM and Immediate Superior In Command of each occurrence. In a situation where holding sanitary wastes would present a health or safety hazard, the system must be reported by Casualty Report per reference (e) and secured.

5.4 SYSTEM MAINTENANCE AND INSPECTION.

a. Ship-to-Shop Work. All Fleet Maintenance Activities are capable of accomplishing repair and overhaul of all MSD components on a ship-to-shop basis. When components are delivered to the Fleet Maintenance Activity, their cleanliness will be certified in writing by the delivering ship's Medical Department representative.

NOTE: IF NONE OF THE METHODS IN SUB-PARAGRAPH (b) ARE AVAILABLE, AND AN EMERGENCY SITUATION EXISTS, REFER TO REFERENCE (b) FOR EMERGENCY DISPOSAL REQUIREMENTS.

b. MSD Cleaning. The only authorized MSD pipe cleaning processes are hydroblast cleaning and acid cleaning. Acid cleaning may only be performed by qualified activities using the procedures of reference (c). Request cleaning for the removal of hard deposits which cannot be removed by ordinary shipboard means.

(1) Due to the extreme hazards involved in cleaning MSD systems, a high level of supervisory attention must be applied to all evolutions. An agreement on the procedures to be used by the Fleet Maintenance Activity and Ship’s Force
must be established by a locally prepared Memorandum Of Agreement which describes all aspects of the operation.

(2) Disposal of effluent must be accomplished in an environmentally safe manner. Depending on port availability, the following methods of disposal must be used in priority order:

(a) Discharge to pier side sewage system.
(b) Discharge to tank truck or barge.
(c) Discharge to sea (when hydroblasting while underway).

5.5 TECHNICAL SYSTEM ASSESSMENT.

a. Technical System Assessments may be requested for training or, when necessary, to develop a work package.

b. Technical assist visits and assessments are described in Volume VI, Chapter 42 of this manual.

5.6 TRAINING.

a. Training courses in the maintenance and operation of MSD systems are offered by Fleet Training Centers at various locations. Consult reference (f) for current course offerings and details.

b. On ships with Collection, Holding and Transfer and JERED systems installed, the following school graduates are required:

(1) An Officer responsible for the operation and maintenance of the system.
(2) Senior enlisted personnel assigned the responsibility for operation and maintenance of the system.
(3) Other maintenance personnel; at least one in each inport duty section.
VOLUME IV
CHAPTER 6
OXYGEN AND NITROGEN SYSTEMS

REFERENCES.

(a) NAVSEA S9086-SX-STM-010 - NSTM Chapter 550 (Industrial Gases; Generating, Handling, and Storage)
(b) MIL-STD-1330 - Standard Practice for Precision Cleaning and Testing of Shipboard Oxygen, Helium, Helium-Oxygen, Nitrogen and Hydrogen Systems
(c) NAVAIR A6-332AO-GYD-000 - Laboratory and Aviators Breathing Oxygen Field Guide

6.1 PURPOSE. Oxygen - Nitrogen (O2-N2) producing storage and transfer systems are installed onboard all Aircraft Carriers, Submarine Tenders and other surface force ships and shore stations to provide liquid and gaseous oxygen and nitrogen for use by Ship’s Force and embarked air wings. Guidance for the proper operation and maintenance of these systems is provided by this chapter and references (a) and (b).

6.2 PRECAUTIONS.

a. Oxygen is not flammable but supports and rapidly accelerates the combustion of all flammable materials. Any substance that burns in a normal atmosphere will burn much more rapidly in concentrated oxygen with a much higher flame temperature. Combustible material (e.g., dirt, dust, soap, oil, cloth, paper, wood, cork, carbon black and gasoline) should not be allowed to come in contact with an enriched oxygen environment. Oxygen can cause combustion of substances not normally considered burnable (notably steel wool, thin gauge metals and certain types of cloth).

b. Gaseous nitrogen is an almost totally inert gas, does not burn, and does not support combustion or respiration. It is not poisonous but can displace oxygen from the air and cause asphyxia.

c. Cryogenic fluids (liquid oxygen and liquid nitrogen) are extremely dangerous. They can cause severe burns or frostbite if they contact the skin. Prolonged exposure to the cold vapors can damage delicate tissues such as those of the eye, windpipe and lung. The cold surface of piping components and vessels containing cryogenic fluid can burn or freeze bare flesh and cause it to stick to the cold metal. At the temperature of cryogenic fluids, many metals and other materials become brittle. Ship structural steel can crack if contacted by cryogenic fluid. Liquid oxygen and nitrogen will produce a very large volume of gas when they vaporize. In a closed compartment with inadequate ventilation, vaporizing liquid can create a hazardously high concentration of oxygen or nitrogen. The cloudy vapor that appears from vaporizing liquid, or cold gas venting is condensed moisture, making the issuing gas visible. When handling liquid cryogenic products, personnel must utilize protective clothing per the requirements of reference (b) and comply with all safety rules.
6.3 AVIATORS BREATHING OXYGEN TESTING.

a. Because of the severe consequences of liquid oxygen failing to meet the standards for Aviators Breathing Oxygen (ABO), stringent requirements for testing and ABO certifications have been established. Liquid oxygen and nitrogen is to be sampled and tested for production and stowage per reference (a) and Planned Maintenance System procedures.

b. All Aircraft Carriers producing ABO have certified ABO test sites and are capable of certifying shipboard produced liquid oxygen. These ABO test sites are under the control of the shipboard Aviation Intermediate Maintenance Department. The testing and surveillance requirements of Aircraft Carrier shipboard O2-N2 plant oxygen and nitrogen products must be accomplished per reference (a) and meet the spectrographic analysis requirements of reference (c).

c. Aircraft Carrier O2-N2 producers are known to experience high levels of methane (i.e., aircraft exhaust fumes, Collection, Holding and Transfer system discharge and boiler or Emergency Diesel Generator exhaust gases) which exceed the current established maximum limit of 25 parts per million per reference (c). The following direction is established for aircraft carrier O2-N2 producer liquid samples as stated in reference (a).

(1) For shipboard produced liquid oxygen, the limit for methane, when sampled at the storage tank, is 75 parts per million. This limit must not be exceeded.

(2) Liquid oxygen samples drawn from the storage tank are “customer or user” samples, for issuance in compliance with the ABO surveillance program. Samples from the O2-N2 producer are Maintenance samples used for monitoring and contaminate analysis and correction.

d. If at any time a liquid oxygen test sample or test method is found unsatisfactory, Ship's Force O2-N2 Plant operators and Aviation Intermediate Maintenance Department ABO laboratory personnel must work together to identify and correct the problem. Guidelines to follow for this are outlined in references (a), (b) and (c).

e. Certification of high-pressure gaseous storage flasks must be performed per reference (b).

6.4 OPERATIONS AND MAINTENANCE.

a. Per reference (a), only qualified personnel with full knowledge and understanding of the applicable safety requirements and hazards associated with oxygen production and handling must be permitted to handle gaseous and liquid oxygen aboard ship. Equipment such as O2-N2 producing plants, storage tanks, and pump-vaporizer units must be operated only under the supervision of a Fleet Cryogenics School graduate that holds a current Navy Enlisted Classification (NEC)-4283 qualification. Ideally, all operating personnel, as well as supervisory personnel, will be graduates of the Cryogenics School; however, there may be cases where sufficient personnel with this formal training are not available. In this event, operators trained by a currently qualified NEC-4283 supervisor may be used if they have successfully completed the required Personnel Qualification Standard and are designated in writing by the Commanding Officer.
b. Only qualified personnel will be authorized to perform oxygen clean maintenance and repairs to shipboard oxygen or nitrogen system components. The procedures and guidelines, as stated in reference (b), must be followed.

c. High-Pressure O2-N2 Producers onboard Aircraft Carriers are equipped with R-22 Refrigeration Units. When maintenance or repairs are being conducted on this equipment strict guidance must be followed to prevent the release of any ozone depleting substances (i.e., CFCs and HCFCs) to the atmosphere as mandated by the Environmental Protection Agency Clean Air Act. The Environmental Protection Agency Clean Air Act, Section 608 prohibits individuals from knowingly venting ozone-depleting compounds, used as refrigerants, into the atmosphere while maintaining, servicing, repairing, or disposing of air-conditioning or refrigeration equipment. Only the following four types of ozone-depleting substance venting releases are permitted under this section of the act.

(1) Absolute minimum quantities of refrigerant released in the course of making good faith attempts to recapture and recycle or safely dispose of refrigerants.

(2) Refrigerants emitted in the course of normal operation of air-conditioning and refrigeration equipment, (i.e., purging of air and non-condensable gases), as opposed to during the maintenance, servicing, repair or disposal of the equipment.

(3) Mixtures of nitrogen and R-22 that are used as holding charges or as leak test gases, because in these cases, the ozone-depleting compound is not used as a refrigerant. However, a technician may not avoid recovering refrigerant by adding nitrogen to a charged system.

(4) Small releases of refrigerant which result from purging hoses or from connecting or disconnecting hoses to charge or service appliances. Additionally, refrigerant recovery and recycling equipment must be equipped with low-loss fittings.

d. Personnel who perform maintenance or repairs to equipment that utilize ozone depleting substances, are required to successfully pass an Environmental Protection Agency approved technician certification test and be licensed before any commencement of work begins.
REFERENCES.

(a) NAVSEA 0989-031-4000 - Reactor Plant Instrumentation and Control Equipment Maintenance
(b) NAVSEA 0989-064-3000 - Cleanliness Requirements for Nuclear Propulsion Plant Maintenance and Construction

LISTING OF APPENDICES.

A Nuclear Test Equipment Check-Out and Check-In Form
B Nuclear Support and Test Equipment Certification Record

7.1 PURPOSE. To issue requirements for the certification and accountability of Nuclear Propulsion Plant Test and Support Equipment as required by the applicable Reactor Plant Manual (RPM) and reference (a). Nuclear Propulsion Plant Test and Support Equipment is commonly referred to as Nuclear Test Equipment (NTE).

a. NTE specified by the applicable RPM and reference (a) to support planned and corrective maintenance of Nuclear Propulsion Plant systems must be carefully controlled. Maintaining accountability and certifying accuracy, operability, and reliability per the most current Field Changes and technical specifications is an essential element of reactor safety. The basic elements of the NTE program are certification and verification.

b. Certification is the detailed technical evaluation of the equipment to conclude that the item conforms to the required specification. Certification is conducted prior to initial issue and after any event that invalidates the certification, such as repair, Field Change installation or a revision to the equipment reference drawing or figure and is recorded on a NTE Certification Record. Equipment will normally be maintained in a Ready for Issue, certified condition, requiring verification prior to each issue.

c. Verification is the validation that the equipment is certified based on a review of records and is in a physically acceptable condition for issue and use. Verification is conducted prior to each issue and is recorded on a NTE Check-out and Check-in Form contained in Appendix A of this chapter.

7.2 NUCLEAR TEST EQUIPMENT CATEGORIES. For purposes of this chapter, NTE is divided into three categories.

a. General Purpose Electronic Test Equipment.

b. Electronic and Electrical Test Equipment, non-General Purpose Electronic Test Equipment (e.g., switchboard test equipment, scram breaker time response equipment, etc.).
c. Mechanical Test Equipment.

7.3 ACTION. The Repair Officer must implement the requirements of this chapter. The Nuclear Repair Officer is designated as the custodian of NTE and must ensure that assigned personnel carry out the requirements of this chapter.

7.4 PROCUREMENT. Only test equipment meeting the specifications of the applicable RPM and reference (a) may be used to conduct testing on Nuclear Propulsion Plant Systems. Requisitions for new equipment must contain sufficient detail to ensure the correct item is purchased. Allowance Equipage Lists for required NTE are provided in the tender Coordinated Shipboard Allowance List or Q-Coordinated Shipboard Allowance List. The requirements for General Purpose Electronic Test Equipment to support nuclear electrical and electronic testing are contained in the applicable Ship’s Portable Electronic Test Equipment Requirements List.

7.5 NUCLEAR TEST EQUIPMENT CERTIFICATION. NTE must be certified using a Formal Work Package (FWP) for Electronic and Electrical Test Equipment and a Controlled Work Package (CWP) for Mechanical Test Equipment. Certification is required for new equipment prior to initial issue and following repairs or modifications which could impact performance. Periodic recertification is not required. The FWP or CWP should be as simple as possible. As a minimum, the FWP or CWP must provide the exact equipment reference and indicate the attributes that must be verified and the required testing. Recertification following repair must be a step in the repair FWP or CWP. Certification must be documented on NTE Certification Records and is discussed in detail in paragraph 7.5.4 of this chapter. Certification must be accomplished per paragraph 7.5.1 or 7.5.2 of this chapter. The ultimate objective is to demonstrate that the NTE available for Nuclear Propulsion Plant application is technically correct.

7.5.1 Electronic and Electrical Test Equipment. The FWP must require completing and retaining an NTE Certification Record.

a. To certify new or existing measuring and recording equipment, such as a Visicorder or strip chart recorder, verify that the specifications given in the equipment technical manual match the specifications required by the applicable RPM, reference (a), or applicable test reference.

b. To certify repaired or re-calibrated measuring and recording equipment, the repair or calibration activity must certify that the item still conforms to the original technical specifications and is properly calibrated (as evidenced by a calibration sticker). The Fleet Maintenance Activity Work Center performing the repair or calibration must complete the NTE Certification Record. If the repair or calibration was not performed by the Fleet Maintenance Activity, Nuclear Repair must certify the equipment. Work orders for repair must require conformance to referenced drawings and figures.

c. To certify other existing electrical test equipment not previously certified, such as switch boxes, jumper boxes, cables, Under Voltage and Under Frequency test boxes, etc., each component and the wiring configuration must be compared to the referenced drawing for correctness.

d. To certify other new electrical test equipment verify the test equipment as correct with respect to what was ordered and the nameplate data or other markings compared to the equipment requirements of the RPM, reference (a), or referenced test procedure.
7.5.2 Mechanical Test Equipment.
   a. To certify existing or newly manufactured mechanical test equipment, the CWP that manufactures the test equipment must include steps to verify that the material specifications and configuration match the equipment reference. The CWP must also include all required testing.
   b. To certify purchased mechanical test equipment, the CWP must include steps to verify the equipment as correct with respect to what was ordered, compare the equipment to the requirements of the RPM, reference (a) and or referenced test procedure and must also specify any testing that may be required prior to use.

7.5.3 Recertification Following Reference Revision. To certify existing equipment after a revision to the equipment configuration reference, take the actions necessary for the NTE to conform to the revision and complete an NTE Certification Record for recertification. The FWP for Electronic and Electrical Test Equipment and a CWP for Mechanical Test Equipment used to accomplish the equipment changes will specify recertification. A new NTE Certification Record will be generated regardless of whether or not the equipment required modification. The new certification record will serve to update the applicable revision and will provide evidence that the NTE was in fact validated to the correct revision.

7.5.4 Certification Documentation. The FWP or CWP must contain a NTE Certification Record. The minimum attributes are shown in Appendix B of this chapter.
   a. The Certification Record page (current and superseded) must be retained by the Nuclear Repair Officer for the life of the equipment. This record must be available for review by personnel checking out equipment.
   b. The active revision or advance change notice level of the reference to which the equipment was built must be specific enough to allow verification of the effects of future reference revisions. For example, while the RPM or reference (a) may be at revision 480, a figure showing test equipment details may be revision 453. The reference should be stated as the exact figure number and 453 should be recorded as the revision level.
   c. Existing records that contain proper certification data are acceptable and need not be replaced.

7.6 ACCOUNTABILITY.
   a. Electrical and electronic test equipment must be fitted with tamper resistant seals where unauthorized access to calibration settings or internal components may invalidate certification.
   b. Requests for test equipment are normally made using an OPNAV 4790/2L form and identifying the appropriate Master Job Catalog routine Job Sequence Number. The OPNAV 4790/2L form requesting the test equipment must be specific with respect to the fittings or other associated components required in addition to the specific piece of test equipment. For hydrostatic test equipment, sufficient information must be provided to complete the checklist requirements of Chapter 9 of this volume.
c. Equipment should be issued for a specified period and delinquent equipment recovered as soon as possible.

d. Activities receiving NTE must be briefed that only the issuing activity is authorized to repair NTE and that tampering will invalidate certification.

e. Equipment Check-out and Check-in Forms will, as a minimum, contain the attributes contained in Appendix A of this chapter.

f. Verification that the equipment is following the latest revision of the controlling reference must be accomplished by:

(1) Review of the NTE Certification Record prepared per Section 7.5 of this chapter to demonstrate that the item has been certified.

(2) Compare the revision level stated on the NTE Certification Record to the latest revision of the reference.

g. When equipment is returned, those items of the issue and receipt procedure necessary to determine the condition of the equipment must be repeated. This will ensure that equipment requiring repair is identified in a timely manner. A check-in operational test need not be performed in every case, but would be appropriate if visible physical conditions indicate possible damage affecting operability.

h. Prior to issue by the repair facility, mechanical NTE which is expected to be subjected to pressure greater than 10 pounds per square inch will be operationally pressure tested to the highest pressure expected during use in the propulsion plant. Individual gages are excluded provided they are issued as individual components without adapters or hoses (for normal installation in a system) and are properly calibrated.

i. The activity requesting mechanical NTE will be specific when requesting NTE. The following data (at a minimum) will be specified as applicable:

(1) Maintenance for which the NTE is required.

(2) Gage range and required tolerance.

(3) Set-points of protective devices.

(4) Length of hose.

(5) Size and style of fittings for attachment to ships system (e.g., Swagelok SS 1/8” inverted 37 Degrees SAE flare fitting).

(6) Maximum temperature the NTE is expected to be subjected to during use.

(7) Date required.

(8) Any special requirements.

7.6.1 Lost or Damaged Test Equipment. Lost or damaged test equipment must be repaired or replaced in a timely manner. Equipment requiring repair will be entered in the Equipment Deficiency Log, assigned a Job Sequence Number and entered in the Current Ship’s Maintenance Project. Out-Of-Commission equipment that results in an inability to provide necessary test equipment for reactor plant testing must be given high repair priority. Maintenance of NTE will only be accomplished by the issuing activity.
7.6.2 **Cleanliness and Foreign Material Exclusion.** Mechanical Test Equipment and Assemblies attached to Nuclear Propulsion Plant Systems must meet the requirements for cleanliness control and foreign material exclusion specified by reference (b). Verification of cleanliness will be incorporated into check-out and check-in forms and into FWPs and Technical Work Documents.

7.6.3 **Stowage.** NTE must be stowed in a location segregated from non-NTE. Ready For Issue equipment will be stowed apart from non-Ready For Issue equipment. Segregated stowage must be such that it precludes inadvertent mixing of equipment.

7.6.4 **Inventory.** NTE will be inventoried at least annually. A record of the most recent inventory will be retained by the Nuclear Repair Officer.
APPENDIX A

NUCLEAR TEST EQUIPMENT
CHECK-OUT AND CHECK-IN FORM

IV-7B-1
VOLUME IV
CHAPTER 8
WEAPONS AND CARGO ELEVATOR ASSESSMENTS

8.1 PURPOSE. To provide guidance in the preparation for and execution of shipboard weapons and cargo elevator assessments and assist visits by the Elevator Support Unit (ESU). Shipboard weapons and cargo handling elevators are supported through the elevator assessment and repair program, which is executed by the ESU. The ESU program, formerly the Program to Assess and Repair Shipboard Elevators for the Atlantic Fleet, and Weapons Elevator Support Unit for the Pacific and Atlantic Fleets, provides direct fleet support for the maintenance and modernization of shipboard elevators. The program is executed by the ESU on a per ship cycle, as dictated by the individual ship’s deployment and maintenance schedules. Although ESU scheduled milestones are based on the maintenance cycle, the primary focus of the program is to achieve peak system readiness at the time of deployment by evaluating and repairing elevators throughout the ship’s cycle. Additionally, DDG-51 Class 5”/54 and 5”/62 Ammunition Strike Down Equipment, which are similar to elevators, are supported through the ESU program.

8.2 ELEVATOR SUPPORT UNIT. The Regional Maintenance Center ESU is composed of skilled technicians qualified in the operation, repair, testing and training of weapons and cargo elevator systems. The ESUs are responsible for periodic material assessments, repair, technical assistance, on board operator maintenance training, and verification of Integrated Logistics Support (ILS) elements under this program.

8.3 SHIP’S FORCE ASSESSMENT RESPONSIBILITIES.
   a. Ensure that the Current Ship’s Maintenance Project (CSMP) is up to date.
   b. Ensure operators and maintenance personnel are available to assist the Assessment Team.
   c. Require operators and maintenance personnel to accompany the Assessment Team for on the job training to increase self-sufficiency.
   d. Prepare and submit an OPNAV 4790/2K for each deficiency not corrected prior to completion of the assessment. Provide a listing of Job Control Numbers to the ESU.

8.4 ELEVATOR SUPPORT UNIT EVOLUTIONS. The specific components of each ESU evolution are defined in sub-paragraphs “a.” through “d.” of this paragraph. These evolutions are designed to ensure deficiencies are identified and repaired in a timely manner. Prior to commencement of any ESU evolution, a pre-brief will be conducted by the ESU representative and attended by the ship’s Maintenance Manager and all applicable departmental representatives. The pre-brief will cover, but is not limited to, the following topics:
   a. Key evolution elements.
   b. Roles and responsibilities of:
      (1) ESU technical personnel.
      (2) Ship’s Force personnel.
   c. Working relationship between ESU technical personnel and Ship’s Force.
d. Overall safety practices and precautions applicable to the evolution.

8.4.1 Material Condition Assessment Visit. A Material Condition Assessment visit will be used to determine a baseline and establish the scope of follow-on actions. This visit is accomplished once per Fleet Readiness Training Plan. The ESU uses assessment guidelines to determine the system’s material condition, while ensuring the following is accomplished:

a. The CSMP is validated to avoid redundancies during the assessment.

b. The elevator system is assessed, repaired, groomed and operationally tested. The ESU will make every effort to correct all deficiencies prior to the end of the visit.

c. On the Job Training (OJT) is conducted with Ship’s Force to promote self-sufficiency.

d. Working with the ship’s cognizant Department(s) Maintenance Manager, and TYCOM coordinators, determine the preliminary level of effort required to correct the discrepancies.

e. All discrepancies and corrected items have been documented in the ship’s CSMP using the appropriate IT System.

f. The Commanding Officer, or an officer designated by the Commanding Officer, is briefed on the elevator system material condition.

g. A final report is issued to the ship, ISIC and TYCOM following the Material Condition Assessment visit. The report must address the following:

(1) Safety of systems, including “safe to operate” conditions.

(2) Major discrepancies found during the visit.

(3) System Operability Test results.

(4) Training status of Ship’s Force with respect to Personnel Qualification Standards (PQS) and practical elevator system maintenance and operation.

(5) Status of authorized, completed, or programmed Ship Alterations.

(6) Recommendations to the In-Service Engineering Agent for system changes.

(7) In-Service Engineering Agent.

8.4.2 Repair Visit. The Repair Visit is designed to correct discrepancies identified in the ship’s CSMP that could not be repaired during the assessment visit.

a. Conduct multiple visits, as receipt of material permits, to repair as-found conditions.

b. Provide logistics assistance as necessary.

c. Conduct OJT with Ship’s Force.

8.4.3 In Process Review. This review will be conducted on a case-by-case basis, contingent on the scope of repairs programmed for the maintenance availability. When tasked, the ESU will review the elevator system work package prior to the start of an availability. During the availability the ESU will:

a. Monitor the progress and Quality Assurance of the repair contractor, coordinating with Supervisor of Shipbuilding and industrial activity representatives, Naval Surface
b. Provide technical and logistic support to Ship’s Force.

c. Monitor the CSMP status.

d. Witness elevator tests, as tasked.

8.4.4 On-Board Maintenance Training. On-board maintenance training will be conducted at least once per Fleet Readiness Training Plan with each ship receiving training as a host ship or by having their personnel participate in training on another ship of the same class. It consists of operator and maintenance classroom instruction followed by hands-on training. The ship class on-board maintenance training documentation is tailored to be ship specific, giving the ship the most accurate and coherent training possible.

8.4.5 Integrated Logistics Support.

a. A one-time ILS validation of elevator configuration, Allowance Parts Lists (APL), Coordinated Shipboard Allowance Lists (COSAL) and technical manuals will be conducted.

b. Follow-on ILS visits will be accomplished at the TYCOM’s request.

8.5 VISIT SCHEDULING. The ISIC will schedule all ESU visits through the TYCOM sponsored Quarterly Scheduling Conference. Visits will not be authorized without prior approval by the cognizant TYCOM.

8.6 REPORTS. Before departing the ship, the ESU will debrief the Commanding Officer, or designated officer, on the material condition of the elevator system. The ESU must provide the ISIC and TYCOM a report, outlining the results, not later than 30 days following the visit.

LISTING OF APPENDICES.
A Nuclear Test Rig Determination and Inspection Check List
B Non-Nuclear Test Rig Determination and Inspection Check List
C Nuclear and Non-Nuclear Pre-Test Inspection Check List
D Nuclear and Non-Nuclear Performance of Test Check List

9.1 PURPOSE. To provide standard check lists for the proper preparation for the conduct of and recovery from nuclear and non-nuclear tests. Appendices A through D of this chapter are applicable to installed ship systems, individual components and support equipment tested in conjunction with Formal Work Packages (FWP) and Technical Work Documents (TWD).

a. Appendices A through D of this chapter are similar to a standard FWP that will require entries, prior to each use, to detail the specifics of the test to be performed. When TWDs are utilized, the locally developed FWP should direct execution of the checklists and need only direct other actions that are not included in the checklists. For example, since Forces Afloat rarely perform hydrostatic tests on hot systems, the checklists are prepared based on system temperatures less than 200 degrees F. In the event that a hydrostatic test is performed with temperatures greater than 200 degrees F, the locally developed FWP must contain additional requirements for the test from the referenced test manual.

b. These lists are developed from references (a) through (d) and are not inclusive of all requirements. All applicable test references must be reviewed in preparation for the test to ensure no requirement or precaution is overlooked. Other references such as the Reactor Plant Manual (RPM), Propulsion Plant Manual, Steam Plant Manual, Steam and Electric Plant Manuals, Ship Systems Manuals, Ships Information Books, Test Pressure Drawings, component technical manuals, etc., provide additional guidance and requirements that must be included in the locally developed FWP for the test.
9.2 GENERAL INSTRUCTIONS.

a. Blank spaces are provided throughout the checklists so that requirements for the specific test to be performed may be added. These specifics must be entered during FWP preparation.

b. Portions that are not applicable must be marked “N/A” prior to FWP approval.

c. Multiple “Completed by” signature blanks are provided at the end of each checklist since one individual may not be able to fully complete a particular checklist. Additional signature blanks may be added if required.

d. The Test Rig Determination and Inspection Check List, Appendices A and B of this chapter, must be completed by the activity issuing the test equipment. It is the responsibility of both the issuing and receiving activity to ensure that the correct test gear is used. Local exceptions to gages specified in reference (b) Table 504-6-1 will be approved by an individual with a technical warrant. When gage exceptions are invoked, the approved exception must be included with associated test form. This may be accomplished by requesting the correct test equipment, and the issuing activity completing the check list and providing it with the test equipment for review. To satisfy the scope of this chapter, the activity requesting the test equipment must include in their request (OPNAV 4790/2L) the information necessary for the issuing activity to complete Item 1 of Appendices A or B of this chapter, as applicable.

e. These check lists may also be used when a maximum operating pressure test is specified and an external pressure source is required to obtain this pressure. Installed system equipment must be used whenever possible to perform operating pressure tests.

f. Appendices B, C, and D of this chapter may contain classified information when filled in (i.e., the nuclear information or classified test pressures). It will be the responsibility of the requesting activity to ensure the proper classification is annotated on the document when applicable.

9.3 RECORD RETENTION. System Check Lists do not require retention after the test has been satisfactorily completed, documented in the FWP or TWD, and the FWP or TWD is closed. Additional reviews of testing information are provided in sub-paragraphs “a” and “b”:

a. For Ship's Force testing to recertify TWD work performed by the Fleet Maintenance Activity (FMA), the completed checklists, or copies must be provided with the test documentation provided to the FMA. When the FMA Quality Assurance Officer accepts the completed retest, the checklist may be discarded.

b. For FMA shop testing of controlled work, the completed checklists, or copies, must be provided with the test documentation required by the Controlled Work Package until the FMA Quality Assurance Officer or Quality Assurance Supervisor accepts the testing objective quality evidence. Once the tests are accepted, the checklist may be discarded.

<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>ATTRIBUTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>g.</td>
<td>Gages have been calibrated within the required periodicity.</td>
</tr>
</tbody>
</table>

Circle applicable item:

1. Normal metrology requirements list calibration frequency (This is the frequency unless specified otherwise for the specific test).

2. Special frequency ______ Required by ____________ (Indicate required frequency and reference).

3. OVERPRESSURE PROTECTION:
   a. The manual release of pressure is the primary method of protection.
   b. Automatic backup relief valve will be provided.
   c. If the temporary relief valves provided are to be installed in the system, installation must be such that it does not cause damage to the system or system components.
   d. The over-capacity of relief valves should not cause excessive thermal and pressure shock. (Relief valve capacity should not be grossly higher than pressure source capacity).
   e. The blow down characteristics must be compatible with the system being tested. (The reseating characteristics of automatic reliefs should be consistent with the requirements of the system being tested. For example, a relief that does not reseat until pressure is reduced to zero would not be acceptable for a primary hydro). (Review manufacturer's data).
   f. Valve accumulation at the flow of the test pressure source must not exceed 10% of the relief valve set point.
   g. Temporary automatic relief valves which have more than one inlet and therefore provide different relief valve performance characteristics (e.g., set pressure) must not be used.
   h. Temporary automatic reliefs which require no tools for set point adjustment (e.g., employ hand adjustment knob) must:
      (1) Have some means to positively lock the setting once it has been made or
      (2) Must be designed to prevent ready access to the adjustment knob.

4. OVERPRESSURE PROTECTION SETPOINT DETERMINATION:
   a. Record required hydrostatic test pressure ______ psi.
   b. Record required overpressure protection set point ______ psi.

Circle applicable determination method:

1. As specified in the applicable RPM.
2. Other Naval Sea Systems Command (NAVSEA) approved document (identify reference).
3. Using Reference (a), Figure 8-2 (attach).

4. Potential maximum overpressure (Reference (a), Figure 8-2, item 29) conforms to the requirements of reference (a) Section E.3.3.
5. TEMPORARY EQUIPMENT REQUIREMENTS:

a. Temporary connections and equipment (cap, spool pieces, jumpers, blank flanges, etc.) must be verified to be capable of withstanding hydrostatic test pressure.

b. Verify that within the last year and subsequent to disassembly or replacement of any test rig equipment, the assembled test rig (pump, hoses, gages, connecting tubing) has been satisfactorily tested to a pressure at least equal to the maximum pressure which might be encountered during this hydrostatic test. (Hydro is not required to test pressure gage and relief valve replacement or fittings between subassemblies designed to be broken for portability. Set point testing of the test rig relief valve while on the test rig meets this requirement).

c. Verify the rig has been cleaned to meet the system cleanliness requirements of the system being tested. If the rig is not maintained clean, comply with the cleanliness boundary requirements of reference (a), Section E.4.

d. No quick-disconnects with check features are to be used in the hydro rig.

6. OPERATIONAL TEST:

INSTRUCTIONS: The following checks must be performed with the test rig isolated from the system being tested. This may be done by blanking the hose prior to connecting the rig to the system. Equipment provided by an FMA will be tested at the FMA prior to being issued to a tended ship. The operational test need not be repeated by the tended ship receiving the test gear.

NOTE: FOR SHOP TEST FACILITIES (I.E., INTERMEDIATE MAINTENANCE ACTIVITIES, NAVAL SHIPYARDS AND TENDERS) WHERE HYDROSTATIC TESTS ARE CONDUCTED AT LEAST ONCE EVERY TWO WEEKS AND WHERE THE TEST GAGES (BACKUP AND MASTER) ARE COVERED UNDER THE NAVY METROLOGY AND CALIBRATION (METCAL) SYSTEM, CROSS CHECKING THE GAGES BEFORE TEST IS NOT REQUIRED.

a. Mark hydro gages with a red pointer at the required relief set point.

b. Raise rig pressure to the specified test pressure. If the backup gage is included with the test rig, (vice an installed system gage) verify primary and backup gages are in agreement. (Maximum difference after height correction is no more than the sum of the specified accuracies plus a readability error of one-half the smallest graduation of each gage).

Required accuracy + or - ______ psig.

If not in agreement, replace or re-calibrate and repeat this step until satisfied.

c. Record required overpressure protection set point ______ psig.

Continue to raise pressure to the specified overpressure protection set point.

If the manual relief is installed on the rig, with the pressure source operating at the specified manual relief set point, verify that the manual relief and associated piping relieve the capacity of the pressure source.

d. Set or confirm set point of the automatic relief valve.

With the pressure source operating and at the relief set point, verify that the automatic relief and associated piping relieve the full capacity of the pressure source.

e. Vent the rig to reduce pressure to reseat the automatic relief valve. Slowly raise pressure again to recheck the automatic relief set point.

### 2. GAGES:

**NOTE:** TYPICAL GAGES FOR MOST NON-NUCLEAR TESTS ARE LISTED IN REFERENCE (a), TABLE 504-6-1.

**CAUTION:** REFERENCE (a) TABLE 504-6-1 ALLOWS EXCEPTIONS TO THE GAGES LISTED IN THE TABLE. IF USING A GAGE NOT LISTED ON THE TABLE, IT MUST STILL COMPLY WITH THE CRITERIA SPECIFIED IN THIS APPENDIX.

| a. | ANALOG GAGES | |
|----|---------------| |
| The pressure gage range based on the maximum test pressure up to and including the relief valve setting must be: | |
| - greater than the test pressure | |
| and | |
| - not more than 200% of the maximum test pressure. | |

<th>ATTRIBUTE</th>
<th>CHECK OFF or N/A</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**a.** If performing a maximum operating pressure test, verify that installed system relief valves are unisolated and not blocked or gagged. The set point for the manual release of pressure must be based on installed system relief set points.

**CAUTION:** WHEN PERFORMING MAXIMUM OPERATING PRESSURE TESTS, INSTALLED RELIEF VALVES PROVIDE SYSTEM PROTECTION. SYSTEM RELIEF VALVES MUST NOT BE REMOVED FROM SERVICE.

**b.** Record required hydrostatic test pressure ______ psi.

**c.** Record required overpressure protection set point ______ psi.

Circle applicable determination method: the lesser of:
1. 100 psi over test pressure.
2. 10% above test pressure.

### 5. TEMPORARY EQUIPMENT REQUIREMENTS:

<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>ATTRIBUTE</th>
<th>CHECK OFF or N/A</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**a.** Temporary connections and equipment (cap, spool pieces, jumpers, blank flanges, hoses, etc.) must be verified to be capable of withstanding the test pressure.

**b.** Verify that within the last year and subsequent to disassembly or replacement of any test rig equipment the assembled test rig has been satisfactorily tested to a pressure approximately 15% above the maximum pressure it will witness during the system hydrostatic test. (Hydro is not required to test pressure gage and relief valve replacement or fittings between subassemblies designed to be broken for portability. Set point testing of the test rig relief valve while on the test rig meets this requirement).

**c.** Verify the rig has been cleaned to meet the system cleanliness requirements of the system being tested.

**d.** No quick-disconnects with check features are to be used in the test rig.

### 6. OPERATIONAL TEST:

**INSTRUCTIONS:** The following checks must be performed with the test rig isolated from the system being tested. This may be done by blanking the hose prior to connecting the rig to the system. References (b) and (c) provide a sample step-by-step procedure for these checks. Equipment provided by an FMA or Industrial Activity must be tested prior to being issued to a tended ship. If documentation is provided by the issuing FMA or Industrial Activity that the assembled test rig has been verified to meet all of the requirements of this appendix, the operational test need not be repeated by the end user.

**NOTE:** FOR SHOP TEST FACILITIES (I.E., INTERMEDIATE MAINTENANCE ACTIVITIES, NAVAL SHIPYARDS AND TENDERS) WHERE HYDROSTATIC TESTS ARE CONDUCTED AT LEAST ONCE EVERY TWO WEEKS AND WHERE THE TEST GAGES (BACKUP AND MASTER) ARE COVERED UNDER THE NAVY METROLOGY AND CALIBRATION (METCAL) SYSTEM, CROSS CHECKING THE GAGES BEFORE TEST IS NOT REQUIRED.

**a.** ANALOG GAGES:
Mark all test gages with either a red grease pencil, red tape, or the use of an integral red hand or other suitable mark at the required relief over pressure protection set point, half way between the test pressure and the relief valve set point.
<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>ATTRIBUTE</th>
<th>CHECK OFF or N/A</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIGITAL GAGES:</td>
<td>Digital gages must have the manual over-pressure value (red hand setting) posted in the immediate vicinity of the display with red digits approximately the same size as the digits in the instrument display. For example, red hand settings may be marked on a blank label plate of “Whiteboard” material affixed to the test rig and the setting entered using a non-permanent red marker (dry erase).</td>
<td></td>
</tr>
<tr>
<td>b.</td>
<td>Raise rig pressure to the specified test pressure. Verify primary and backup gages are in agreement. Maximum difference between the two gage readings after height correction is no more than 2%. Calculate 2% for each gage using the full-scale pressure measured by each gage (i.e., a 0-100 psi gage, 2% = 2 psig, the maximum difference between two gages with a 0-100 psi scale at a given pressure is 2 psig). Required accuracy ± or - psig. If not in agreement, replace or re-calibrate and repeat this step until satisfied.</td>
<td></td>
</tr>
<tr>
<td>c.</td>
<td>Continue to raise pressure to the specified overpressure protection set point. If the manual relief is installed on the rig (vice using an installed system valve), with the pressure source operating and at the specified manual relief set point, verify that the manual relief and associated piping relieve the capacity of the pressure source.</td>
<td></td>
</tr>
<tr>
<td>d.</td>
<td>Set or confirm setting of the automatic relief valve. With the pressure source operating and at the relief set point, verify that the automatic relief and associated piping relieve the capacity of the pressure source.</td>
<td></td>
</tr>
<tr>
<td>e.</td>
<td>Vent the rig to reduce pressure to reseat the automatic relief. Slowly raise pressure again to recheck the automatic relief set point.</td>
<td></td>

</tbody>
</table>

2. WALKTHROUGH OF THE TEST AREA: The attributes listed in Section 2 of this appendix are basic quality control checks that should be conducted or supervised by the Petty Officer in charge of the test.

- **a.** Piping in the test boundary is free from dents, gouges, arc strikes and other external defects (Removal of additional lagging or other interference is not required to perform this check).
- **b.** Conditions for detecting leaks are satisfactory (e.g., joints being tested are not covered or lagged).
- **c.** Hot piping or equipment that could result in a safety hazard to personnel has been insulated or precautions have been taken to minimize the hazard.
- **d.** The hydrostatic test will not be a hazard to other evolutions adjacent to the test area (e.g., Work on an open oxygen system adjacent to a seawater hydro).
- **e.** Adequate measures have been taken to prevent spray damage to electrical equipment in the event of a leak during pressure testing.
- **f.** Pipe hangers removed for work have been reinstalled.
- **g.** All mechanical joints are re-made; system integrity established.
- **h.** No obvious loose fasteners.
- **i.** No obvious instances of missing fasteners or improper fastener material or material mismatch (e.g., no carbon steel fasteners in seawater systems, no improper use of black oxide coated fasteners).

APPENDIX D
NUCLEAR AND NON-NUCLEAR
PERFORMANCE OF TEST CHECK LIST

NOTE: DO NOT PRESSURIZE TEST PUMP WITH AIR AND WATER SUPPLY UNTIL READY TO ACTUALLY START THE TEST. DO NOT LEAVE TEST PUMP UNATTENDED DURING ANY PORTION OF THE TEST.

<table>
<thead>
<tr>
<th>ITEM NO.</th>
<th>ATTRIBUTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. VERIFY SYSTEM LINE-UP:</td>
<td>CHECK OFF or N/A</td>
</tr>
<tr>
<td>a.</td>
<td>Verify the system to be tested is aligned for the test by performing valve lineup checks or by aligning valves via procedural steps in the test procedure or by steps in an operating instruction.</td>
</tr>
<tr>
<td>b.</td>
<td>Verify that required plant conditions have been established.</td>
</tr>
<tr>
<td>c.</td>
<td>All valves are DANGER TAGGED OPEN that: Could block either the primary or backup pressure relief point from the pressure source unless they are to be used during the test to isolate the pressure source from the portion of the system being tested. Could block discharge from the pressure relieving point. Could block either the primary or the back up pressure gage from the pressure source. (To ensure pressure indication, a clear pressure path between the applied pressure source and at least one pressure gage must be confirmed by danger tagging any isolation valve in this path. Confirmation that the other pressure gage is not isolated will be made by comparison with the tagged open gage). Would isolate the test pressure gages and the portion of the system being tested. Are vent paths in adjacent systems when the design or test pressure of the adjacent system is less than that of the system being tested?</td>
</tr>
<tr>
<td>d.</td>
<td>If a section of pipe will be pressurized downstream of a check valve and no provisions are available for measuring the pressure in that section of piping, ensure that: (1) Pressure sources in that portion of the system are isolated or inoperative as discussed in item 1.e of this appendix. (2) Provisions are included to manually depressurize any section of pipe isolated by a check valve as soon as possible after test completion.</td>
</tr>
<tr>
<td>e.</td>
<td>Potential pressure sources within the test area boundaries that are not required for testing are isolated or rendered inoperative by danger tagging out fuses, danger tagging shut appropriate valves, etc.</td>
</tr>
<tr>
<td>f.</td>
<td>There must be no valves in the pressure-relieving path which could shut as a result of depressurization and thereby block the relief path from relieving the applied test pressure.</td>
</tr>
<tr>
<td>g.</td>
<td>System relief valves within the test boundary are rendered inoperable to permit reaching elevated test pressure.</td>
</tr>
</tbody>
</table>
Systems susceptible to chloride stress corrosion are isolated to protect in-leakage of chlorides from adjacent systems being tested to an elevated pressure. This isolation may be accomplished either by using double valve isolation with leak off in between or by pressurizing the system susceptible to chloride stress corrosion to prevent in-leakage. If such isolation cannot be attained by practical means or is not assured, then the system susceptible to chloride stress corrosion must be flushed outwardly before and after the elevated pressure test and appropriate samples taken to confirm the absence of contaminants. (Not applicable to non-nuclear tests).

Verify test equipment:

(1) Installation is as specified on the QA form 26.
(2) Test gages are within required calibration periodicity.
(3) Automatic relief valves set point have been checked within 30 days prior to the test.

If test gages are provided with a dial adjustment which does not affect calibration, the dial should be adjusted to zero after the gage is installed for the test and prior to opening the valve that isolates the gage from the system being tested.

Verify calibration and dial adjustment devices, if readily accessible, are protected from inadvertent movement or adjustment during the test.

The discharge of test medium for overpressure protection is directed into areas where the discharge will not cause damage to equipment, create personnel hazards or radioactive problems.

Pressure gages must be clearly visible and readable by test personnel.

The location of gages is such that no path exists whereby pressure could be applied to any portion of the system undergoing test without a pressure gage (primary or backup) indicating this pressure.

The primary and backup pressure gages must be located on different branch lines (where this can be done without extending the test boundaries).

<tr>
<td>(9) Duties of manual overpressure relief operators.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(10) Immediate action must be taken to secure the test pressure source and investigate the problem should any of the following occur:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Pressure gages fail to respond to changes in test pressure.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- A rupture of a test gage occurs.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Pressure gage readings do not agree with the sums of their accuracies plus readability errors + or - _______ psig.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Changes in test pressures are erratic or operation of the test pumps after the system is filled solid does not produce a corresponding increase in pressure.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(11) Immediate action must be taken to secure the test pressure source and relieve system pressure if the pressure at which manual overpressure protection is to be initiated is exceeded on any primary or backup pressure gage.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(12) Plant and system status.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(13) Preliminary leak checks.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(14) Valve packing leak checks (if applicable).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(15) Criteria for an acceptable elevated pressure test.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(16) Pressurizing to elevated test pressure.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(17) Depressurization following completion of test.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. Manual overpressure protection relief valve operators have no other responsibilities assigned.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NOTE: WHEN PRESSURE IS BEING APPLIED BY A HAND-OPERATED TEST PUMP OR WHEN THE PRIMARY AND BACKUP TEST GAGES AND THE MANUAL OVERPRESSURE PROTECTION VALVE(S) ARE ALL INSTALLED ON THE HYDROSTATIC TEST RIG, THE TEST PUMP OPERATOR MAY ALSO SERVE AS THE PRIMARY OVERPRESSURE PROTECTION WATCH, PROVIDED THAT:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(1) THE MANUAL OVERPRESSURE PROTECTION VALVE IS WITHIN EASY REACH.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(2) PROPERLY SET AND TESTED BACKUP RELIEF VALVE PROTECTION IS PROVIDED (FOR OTHER THAN HAND-OPERATED TEST PUMPS, EITHER AN AUDIBLE OVERPRESSURE ALARM IS PROVIDED OR A SECOND BACKUP RELIEF VALVE IS INSTALLED ON THE TEST RIG).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(3) THE USE OF THIS EXCEPTION DOES NOT RESULT IN ONE INDIVIDUAL BEING SOLELY RESPONSIBLE FOR SATISFACTORY TEST PERFORMANCE.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Adequate communications have been established between testing personnel.

Rate of pressurization and depressurization is specified at 100 psi per minute maximum. If testing a small component or small volume system such that 100 psi per minute is not practicable, control rate as low as possible.

### 3. PERFORM ELEVATED PRESSURE TEST:

- a. Obtain permission to conduct test.

- b. Verify that the water purity of the test medium will not degrade system cleanliness or the required purity of water already in the system.

- c. Note depressurized gage readings of all primary gages for comparison later, at test completion.

  Location _______ _____ psig  Location _______ _____ psig

  Mark all test gages with a red mark at the overpressure protection set point, half way between the test pressure and the relief valve set point.

- d. Raise rig pressure to the specified test pressure. Verify primary and backup gages are in agreement. Maximum difference between the two gage readings after height correction is no more than 2%. Calculate 2% for each gage using the full-scale pressure measured by each gage (i.e., a 0-100 psi gage, 2% = 2 psig, the maximum difference between two gages with a 0-100 psi scale at a given pressure is 2 psig).

  Required accuracy + or - _______ psig.

  If not in agreement, replace or re-calibrate and repeat this step until satisfied.

- e. If a less accurate gage is used for backup and is indicating higher than the primary gage during gage cross checks, increase the overpressure set point mark on the backup gage by the indication differential after the second crosscheck.

- f. Increase pressure in increments and perform preliminary leak checks.

- g. Unless required to be positioned differently (e.g., throttle valves), backseat all valves that were aligned for packing leak checks prior to increasing pressure above normal operating pressure.

- h. Hold test pressure for 30 minutes prior to commencing final inspection unless otherwise specified.

- i. Primary and backup gages are in agreement at test pressure. (Same criteria as in Section 3.d of this appendix) + or - _______ psig.

- j. Results of inspection _______. Also record data on QA form 26.

Remarks:

- k. Slowly depressurize the test area at less than 100 psi per minute. If testing a small component or small volume system such that 100 psi per minute is not practicable, control rate as low as possible.

  For nuclear tests only:

  When depressurizing systems which are adjacent to systems potentially contaminated with chlorides, ensure that the potentially contaminated systems are depressurized before depressurizing the system susceptible to chloride stress corrosion to prevent in-leakage.

  Ensure that the depressurization path is selected such that any fluid flow produced by depressurization will tend to keep chlorides away from the system of concern.

F Safety of Ship Maintenance Item List
G Procedures and Safety Precautions for Entering Submarine Spaces, Tanks and Voids
H Close-out Inspection Check-off List

10.1 PURPOSE. To provide the procedures for authorization and control of shipboard work.

10.2 WORK AUTHORIZATION. Work on ship’s systems and components, as defined in Volume I, Chapter 1, Appendix D of this manual, must be properly authorized and controlled in
order to ensure rigorous personnel and ship safety standards are met at all times. All outside activity work on ship’s systems and components, regardless of who performs the work, requires formal authorization through a Work Authorization Form (WAF) for the specific work to be accomplished. This applies to all U.S. Naval ships in all types of maintenance availabilities, public and private. The Work Authorization System and preparation of the WAF are discussed Sections 10.3 and 10.4 of this chapter. For the purpose of this chapter, the term “Repair Activity” is any activity other than Ship’s Force involved in the construction, testing, inspection, repair, overhaul, refueling or maintenance of the ship.

10.3 WORK AUTHORIZATION CONTROL. Work on the Fleet’s ships is conducted under positive Work Authorization Control in order to ensure rigorous personnel and ship safety standards are met at all times. The following considerations apply in meeting these standards:

a. Work requiring formal authorization may include Planned Maintenance System (PMS), troubleshooting, corrective maintenance (repair) or alterations. It may also include removal of system components for repairs.

b. As many ship systems, such as hydraulics and high-pressure air, are operationally interrelated, caution must be exercised in planning work so that other systems are not unintentionally disabled when setting work boundaries for the system to be worked.

10.4 WORK AUTHORIZATION SYSTEM. Work Authorization must be controlled.

a. Designation of Work Requiring Formal Control. The WAF is the vehicle by which work requiring formal control is authorized for accomplishment and tracked to completion or otherwise no longer requiring isolation or authorization.

b. A WAF, shown in Appendix A, is required to authorize the start of work on all ship systems and equipment by activities other than Ship’s Force. Work includes all maintenance, repairs or modifications and installation or removal of temporary support systems and equipment. Repair activity non-intrusive work (e.g., painting, lagging, sheet metal work, deck plate, structural foundation) that does not affect ship or personnel safety does not normally require a WAF.

c. For Ship’s Force maintenance conducted in nuclear propulsion plants, the Engineering Department Manual contains the requirements regarding when a WAF is needed. For Ship’s Force work conducted outside the nuclear propulsion plant, the cognizant department head must determine the necessity for a WAF.

d. For availabilities where a repair activity is assigned responsibilities for work authorization control by Memorandum of Agreement (MOA), the requirement regarding when Ship’s Force must submit a WAF must be specified in the MOA.

10.4.1 Administration. The following administrative process is to be used in executing Work Authorization Control:

10.4.1.1 Work Authorization Form. The WAF, shown in Appendix A, must be filled out by the organization conducting the work, or Ship’s Force, as determined by the MOA signed for the availability per Volume II, Part I, Chapters 3 and 4 of this manual.

10.4.1.2 Work Authorization Log. The Work Authorization Log(s) must be maintained at the same location and administered by the same individuals as the ship’s tagout logs or, when the
repair activity is assigned responsibilities for work authorization control by MOA, the repair activity must retain original WAFs with a copy of all WAFs (or as specified by local MOA) and the WAF index must be provided to Ship’s Force either by hard copy or electronically via a database that can be easily accessed by the Ship’s Duty Officers.

**NOTE:** FOR SHIP’S FORCE GENERATED WAFS, THE SERIAL NUMBER MUST USE THE SAME PREFIXES USED FOR THE TAGOUTS THAT SET THE SYSTEM ISOLATION FOR THE WORK. WHEN A REPAIR ACTIVITY IS ASSIGNED RESPONSIBILITIES FOR WORK AUTHORIZATION CONTROL, THAT ACTIVITY WILL SPECIFY THE SERIALIZATION PROCESS USED BY ALL ACTIVITIES INCLUDING SHIP’S FORCE FOR THE AVAILABILITY.

10.4.1.3 Technical Work Document Record Sheet. When the job description on the WAF covers multiple components and their associated Technical Work Documents (TWD), a TWD Record Sheet (Appendix B) in addition to the WAF may be used to document this work.

10.4.1.4 Work Authorization Form Continuation and Revision Sheets. If necessary, a WAF Continuation Sheet similar to the one shown in Appendix C may be used when information on the initial original WAF will not fit in the blocks provided in the WAF form in Appendix A. The WAF Continuation Sheet shown in Appendix C depicts the minimum blocks that must be filled out. Additional blocks may be utilized as deemed appropriate. Any changes necessary to the information on the WAF form after Block 14 is signed will be on the WAF Revision Sheet or changes to the existing WAF as described in paragraph 10.4.4 of this chapter. Existing WAF Continuation Sheets may be used until exhausted if desired. The WAF Revision Sheet, similar to the one shown in Appendix C, may be used to accomplish WAF revisions as permitted by paragraph 10.4.4 of this chapter. The WAF Revision Sheet shown in Appendix C depicts the minimum blocks that must be filled out. Additional blocks may be utilized as deemed appropriate.

10.4.1.5 Numbering Work Authorization Form Continuation and Revision Sheets. Revisions and continuation sheets generated by computer software may be numbered as determined by the software programming. Paper WAF continuation and revision sheets are to be numbered using the conventions of sub-paragraphs “a” through “c” of this paragraph:

a. The WAF (Appendix A) will be identified as “Sheet 1”.

b. Continuation sheets will be identified as “Sheet 1A, Sheet 1B”, etc.

c. Revision sheets will be identified as “Sheet 2, Sheet 3”, etc.

10.4.2 Work Authorization Procedure. The following procedure is to be followed for properly authorizing work:

a. The WAF is presented to the Watch or Duty Officer by the division or repair activity tasked with the work.

b. (Submarines Only) For Safety of Ship items, as defined in paragraph 10.4.8 of this chapter and reference (a), the Watch or Duty Officer must obtain the Commanding Officer’s permission prior to authorizing work. When assigned, the Repair Activity’s Ship Safety Officer signature is required.
c. The Watch or Duty Officer will then determine if adequate isolation and plant or system conditions exist to safely and properly conduct the work including that the system is drained, de-energized and depressurized. The tagout is then established per reference (b). The work is not to be authorized if doubt exists on either of these points. For high energy systems (i.e., >200°F, >1000 psi) that could have the potential for trapped energies, the repair activity after consulting with Ship’s Force, may provide a written plan (i.e., valve lineup, procedure, marked up drawings) to Ship’s Force to ensure all parties are satisfied the system is properly drained and depressurized.

d. When system isolation and plant conditions are satisfactory to conduct the work (e.g., tagout complete, system depressurized, drained and de-energized), the Watch or Duty Officer authorizes the work and signs the WAF. For repair activity generated WAFs, the Repair Activity Representative (RAR) also signs the WAF. The Watch or Duty Officer and RAR signature indicates that, based on personal observation, certified records or direct report from watchstanders or divisional personnel, that system isolation and plant or ship conditions are set and the division or repair activity is authorized to start work.

NOTE: ELECTRICAL SAFETY CHECKS (E.G., VOLTAGE CHECKS TO ENSURE CIRCUITS ARE DE-ENERGIZED) ARE PART OF THE WORK PROCESS, NOT PART OF THE TAGOUT PROCESS, AND THEREFORE SHOULD BE PERFORMED AFTER BLOCK 14 OF THE WAF IS SIGNED.

e. Some component contractor personnel who perform work on ships are not knowledgeable of ship systems and are not qualified to determine if plant or ship conditions are satisfactory to conduct work. For such cases, the contractor’s signature will be based on a direct report or briefing they receive from Ship’s Force or the Naval Supervisory Authority, unless another method of providing the information to the contractor is specified in a MOA. The contractor’s signature represents confirmation that the contractor understands the hazards presented by the ship’s systems on which he will be working, and that he or she has received assurances the work area has been appropriately isolated, depressurized, de-energized or drained. As an alternative, the contractor may specifically agree via their contract that all repair activity responsibilities as defined in this chapter will be assigned to the Naval Supervisory Authority per paragraph 10.4.5 of this chapter. In all cases, appropriate information should be provided to the contractor prior to initiating work to ensure the contractor understands the hazards involved. A Regional Maintenance Center representative must sign MOA(s) only after ensuring all civilian contractor requirements detailed in any MOA(s) are contained within the applicable contracts.

f. The original WAF is placed in the Work Authorization Log and a copy must be maintained with the TWD until the work is completed.

g. Once the work is completed, the WAF is signed by the repair activity as work complete and forwarded to Ship’s Force for clearing of Tagout Record Sheet line items per reference (b).
h. Following completion of testing (if there is no formal test program) and setting of appropriate system status (e.g., clear tags and perform valve line-ups as appropriate for the situation), the WAF is signed as closed and forwarded to the cognizant department head for review.

10.4.3 Transfer of Non-Nuclear Systems and Nuclear Instrumentation and Control Systems (Depot availabilities only). During depot availabilities, large amounts of work will be performed on ship’s systems. Formal work control practices in place by a shipyard enable Ship’s Force to transfer non-nuclear systems and Nuclear Instrumentation and Control systems to the shipyard. Transfer of systems is the process by which Ship’s Force transfers the authority to approve all actions within a system or portion of a system to a shipyard and subsequent return of systems back to Ship’s Force prior to major events. Systems, or portions of systems, are transferred with or without transferring the ability to operate ship’s equipment. By transferring a system or portion of a system to the shipyard, the shipyard is responsible for authorizing all work, testing and equipment operation within the boundary transferred. Transfer of systems does not diminish a Commanding Officer’s overall responsibility for the safety of personnel, equipment and the ship. Although other activities may perform work within the boundaries and Ship’s Force normally retains responsibility for operating ship’s equipment, all actions (i.e., work, testing, equipment operations, etc.) within the boundary must be approved by the shipyard.

a. The MOA between the shipyard and ship for the availability must include the following minimum attributes regarding transfers:

   (1) Clearly state that all actions performed within the boundary being transferred must be approved by the shipyard.

   (2) Normally, Ship’s Force retains responsibility for operating ship’s equipment. If any transfers with operations are planned, the MOA must define the extent to which the shipyard will operate ship’s equipment within the boundaries.

   (3) Normally, Ship’s Force retains responsibility for PMS, unless otherwise specified in the MOA.

   (4) Delineate who is responsible to maintain system status within the boundary.

   (5) Identify the process (e.g., Joint Fleet Maintenance Manual Volume IV, Chapter 10, paragraphs 10.2 through 10.4.5) by which work control must be administered, including interface between the shipyard, Ship’s Force and other applicable activities.

b. A WAF must be used to transfer a system or portion of a system to the shipyard. Block 7 of the WAF must clearly state this intent (i.e., specify “transfer” or “transfer including operations”). Ship’s Force formally transfers a system or portion of a system to the shipyard by signing Block 14 of the WAF. Unless Block 7 of the WAF states the transfer is “including operations”, the shipyard is not authorized to operate ship’s equipment within the transferred boundary.

c. The shipyard returns a system or portion of a system back to Ship’s Force by completing all authorized work and testing specified on the WAF and signing Blocks 16, 17 and 18 of the WAF. Ship’s Force indicates acceptance of the work and testing and, if applicable, operation by signing Block 18 of the WAF. For nuclear powered
ships, the Engineering Department Manual contains requirements for accepting operational control from the shipyard.

d. When the shipyard is responsible for operating ship’s equipment as specified in the transfer MOA, operation of ship’s equipment must be following shipyard or Naval Sea Systems Command (NAVSEA) procedures (e.g., test procedures, ship’s operating instructions, Steam and Electric Plant Manual, etc.).

e. When waterborne, Ship’s Force must retain operation of hull and back-up valves.

f. When portions of a system are required to be operational to support propulsion plant key events per NAVSEA Instruction 4730.1 and 4730.2 series, those portions of the system must be transferred back to Ship’s Force.

g. Ship’s Force must have the capability to isolate the transferred area from components and systems under Ship’s Force control. The valves, switches, breakers, fuses, blanks, etc., that provide this capability must remain under Ship’s Force control.

h. Any ship system which could directly affect the reactor plant or conduct of reactor plant testing must not be transferred to a shipyard until required nuclear temporary support systems are installed and the system is isolated from the reactor plant.

i. Within the boundaries transferred to the shipyard, Ship’s Force must be notified prior to commencing testing and when testing is interrupted and completed.

j. All transfers on submarines must be consistent with ship’s safety requirements and reference (a).

k. In order to minimize subsequent changes to the WAF and ensure that Ship’s Force is aware of the work scope, the WAF which transfers systems or portions of systems should include all known customer authorized work within the specified job description.

l. This authority applies to all work performed by or sub-contracted by the shipyard.

m. Within the boundaries approved by the WAF, the shipyard can add additional work to the WAF without Ship’s Force approval by adding additional TWDs to a TWD Record Sheet (Appendix B) provided the additional work is within the original description of work and tagout boundaries (i.e., no additional tags are required). This method is applicable only when two independent reviews of the additional work by the shipyard confirms that the existing WAF and its associated tagout(s) provide adequate isolation and conditions for the work (see paragraph 10.4.5 of this chapter). TWDs (Task Group Instructions (TGI), Deficiency Logs, Deficiency Reports, etc.) that meet this criteria and require work control per paragraph 10.3 of this chapter will be added to the TWD Record Sheet. To ensure Ship’s Force remains informed of all work being performed on ship’s systems, the shipyard must verbally notify Ship’s Force at the time work is added to the TWD Record Sheet and subsequently provide a hard copy of the changed TWD Record Sheet if it cannot be printed by the Ship’s Duty Officer from an electronic database. Work added to the TWD Record Sheet does not need to be added to the associated Tagout Record Sheet.

IV-10-6
n. When other activities perform work and testing within boundaries transferred to a shipyard and the shipyard is acting as their RAR, the shipyard may add the other repair activity’s work to the TWD Record Sheet. Otherwise, a separate WAF must be generated and a new line item must be added to the existing Tagout Record Sheet.

o. Ship’s Force performing work, testing or equipment operations within boundaries transferred to a shipyard must prepare a separate WAF processed as described in paragraph 10.4.2 of this chapter, add a new line item to the existing Tagout Record Sheet and obtain shipyard concurrence in Block 12 of the WAF. RAR signature is not required on the Tagout Record Sheet.

p. For small depot availabilities (e.g., conventional surface ship availabilities less than six months in duration, submarine Selected Restricted Availabilities and Extended Refit Periods, Aircraft Carrier upkeeps), the provisions of this paragraph may be applied on a case basis where the amount of work on a system is extensive and warrants transferring a portion of a system. These exceptions require Type Commander approval.

10.4.4 Work Authorization Form Revisions. Changes to the scope of the existing job description or system transfer boundary must be authorized by a formal revision to the existing WAF. Except as noted for minor administrative changes, changes to conditions (i.e., Blocks 7, 8, 11, 13 or 14) established by an authorized WAF, including the associated tagout(s), also require a formal revision to the existing WAF. A formal revision to a WAF can be accomplished by either preparing a new WAF with the same number or revising the existing WAF.

a. Prepare a new WAF. A new WAF with the same number will be used primarily for major changes to Block 7, Job Description or other major changes which warrant reverification of all aspects of the work authorization.
   (1) A new WAF with the same number will be generated with changes included.
   (2) In Block 9, enter revision (REV A, REV B, REV C, etc.) the reason for, and description of the change.
   (3) Authorize the new WAF per the requirements of this chapter.
   (4) Mark superseded WAF(s) “SUPERSEDED” and retain with the new WAF.

b. Revise Existing WAF. The revised existing WAF will be used primarily for tag shifts or other minor changes.
   (1) Enter all required changes. Include initials, date and revision with each entry.
   (2) Line-out all changed or invalidated information. Include initials, date and revision with each line-out.
   (3) Remake all affected signatures.
   (4) In Block 9, enter reason for and description of the change. Sign and date the entry.
   (5) Obtain authorization including verification of “Plant or Ship Conditions Set” by resigning Blocks 13 and 14 of the WAF.

c. Revise existing WAF using the WAF Revision Sheet.
(1) Fill in the information required by the WAF Revision Sheet, including the revision (REV A, REV B, REV C, etc.). Add additional blocks as deemed appropriate.

(2) Enter the reason for and description of the change. Sign and date the entry.

(3) Obtain all required signatures.

(4) Once the WAF Revision Sheet has been completed, it must be maintained with the original WAF in the WAF log.

d. Minor Administrative Changes to Existing WAFs. The Watch or Duty Officer or the RAR may make pen and ink changes that are editorial or administrative in nature to the original WAF without processing a new or revised WAF. These changes must not affect the scope or sequence of shipboard work, and include items such as obvious typographical errors, erroneous job order numbers or spelling errors. Either the Watch or Duty Officer or Repair Activity may make these changes on the original WAF without resigning Blocks 13 and 14. The changes must be initialed and dated by the person entering the changes.

e. Iterative Tagouts. When using the reference (b) Iterative Tagout procedure, a revision to the WAF is not required provided the specific tests or maintenance evolutions are controlled by a formal process. This process is to be defined and concurred with by a MOA established between Ship’s Force and the Lead Maintenance Activity. The process must ensure that isolation is re-established and system conditions verified prior to recommencing work.

10.4.5 Centralized Work Control Procedures. It is the responsibility of the Lead Maintenance Activity to determine the need for centralized work control and to assign the responsibility for work authorization control. During depot availabilities, a centralized work control team will be established. For other availabilities, this decision is based on the number of repair activities performing work during the availability and the complexity of the work. When centralized work control procedures are invoked, the following process must be used:

a. Work by all repair activities is processed by the centralized work control team including work covered by paragraph 10.4.3 of this chapter. Ship’s Force involvement will be defined by MOA.

b. The Lead Maintenance Activity will specify participation and supervision of the centralized work control team by MOA. Ship’s Force is an integral part of the centralized work control team and should man the team with experienced officers or senior petty officers.

c. The repair activity performing the work must prepare the WAF, sign as RAR on the Tagout Record Sheet and sign the WAF blocks 10, 14, 16 and 17 if applicable, unless specified otherwise by MOA (e.g., repair activity does not maintain qualified personnel). The Lead Maintenance Activity assigned responsibility for centralized work control is responsible for processing the WAF and signing all other repair activity blocks on the WAF.

d. For work covered by paragraph 10.4.3 of this chapter, the Ship’s Force member(s) of the centralized work control team would notify the responsible Division or Work
Center Supervisor and Duty Officer of added work to a TWD Record Sheet to ensure that Ship’s Force remains informed of all work being performed on ship’s systems.

10.4.6 Equipment Tagout Procedures. Tagouts must be accomplished per the requirements of reference (b).

10.4.7 Barrier Criteria.

a. Barrier criteria for maintenance is located in reference (b) and applicable Reactor Plant and Steam and Electric Plant manuals.

NOTE: BARRIER CRITERIA REQUIRED BY REACTOR PLANT AND STEAM AND ELECTRIC PLANT MANUALS HAVE PRECEDENCE OVER REFERENCE (b) CRITERIA.

b. (Submarines only) Specific guidance for hull penetrations is located in Appendix D.

10.4.8 Safety of Ship Maintenance Item Identification, Listing and Control (Submarines only).

a. Safety of Ship Maintenance Item List (SOSMIL). Safety of Ship maintenance items are those evolutions having significant potential to impact the ship’s watertight integrity, damage control capability or which require special attention to ensure ship safety.

NOTE: DESIGNATION OF SAFETY OF SHIP MAINTENANCE ITEMS FOR BOTH SHIP’S FORCE AND ANY OUTSIDE ORGANIZATION IS REQUIRED WHEN FLEET MAINTENANCE ACTIVITY (FMA), INDUSTRIAL ACTIVITIES AND CONTRACTOR PRODUCTION WORK IS IN PROGRESS. REQUIREMENTS OF PARAGRAPH 10.4.8 OF THIS CHAPTER OR A SHIP’S PLAN OF THE DAY, IF REFERENCE (a) IS IN EFFECT, WILL BE IMPLEMENTED ANY TIME WORK AFFECTING SAFETY OF SHIP ITEMS IS PERFORMED REGARDLESS OF AVAILABILITY STATUS.

b. Safety of Ship Maintenance Items. The ship’s Commanding Officer’s permission is required prior to authorizing the maintenance evolution. The following, as a minimum, must be scheduled on the SOSMIL:

(1) All maintenance involving single closure isolation from sea.
(2) All maintenance which removes a means of blowing main ballast tanks.
(3) All maintenance requiring the use of flat patches, hull blanks or cofferdams, with specific entries identifying the actual installation and removal of these items.
(4) All maintenance which removes the capability to dewater the ship using either the trim or the main drain systems.
(5) All maintenance which removes the ship’s installed firefighting capability (e.g., maintenance which prevents pressurization of the trim system).
(6) Bleeding or charging oxygen banks.
(7) Handling or loading of explosives or weapons.
(8) All maintenance which removes portions of, or the entire Emergency Air Breathing system.

(9) Fueling or defueling.

(10) Diver operations.

(11) Pumping or flooding the sonar dome.

(12) Battery charges (all battery charges on submarines equipped on with an ASB-49 Main Storage Battery and during procedures that may reach or exceed 2.45 volts per cell on submarines equipped with a Submarine Valve Regulated Lead Acid Main Storage Battery).

(13) Nitrogen load.

(14) Refrigerant on or off load.

(15) Evolutions with an expected draft change of >3 inches (e.g., ballasting, lead load, etc.).

(16) Securing the Emergency Diesel Generator.

(17) Other maintenance or evolutions which require special coordination between Ship’s Force and maintenance providers to ensure safe accomplishment of authorized work (e.g., Loading Vertical Launch System Platform).

(18) All maintenance that violates the integrity of the pressure hull, watertight bulkhead or watertight doors, excluding the routine operations of access hatches.

(19) All maintenance that disables any bilge alarm or any portion of an emergency announcing circuit when temporary alarms or indications are not installed.

(20) All maintenance that secures normal or emergency lighting circuits in a compartment or space such that damage control response would be significantly impacted.

NOTE: USE OF TEMPORARY SYSTEMS TO REPLACE FUNCTIONS OF SHIP’S INSTALLED SYSTEMS SHOULD BE CONSIDERED WHEN DEEMED NECESSARY. CLASS SUBMARINE ORGANIZATION AND REGULATIONS MANUALS AND SHIP SYSTEM MANUALS MAY PROVIDE FURTHER GUIDANCE.

c. SOSMIL Preparation. The SOSMIL will be prepared by a person designated by the ship’s Commanding Officer using written input provided by Ship’s Force divisions and the FMA representative. A new SOSMIL will be prepared prior to the FMA Daily Production Meeting of Volume II, Part I, Chapter 4, paragraph 4.4.11 of this manual. Appendix E of this chapter is provided as an example and depicts the minimum attributes that must be documented on the SOSMIL. Appendix F of this chapter may be reproduced locally for use. The requirements to prepare the SOSMIL are:

(1) Indicate ship’s name, hull number, upkeep number, calculated maximum expected draft, actual morning draft and date prepared.
(2) For each job, list the Job Control Number or WAF number (as applicable) (operating instruction, PMS item, operating procedure), job description, scheduled end date and any remarks.

(3) The SOSMIL should indicate planned work for the next seven days. A thick black line must be used on the left side of the current day to indicate the current days’ work.

(4) In the job description block, indicate in parentheses a number that corresponds to the list at the bottom of the sheet as to why the job requires a SOSMIL entry.

(5) Items must remain listed on the SOSMIL until work has been verified complete and associated WAF has been completed or Block 11 of the WAF revised as no longer affects Safety of Ship.

d. Maximum Expected Draft. For those items which will have an effect on ship’s draft, expected draft changes greater than three (3) inches will be calculated fore and aft for that evolution and indicated in the remarks section. Draft calculations will be made by a Diving Officer of the Watch qualified individual. Additionally, for all ballasting evolutions, a second independent calculation will be performed and provided by a second Diving Officer of the Watch qualified individual. The worst-case draft change for each item will be totaled to arrive at a “maximum draft” and a maximum one foot buffer added to arrive at the “maximum expected draft”. (The ship’s Commanding Officer can decide to reduce the buffer as he desires. If Safety Draft Marks are in use, the bottom edge of the mark must match the “maximum expected draft”.) The “maximum expected draft” is listed at the top of the SOSMIL. Calculation sheets will be retained until the job is no longer carried on the SOSMIL. If the ship exceeds the “maximum expected draft”, the Duty Officer will stop the evolution, place the ship in a safe condition and notify all parties who signed the SOSMIL and the ship’s Commanding Officer.

NOTE: THIS MUST IN NO WAY BE CONSTRUED AS LIMITING ACTIONS BY THE DUTY OFFICER OR NOTIFICATION OF THE SHIP’S COMMANDING OFFICER OF SMALLER DRAFT CHANGES. ANY UNEXPECTED DRAFT CHANGE SHOULD BE THOROUGHLY INVESTIGATED AND UNDERSTOOD.

e. Morning Actual Draft. The actual ship’s draft recorded each morning prior to the Daily Production Meeting. This draft will serve as a baseline value for draft changes that occur throughout the day.

f. The Ship’s Force Availability Coordinator will present the SOSMIL at the FMA daily production meeting for review and signatures. The SOSMIL will be signed by:

(1) Ship’s Force (signed by a department head). Signature indicates that all evolutions that affect ballast have been identified, the form has been completed per this instruction and the correct drafts have been calculated and at least four feet of freeboard is available to all hull openings.
(2) Immediate Superior In Command (ISIC) (signed by an ISIC representative). Signature indicates that all maintenance has been identified, the form has been completed per this instruction and the draft measurements are noted.

(3) Maintenance Organization (signed by appropriate senior level person of the repair activity, normally the Production Officer, as he leads the FMA Daily Production Meeting). Signature indicates all authorized Safety of Ship work items are listed. If any additional items are to be worked, a formal change to the SOSMIL will be required.

g. Following review and signature, the Ship’s Force Availability Coordinator will provide the original copy to the ship’s Duty Officer. Reproduced copies for distribution must be made from the “original document” only. Copies will be provided to:

(1) Each Production Meeting attendee listed:
   (a) FMA Division Officers
   (b) FMA Repair Duty Officer or Repair Duty Chief Petty Officer
   (c) FMA Regional Maintenance Team Leader. He or she must receive enough copies to make further distribution to the FMA Duty Officers and each FMA Division Officer having work listed on the SOSMIL.
   (d) Supply Repair Other Vessel Officer
   (e) Ship’s Force Availability Coordinator
   (f) ISIC Material or Squadron Representative
   (g) FMA Availability Coordinator

(2) The ship’s Engineering Duty Officer.
(3) The ship’s Below Decks Watch.
(4) The ship’s Petty Officer of the Deck.
(5) Naval Submarine Support Center Representative.

h. SOSMIL Use and Pre-Job Briefs. None of the evolutions or maintenance specified in paragraph 10.4.8.b of this chapter must commence unless it is scheduled on the current SOSMIL. The activity performing any maintenance or evolutions listed on the SOSMIL is responsible for a pre-job brief prior to commencing work. A pre-job brief is required for all items listed on the SOSMIL and will be attended by all parties involved as desired by the Ship’s Duty Officer.

10.4.9 Ship in Dry Dock (Submarines Under Joint Fleet Maintenance Manual Controls).

a. When the ship is in dry dock, Chapter 0872 of Navy Regulations requires the closing of all valves and other openings in the ship at the end of working hours when such closing is practical. In situations where there is extensive disruption of watertight integrity, making daily closing impracticable, it is prudent to protect the dry dock, rather than the ship, from inadvertent flooding. To this end, shipyards must maintain dry docks per reference (c).
b. Temporary fluid systems must be considered a controlled constant fluid supply provided the following conditions exist:

(1) The temporary fluid supply contains two in-line isolation valves external to the ship between the source and the ship.

(2) The two isolation valves must be located to facilitate rapid isolation (e.g., close to the ship).

(3) The temporary fluid system, including both off hull isolations, must be formally transferred to, including operation of, Ship’s Force.

(4) The supplied ship system must be tested to the temporary system operating pressure.

c. Dry dock simulated waterborne conditions exist when water is introduced to the dry dock and kept at a level below that necessary to lift the vessel off the blocks. During this condition, the following minimum requirements must apply:

(1) The event must be authorized on the SOSMIL, contained in section 10.4.8 of this chapter (Submarines only).

(2) Hull openings must be maintained per reference (a).

(3) Seawater valves should normally be operated using ship’s systems. A temporary system may be used to operate seawater valves after obtaining Commanding Officer’s permission.

(4) Ship’s dewatering capability meets the requirements of references (d) through (f).

d. Dewatering capability. Each compartment must be capable of being dewatered at a rate of at least 200 GPM with pumping started within three minutes of the flooding being called away. Ship’s Force will demonstrate adequate dewatering capability by planning and scheduling flooding drills to be observed by the ISIC and Lead Maintenance Activity Representative at the following times:

(1) Within seven days of docking and temporary systems being delivered.

(2) Just prior to undocking, normally within 30 days.

10.5 FINAL CERTIFICATION, CLOSEOUT AND RE-ENTRY OF SUBMARINE SPACES, TANKS AND VOIDS.

10.5.1 Purpose. To establish procedures for the final certification, closeout and re-entry of submarine spaces, tanks and voids.

10.5.2 Discussion. Historically during space, tank or void closeout, a large number of diverse and inconspicuous items have been overlooked. These items have, at times, seriously degraded both material readiness and acoustic signature of submarines. This section establishes a procedure to ensure a thorough certification of all spaces prior to final closeout and provides a check-off list when re-entry is required. The check-off list or sheet is not all-inclusive. Common sense and effective use of personnel experience and knowledge must be used to ensure complete and thorough inspections. A review of references (g), (h) and (i) should be performed to determine if a formal report of unscheduled visual inspection is required to be submitted for tank
and voids being entered or closed. Non-steel damping and acoustic restraining covers are not required to be painted. Accidental overspray is acceptable. Full paint out of damping restraining covers and acoustic tile covers is not the intent. If damping and acoustic tiles are painted, they must be checked to ensure that the paint will not bridge the gap between the rubber and the restraining cover more than 75% over an area. Degradation of the performance of tiles is possible. A suggested way to repair the area is to score the gap between the restraining cover and the damping tile and between the acoustic tile covers and the rubber. Previously painted serviceable tiles may remain in service. Reference (g) allows paint on piping.

**NOTE** APPENDIX G MAY BE USED AS AN AID FOR ENTERING SUBMARINE SPACES, TANKS AND VOIDS.

10.5.3 **Action.**

a. The Damage Control Assistant (DCA) is designated the coordinator for the closeout of all spaces. As such, he is responsible for the following:

   (1) Assigning responsible personnel to closeout or assist in closing out specific spaces, tanks and voids.

   (2) Providing personnel designated to conduct tank, void, or space closeouts with a copy of Appendices G or H as applicable.

   (3) Ensuring personnel performing closeouts are aware of their responsibilities and are adequately trained. He must provide, by periodic notice, a list of personnel qualified to perform closeout inspections.

   (4) Maintaining a folder for completed copies of Appendix H. This folder will serve as a space, tank and void closeout certification record. Only the most recent copies of these Appendices are required to be retained. This folder should also include an index of all spaces, tanks and voids applicable to closeout certification and their status.

   (5) Keeping the Commanding Officer and the Engineer Officer informed as to the status of closeouts and significant deficiencies noted.

b. Personnel performing tank, void and space closeout or entry are responsible for:

   (1) Obtaining a copy of Appendix G and Appendix H.

   (2) Forwarding to the DCA completed copies of Appendix H.

**NOTE** A REVIEW OF REFERENCES (G), (H) AND (I) SHOULD BE PERFORMED TO DETERMINE IF A FORMAL REPORT OF UNSCHEDULED VISUAL INSPECTION IS REQUIRED TO BE SUBMITTED FOR TANKS AND VOIDS BEING ENTERED OR CLOSED.

c. Responsibility for Re-Entry Controls (REC) and final certification are:

   (1) In cases where entry is required to be made for production work by both Ship’s Force and FMA personnel, the FMA will be responsible for REC and Ship’s Force will be responsible for final certification closeout.

   (2) For cases where only FMA work is anticipated, the FMA will be responsible for REC and Ship’s Force will be responsible for final certification closeout.
For the cases in which only the maintenance activity has access (e.g.,
waterborne entry into mud tanks or ballast tanks by divers) the maintenance
activity will be responsible for final certification closeout.

(3) For cases where only Ship’s Force work is anticipated, Ship’s Force will be
responsible for REC and final certification closeout.

10.5.4 Applicability. All SSN, SSBN and SSGN Class submarines and FMAs.

☐ CHECK IF CONTINUED ON ANOTHER SHEET  

Sheet ____
INSTRUCTIONS FOR COMPLETING WORK AUTHORIZATION FORM

Block 1. USS: Enter name or the hull number.

Block 2. SYSTEM: Enter the system noun name, abbreviation or identification number.

Block 3. WAF NO.: Enter the WAF serial number.

Block 4. JSN: Enter the Job Sequence Number or job order.

Block 5. DIVISION, Lead Work Center (LWC) or REPAIR ACTIVITY (RA): Enter ship’s Division, LWC or repair activity Point of Contact responsible for conducting the maintenance.

Block 6. TECHNICAL WORK DOCUMENT: Enter the TWD (e.g., Controlled Work Package (CWP) or Formal Work Package (FWP), Task Group Instruction (TGI)) number(s) or enter “see attached TWD Record Sheet”. If a TWD Record Sheet is used, it must be referenced in Block 6.

Block 7. JOB DESCRIPTION: Enter a description of work to be performed detailed enough for the Authorizing Officer or RAR to understand the scope of the work boundary and prepare or concur in the isolation established for this work. If necessary, use of an additional Continuation Sheet per Appendix C is authorized. Description of work can contain either a description of work boundaries or a description of components (see paragraph 10.4.3a of this chapter).

Block 8. POST WORK TESTING IS AS SPECIFIED: Check BELOW and identify test requirements when retest is not contained in a TWD or formal test program. Check FORMAL TEST PROGRAM if retesting will be tracked or completed in a program administered by the repair activity. If FORMAL TEST PROGRAM or NO TEST REQUIRED is checked, Block 17 is N/A.

Block 9. RESTRICTIONS, PRECAUTIONS AND REMARKS (OPENING): Enter any restrictions or precautions associated with the work item. If any information is entered in this block, the person making the entry must enter name, organization and date. If necessary, use of an additional Continuation Sheet per Appendix C is authorized.

Block 10. DIVISION OR REPAIR ACTIVITY READY TO COMMENCE WORK: Signature by Leading Petty Officer or Division Officer for Ship’s Force work or repair activity indicates that sufficient prerequisites are met to commence isolation for production work.

NOTE: SHIPYARDS IMPLEMENTING SAFETY OF SHIP REQUIREMENTS FOR SURFACE FORCE SHIPS PER LOCAL MOAS MAY MODIFY AND USE BLOCK 11 TO DOCUMENT SHIP SAFETY DETERMINATIONS.

Block 11. SAFETY OF SHIP: For submarines, when required by paragraph 10.4.8 of this chapter or reference (a), check YES.

(1) If the SPOD is used, the Repair Activity’s Ships Safety Officer will sign concurrence.

(2) If the SOSMIL is used, the qualified Watch or Duty Officer will verify that work is listed on the SOSMIL for that day and sign the block. NON-SAFETY OF SHIP WORK CONTROLS. Check NO. When safety of ship qualified RA or Ship’s Force work control personnel process their respective WAFs, they may sign concurrence for non-safety of ship maintenance.
Block 12. CONCURRENCES: Concurrence signatures may be entered as necessary (e.g., nuclear or non-nuclear interface, assist work center(s), two cognizant department heads). The Authorizing Officer or RAR should define any needed concurrences by noting the concurring organization beneath the signature line in Block 12 and obtain the concurrences. Enter N/A if no concurrences are required.

Block 13. TAGOUT REQUIRED: If tagout is required, mark YES. When tagout is hung, enter tagout number(s) (Log Serial Number or Shift Operations Management System line item number) and Watch or Duty Officer will sign block. If no tagout is required, mark NO. Enter N/A in TAGOUT NO., and Watch or Duty Officer will sign block.

Block 14. PLANT OR SHIP CONDITIONS (e.g., drained, de-pressurized, de-energized, restrained) SET, FMA, DIVISION OR REPAIR ACTIVITY ARE AUTHORIZED TO START WORK: The Watch or Duty Officer signs in all cases for authorizing the start of all work. Note any restrictions, precautions, or both, in Block 9. If Block 11 is checked YES, the Watch or Duty Officer must ensure the work of the WAF is listed on the SOSMIL or Ship’s Plan of the Day prior to authorization of the WAF. RAR signs for authorizing the start of work when the WAF is for repair activity work.

Block 15. RESTRICTIONS, PRECAUTIONS OR REMARKS: Enter any general conditions (e.g., outstanding work) that may affect system restoration. If any information is entered in this block, the person making the entry must enter name, organization and date. If necessary, use of an additional Continuation Sheet per Appendix C is authorized.

Block 16. WORK IS COMPLETE: A signature by Ship’s Force or the repair activity is entered when the work described in Block 7 is verified complete and tags may be cleared with any exceptions listed in Block 15.

Block 17. TESTING IS COMPLETE: A signature by the activity performing the retest is entered when testing of Block 8 is completed. Block 17 is marked N/A if Formal Test Program is in effect or no test required.

Block 18. WAF CLOSED OUT: When work specified in Block 7 and testing as specified in Block 8 is completed, including all exceptions listed in Block 15, repair activity signature is entered to indicate the WAF is closed out. Ship’s Force signature indicates acceptance of the work and testing and that appropriate system status has been set (e.g., clear tags and perform valve lineups as appropriate for the situation). Block 18 may be signed prior to completion of testing covered by a formal test program. A copy of the closed out WAF must be provided to Ship’s Force if the repair activity is maintaining the original WAF.

IV-10C-2

APPENDIX C
APPENDIX D

BARRIER CRITERIA FOR HULL PENETRATIONS

1. SYSTEMS WHICH PENETRATE THE HULL. Commanding Officers will review tag-outs and work procedures for systems which penetrate the hull to the detail considered necessary for safety. Any required work or testing which violates the requirements of this appendix should not commence without prior specific approval of the Commanding Officer.

2. HULL PENETRATIONS BELOW THE WATERLINE. The principle of double closure applies to all hull penetrations except for those mechanical and electrical penetrations (such as the secondary propulsion motor shaft and cable penetrations) which are designed for single closure. Double closure is accomplished by using installed valves, blank flanges, outside closure plates, shaft seal inflatable boots, or shaft seals. Positive control must be exercised by Ship’s Force to maintain closure through the use of danger tags and interlocks, gagging devices, chains, mechanical locks, hydraulic locks, blanks etc., until the work, including the required testing, on the associated system has been completed.

   a. Single closure can be used only with the specific permission of the Commanding Officer. If single closure is approved, the barrier must be verified by a satisfactory leak check of the single closure before opening the system for maintenance as listed in sub-paragraphs (1) through (3):

      (1) The system should be isolated using the single closure barrier.

      (2) If the system has not been drained, open the closest system high-point vent to conduct a controlled leak check of the single closure.

      (3) If the system has been drained, open the closest low-point drain to conduct a controlled leak check of the single closure.

   b. Prior to undocking:

      (1) If undocking becomes necessary prior to completing all sea connected system maintenance and testing, obtain double closure through reassembly, then satisfactorily hydrostatic test all pressure boundary joints outboard of the backup valve seat and verify the integrity of the hull and backup valve seats by performing a hydrostatic seat leakage check of both valves.

      (2) Where schedule, resources or other constraints prevent accomplishment of the requirements of sub-paragraph b(2) at the time of undocking, a blank flange(s) must be installed, tested and identified external to the hull penetration to provide double closure. This condition must be identified both internally and externally to prevent inadvertent removal. The installation of the blank flange must be approved by the Commanding Officer. Removal of these blank flange(s) must not commence until the required valve(s) and associated local Valve Position Indicator(s) have been reinstalled and tested to support removal of the blank and blank removal has been approved by the Commanding Officer.

3. HULL PENETRATIONS ABOVE THE WATERLINE. These penetrations or openings will also be protected by double closure or as listed in sub-paragraphs “a” and “b”:
NOTE: THE DETERMINATION OF LESS THAN OR GREATER THAN FOUR FEET FROM THE WATERLINE WILL BE DETERMINED BY A MEASUREMENT FROM THE LOWEST LIP OF OPENINGS IN A PENETRATION TO THE ACTUAL WATERLINE.

a. Hull penetrations less than four feet above the waterline.
   (1) Cofferdams must be installed around all open hull access openings, including temporary hull cuts, which have less than four feet of freeboard at the opening. Cofferdams must be constructed and tested per reference (a) to maintain watertight integrity to at least four feet above the waterline. A hull opening such as an electrical cable penetration need not have a cofferdam installed if it is adequately blanked or plugged while the system is under repair. Cofferdams will be designed to permit personnel access, temporary services and equipment shipping, as applicable, without violating the required watertight integrity. The ship’s topside freeflord structure may be used to achieve the four-foot requirement, however, the opening must be controlled in the same manner as a cofferdam. Positive control to maintain closure through the use of danger tags, and gagging devices, mechanical locks or blanks must be exercised for all hull access openings not in an as-built condition. Removal or changes in status must be approved by the Commanding Officer.
   (2) Other penetrations or openings which do not meet this criteria or which cannot be isolated by some type of single closure will be attended at all times by personnel with access to equipment capable of securing flooding, should it ever occur. Exceptions require specific permission of the Commanding Officer. Single closure may be affected by any suitable temporary watertight closure.

b. Hull penetrations greater than four feet above the waterline. Penetrations or openings not in their normal as-built condition are not required to be watertight but should be provided with protection against unwanted fluid entry.

4. INADVERTENT OPERATION OF HYDRAULIC ACTUATORS. For those conditions when the ship is waterborne with a hull or backup valve below the waterline installed but the associated inboard piping is not complete and the hull or backup valve hydraulic actuator lines are disconnected, the following guidance is provided for reconnecting the hydraulic actuators (which may cause valve movement):
   a. If an external blank flange is installed, any additional precautions should be determined by the Commanding Officer.
   b. If an external blank flange is not installed, then the hull and backup valves should be installed, hydrostatically tested and local valve position indication proven correct and reliable. Additional safety precautions such as not working the actuators for a particular hull and backup combination concurrently, shutting and danger tagging both valves at all times, isolating and danger tagging the hydraulic pressure source to the control valve for the specific actuator being worked and not pressurizing or operationally testing the actuators until the seawater system integrity has been
reestablished, should be employed to provide the additional assurance required to preclude the need for an external blank.

5. INSTALLATION OF HULL FITTINGS OR FLANGES. When maintenance is to be performed which requires a hull fitting or flange to be installed, the following actions will be taken:

a. Ship’s Force will identity the hull opening by noun name, docking plan number, frame number, side and distance off centerline and item number (as obtained from the ship’s docking plan) and provide this information to the FMA.

b. The FMA planning division will verify the data provided by Ship’s Force and calculate the circumferential distance from the centerline.

c. The FMA LWC will provide the verified data and the fitting or flange, including the required installation hardware, to the diving supervisor.

d. Ship’s Force must mark the fitting location using a weighted and marked line, referenced from frame marks topside.

e. The Ship’s Duty Officer must authorize the installation of the fitting or flange and coordinate the pre-brief for the installation evolution. As a minimum, the brief must be attended by the Ship’s Duty Officer, LWC Supervisor and Diving Supervisor. The mechanism for authorizing the hull blank installation must be the Work Authorization Form (Appendix A), per this chapter.

f. The divers, in conjunction with Ship’s Force and the LWC Supervisor must verify the location of the hull opening and weighted or marked line prior to the divers entering the water.

g. A diver accompanied by Ship’s Force must tap on the internal hull opening until the in-water diver acknowledges the location by returning the signal except where permanent markings identifiable by a diver uniquely identify a specific hull fitting or penetration (markings such as a fitting name or number welded as raised characters on or adjacent to the fitting or penetration).

h. After installation, the hull fitting or flange location and installation must be independently verified by a second diver.

i. Divers, assisted by the LWC and Ship’s Force, must verify the hull fitting or flange integrity with a 100-psig air test.

j. Divers and the LWC Supervisor must mark the hull fitting or flange by attaching a tether from the fitting or flange to topside. At the topside attachment point, the tether must be labeled “Hull Fitting (Noun Name) Installed”.

k. Positive verification from inboard of the hull fitting or flange placement and integrity must be achieved for each installed fitting or flange prior to proceeding with any maintenance. The verification must be accomplished using the method for testing a single closure described in paragraph 2.a of this Appendix. If either of the leak check methods of paragraphs 2.a.(2) or (3) of this Appendix are not possible, the Commanding Officer must be notified and give specific permission for continuing or conducting the maintenance.
1. If internal verification of hull fitting or flange integrity is not possible due to system configuration, the fasteners must not be fully removed from the pressure boundary being disassembled until the system is fully drained and hull fitting or flange integrity has been verified.

m. If a hull fitting or flange is left installed for system or at sea operations, the guidance of Volume V, Part I, Chapter 8 of this manual concerning Departure From Specification must be followed.

6. REMOVAL OF HULL FITTINGS OR FLANGES. Prior to removal, divers, in conjunction with Ship’s Force, must verify the label of the tether of the fitting or flange to be removed and check for the presence of danger or caution tags. The divers must then follow the tether to the fitting or flange to ensure the removal of the correct fitting or flange.

7. BULKHEAD VENTILATION VALVES. Bulkhead ventilation valves must either be operational and capable of being shut or made water tight with a blank. Bulkhead penetrations must either be in their normal condition or be rendered watertight if unattended. Temporary closures are permitted.

8. FABRICATION OF NON-NUCLEAR PIPING BLANKS. For fabrication of non-nuclear piping blanks to be used during hydrostatic testing and maintenance on submarine piping systems, the following general guidelines apply:

a. The material must be the identical type, level and pedigree required for the system application per reference (j) or as required by NAVSEA drawings.

b. Blanks must be constructed such that the design sealing surface dimensions and fit-up characteristics of the system are maintained.

c. Dimensions of blanks will be per reference (j).

d. Applicable hydrostatic strength and porosity testing will be performed as required by system test pressure drawings.

e. All blanks must be marked per reference (j). Maximum allowable pressure will be the hydrostatic test pressure (e.g. 6750 psi for a 4500-psi application, 4500 psi for a 3000-psi application, etc.). Additionally, mark piece with nominal operating pressure and material used. Ensure pressure markings are annotated “MAX” and “NOM” as appropriate.

f. Blanks installed for maintenance or testing will be identified by a plain tag stating the purpose of the blank. This tag will be in addition to any danger tags used.
### SAFETY OF SHIP MAINTENANCE ITEM LIST EXAMPLE

**Ship name:** USS Bigcity  
**Hull #:** SSN-799  
**Upkeep #:** 802  
**Maximum expected draft:**  
- Fore: 32’0”  
- Aft: 34’6”  
**Actual Morning Draft:**  
- Fore: 32’0”  
- Aft: 32’0”

**Date:** Wednesday  
**Prepared:** 23 SEP 98

**NOTE:** THE MAXIMUM EXPECTED DRAFT MUST IN NO WAY BE CONSTRUED AS LIMITING ACTIONS BY THE DUTY OFFICER OR NOTIFICATION OF THE SHIP’S CO OF SMALLER DRAFT CHANGES. ANY UNEXPECTED DRAFT CHANGE SHOULD BE THOROUGHLY INVESTIGATED AND UNDERSTOOD.

APPENDIX G

PROCEDURES AND SAFETY PRECAUTIONS FOR ENTERING
SUBMARINE SPACES, TANKS AND VOIDS

NOTE: IN ADDITION TO THE PRECAUTIONS NOTED IN THE STEPS OF THIS
APPENDIX, SHIP’S FORCE MUST COMPLY WITH SAFETY PRECAUTIONS
IDENTIFIED IN REFERENCES (k) THROUGH (p).

1. Prior to entry into any free-flood area or main ballast tank, check with the Engineering Duty Officer to ensure radiological surveys have been conducted to determine the radiological controls, if required.

2. Verify REC requirements, if any.

3. Obtain permission from the Duty Officer prior to entering any tank.

4. Ensure atmosphere surveys have been completed and adequate ventilation is available prior to entering the tank.

5. Obtain the necessary tools and equipment (i.e., rubber mallet, explosion proof flashlight or drop light, hardhat, wrenches, screwdrivers, etc.) required to enter or close out the space, tank or void.

6. Wear a hard hat when entering any Main Ballast Tank or free-flood area.

7. Use the buddy system with one man external to the tank or void at all times.

8. No smoking in any tanks or voids. Do not carry any naked lights or sparking electrical apparatus. Ensure all droplights are inspected and approved by the Electrical Division.

9. While inside the tank, make maximum use of ladders and walkways provided. Do not step on valves and piping.

10. Ensure positive measures are taken to identify the access to the tank or void to be opened (ship’s plans, two-man check, label plate identification).

11. Ensure all system penetrations to the tank or void are isolated and all sources of potential pressurization danger tagged out per reference (b), to include gravity drain funnels, and the tank or void is vented to the atmosphere.

12. Ensure the tank or void fasteners are loosened to permit breaking the gasket seal. Remove fasteners only after the seal has been broken.

13. Use lanyards on tools and tethered sealable parts pouches.

14. Prior to entering a tank or void, remove all unnecessary items from your person (i.e., combs, lighters, wallets, etc.).

15. Take an inventory of all tools and materials with which he or she entered the tank or void. Have a second person verify the inventory before and after each entry.

16. A rubber mallet should be used to investigate for sound shorts, rattles, etc.

### NOTE 1:

If evidence of gross preservation system failure exists, then a qualified preservation system inspector must be contacted to confirm that the preservation system meets the requirements.
11.1 PURPOSE. This chapter defines the responsibilities with respect to the management of technical documentation and data and requires the establishment and operation of technical libraries. Unless otherwise noted, Aircraft Carriers are governed by references (a) and (b). Technical data and information are critical for the proper operation, maintenance, troubleshooting and repair of all plant equipment. Improper maintenance or equipment remaining not repaired and inoperative can result from a lack of proper documentation in the form of technical manuals, ship’s drawings and blueprints, Military Specifications and standards, etc.

11.2 SHIPBOARD TECHNICAL DOCUMENT MANAGEMENT. Ships must maintain the Advanced Technical Information Support (ATIS) System up to date. ATIS updates are mailed out to the ship on Compact Disks (CD or DVD). Ship technical document distribution is based on configuration and therefore relies upon the Configuration Data Managers Database - Open Architecture being maintained up to date to accurately assign documents to the ship. To ensure ships maintain up to date technical documents, the following requirements must be met:

a. The ship must assign a senior Petty Officer (E-6 or above) as the Technical Librarian who will maintain the ATIS systems up to date under the supervision of the 3M Systems Coordinator. Assignments as a Technical Librarian should be for a minimum
of 12 months. Technical Librarians on Aircraft Carriers are assigned for 18 months per reference (b). For Aircraft Carriers, the point of contact is the Maintenance Support Center (MSC) Officer and the Maintenance Officer. At Submarine Fleet Maintenance Activities (FMA), ashore and afloat, the Technical Librarian will work under the supervision of the Planning and Estimating Officer for ATIS and other databases maintained for FMA use.

b. The Technical Librarian must promptly apply ATIS changes within one week of being received on board.

c. 3M System Coordinator must report completion of ATIS updates to the Executive Officer. For Aircraft Carriers, the point of contact is the MSC Officer and the Maintenance Officer.

11.3 TECHNICAL LIBRARIES. Technical Library personnel maintain a complete master technical library including electronic or hard copies of technical manuals, drawings, aperture cards, Coordinated Shipboard Allowance Lists, provisioning Allowance Parts Lists (APL), computerized databases and any other technical documents or aids which support maintenance functions. The appropriate IT system computer programs will be used to maintain the library. In general, the technical library serves the following basic functions:

a. Acquisition of new documents and data and the updating of existing materials.

b. Cataloging, indexing and filing all documents, data and information materials to allow for effective use of library technical information.

c. Accountability and control to ensure continuous integrity of the library collection and to enhance periodic inventories.

d. Central control point for all technical documents received, held, used, transferred or disposed of by the repair department (FMA only) or command. For FMAs having a Nuclear Support Facility (NSF), all Naval Sea Systems Command Nuclear Propulsion Directorate (NAVSEA 08) controlled documents must be controlled by the NSF. For MSCs aboard aircraft carriers, all NAVSEA 08 controlled documents must be controlled by the Reactor Department Technical Publication Library. All aircraft maintenance related documents must be controlled by the Aircraft Intermediate Maintenance Department.

e. Maintain access to the following computer networks and web sites whenever possible.

(1) Technical Data Management Information System (TDMIS).
   https://mercury.tdmis.navy.mil/default.cfm

(2) Military Engineering Drawing Asset Locator System.

(3) Naval Surface Forces, Atlantic Planning and Execution of Alterations and Repair (FMA and COMNAVSURFLANT and COMNAVSURFPAC commands only) https://www.spear.navy.mil click on SPEAR info.

(4) Maintenance and Modernization IT Systems.
11.3.1 Technical Library Supervisor. The Technical Library Supervisor is responsible for keeping current plans, prints, specifications, manuals and all other technical documents and information needed by ship and FMA departments and for managing the daily operation of the library. The Technical Library Supervisor must:

a. Have a sufficient understanding of technical library organization requirements in references (a) through (n) (as applicable) to supply the necessary technical information.

b. Have a minimum security clearance equal to the highest security classification of any document held within the library.

c. Supervise personnel assigned to library.

d. Operate the technical library in the following manner:

(1) Schedule and carry out a frequent and recurring on the job training program for all personnel assigned to the technical library staff or to satellite librarian positions. As a minimum, training must include topics that provide guidance for performing each library or satellite library function. Satellite librarian training may be tailored to cover only those areas applicable to satellite libraries. Lesson plans must be developed for each topic.

(2) Maintain and provide applicable and current plans, prints, specification, manuals and all other technical documents and information needed by the cognizant department. FMAs will also provide technical documents to tended units, other FMAs, non-FMA government activities or qualified Department of Defense contractor personnel.

(3) Maintain an inventory of technical publications, manuals and manufacturer instruction books and other technical and repair documents available in the technical library or any satellite libraries (Work Centers and division offices, etc.).

(4) Develop a system for checking out or in and recall of library technical publications issued to individuals in order to maintain the integrity of the library and ensure revisions or changes are made as received and also to minimize lost materials due to unaccountability. The system should include a recall capability that would allow for the location and recall or reissue of materials after 90 days. FMAs issuing technical publications and documents to tended units should establish a 90-day or end of fleet maintenance availability recall whichever comes first.

(5) Requisition technical documentation needed for maintenance and repair procedures but not already available on board. Maintain a separate file of material on order. Track the status of requisitioned documents until received. Initiate follow-up action for those documents where supply status has not been
received for a 30-day period, unless previous supply status indicates no follow-up is required.

(6) Ensure proper security for the contents of the technical library.

(7) Exercise positive control over access to the Library Management or TDMIS database functions using locally generated procedures.

(8) Maintain written procedures which describe how to perform each function carried out by the technical library (i.e., checkout or check-in of technical documents, updating library document files, operating reproduction equipment, performing updates, requisitioning, inventories and audits of library documents, etc.).

(9) Ensure maintenance calls or contracts are made for all viewing, reproduction, computer and powered document retrieval systems or equipment used to carry out library functions. The program must include devices associated with this equipment.

(10) Perform an inventory of technical publications and manuals and manufacturer’s instruction books.

(a) Ships are to perform an annual inventory of technical publications and manuals and manufacturer’s instruction books and other maintenance and repair documents available in the technical library and satellite libraries (work center and division offices).

(b) Shore facilities and submarine tenders are to perform an inventory of technical publications and manuals and manufacturer’s instruction books and other maintenance and repair documents available in the technical library and satellite libraries (work center and division offices) every 12 months.

(11) Ensure manuals within library’s inventory contain applicable Advance Change Notices (ACN), or Interim Rapid Action Changes (IRAC). Verify each manual against the ACN report available from Naval Systems Data Support Activity (NSDSA), Port Hueneme, CA, and the NATEC IRAC Tracker Report.

(12) Perform an annual data verification (configuration audit) of technical manuals and other repair documents available in the technical library and satellite libraries. Afloat libraries should perform verifications as often as operational constraints permit, within 6 months of major deployments, is recommended if verifications are not conducted annually.

(a) Verify each NAVSEA and Space and Naval Warfare Systems Command technical manual held with the data listed in TDMIS using LMD for manual or automated verification. Verify Naval Supply Systems Command (NAVSUP) manuals with the modem Internet access.

(b) Verify NAVSUP manuals against reference (c) (i.e., NAVSUP 600
CD) or by performing a process verification file with LMD or TDMIS.

(c) Compare each technical manual held with the ACN Report provided from NSDSA, Port Hueneme, CA. This should be performed monthly.

(d) Compare each technical manual held with TDMIS (Index of Technical Publications) to ensure library is receiving the technical manual automatically.

(f) Make sure each technical manual is in good material condition (i.e., does not have loose or un repaired torn pages, is readable and has an outside cover).

(g) For Naval Air Systems Command manuals, submit an Automatic Distribution Requirements List annually to NATEC to update distribution and verify manuals per reference (a).

(13) Keep a record of annual inventories for 24 months. The annual inventories should include an assessment of recorded deficiencies in the technical data management program to determine areas that require improvement.

(14) Establish procedures to incorporate changes or revisions to technical documents held within library or satellite libraries as soon as practical after receipt. Updates involving the safety of personnel or equipment (ACNs) must be entered within 48 hours of receipt. Routine changes must be installed before publication use or within 30 days of receipt, whichever occurs first.

(15) Establish procedures that assure positive control of all technical documents held by the library. If Process Instructions or documents listed in ASSIST Quick Search http://quicksearch.dla.mil or any alteration text documents are held in Satellite library inventories, verify that these documents are up-to-date at least semiannually.

(16) Establish procedures for issuing technical documents to Department of Defense contractor personnel using guidance provided in references (d) (FMA only).

(17) Be the department point-of-contact for the Integrated Logistics Overhaul team with respect to technical documentation.

(18) Ensure all superseded technical documentation is removed and disposed of following local procedures.

11.3.2 Technical Library Non-Supervisory Personnel. The Technical Library non-supervisory personnel will carry out the daily operations of the technical library as directed by the Technical Library Supervisor. The Technical Library non-supervisory personnel must:
a. Be a reliable and motivated petty officer (E5 or above for FMA or MSC or full time civilian equivalent).

b. Military should be assigned for at least 12 months. On Aircraft Carriers, they are assigned for 18 months per reference (b).

c. Personnel assigned as satellite librarians will be reliable and motivated petty officers appointed in writing and assigned for at least 9 months. Satellite librarians will have a minimum security clearance equal to the highest security classification of any document held within the library per reference (n).

11.3.3 Technical Library Materials. The technical library has a wide variety of technical information and data in many different forms and formats. For FMA Technical Libraries eight broad categories of information exist which are described in reference (e).

11.3.3.1 Indices. Indices serve as reference or information sources that name systems, supplies and other information sources. Examples of indices include:

a. Ships Drawing Index (SDI).

b. Index of Technical Publications (ITP).

c. TDMIS.

d. Navy publications, forms and instructions (Reference (c)).

e. ASSIST Quick Search http://quicksearch.dla.mil

f. ATIS Systems

11.3.3.2 Technical Manuals. Technical manuals outline inspection and repair procedures for shipboard systems. Examples of technical manuals include:

d. Propulsion Operating Guide.

e. General Specifications for Overhaul.

g. Organizational Maintenance and Management System - Next Generation (OMMS-NG).

h. Ordnance Publications.

i. Ordnance Data.

11.3.3.3 Drawings. Drawings have engineering and design requirements needed to repair equipment to original specifications. Drawings are also used to find the location of shipboard systems and system equipment and components. Drawings stored in technical libraries include:

a. Ship’s construction drawings.

b. Ship Alteration installation drawings.
c. Selected Record Drawings.

d. Ship’s Equipment Drawings.

e. Vendor and Manufacturer’s Drawings.

f. Booklet of General Drawings.

11.3.3.4 **Handbooks and Cataloging.** Handbooks have detailed information about specific systems or equipment and may also list equipment repair procedures. Examples of handbooks include the following:

   
   b. Identification Markings for Fasteners.
   
   c. Gasket Material (Non-metallic).
   
   d. Guide for Sampling Inspections.
   
   e. Shipyard welding procedures.

11.3.3.5 **Military Specifications and Standards.** Military specifications and standards are specific, detailed requirements for equipment or material. ASSIST Quick Search [http://quicksearch.dla.mil](http://quicksearch.dla.mil)

11.3.3.6 **Documents and Lists.** Documents and lists are catalogs of parts, equipment or publications and alteration records. The following are examples of documents and lists typically found in technical libraries:

   
   
   
   d. Ship Changes.
   
   e. Planning Yard Work Instructions.

11.3.3.7 **Instructions, Technical Publications and Bulletins.** These publications give guidelines for the operation of equipment, introduce new equipment and may have lists of available items. Instructions, technical publications and bulletins commonly stocked in technical libraries include:

   a. General Services Administration Supply Catalog.
   
   b. Electronics Information Bulletins.
   
   c. Field Change Bulletins.
   
   d. NAVSEA Instructions.
   
   e. Type Commander Instructions.
   
   f. Technical Directives.
11.3.3.8 Repair Standards. These standards are detailed repair procedures for the troubleshooting and overhaul of specific equipment and guidance for standard processes. Examples of repair standards include:

d. Unified Industrial Process Instruction.

11.4 INDEX OF TECHNICAL PUBLICATIONS AND SHIP’S DRAWING INDEX. Due to the wide variety of types of materials that may be included in a technical library, it may be confusing as to what are the minimum titles and requirements needed for a particular ship. The ITP and SDI have been developed for each ship and list the titles and drawings applicable to the ship.

11.4.1 Index of Technical Publications. The ITP is a guide to facilitate the identification of technical manuals used on board a ship. The ITP is tailored to the configuration of a specific ship and lists technical manuals needed to operate, maintain and repair ship systems and equipment. It also lists any other general and ship related manuals needed by Ship’s Force. The ITP will:

a. Contain a list of the technical manuals needed on board a ship.
b. Identify technical manuals for specific systems and equipment.
c. List the systems and equipment supported by a specific technical manual.
d. Include information about each technical manual.
e. Be in electronic (EXCEL) format and sorted by APL or Repairable Identification Code and Hierarchical Structure Code.

11.4.2 Ship’s Drawing Index. The SDI is a list of ship drawings and related design reference information that shows the actual current configuration of the ship. SDIs are required by General Specifications for Shipbuilding for all ships over 200 feet in length.

a. The original SDI is prepared by the shipbuilder and approved by Supervisor of Shipbuilding. After acceptance of the ship by the Navy, the SDI is sent to the selected planning yard which is assigned as custodian of the index.
b. Corrections to the SDI are submitted by the industrial activity to reflect work performed during Chief of Naval Operations maintenance availabilities and Fleet maintenance availabilities. Original SDIs are to be corrected by the planning yard to reflect changes reported by the ship or other activities when changes are made between regular overhauls.
c. SDI information includes:
   (1) Drawing title.
   (2) NAVSEA drawing number and revision.
(3) Builder or contractor drawing numbers of Hull Mechanical and Electrical drawings applicable to the individual ship.

11.5 MAINTENANCE SUPPORT CENTERS (AIRCRAFT CARRIERS ONLY).

a. MSCs provide a centralized support facility to aid work center technicians in Integrated Logistics Support processing and problem resolution services. The MSC provides shipboard management of technical documentation and libraries in support of ship’s maintenance and material requirements. The MSC will function within the policy and procedural guidelines of references (a) and (b).

b. The MSC manages and maintains an accurate equipment or component configuration database, identification of required technical support (e.g., repair part APLs, drawings, technical manuals, test equipment, Planned Maintenance System, etc.), and facilitates resolution of repair part support problems.

CHAPTER 12
HULL INSPECTION OF SHIPS AND CRAFT

REFERENCES.

(a) NAVSEA S9086-DA-STM-000 - NSTM Chapter 100 (Hull Structures)
(b) ABS Guide for Building and Classing High Speed Naval Craft (2007)
(c) NAVSEA T9074-AS-GIB-010/271 - Requirements for Nondestructive Testing Methods

LISTING OF APPENDICES.

A Sample Layout of Inspection Areas
B Hull Reporting Format

12.1 PURPOSE. To provide general guidance for the inspection of ship’s hulls to detect structural defects or hull thickness degradation and to establish supplemental procedures and periodicities for the conduct of hull inspections of thin hulled ships and craft for the timely detection of corrosion or erosion.

12.1.1 Scope. Thin hull ships are defined as those ships and craft with hull plating less than 1/2-inch design thickness at any location below the waterline. Hull Inspections and repair for wooden hulled ships and craft are addressed in Chapter 24 of this volume. Guidance contained in this chapter applies to all thin steel hull ships and craft.

a. Detailed direction for thin hull assessment can be found in reference (a) for the following classes of surface force ships:
   (1) DDG 51
   (2) FFG 7
   (3) CG 47
   (4) LPD 17

b. The following classes of surface force ships were built to reference (b), therefore reference (a) does not apply:
   (1) LCS
   (2) PC

12.1.2 Discussion.

a. All ship’s hulls must be inspected per Planned Maintenance System (PMS). Reference (a) contains additional guidance and checklists for conducting a thorough internal and external visual hull inspection. Should visual hull inspections reveal suspect areas, these areas should be ultrasonically tested to determine the need for repairs.
b. Hull inspections will reveal the ship’s hull condition through self-inspection of inner shell structure by Forces Afloat. These inspections will permit detection of structural defects and hull thickness degradation resulting from the cumulative effects of unarrested corrosion, and identify any areas in need of repair or preservation. Shell plating areas which are inaccessible can be measured ultrasonically by divers from outside the hull.

c. Besides verbal descriptions of damage, graphical layouts of hull structure for some ship classes are available for use in the inspection. These schematics are for the purpose of plotting damage locations, as well as assisting the inspector in orientation and report analysis in assessing damage effects.

d. Main machinery spaces are most prone to corrosion due to the severe environmental extremes of temperature and humidity arising from continuous operation of the propulsion machinery and supporting systems. This alternate wetting and drying of the interior hull surfaces resulting from normal ship’s operations and shutdowns over a long period produces oxidation cycles which lead to corrosion.

e. Inspections should take place inport during a period when the machinery plant will be secured for at least one week. During the work definition period, prior to a scheduled dry-dock availability, an inspection should be scheduled so that it precedes the availability in enough time to permit the identification of all hull structure in need of repair (i.e., approximately nine to ten months prior to the scheduled availability). The ISIC or TYCOM will coordinate and schedule the inspections as requested by the ship’s Commanding Officer.

f. The inspection is primarily intended for areas which are subject to both high stress and heavy corrosion, namely, bottom shell structure in the main machinery spaces of the ship. Accordingly, all fire rooms and engine rooms must be surveyed for structural deterioration, with emphasis on the following areas:

1. Under boilers and turbines, where access is difficult and environmental extremes are most severe.
2. Around boiler feedwater tanks, which are continuously wet from “sweating”.
3. Around the various overboard intakes and discharges, where external turbulence often produces erosion.
4. Along the interior of the side shell in way of the exterior waterline. Here the design thickness of the shell plating is thinnest, and exterior corrosion from wave action is always present.
5. Around “wet” equipment, which continuously operate with steam or water emission (e.g., pumps, condensers, evaporator, etc.).
6. Areas of the bottom shell which are subject to the corrosive action of bilge water.

g. Items such as deck plating in way of uptake spaces, pump rooms, refrigeration spaces, heads, etc., are omitted from this inspection. These “wet” areas are considered to be “housekeeping” items and will be surveyed during the pre-overhaul hull inspection.
All tank and void spaces, which are in proximity to the machinery spaces being surveyed, are also omitted from this inspection, as these compartments do not meet the criteria in sub-paragraph “f”. The interiors of these spaces are inspected during industrial availabilities.

h. Procedures regarding hull inspections which are associated with Pre-CNO Maintenance Availability planning are issued separately for each availability as determined by the requirements for each ship.

12.2 ACTION. Both internal and external hull inspections must be accomplished per reference (a) and (c) on all ships and craft identified in paragraph 12.1.1 of this chapter. Periodicities must be as specified by the TYCOM or as required by PMS.

a. At the beginning of any dry-docking period, (regular overhaul, Docking Selected Restricted Availability, interim dry-docking, etc.) an extensive hull survey will be conducted using the ship’s plans and a sampling plan similar to that shown in Appendix A of this chapter. The inspection must be conducted using ultrasonic techniques, drill testing or caliper method as appropriate.

b. A pre-overhaul inspection of the hull should be conducted prior to a dry-docking availability to ensure known hull repairs are included in the planned work package and to ensure unexpected costs are kept to a minimum. Dry-docking is not required for a pre-overhaul inspection; however, maximum use should be made of available tools and techniques to accurately determine the condition of the hull.

c. A minimum of one hull reading every other frame, and every other strake (as shown in Appendix A of this chapter) up to the waterline, must be taken and the results recorded in the inspection report of Appendix B of this chapter. Suspect areas, as determined by visual inspection, must have several readings taken and the least thickness recorded. Any area showing a reading less than the minimum allowable must have additional readings taken in an expanding fashion to determine the actual extent of the excessive deterioration.

d. In locations where there is an inner hull, such as bilge area tank tops, inside readings must be taken in addition to those readings taken on the hull. These readings must be taken every other frame, port and starboard, recorded in the format of Appendix B of this chapter, and submitted with the hull inspection report.

e. In general, hull sections and structures which have suffered 25 percent or greater reduction in cross-sectional area from their original thickness should be cut out and replaced. Scattered pits of depth at least 25 percent, but not greater than 45 percent of the original thickness, may be repaired by clad welding.

f. An engineering analysis considering current and probable future corrosion may be performed to determine if the corroded structure is within allowable stress levels, rather than performing an automatic repair when corrosion has resulted in a 25 percent or greater reduction of cross sectional area. The repair criteria must be based on the applicable General Specifications for Overhaul.

12.3 REPORTS. The results of all hull inspections must be forwarded to the ship, with an information copy to the TYCOM or ISIC, using the format of Appendix B of this chapter. Areas
having unsatisfactory results must be superficially noted in the report cover letter. Unsatisfactory areas must be defined by size in feet and inches and location in relation to strake and frames.

(ab) NAVSEA STD DWG 804-1213717 - Vehicle Tiedown Deck Fittings
13.1 PURPOSE. To ensure Weight Handling Equipment (WHE) is capable of continued reliable and safe operation.

a. WHE must be of sufficient rated capacity to safely handle the calculated load; including, all slings, shackles, turnbuckles, strongbacks and chain hoists.

b. The WHE selected must be inspected before each use for obvious material deficiencies, equipment capacity markings, and load test expiration date (as applicable).

c. The following guidance has been utilized to incorporate both Naval Sea Systems Command (NAVSEA) and Naval Facilities Engineering Command (NAVFACSYSCOM) requirements:

1. For shipboard WHE used both afloat and ashore, including Floating Drydocks, NAVSEA technical requirements are cited and invoked as the top-level guidance.

2. For shore based WHE used only ashore, NAVFACSYSCOM and the Code of Federal Regulations technical requirements are cited and invoked as the top-level guidance.

3. For general purpose lifting and rigging, shore based rigging gear and portable hoists meeting the requirements of reference (a) may be used aboard ship when the ship is pierside.

4. For Reactor Plant Lifting and Handling Equipment and lifts of major reactor plant components, additional guidance is provided in Section 9400-0 of reference (b) and in reference (c). Reference (d) provides guidance for lifting radioactive material or reactor plant components when NAVSEA approved lifting equipment is not available (i.e., use of the B & M crane to lift portable effluent tanks or radioactive waste). These requirements apply to all commissioned ships, shipyards and Naval shore-based activities.

13.2 NAVAL SEA SYSTEMS COMMAND AFOAT REQUIREMENTS.

13.2.1 Definitions.
a. Dynamic Load Test. An operational overload test conducted to verify the ability of the lifting equipment to operate with rated load while being subjected to dynamic conditions associated with ship motions.

b. Load Bearing Members. Those components or structural support members of the lifting and handling equipment which support the load; a failure of which could cause dropping, uncontrolled shifting or movement of the load.

c. No-Load Test. A test which verifies equipment functional performance without a load.

d. Rated Load. The maximum permissible load carried during use (also called “Safe Working Load”). The weights of handling gear; such as slings, strongbacks, handling dolly, which are not an integral part of the equipment being tested, must be considered as part of the rated load.

e. Rated Load Test. A load test at 100 percent of the rated load, conducted at rated speed through the complete range of operating limits. The test is performed to determine the proper operation of the equipment, repeatability of functions and heat dissipation ability.

f. Safe Working Load. See Rated Load.

g. Factor of Safety. The ratio of the yield strength of a structure to the required strength (based on estimated maximum load in ordinary use).

\[
\text{Factor of Safety} = \frac{\text{Actual Yield Strength}}{\text{Required Strength}}
\]

h. Static Load Test. A stationary overload test conducted to verify the structural and mechanical integrity of the lifting equipment. In this test, the lifting equipment holds the test load for a short period of time while the test inspector checks the equipment for signs of brake slippage or damage.

13.2.2 Procedure. Fabrication, repair and testing of Shipboard Weight Handling Equipment will be conducted using a Controlled Work Package developed per Volume V, Part I, Chapter 2 of this manual. This requirement does not apply to periodic weight test of Shipboard Weight Handling Equipment. Shipboard Weight Handling Equipment requiring a weight test based on Planned Maintenance System (PMS) or other periodic testing requirements, excluding tests in conjunction with repair or manufacture, will be inspected and tested using Technical Work Documents, such as a pre-existing maintenance procedure, test load methods drawing, technical manual or Formal Work Package. Periodic weight testing must be witnessed by a qualified inspector.

a. Testing Sequence. Newly installed or overhauled equipment must be tested in the following order:

(1) No-load Test.
(2) Static Load Test.
(3) Dynamic Load Test.
(4) Rated Load Test.
b. Results of completed weight tests will be documented on QA form 17W, using the procedures of Volume V, Part I, Chapter 11 of this manual. The serial number (if known) of the equipment must be recorded on the weight test record.

c. Weight Handling Equipment that has satisfactorily passed the required inspections and load testing must be so marked by the activity conducting the tests. As a minimum, this marking must include the name of the testing activity, the date (year and month) tested, date of re-inspection due date, the rated load and a unique serial number that will allow it to be traced to its test and inspection documentation.

(1) Where there is little available space for surface marking, such as on wire rope slings, the item may be marked with a Periodic Load Test Record Strap as shown in reference (e).

(2) Nylon webbing slings must have etched leather tags sewn to each sling leg to identify the leg and indicate test results as described in reference (f).

(3) Stamped, etched or engraved metal tags, which are attached to the tested item with mechanical fasteners or adhesives, may also be used.

(4) Color coding, for local control only, may be used in addition to, but not as an alternate to, one of the authorized marking methods.

(5) Wire rope (1/32” through 3/16” diameter) may be used to attach metal tags to WHE provided that the wire rope is secured using mechanical fasteners designed to secure wire rope such as swedges. Metal tags attached using lockwire style twisted wires are prohibited.

d. A permanent log, written or electronic, must be maintained to record the following information:

(1) Equipment identification.

(2) Date of the test or inspection.

(3) Description of the test or inspection.

(4) Weight used for the test, in pounds.

(5) Testing activity.

e. New hooks, blocks, sheaves, wire rope, fiber rope, and other loose hardware or gear need not be load tested after installation if it has not been modified and has been purchased to Military Specifications (MILSPEC) or NAVSEA standard drawings through the Naval Supply System. Any load carrying loose gear procured otherwise must be tested prior to placing in-service to 200% of the SWL of the part in question. If any sheave, block or hook assembly is received that does not bear the manufacturer’s test stamp, it must be tested to 200% of the SWL.

f. Unless otherwise specified, all load test capacity tolerance must be ±5%, -0%.

13.2.3 Load Test Types and Duration. For each test type, the equipment must withstand the required load for the specified amount of time, per the applicable reference(s) listed in paragraph 13.2.8.
13.2.3.1 No-Load Test. As a prerequisite to any load testing, a no-load test must be performed. During the test, the equipment or system must be operated through full ranges and directions of motions and in all operating modes. All safety devices and travel limits must be demonstrated during the test.

13.2.3.2 Static Load Test.
   a. Unless otherwise specified, all arrangements for handling and supporting weights (including weights of personnel), all arrangements for taking heavy strains, and all parts upon which the safety of the ship or life depend, must be given a static load test equal to twice the rated load. In cases in which the rated load is not specified, the test load must be based on the expected duty of the equipment or system. For hoisting arrangements, the static test load must be suspended clear of all supports and held suspended for a sufficient period of time to allow for the inspection of welds and other fastenings, but need not be lifted or moved by the system under test. After relieving the static test load, there must be no evidence of permanent deformation of structure.
   b. The equipment or system to be tested must not be used to lift the total static test load. Static load tests must be completed prior to performance of operational tests. Where static test loads exceed 40% of rope breaking strength, the ship’s rope must not be used for the static test.

13.2.3.3 Dynamic Load Test. Weight handling arrangements must be tested to demonstrate capacity to withstand additional loads imposed on a system when operating under unfavorable sea conditions at reduced speed. The dynamic load test must be conducted to demonstrate handling equipment load capabilities throughout the complete operating range, but the load need not be lifted or moved at rated speeds. As far as practicable, test loads must be moved completely through the equipment operating range, within the limits of all operating modes.

NOTE: IF THE EQUIPMENT USES HYDRAULIC POWER, THE SYSTEM RELIEF VALVES MUST BE CHECKED FOR PROPER SETTINGS BEFORE PERFORMING A DYNAMIC LOAD TEST.

13.2.3.4 Rated Load Test. Following satisfactory completion of the dynamic load test, the rated load test must be conducted to demonstrate capability to operate with a full load, at rated speed, through the complete range of operating limits. As far as practicable, test loads must be moved completely through the equipment operating range, within the limits of all operating modes. Proper operational functions must be demonstrated at each speed in all operating modes. The mechanical safety devices must be tested for their ability to stop and hold when carrying rated load at rated speed.

13.2.4 Load Test Periodicity.
   a. In the interest of personnel safety and equipment protection, inspection and testing of all WHE not covered by PMS or other directives will be performed at intervals not to exceed four years.

NOTE: PER NAVSEA DIRECTION, STATIC, DYNAMIC AND RATED LOAD TESTING OF MAIN STORAGE BATTERY LIFTING GEAR INSTALLED IN SUBMARINE BATTERY COMPARTMENTS IS NOT REQUIRED UNLESS REPAIRS TO STRUCTURAL OR WEIGHT SUPPORTING COMPONENTS
HAVE BEEN ACCOMPLISHED. FOLLOWING REPAIRS, LOAD TESTING WILL BE ACCOMPLISHED DURING BATTERY REPLACEMENT AFTER THE BATTERY CELLS HAVE BEEN REMOVED.

b. Testing of the following components is required when newly installed or after major structure repair or modification.

(1) Accommodation ladders.
(2) Cleats.
(3) Gangplanks.
(4) Leadsman platform.

NOTE: SSN 688 CLASS LIFELINE STANCHIONS DO NOT REQUIRE WEIGHT TESTING FOLLOWING MANUFACTURE OR REPAIR.

(5) Life rails or stanchions.
(6) Lifelines.
(7) Padeyes.
(8) Portable davits.
(9) Reversible eyebolts.
(10) Slings.
(11) Safety nets (including deck edge safety nets).
(12) Vertical ladders.

13.2.5 Shipboard Crane Program.

a. A Shipboard Crane Program must be implemented on each ship with a crane installed or assigned, per reference (g).

b. Guidelines for training and qualification of personnel responsible for shipboard crane operation and maintenance are contained in reference (g).

13.2.6 Daily Inspections. Daily, before use visual inspections must be conducted:

a. For Weight Handling Equipment:

(1) A daily, before use visual inspection must be performed following PMS for the assigned equipment before any load handling operations.

(2) A no-load operational test must be conducted by each shift prior to handling ammunition.

b. All handling equipment selected (including slings, shackles, turnbuckles, strongbacks, chain hoists and taglines) must be visually inspected before use for obvious material deficiencies, equipment capacity markings and load test expiration date (as applicable).

c. Before beginning crane operations for each new day, a qualified crane operator must perform an inspection of each crane to check for discrepancies in the crane’s structure.
or operating controls using the crane Operator’s Daily Check List provided in reference (g).

13.2.7 Use of Nylon Straps.
   a. The use of knotted nylon strapping as handling equipment is prohibited.
   b. Rigging with nylon straps is permitted only when nylon strapping is equipped with sewn (lifting) eyes and the strapping has been static load tested to 200 percent of rated load.
   c. When available handling equipment (for example, wire rope slings) cannot be properly attached, or load surface damage may occur, 6,000-pound (rated breaking strength) nylon strapping is permitted only for loads up to 1,000 pounds.
   d. Webbing slings must be inspected for abrasions and fraying of the webbing and stitching, and for broken stitches. Slings must not be used if signs of deterioration are visible.

NOTE: REFERENCE (a) IS TO BE USED ONLY WHEN THE SHIP IS ACTUALLY PIERSIDE.

13.2.8 Weight Test Procedure Matrix. The following matrix provides sources of load test procedures for shipboard equipment or systems that may require periodic load testing or testing following fabrication or repair:

13.2.9 Identification of Equipment. Following the weight test, ensure the Weapons Handling Equipment is properly marked as detailed per reference (e) section 4.

13.2.10 Record Keeping. QA form 17W must be used to document Shipboard Weight Handling Equipment weight testing. The Weight Handling Test Inspector must sign the Quality Assurance blocks of QA form 17W. The signed QA form 17W or a copy must be provided to the activity who maintains the Shipboard Weight Handling Equipment in all cases. QA form 17W must be retained by the end user or maintaining activity until superseded by successive testing for each piece of Shipboard Weight Handling Equipment. QA form 17W used to document Shipboard Weight Handling Equipment testing in a Controlled Work Package will be retained with the Controlled Work Package as prescribed by Volume V of this manual.

IV-13-8
13.2.11 Crane Material Condition Assessments. This section provides guidance in the preparation for and execution of shipboard crane assessments by qualified crane assessors per reference (g). A crane assessment is used to determine a baseline condition and establish the scope of any follow-on actions. The assessment is designed to evaluate the material condition of the crane and all safety features and ensure all repairs, maintenance actions and design changes conform to the applicable standards and specifications.

13.2.11.1 Ship’s Force Assessment Responsibilities.
   a. Ensure that the crane’s PMS is up to date.
   b. Provide qualified operators as necessary to safely perform all crane operations.
   c. Provide qualified maintainers as necessary to assist and learn from assessor.
   d. Ensure all members of the assessment team comply with shipboard safety requirements.
   e. Ensure all necessary tag-out procedures are accomplished following shipboard instructions.

13.2.11.2 Assessor Responsibilities.
   a. Conduct crane assessments based on assessment procedures and reference (g).
   b. Ensure the crane has been assessed, adjusted, repaired (where feasible) and operationally tested.
   c. Ensure all discrepancies and corrected items have been documented via an OPNAV 4790/2Ka in the ship’s CSMP.
   d. Ensure before leaving the ship that the Commanding Officer, or an officer designated by the Commanding Officer, is briefed on the crane material condition, to include all completed and outstanding maintenance and repair actions.
   e. Issue a dedicated final report to the ship, SURFMEPP, ISEA, ISIC and TYCOM within 30 days following the assessment visit. The report must address the following:
      (1) All discrepancies found during the assessment, specifically calling out any “In-Service Envelope” discrepancies (refer to reference (g)).
      (2) Operational testing results.
      (3) Any recommendations to the In-Service Engineering Agent for system changes.

13.3 NAVAL FACILITIES ENGINEERING COMMAND ASHORE REQUIREMENTS. WHE assigned to naval shore activities and utilized only in ashore operations or aboard ships when the ship is pierside must be certified, tested, inspected and operated in compliance with reference (a). For general purpose lifting and rigging, shore based rigging gear and portable hoists meeting the requirements of reference (a) may be used aboard ship when the ship is pierside (this does not apply to ordnance or radiological lifting and handling). Reference (a) covers line-handling mechanisms on floating cranes, hoists and chain falls which are used in multiple locations, and portable and adjustable gantry cranes and floor cranes. Material handling equipment is covered by Naval Supply Systems Command criteria.
13.3.1 Certification Program. The Commanding Officer is responsible for ensuring safety within the activity and must designate a WHE certifying official who must ensure the activity’s WHE is inspected, tested and certified per reference (a).

13.3.2 Operator Licensing Program. All Navy civilian and military personnel assigned duties involving the operation of Navy shore based Category 1, Category 2, Cab Operated Category 3 or Category 4 WHE must be qualified and licensed per the provisions of reference (a).

13.3.2.1 Operator Qualification and Testing. All applicants for Crane Operation Licenses must meet the requirements of reference (a).

13.3.2.2 Licensing Procedures and Documentation. Reference (a) contains the necessary procedural requirements for licensing and documentation.

13.3.3 Inspections.

a. Pre-Use Check (Category 1, 2, Cab Operated Category 3 and Category 4 Cranes). The operator must perform an inspection of their assigned crane using a Crane Operator’s Daily Checklist as required by reference (a).

b. Specific instructions in reference (a) must be used for conducting and reporting the following inspections:

(1) Walk Around Check.
(2) Machinery House or Machinery Area Check.
(3) Operator Cab Check.
(4) Operational Check.

c. Pre-Use Check (Non-Cab Operated Category 3 Cranes) must be performed per reference (a).

13.3.4 Test Procedures. Reference (a) contains instructions for performing crane test procedures.

13.3.5 Special Purpose Service. Activities using special purpose service cranes must follow the requirements of reference (ah) in addition to criteria contained in reference (a).

13.4 SLINGS. Slings used in conjunction with other material handling equipment for the movement of material ashore by hoisting are covered by references (a) and (g).

a. A sling is an assembly which connects the load to the material handling equipment.

b. Slings include those made from alloy steel chain, wire rope, metal mesh, natural or synthetic fiber rope (conventional three strand construction), and synthetic web (nylon, polyester, and polypropylene).

13.5 CRANE RIGGING GEAR AND MISCELLANEOUS EQUIPMENT. Reference (a) contains maintenance, inspection and test requirements for the following common rigging gear used ashore and reference (g) contains maintenance, inspection and test requirements for the following common rigging gear used shipboard. Reference (g) allows shore based rigging gear and portable hoists meeting the requirements of reference (a) to be used aboard ship with shipboard cranes when the ship is pierside.
a. Slings.
b. Shackles, links, rings, swivels, eyebolts, turnbuckles, hooks and swivel hoist rings.
c. Tackle blocks.
d. Portable load indicating devices (dynamometers, load cells, crane scales, etc.).
e. Lashing (e.g., wire rope, synthetic rope, synthetic webbing).
14.1 PURPOSE. To provide guidance for the performance of magazine sprinkler inspections.

14.2 RESPONSIBILITIES.

14.2.1 Commanding Officers.

a. Ensure that sprinkler systems are tested following Planned Maintenance System.

b. Ensure that magazine temperatures are checked and recorded daily.

c. Ensure that magazines are properly maintained.

d. Ensure that prior to acceptance of a sprinkler system in new construction or when design changes (Ship Changes) are made to a sprinkler system during construction or overhaul, the cognizant industrial activity provides written verification that each system is completely operational. A certified magazine inspector will perform the verification of system operability per reference (a).

e. Ensure that magazine sprinkler system inspection requirements are conducted per reference (a) and when directed by Planned Maintenance System. These inspection requirements apply to both the thermo-pneumatic and hydraulic control systems. All tests will be per reference (a) and will be followed by a complete operational test by Ship’s Force using the appropriate Maintenance Requirement Card. A certified magazine inspector will conduct all thermo-pneumatic tests.

f. Ensure that a magazine sprinkler system verification inspection is scheduled prior to ordnance on-load (if required by paragraph “d”, or “e” of this paragraph). A certified magazine sprinkler inspector must conduct the inspection.

g. Take necessary action to correct all discrepancies noted during magazine sprinkler inspections. Within 30 days following receipt of the magazine sprinkler discrepancy list, report the status to the Immediate Superior In Command (ISIC) with an informational copy to the Type Commander via message, identifying corrective action(s) taken or applicable Plan of Action and Milestones.

h. Ensure that design discrepancies are reported to the Type Commander and submitted into the Current Ships’ Maintenance Project. Procedures for reporting discrepancies are included in reference (b) and Type Commander instructions.
14.2.2 Verification Activity.
   a. Ensure Magazine Sprinkler System Inspector has completed applicable qualifications of the Magazine Sprinkler Systems Inspector Course (Course Number: K041-2137).
   b. Provide a sprinkler system discrepancy list by the categories SAFETY, MAJOR, MINOR and INSTALLATION to the Ship’s Commanding Officer and ISIC.
   c. Provide written recommendations to the Ship’s Commanding Officer and ISIC to continue or discontinue thermo-pneumatic certification until correction of any discrepancies and completion of satisfactory sprinkler system operational tests.

14.2.3 Immediate Superior In Command.
   a. Ensure that Shipboard Explosive Safety Inspection is scheduled per reference (a).
   b. Follow-up on all discrepancies reported by the verification activity. Those items that are discrepancies as a result of design problems should be reviewed by the cognizant Naval Engineering Agency and recommended corrective actions should be performed at the earliest convenient availability.
   c. Must act as sole grantor of all magazine sprinkler systems re-certification via message. Re-certification is based on verifying activity’s recommendation.
REFERENCES.

(a) NAVSSES Philadelphia ltr 9320, Ser 934/010 dated 19 Mar 2001, titled Shipboard Circuit Breaker Maintenance and Overhaul Policy

15.1 PURPOSE. To issue the Naval Sea Systems Command (NAVSEA) policy on maintenance and overhaul of Navy shipboard shock-hardened circuit breakers of both ACB and AQB types specified in reference (a).

15.2 CIRCUIT BREAKER FUNCTION AND ACQUISITION ON NAVY SHIPS. Circuit breakers onboard Navy ships and submarines are used primarily to provide electrical system protection against disruptive and sometimes destructive abnormal currents. This protection is so precise that it selectively removes only the cause of the abnormal current (such as electrical system damage acquired in battle) while continuing to power other unaffected weapons, electronics and electrical systems. This continuous supply of electrical power is also ensured by the unique ability of these circuit breakers to maintain proper position during severe impacts produced by missiles, bombs, mines, torpedoes and other detonation sources. Due to the unique nature and critical function of Navy shock-hardened circuit breakers, their acquisition is controlled through a Qualified Products List (QPL) governed by requirements set forth in appropriate military specifications. There is no equivalent commercial requirement.

15.3 CIRCUIT BREAKER OVERHAUL FACILITIES AND PART PROCUREMENT. Type AQB circuit breakers with non-replaceable trip units (100 amp and smaller sizes) are not repairable. All other circuit breakers are classified as Depot Level Repairable. NAVSEA has designated Puget Sound Naval Shipyard and the Original Equipment Manufacturer (OEM) as Designated Overhaul Points (DOP) for these items. The current OEMs offering overhaul service for their products are SPD Technologies, Inc., Whipp & Bourne, and Eaton/Cutler-Hammer (for Westinghouse breakers). Other (obsolete) ACB and AQB circuit breakers are overhauled by the Navy DOP. The ability to repair and refurbish circuit breakers is a “core” Naval Shipyard function, with all Naval Shipyards expected to maintain and execute this capability. This does not imply all Naval Shipyards will be appointed DOP status. The single Navy DOP at Puget Sound Naval Shipyard along with the OEMs and their service centers provide production capability and capacity to meet the requirements for restoration of stock assets to Ready For Issue condition and meet other routine circuit breaker overhaul requirements. Prior to the initial listing of a vendor's circuit breaker on the QPL, the OEM must successfully demonstrate by appropriate tests and inspections that the circuit breaker passes all the requirements contained in the military specification. To maintain the integrity of the circuit breaker as a qualified product, NAVSEA prohibits the local manufacture or fabrication of certain (restricted) parts during repair or overhaul. Due to the critical nature and stringent materials and manufacturing requirements, the Navy restricts the manufacture of these parts to the OEM listed for the particular circuit breaker. Specifically, all replacement parts for circuit breakers, except fasteners and general hardware items, are restricted parts. Non-restricted parts include nuts, bolts, screws, washers, lockwashers, cotter pins, O-rings, indicator lights, and indicator light globes (colored and clear).
The restricted replacement parts must be obtained from the Federal Stock System, the OEM or approved material diversion.

15.4 SUBMARINE CIRCUIT BREAKERS. NAVSEA has established a pool of circuit breakers removed from inactivated SSN 688 Class submarines to support SSN 688, SSBN and SSGN 726 Class submarine's lifecycle requirements. The OEM has designated some circuit breakers still in use as obsolete and may no longer readily support them with parts. For obsolete breakers no longer supported by the Federal Stock System, Puget Sound Naval Shipyard and in some cases Ship's Maintenance Monitoring Support Performance Monitoring Teams (PMT), may be a source of parts. The ship must obtain the parts by approved material diversion. This will allow Puget Sound Naval Shipyard to either make parts or purchase parts from the OEM. The OEM can still manufacture the obsolete parts but the cost could be excessive. Even after the shipboard repairs are complete, the pay back is critical to ensure the lifecycle pool is maintained. If the lifecycle pool is allowed to deteriorate, circuit breakers for future requirements may not be available.

15.5 NAVY POLICY ON SHIPBOARD CIRCUIT BREAKER MAINTENANCE AND OVERHAUL.

a. Not Repairable Circuit Breakers. Type AQB circuit breakers with non-replaceable trip units (100 amp and smaller) are not repairable. Any attempt to open and repair this type of circuit breaker results in an unacceptable risk to subsequent performance, even if retest is performed.

b. Overhauls must be performed by the Navy DOP at Puget Sound Naval Shipyard or the OEM. Class A and B overhauls are defined as:

(1) Class A Overhaul. An extensive overhaul that involves complete disassembly and refurbishment, such as re-plating mechanical and electrical parts, and replacing the wire harness. The “most recent” design and technical specifications will be met. The end product must be in “like new” condition in appearance, operation and performance. All manufacturers' and technical manual performance standards and specifications, and all technical documentation, unless superseded by proper authority, must be met. The repair activity must demonstrate that the end product successfully meets all performance criteria of the governing specifications. Defining an overhaul as Class “A” means that all actions required to meet the definitions are authorized.

(2) Class B Overhaul. A less extensive overhaul that re-uses most of the existing parts to restore the operating and performance characteristics of a circuit breaker to its original design and technical specifications. Machinery Alterations, field changes and modifications, even if applicable, are not to be accomplished unless specified by proper authority. The repair activity must demonstrate that the end product successfully meets all performance criteria of the governing specifications.

c. Non-OEM Vendors. When commercial repair facilities other than the OEM express an interest in performing repair and overhaul work, they must demonstrate to NAVSEA the capability to perform the work. Capability to perform circuit breaker
overhaul and repair work includes having the facilities, trained mechanics, and access to the OEM's qualified parts and repair procedures. Use of nonqualified, restricted parts violates the integrity of the circuit breaker, nullifying the breaker’s prior qualification under the QPL process. Restricted parts must be obtained from the OEM either directly or via the Federal Stock System (with the exceptions as noted in sub-paragraph “b”). If a restricted part is replaced with an unqualified part, the qualification of the particular circuit breaker is revoked until the full set of QPL required tests are repeated and submitted to NAVSEA for approval.

d. Fleet Maintenance Activities and Organizational Level Maintenance and Repair. Maintenance and repair of circuit breakers by Organizational and Fleet Maintenance Activities includes cleaning, inspection, lubrication, accomplishment of technical manual specified corrective maintenance, and operational testing and replacement of the bolt-on parts (obtained from qualified sources). Bolt-on parts include charging motors, arc chutes, auxiliary switches, closing relays, electronic trip units (only units that are adjustable with a portable trip unit calibration test set), indicator lights and indicator light transformers, rectifier units and resistors, secondary disconnects, shunt trip units, transformers, undervoltage trip units, and wiring and connections. Repairs which alter the breaker calibration, require major disassembly of the operating mechanism, or require re-plating must be performed at a depot level activity. Repairs of this type conducted by a non-depot level activity to meet operational commitments must be certified at the earliest available opportunity by an authorized depot activity (DOP or Naval Shipyards with demonstrated circuit breaker repair and retest capability). Type Commanders should ensure a Departure From Specification is processed for these types of emergent repairs.

e. (Submarines Only) Performance Monitoring Teams. PMTs are permitted to perform in-depth circuit breaker maintenance and repairs as an augmentation to Forces Afloat maintenance when the PMT member is designated, trained, certified, and provided with the proper equipment. The PMT must not make calibration repairs or adjustments that require shop verification by primary current injections. These types of calibration and certification adjustments must only be accomplished by an authorized depot activity. NAVSEA 08 has authorized the Ship’s Maintenance Monitoring Support PMTs to conduct repairs on NAVSEA 08 cognizant circuit breakers similar to those on non-nuclear applications.

f. NAVSEA 08 cognizant circuit breakers. If questions or technical issues arise regarding NAVSEA 08 cognizant circuit breakers which cannot be resolved by consulting the applicable technical manual, prepare a Trouble Record or Liaison Action Request and submit to Assistant NAVSEA Technical Representative, Schenectady, NY following the Commissioned Submarine and Surface Ship General Reactor Plant Overhaul and Repair Specification.

(e) COMLANTFLTINST 3500.18 - Certification and Readiness of Aviation Facilities in Naval Ships Operating Aircraft
(f) NAVAIRINST 3120.1 - Lead Systems Command Procedures and Responsibilities for Certification of Aviation Facilities and Equipment in Naval Ships Operating Aircraft

16.1 PURPOSE. To provide guidance concerning the maintenance policies, procedures and responsibilities for Aircraft Launch and Recovery Equipment (ALRE) throughout the ship’s operating cycle. The Aircraft Launch and Recovery Equipment Maintenance Program (ALREMP) is sponsored and directed by the Chief of Naval Operations, and is administered through the chain of command to provide material and technical support by the cognizant Systems Command. The ALREMP provides an integrated system for performing maintenance and related support functions on ship’s installed aircraft launching and recovery systems and associated peripheral support systems and equipment.

16.2 AIRCRAFT LAUNCH AND RECOVERY EQUIPMENT MAINTENANCE PROGRAM.

16.2.1 Applicability. The ALREMP encompasses all Navy activities concerned with the operation, rework, repair, production and support of Aircraft Carrier ALRE, including catapults, arresting gear, Visual Landing Aids (VLA), and associated deck gear and accessories.

16.2.2 Objectives. The ALREMP establishes standard procedures to control maintenance, provide quality assurance performance verification and provide for a more effective ship’s Maintenance and Material Management system in compliance with reference (a).

16.2.3 Responsibilities.

a. Naval Air Systems Command (NAVAIR) must provide overall ALREMP management through the ALRE Program Manager (PMA 251).

b. The ALRE Program Manager, or his direct representative, must establish and chair the ALREMP Working Committee.
c. The Naval Air Warfare Center (NAVAIRWARCEN) Aircraft Division, Lakehurst will provide technical services and act as the technical manager for the ALREMP.

d. The Type Commanders (TYCOM) must provide ALRE Maintenance Management Teams to conduct assist visits and annual audits of all units, per the requirements of reference (b). These assist visits and annual audits will ensure operation and maintenance of ALRE is conducted within the guidelines of the ALREMP as directed by reference (b).

16.2.4 Management Team. The ALREMP Management Team consists of a qualified ALRE Maintenance Officer and an experienced Senior or Master Chief Aviation Boatswains Mate (ABECS or ABCM) assigned to Commander Naval Air Force Atlantic (COMNAVAIRLANT) N433 or Commander Naval Air Force Pacific (COMNAVAIRPAC) N435. Audit assistance may be provided to the TYCOMs by the ALRE Program Office (PMA 251) Fleet Programs Team. The ALREMP Management Team provides the following services.

a. Pre-implementation training for the ALREMP.

b. Assistance to ships during the ALREMP implementation phase.

c. Assist visits during industrial availabilities.

d. Assist visits following an industrial availability or during a ship’s work-up cycle.

e. Formal audits, per references (c), prior to or during mid-deployment.

16.2.5 Assist Visits. Assist visits will be advisory in nature and will normally be scheduled to follow a ship’s Selected Restricted Availability or during the work-up cycle. Units visited are encouraged to discuss maintenance and material quality assurance problems with team members. Upon completion of the visit, the team will debrief the Air Department Officer and designated Air Department personnel. An informal report of noted problems and recommendations will be provided at the debrief. The Commanding Officer will be debriefed at the discretion of the team leader. The ALREMP Management Team may be requested for additional assist visits at the ship’s discretion via the applicable TYCOM.

16.2.6 Audits.

a. Formal audits will be conducted upon completion of a Chief of Naval Operations availability, annually or prior to deployment, and will evaluate the overall ALREMP and quality assurance management procedures, including compliance with current OPNAV and TYCOM instructions.

(1) The Commanding Officer must be debriefed by the ALREMP Team Leader at the completion of the audit.

(2) A formal report listing all discrepancies will be forwarded to the Commanding Officer within fifteen days of the audit completion. A report of corrective actions taken will be submitted to the TYCOM no later than thirty days after receiving the formal audit report. Updates will be submitted monthly until all discrepancies are corrected.
b. Semi-annually, the TYCOMs will provide the ALRE Program Office PMA 251 with an ALREMP status report detailing their respective carrier’s performance. Reports will be used to evaluate overall ALREMP program effectiveness.

16.3 AVIATION CERTIFICATION. Aviation Certification, including ALRE certification, responsibilities, procedures, and waiver guidance are provided in references (d), (e) and (f).

16.4 CARRIER AND FIELD SERVICE UNIT.

a. Carrier And Field Service Unit (CAFSU) is a branch of the NAVAIRWARCEN Lakehurst, ALRE Fleet Technical Support Competency. The organization is comprised of civilian technicians highly skilled and thoroughly qualified in the operation, maintenance, repair, installation, and testing of both shipboard and shore based ALRE and VLA systems. They are geographically located in field offices to provide instant technical assistance to Fleet personnel and industrial activities throughout the Fleet operating areas. CAFSU Field Offices are located at:

- Naval Aviation Depot, JAX, Norfolk, VA Voyage Repair Team (VRT) Detachment
- Naval Station, Mayport, FL
- Naval Aviation Depot North Island, CA
- Puget Sound Naval Shipyards Bremerton, WA
- Ship Repair Facility Yokosuka, Japan
- Supervisor of Shipbuilding Newport News, VA
- Norfolk Naval Shipyards Portsmouth, VA

b. The CAFSU Supervisor is located at TYCOM headquarters. Technicians are under the operational control of the Ship Installation Officer, TYCOM (N433 or N435). CAFSU functions as the technical representatives of NAVAIR, the TYCOM and NAVAIRWARCEN in all matters which concern launch, recovery, and VLA equipment. CAFSU is required to maintain technical liaison with the commands listed in sub-paragraph “a” and is responsible for the completion of work to the satisfaction of these commands and for providing all interested parties with timely information as required. CAFSU will provide technical assistance during Chief of Naval Operations Maintenance Availability and other availabilities, and to ships not in a repair status. All industrial activity repairs, modifications, and operational tests of shipboard, launching, recovery and VLAs will be monitored by a CAFSU representative. All technical questions concerning the equipment may be directed to the local CAFSU representative. CAFSU must recommend approval or disapproval of work after consultation with the TYCOM. CAFSU will submit timely written reports concerning repairs, alterations and work accomplished to the Commanding Officer NAVAIRWARCEN for appropriate action and distribution.

16.5 RESPONSIBILITIES.

16.5.1 Aircraft Carrier Commanding Officer.

a. Request CAFSU technical assistance when required, by message, letter, or informal means from the TYCOM. In the case of a formal request, direct an information copy to the local CAFSU field office.
b. Provide appropriate berthing and messing facilities for CAFSU representatives when embarked.

c. Pass to the TYCOM (N433 or N435) any comments concerning meritorious or substandard performance of CAFSU representatives.

d. Upon completion of the CAFSU assignment at sea, ensure timely departure from the ship.

16.5.2 Industrial or Repair Activity.

a. Provide support to the CAFSU representative, as appropriate to allow for accomplishment of the objectives set forth in paragraph 16.2.2 of this chapter.

b. Refer technical questions concerning the launching, recovery and VLA equipment to the local CAFSU representative for timely resolution.

16.6 NAVAL AVIATION DEPOT.

a. The Naval Aviation Depots maintain and operate facilities to perform:

   (1) A complete range of industrial level rework operations on designated weapon systems, accessories and equipment.

   (2) Manufacturing of parts and assemblies as required.

   (3) Engineering services in the development of change hardware design.

   (4) Technical and other professional services for Aircraft Carrier maintenance and logistic problems.

   (5) Other levels of Aircraft Carrier maintenance for eligible activities upon specific request or assignment.

   (6) Other functions as directed by NAVAIR.

b. In order to meet the material support needs of the operating forces, by accomplishment of the mission, the following specific functions are assigned:

   (1) Perform depot maintenance functions for aircraft, engines and their components and accessories. Ground Support Equipment trainers and training equipment as specified in appropriate Aircraft Maintenance Program directives.

   (2) Provide engineering, technical and professional services in support of rework of specific aircraft, engines, aeronautical components, Peculiar Ground Support Equipment, trainers and training equipment.

   (3) Perform shipwork designated as Ship Installations Equipment and systems with the same priority as aircraft rework.

   (4) Serve as the major maintenance, repair and modification point for assigned missiles.

   (5) Provide calibration services as assigned by higher authority.

(7) Perform as a Cognizant Field Activity for assigned aircraft, equipment, and Peculiar Ground Support Equipment.

16.7 NAVAL AVIATION DEPOT VOYAGE REPAIR TEAM.

a. Naval Aviation Depot Operations Instruction 13800.1 denotes organizational relationships between the TYCOM and the VRT and defines the TYCOM’s responsibility, authority for workloading, and operational control of the VRT. Control is exercised through the TYCOM (N433 or N435).

b. To provide industrial level support for Ship Installation Equipment (ALRE) the VRT is used to support the following:

(1) Casualty Reports.
(2) Enroute maintenance or underway repairs.
(3) Miscellaneous repairs beyond Ship’s Force capability.
(4) Rotatable spare overhaul.
(5) Special reports.
(6) Preparation for Overseas Movement repairs.
(7) Service Change installations.
(8) Modernization or repair of components in conjunction with Chief of Naval Operations Maintenance Availabilities and Planned Maintenance System availabilities.

c. The capabilities of the VRT are such that almost any task related to launch and recovery equipment is feasible, assuming adequate support from Ship’s Force is available. The following ship’s support for the VRT is required:

(1) Timely Current Ship’s Maintenance Project deferral submission for the Maintenance Manager and TYCOM screening and programming.
(2) Providing sufficient V-2 Division personnel to assist the team, in such areas as providing forklifts, obtaining necessary parts, gaining machine shop assist and space access, etc.

LISTING OF APPENDICES.

A Sample Catapult Accumulator Inspection Request
B Sample Inspection Confirmation Letter
C Summary of Catapult Accumulator Inspection Scheduling and Responsibilities
D1 Sample Catapult Accumulator Inspection Report Cover Letter
D2 Sample 5 Year Strength and Integrity Catapult Accumulator Inspection Report Cover Letter
D3 Sample Other Catapult Accumulator Inspection Report Cover Letter
E Sample Catapult Accumulator Inspection RBO-Deficiencies Message
F Sample 30 Day Update Message
G Sample Catapult Accumulator Rescission Message

17.1 PURPOSE. To establish policy and provide procedures and inspection requirements for Steam Catapult Accumulators and support systems including:

a. Inspection scheduling.
b. Required preparations.
c. Inspection guidelines.
d. Reporting requirements.

17.2 POLICY. Periodic standardized inspections are required of all steam catapult accumulators and associated support systems including steam fill and blowdown systems, feed water fill and drain systems, steam piping and accumulator drain systems, control and indicating systems associated with the fill, pressurization and blowdown of the steam catapult accumulators, and steam supply and drain piping for the trough heating system. Inspections must be conducted by a certified Steam Generating Plant Inspector (SGPI) or Naval Surface Warfare Center, Philadelphia Division (NAVSURFWARCCEN PD), as applicable per the requirements of
reference (a). The maximum interval between inspections and other occasions requiring inspections, as well as responsibilities for continuation and standardization of the inspection program, are formally assigned in reference (a). Specific inspection criteria, attributes and intervals are detailed in reference (b).

17.3 TYPES OF INSPECTIONS.

a. Routine Inspection.

b. Pre-start of Availability Inspection (PSAI).

c. Start of Availability Inspection (SAI).

d. Strength and Integrity Inspection.

e. Industrial Support Visit (ISV).

f. Completion of Availability Inspection (CAI).

g. Inactivation or Reactivation inspection.

h. Special Inspections.

17.4 RESPONSIBILITIES.

17.4.1 Naval Sea Systems Command. Naval Sea Systems Command (NAVSEA) must provide Technical Authority oversight over all steam catapult accumulators and associated equipment. The designated NAVSEA Technical Warrant Holder must:

a. Assure safe and reliable system operation.

b. Set and enforce all technical requirements.

c. Be the approval authority for all major Departure from Specifications (DFS).

d. Provide technical oversight and management of the SGPI and NSWCPD programs.

(1) Establish and enforce requirements for SGPI certification and recertification.

(2) Ensure periodic SGPI Seminars are conducted.

(3) Ensure periodic technical audits of all Integrated Logistics Support documentation and training.

(4) Maintain the Steam Catapult Inspection and Repair Management Information System (SCIRMIS).

(5) Routinely evaluate and ensure state of the art inspection, maintenance and repair tools and techniques are used.

17.4.2 Naval Surface Warfare Center, Philadelphia Division.

a. Provide support to NAVSEA for the SGPI and NSWCPD programs. Ensure that the required technical documentation to support the SGPI or NSWCPD Inspector programs is maintained current.

b. Establish and monitor the requirements and standards for routine and industrial inspections of steam catapult accumulators.
c. Develop, implement and maintain a program to train and certify NSWCPD Inspectors per reference (a).

d. Ensure that inspection of ships undergoing major overhaul or conversion are conducted per this instruction.

e. Conduct periodic technical audits of the SGPI Training Course per reference (a).

f. Provide management of technical data, SCIRMIS accumulator history associated repair management information database system.

g. Provide technical support to the semiannual SGPI seminars.

h. Maintain a roster of all Certified SGPIs by name, rating, duty station, date of certification and expiration date of certification. Recommend inspector certification and initiate action to decertify inspectors who fail to comply with the requirements of reference (a).

i. Ensure that the requirements for SGPI certification, recertification and certification extensions are met prior to final approval.

j. Conduct PSAI, SAI, ISV, Strength and Integrity Inspections, CAI and Special Inspections as specified in section 17.6 of this chapter and reference (b).

17.4.3 Type Commander.

a. Provide or arrange for certified SGPIs to perform inspections per the requirements of reference (b).

b. Schedule inspections of all catapult accumulators and support systems required by reference (b). Coordinate the inspections with the appropriate technical activities to avoid unnecessary opening of accumulators.

c. Assist Commanding Officers in arranging for the corrective action of deficient items which are beyond the capability of Ship's Force to perform. Monitor the follow-up action required to correct these deficiencies.

d. Review the SCIRMIS to ensure deferred inspection deficiencies are entered into the Current Ship’s Maintenance Project (CSMP) and are planned or programmed for repair.

17.4.4 Regional Support Group, Regional Maintenance Center and Fleet Maintenance Activity Commanding Officers. Maintenance Activity Commanding Officers must provide a certified SGPI, when requested by the ship, Immediate Superior in Command (ISIC) or Type Commander (TYCOM), to conduct the accumulator inspections.

17.4.5 Ship Commanding Officer.

a. Request inspections via Naval Message with the desired primary and alternate dates to the TYCOM with info copies to Cognizant Regional Maintenance Center (RMC) and NSWCCD for accomplishment of the inspections using the format in Appendix A.

b. Prepare for the scheduled inspections per references (a) and (b).

c. Conduct Ship’s Force responsible inspections and provide reports required by reference (b).
d. Review inspection results and initiate corrective action for those deficiencies within Ship's Force capability. Initiate requests for those corrective actions beyond Ship's Force capability. If any discrepancies of paragraph 17.9.2 of this chapter cannot be corrected within 72 hours following completion of the inspection, or if said discrepancies will impact ship’s operational schedule, initiate a Casualty Report for the affected catapult accumulator(s) per reference (c).

e. Assess the impact of corrective actions (if any) on the ship’s operating schedules and advise the TYCOM and operational commanders of any adverse effects.

f. Submit reports per paragraph 17.7.2 of this chapter.

g. Schedule catapult accumulator inspections as required by appropriate Planned Maintenance System (PMS) or Class Maintenance Plan items.

17.4.6 Regional Maintenance Center Senior Inspector. RMC Senior Inspector must:

a. Ensure all assigned SGPIs maintain current SGPI certificates per reference (a).

b. Perform catapult accumulator inspections per reference (a).

c. Review and submit reports per paragraph 17.7.2 of this chapter.

d. Coordinate inspections in cognizant maintenance areas.

e. Send inspection confirmation messages using Appendix B of this chapter.

f. Maintain an up to date list of required catapult accumulator inspections which must include the latest inspection for all ships assigned to the RMCs in their geographic area of responsibility.

17.4.7 Steam Generating Plant Inspector.

a. Maintain certification per the requirements of reference (a).

b. Perform inspections per the requirements of reference (a), (b) and section 17.9 of this chapter when directed.

c. SGPIs are part of the technical authority chain-of-command and are accountable to the NAVSEA Technical Warrant Holder for the performance of their inspection duties.

17.5 INSPECTION SCHEDULING. Commands will initiate inspection requests in a timely manner to assist with inspection scheduling coordination. Commands must ensure inspection scheduling complies with reference (b) and the following:

a. Commanding Officers or Officers In Charge of ships must request inspections by message. In addition, OPNAV 4790/2-Kilo must be submitted to the RMC requesting a certified SGPI or NSWCPD inspector as required to conduct inspections.

b. Inspections should coincide with the required routine waterside maintenance.

c. Inspection services must be coordinated by geographic areas for optimum utilization of SGPIs or NSWCPD Inspectors.

d. The TYCOM may utilize PSAIs and CAIs, which are documented in SCIRMIS to satisfy the pressure vessel portion of a routine inspection. This will reduce the number
of catapult accumulator openings. A Routine Inspection will not be considered completed until an SGPI has certified all items required have been accomplished.

17.6 SAFETY PROCEDURES. The safety of personnel must be given the highest priority. Observance of good engineering practices will reduce the frequency of pressure vessel entry.

a. Ensure idle accumulator condition is accomplished following the provisions of the Catapult Engineering Operational Sequencing System and reference (b) in preparations for the inspection. Where conflicts occur, an Engineering Operational Sequencing System feedback form should be submitted for resolution.

b. Ensure the idle catapult accumulator is tagged out (valves wired shut and danger tagged). Observe two-valve protection per Chapter 10 of this volume. Open to the atmosphere the drain connections on all dead interconnecting piping to observe drainage.

c. Place signs warning at the catapult control console and central charging panel that personnel are working in the accumulator and in conspicuous places in the accumulator room and in rooms containing fill and blowdown isolation valves. The signs must remain there until the work has been completed and personnel are clear of the secured accumulator.

d. Ensure all precautions cited in Section 5.3 of reference (b) are followed before entering an accumulator.

e. Do not enter any part of the accumulator until it has been fully ventilated and certified by a Naval Maintenance Facility Gas Free Engineer or National Fire Protection Agency Marine Chemist as safe for entry. Ensure all safety precautions associated with entry into sealed tanks, voids or pressure vessels including gas-free certification are performed per the requirements of references (d), (e) and (f), as applicable, and Chapter 25 of this volume.

f. The use of unshielded or non-approved lighting in an open accumulator is prohibited. Portable lighting must be watertight (National Stock Number (NSN) 9S-6230-00-701-2947).

g. Station an attendant outside the accumulator to provide assistance when any personnel are working inside the accumulator.

h. Maintain accountability of all items taken into an accumulator. Foreign Material Exclusion closures will be used to the maximum extent practical to prevent tools or other foreign materials from being inadvertently left in the accumulator or associated ship's systems.

(1) Personnel entering accumulators will remove all jewelry and empty their pockets of all unnecessary items.

(2) Removal of all items and foreign material exclusion closures from the accumulator will be verified and accounted for prior to conducting a final closeout inspection. Final closeout inspection of the catapult accumulator must be accomplished by the Chief Engineer or his designated representative.
17.7 CATAPULT ACCUMULATOR INSPECTIONS AND REQUIREMENTS. Catapult accumulator inspections conducted per the requirements of reference (b) must fulfill all other catapult accumulator inspection requirements. When practical, various inspections should be scheduled for coincidental performance. Appendix C of this chapter is a summary of inspection scheduling and responsibilities.

17.7.1 Routine Inspection. Routine inspections will be conducted at least once every 30 months not to exceed 36 months from its last inspection. For newly constructed ships, the 30-month period must begin at the completion of the Board of Inspection and Survey Acceptance Trials. The normal interval between routine inspections must be 30 months. The 30-month period begins with the first warm-up of the catapult accumulator to normal operating temperature and pressure following the previous routine inspection. To provide scheduling flexibility, inspections may be performed as early as 24 months not to exceed 36 months after the previous inspection. Inspections that exceed the 30-month interval will require a minor Departure From Specification to the TYCOM with concurrence from NSWCPD. Any catapult accumulator which exceeds the inspection interval must be placed out of commission until inspected by a certified SGPI or a Major DFS is approved by the NAVSEA Technical Warrant Holder to operate beyond 36 months without a Routine inspection.

   a. The catapult accumulator inspection will be scheduled by the TYCOM.
   b. The catapult accumulator inspection will be performed by a certified SGPI.
   c. The TYCOM may utilize PSAIs, CAIs and Strength and Integrity Inspections which are documented in SCIRMIS, to satisfy the pressure vessel portion of a routine accumulator inspection. This will reduce the number of boiler openings. A Routine Inspection will not be considered completed until an SGPI has certified all items required have been accomplished. Once completed, this resets the periodicity required for the next inspection to 18 months not to exceed 24 months.
   d. A Safe to Steam assessment shall be conducted as a condition of approval for both minor (beyond 30 months but within 30-36 month timeframe) and major (beyond 36 months) DFSs. The Safe to Steam assessment will be accomplished by a SGPI and documented in SCIRMIS.

17.7.2 Pre-Start of Availability Inspection. The PSAI may be required at the discretion of the TYCOM to support early bid specification and work package development.

   a. The PSAI will be scheduled by the TYCOM.
   b. The PSAI will be performed by the NSWCPD Inspector and an SGPI.

17.7.3 Start of Availability Inspection. The SAI is required to be accomplished at the beginning of an availability to better define or re-evaluate the accumulator bid specification and identify those major repair items which may impact ship’s operational schedule.

   a. The SAI will be scheduled by the TYCOM, Industrial Activity or Supervising Activity as applicable.
   b. The SAI will be performed by the NSWCPD Inspector and an SGPI.

17.7.4 Strength and Integrity Inspection. The normal interval between strength and integrity inspections must be 60 months. Strength and Integrity Inspections may be conducted as early as
48 months not exceed 72 months after the last Strength and Integrity Inspection to provide flexibility in scheduling. Inspections that exceed the 60-month interval will require a minor DFS to the TYCOM with concurrence from NSWCCD-SSES. Any catapult accumulator which exceeds the inspection interval must be placed out of commission until inspected by a certified SGPI, or a Major DFS is approved by the NAVSEA Technical Warrant Holder to operate beyond 72 months without a Strength and Integrity Inspection.

17.7.5 Industrial Support Visit Inspection. The ISV inspection must be scheduled during the availability, but may be waived by the TYCOM for availabilities of short duration.
   a. The ISV inspection will be scheduled by the industrial activity or Supervising Authority, as applicable.
   b. The ISV inspection will be performed by an NSWCPD Inspector and an SGPI.

17.7.6 Completion of Availability Inspection. The CAI will be conducted prior to final closeout of the catapult accumulator.
   a. The CAI will be scheduled by the industrial activity or Supervising Authority, as applicable, and may be conducted in conjunction with a Routine inspection.
   b. The CAI will be performed by an NSWCPD Inspector and an SGPI, preferably the same SGPI who conducted the SAI.

17.7.7 Inactivation or Reactivation Inspection. This Inactivation or Reactivation inspection must use the attributes of a strength and integrity inspection and must be conducted prior to the final action (in the case of inactivation) unless a strength and integrity inspection has been conducted in the last 18 months. In this instance, the last inspection report may be used to document accumulator lay-up condition. For reactivations, a strength and integrity inspection must be scheduled by the cognizant activity and conducted by NSWCCD and a cognizant RMC SGPI prior to reactivation of the unit.

17.7.8 Special Inspections. Additional catapult accumulator inspections, arranged by Ship’s Force in coordination with the TYCOM and performed by an SGPI, will be conducted per the requirements of reference (a) whenever the following conditions exist:
   a. Variations in end speed exist. Whenever variations in catapult end speed are experienced, a special inspection will be accomplished by an NSWCPD Inspector and an SGPI.
   b. Re-inspection of replaced manifold gasket. Whenever the internal steam charging flanged joint gasket is replaced, the joint must be re-inspected on a not to interfere with operations basis, upon the first cool down following initial operations. This Inspection is accomplished by the Engineering Officer.
   c. Whenever major work as defined by reference (b) is accomplished, the inspection is arranged by Ship’s Force in coordination with the TYCOM and performed by a NSWCCD-SSES LCEM inspector and an SGPI.

1. Repair or adjustments to safety devices or remote isolation devices.
(2) Repairs to the accumulator pressure vessel, including nozzles, circumferential welds, shell and head plates, manhole plate and attachment hinge welds which exceed reference (b), section 5.8 criteria.

(3) Repairs to or replacement of pressure vessel piping and valves.

(4) Repairs to the internal charging manifold.

d. When the TYCOM desires to assess the material condition, the inspection is arranged by Ship’s Force in coordination with the TYCOM and performed by a NSWCCD-SSES LCEM inspector and or an SGPI.

e. Readiness to deploy (RDI) will be conducted by a SGPI 2 - 4 months prior to deployment. If an RDI cannot be accomplished per the above, the cognizant SGPI will schedule and accomplish a Mid-Cycle Inspection (MDI) to occur 15-21 months after the last Routine inspection or Strength and Integrity inspection. The RDI and MDI will include all items currently accomplished Ref (b) Chapter 5 figure 5-5. Both inspections results will be documented in SCIRMIS and reported by Naval message by the cognizant SGPI.

17.8 INSPECTION GUIDELINES AND REPORTS.

17.8.1 Guidelines.

a. All inspections will be conducted using the requirements of reference (b). The catapult accumulator, including the support systems identified in paragraph 17.1.1 of this chapter will be inspected and the results documented in the SCIRMIS.

b. Routine Inspection of catapult accumulators and associated systems will be conducted by an SGPI.

c. All Repair Before Operate (RBO) deficiencies must be corrected and re-inspected by a certified SGPI or NSWCPD inspector and preferably the same SGPI, NSWCCD-SSES or LCEM inspector who originally identified the discrepancy prior to warm-up of the catapult accumulator. As RBOs are safety related, all inspector-designated RBO discrepancies discovered per reference (b) and section 17.9.2 of this chapter must be corrected prior to catapult operation and reinspected by a certified SGPI or NSWCPD Inspector, as applicable, and preferably the same SGPI or NSWCPD Inspector who originally inspected the accumulator. RBO discrepancies include those for which continued unrestricted operation could endanger personnel. RBOs may not be departed via DFS. If there is not an immediate or near future danger to personnel, the discrepancy must be assigned as SEVERELY DEGRADED with major operational restrictions.

d. All catapult accumulator related DFSs will be verified by the SGPI during the inspection for conformance with JFMM requirements prior to placing the accumulator into operation.

17.8.2 Reports. The inspector(s) conducting the inspection must personally debrief and provide a preliminary report of the inspection results to the ship’s Commanding Officer (or designated representative) following completion of the inspection. The results must also be entered into the SCIRMIS database. A copy of the final report will be provided to the TYCOM, Regional
Maintenance Center or Fleet Maintenance Activity and NSWCCD no later than 10 days after the completion of all repairs identified during the inspection using the Appendix D1, D2 or D3 cover letter format, as appropriate.

a. The inspector conducting the inspection must report RBO deficiencies discovered during the inspection to the TYCOM by message within 24 hours using the format in Appendix E of this chapter.

b. The SGPI must report by message to the TYCOM, using the format in Appendices F and G of this chapter, the correction and re-inspection of all RBO deficiencies prior to closeout and warm up of the accumulator.

c. The ship’s Engineering Officer must report corrected deficiencies, by message, using the format in Appendix F of this chapter within 30 days of the completed inspection and at 30-day intervals thereafter until all deficiencies are corrected.

17.9 CATAPULT ACCUMULATOR INSPECTION PREPARATION.

a. Demonstrate the performance of the catapult electronic controls, including the uninterruptible power source and the safety devices of the fill and blowdown valves.

b. Prepare the accumulator per reference (b) paragraph 5.6.1 for routine inspections and paragraph 5.6.2 for strength and integrity inspections.

c. Wire shut and danger tag all steam and water valves to the catapult accumulator per the Ship’s Tag-Out Instruction and the Tag-Out User’s Manual. Post warning signs, PERSONNEL WORKING IN ACCUMULATOR, per reference (a).

d. The ship’s Engineering Officer must ensure all Ship’s Force responsibilities are complete.

17.10 CATAPULT ACCUMULATOR INSPECTION.

17.10.1 Catapult Accumulator Inspection Forms. Catapult accumulator inspections will be conducted using the appropriate SCIRMIS forms. Include specific comments on the state of preservation and material condition of the accumulator and all support systems.

17.10.2 Catapult Accumulator Inspection Areas. A discrepancy is classified as “Repair Before Operating” if left uncorrected it could cause injury to personnel. All RBO items must be corrected prior to operation and re-inspected by a certified SGPI or NSWCPD inspector, as applicable, and preferably the same inspector who originally inspected the accumulator. RBO discrepancies may include but are not limited to the following:

a. Inoperative or misadjusted safety devices.

b. Fire hazards or Safety hazards, oil soaked lagging, oil leaks or other fire hazards such as inoperative or missing firefighting equipment.

c. Inoperative electronic controls (Fairmont controllers, Smars transmitters, uninterruptible power source).

d. Non-deferrable defects, defects indications within the pressure vessel boundary.
e. Ultra-sonic test results of pressure vessel piping that are below minimum requirements, out of periodicity or inspectors discretion of piping of questionable service.

f. Improperly assembled internal steam charging flanged joint.

g. Improperly assembled flanged joints (mixed fasteners, undersized flexitallic gaskets, non-level in Level I systems).

h. In-operative system remote isolation devices.

i. Out of periodicity, in-operative temperature or pressure measuring instruments.

j. Valve tightness integrity which limits its ability to perform intended function and exceeds the criteria of reference (g).

k. Non-conformance of electrical safety and deteriorated or damaged wiring or components.

17.10.3 Completion of Inspection. A debrief and a preliminary inspection report, including a summary of restrictive deficiencies, will follow the inspection. Paragraph 17.7.2 of this chapter identifies official reporting requirements.

17.10.4 Automatic Controls Systems Inspection Guidelines. The automatic control system consists of a series of transmitters, controllers, interface devices, control valves and positioners. Inspection, calibration and alignment of this equipment is detailed in reference (h) and applicable system PMS for test and inspection guidelines.

17.10.5 Operating and Casualty Procedures. Each ship with steam catapults will have approved Operating Procedures in the format prescribed by their respective TYCOM. They must contain detailed procedures and precautions for:

a. Normal operations including startup and shutdown.

b. Infrequent operations such as initial charging following an availability.

c. Operating parameters, limitations, alarms and set points.

d. Casualty conditions including indications, immediate and supplementary actions.

e. Quality Assurance requirements for repairs.

LISTING OF APPENDICES.

A SSN 21 Class Submarine Salvage Inspection Check-Off List
B SSN 688 Class Submarine Salvage Inspection Check-Off List
C SSBN/SSGN 726 Class Submarine Salvage Inspection Check-Off List
D SSN 774 Class Submarine Salvage Inspection Check-Off List
E Sample Pre-Inspection Information or Certification
F Sample Report of Salvage Inspection Forwarding Letter

18.1 PURPOSE. To ensure the continued readiness and quality of maintenance performed on submarine rescue and salvage equipment.

18.2 INSPECTIONS.

18.2.1 Periodicity. The readiness of submarine rescue and salvage equipment is determined by periodic salvage inspections. Salvage inspections will be conducted within a 72-month interval, or:

a. Whenever requested by the submarine.

b. Prior to initial builder's trials for new construction ships, prior to initial sea trials for ships in Chief of Naval Operations (CNO) Maintenance Availabilities, and prior to initial sea trials for ships in Interim Dry Docking.

c. A partial salvage inspection will be completed for all items worked during an availability (i.e., hatches, salvage air valves, DISSUB stowage alterations, etc.).

d. Once every five years for SSBNs and SSGNs.

e. Prior to Sea Trials for repairs of damage from collision or grounding where deformation is observed to be in the hull integrity envelope or supporting structure.

18.2.2 Procedures and Reports. The specific rescue and salvage items to be inspected and the type of submarines to which they are applicable are identified in Appendices A through D of this chapter. Appendix E of this chapter is a sample pre-inspection form to be completed by the submarine prior to the salvage inspection. Appendix F of this chapter is a sample Submarine Salvage Inspection forwarding letter. Inspection attributes or elements of Appendices A through D may not be locally waived or have equipment substituted. Temporary changes to the attributes or elements of Appendices A through D will only be revised by the Type Commander (TYCOM) and the revision must be documented in formal correspondence. Any attributes or elements of Appendices A through D as applicable to the respective ship class not met or which fails inspection is underway limiting until corrected or waived by the TYCOM.

NOTE: IF NO QUALIFIED INSPECTORS ARE AVAILABLE, CONTACT THE TYPE COMMANDER FOR DIRECTION.
18.2.3 Inspection Resources. The hatch and watertight door portion of this inspection will be conducted by members of the local Ship's Maintenance Monitoring Support Performance Monitoring Team (PMT) (i.e., personnel who have successfully completed Submarine Structural Closure Inspection course or personnel designated by NAVSEA). Other portions of the inspection should be conducted by personnel who, by their rate and experience, are qualified in that particular section. Inspection teams are to be assembled, as required, from the following sources in order of the priority shown:

a. Undersea Rescue Commands.
b. Submarine Fleet Maintenance Activities.
c. Immediate Superior in Command (ISIC) Staffs.
d. Submarines of the same class.
e. Other submarines.
f. Salvage ships (ARS).

18.3 RESPONSIBILITIES. The responsibility for the preparation, conduct, and completion reporting for a salvage inspection is listed in the remainder of Section 18.3.

18.3.1 Immediate Superior in Command.

a. Schedule salvage inspections for assigned submarines as specified in paragraph 18.2.1 of this chapter. The inspection should be conducted early enough in the availability to allow for the correction of deficiencies prior to Fast Cruise.

b. Designate the inspecting team using the guidance provided in paragraph 18.2.3 of this chapter to conduct the salvage inspection.

18.3.2 Commanding Officer or Officer in Charge.

a. Request the ISIC to conduct a salvage inspection per the periodicity set forth in paragraph 18.2.1 of this chapter.

b. Coordinate support requirements as may be needed by the inspecting team to fulfill the requirements of the applicable Appendix of this chapter.

NOTE: HATCHES THAT ARE FOULED WILL PREVENT THE SATISFACTORY COMPLETION OF THIS INSPECTION. COORDINATION BETWEEN THE SHIP, INSPECTING TEAM AND MAINTENANCE ACTIVITY IS THE RESPONSIBILITY OF THE COMMANDING OFFICER OR OFFICER IN CHARGE.

c. Complete and forward a pre-inspection information letter to the Senior Inspecting Officer using the sample provided in Appendix E of this chapter as a guideline. Modify Appendix E as necessary to align required attributes with the applicable class-specific checklist.

d. Assemble all ship’s data indicated in the applicable Appendix of this chapter prior to the inspection for ease of reference by the inspecting team.

e. Upon receipt of the Senior Inspecting Officer’s report, take action to correct the discrepancies found and report by letter or message their corrections to the ISIC with a
copy to the TYCOM and Supervising Authority (when assigned) prior to commencement of Fast Cruise.

f. Submit a Casualty Report (CASREP), if applicable, per reference (a) for each item which degrades the Submarine Rescue Chamber (SRC) or Submarine Rescue Diving Recompression System (SRDRS) capability.

18.3.3 Senior Inspecting Officer:

a. Assemble the inspecting team designated by the ISIC.

b. Conduct the salvage inspection per the applicable Appendix of this chapter. Ensure Appendix E of this chapter is received prior to commencement of the inspection. The inspection should be completed at least 14 days prior to commencement of Fast Cruise, or for new construction ships and ships in a CNO Maintenance Availability, at least 28 days and no sooner than 60 days, prior to the scheduled commencement of Sea Trials. This examination should normally be performed close to Phase I crew certification, if possible.

c. At the completion of the salvage inspection, report the following to the Commanding Officer or Officer in Charge of the inspected ship:

(1) Completion of the inspection. When ships are in a CNO availability, the shipyard and the Project Team must be formally notified of the scheduled date of the Salvage Inspection and any deficiencies identified.

(2) Which, if any, systems or equipment have not been restored to normal operating conditions (due to maintenance or required repairs, etc.).

(3) That an advance copy of the inspection results has been provided to the ship to facilitate early correction of deficiencies found.

d. Submit the inspection report to the Commanding Officer or Officer in Charge of the inspected ship in the format of Appendix F of this chapter within three working days following the completion of the inspection, with a copy to the cognizant ISIC.
APPENDIX A
SSN 21 CLASS SUBMARINE SALVAGE INSPECTION
CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces and buoy cable angle tests require substantial support equipment and are designated for industrial activity accomplishment.

2. Configuration differences are noted as comments in the reference column.

3. Portions of the Salvage Inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as “pre-availability inspections” to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship’s Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC and the Senior Inspecting Officer.

4. The user is directed to use the most latest revision of the Planned Maintenance System (PMS) maintenance requirement.

NOTES
(SSN 21 CLASS)

1. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of an availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship's Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b. and 2.c. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

2. The inspected ship’s, vice the inspecting command’s, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

3. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

4. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

5. The current submarine Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the Salvage Inspection item.

6. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship’s valve drawing.

7. Prior to testing Outboard Diesel Exhaust Valve, ensure replacement spring-loaded locking pin is available onboard.

8. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.
9. Unsatisfactory conditions degrade the SRC or SRDRS capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Part I, Chapter 8 of this manual.

10. One or more of the Logistics and Escape Trunks (LET) will be removed during refit. When removed, the LET is isolated from service air and electric power. Communications circuits, electrical power, and charging manifold tests should be conducted prior to LET removal to ensure piping and electrical system continuity, and tested again upon reinstallation.

11. Diver’s knife and ballpeen hammer may be stored in secure stowage in escape compartment.

12. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.

13. A minimum of 30 Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON-DISSUB canisters with quantities and location(s) logged by the crew.

14. Oxygen candle quantity and location impacts inspection acceptance criteria.
   a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be stowed forward or aft.
   b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.
   c. Oxygen candle igniters must be of a quantity and location (FWD or AFT) that supports onboard candle load-out.

15. DISSUB pre and post D7DS supplies:
   a. If total ships manning exceeds designated 153 personnel (SSN 21 and SSN 22) or 220 personnel (SSN 23), refer to OPORD 2000 to determine adjusted quantities of supplies.
   b. If SHIPALT 4731D (SSN 21/22) or SHIPALT 4752D (SSN 23) has not been installed, perform step 7 and omit step 8.
   c. If SHIPALT 4731D (SSN 21/22) or SHIPALT 4752D (SSN 23) has been installed, perform step 8 and omit step 7.
   d. These Pre and Post DISSUB quantities are from COMSUBLANT msg 231132Z Jul 15 and NAVSEA ltr 4700 Ser 391/0348 of 4 Dec15.
APPENDIX B

SSN 688 CLASS SUBMARINE SALVAGE INSPECTION
CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces and buoy cable angle tests require substantial support equipment and are designated for industrial activity accomplishment.

2. Configuration differences are noted as comments in the reference column.

3. Portions of the Salvage Inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as “pre-availability inspections” to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship’s Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC and the Senior Inspecting Officer.

4. The user is directed to use the most latest revision of the PMS maintenance requirement.

6. **External Gagging Devices**:

a. Witness demonstration that all valves with external gagging devices can be gagged from open to shut with the inspecting command’s salvage wrench and with the number of turns specified on the ship’s salvage system arrangement plan. Record number of turns to operate: _____ turns.  
   
   **Notes 2 and 6**

b. Witness resetting of each gagging device and demonstrate satisfactory operation of the valves by normal means.  
   
   **Note 7**

7. **Air Bank Dew Points**:

a. Verify from ships’ records that applicable air bank air sampling maintenance has been completed, is in specification and within required periodicity.  
   
   **Note 5**

b. Perform or witness AHPD Operational Test and Measure Dew point of Effluent.  
   
   **Note 5**

An asterisk (*) will be used in addition to a check mark (✓) in the unsat column to identify any exceptions. An explanation of the exception will be provided with the Salvage Inspection Report, Appendix F of this chapter.
### 8. Towing Equipment

a. Verify from ships’ records that Towing Equipment maintenance has been completed within required periodicity.

</thead>
</table>

1. Submarine Rescue Chamber (SRC) and Submarine Rescue Diving and Recompression System (SRDRS) Fittings:

   a. Verify four rescue vehicle hold-down sockets are installed per plan or authorized alteration on all escape trunk seating surfaces. From one socket per hatch, remove cap screw and plug; demonstrate guide is free.

   - NSTM S9086-T9-STM-010 Chapter 594
   - Ship’s Plans
   - Note 8

   b. Perform inspection of the LETs rescue seating surface.
      1. Remove rescue seating surface protective cover and perform rescue seating surface inspection.
      - Note 5
      2. Verify rescue seating surface PMR’s performed within periodicity.
      - Note 8
      - SMS 1230-081-016
      - SMS 1230-081-046

   c. Remove plug from hatch fairing. Check condition of SRC downhaul shackle. Verify downhaul shackle is free of corrosion and can be operated by hand. Use of plastisol or powder coating on downhaul shackle is not authorized.

   - Ship’s Plans
   - Note 8

   d. AN/BQN-13:
      1. Inspect AN/BQN-13 Beacon to ensure that:
         a. Cable is free of abrasions, cuts or damage.
         b. Cable plug and encapsulation are free of defects.
(c) Unit has no physical damage.

An asterisk (*) will be used in addition to a check mark (✓) in the unsat column to identify any exceptions. An explanation of the exception will be provided with the Salvage Inspection Report, Appendix F of this chapter.

(2) Perform or witness AN/BQN-13 maintenance.

Note 5

### 2. Escape Trunks:

- a. Escape trunk hatch fairings must be maintained in a condition to be easily disassembled to support submarine rescue. Verify Planned Maintenance has been completed within the required periodicity on all escape trunk hatches. Visually inspect escape trunk hatch fairings for compliance with the specifications called out in the PMS. Paint fouling or corrosion of fairing fasteners must be immediately corrected. Demonstrate the ability to remove one fastener in each fairing piece required to be removed in the fairing disassembly procedure.

Note 5

- b. Demonstrate that each access hatch operates satisfactorily with all respects of locking, unlocking, opening, shutting from below and above (with salvage wrench or hand wheel as applicable).

- c. Demonstrate the escape upper hatches have the minimum specified pop-up.

An asterisk (*) will be used in addition to a check mark (✓) in the unsat column to identify any exceptions. An explanation of the exception will be provided with the Salvage Inspection Report, Appendix F of this chapter.

NOTES
(SSID 688 CLASS)

1. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of an availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship’s Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b. and 2.c. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

2. The inspected ship’s, vice the inspecting command’s, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

3. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

4. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

5. The current submarine Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the Salvage Inspection item.

6. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship’s valve drawing.

7. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.

8. Unsatisfactory conditions degrade the SRC or SRDRS capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Par I, Chapter 8 of this manual.

9. Diver’s knife and ballpeen hammer may be stored in secure stowage in escape compartment.

10. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.
11. A minimum of 30 Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON-DISSUB canisters with quantities and location(s) logged by the crew.

12. Oxygen candle quantity and location impacts inspection acceptance criteria:
   a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be stowed forward or aft.
   b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.
   c. Oxygen candle igniters must be of a quantity and location (FWD or AFT) that supports onboard candle load-out.

13. DISSUB pre and post D7DS supplies:
   a. If total ships manning exceeds designated 154 personnel, refer to OPORD 2000 to determine adjusted quantities of supplies.
   b. If SHIPALT 4735, SHIPALT 4812D or A&I N3576 have not been installed, perform step 7 and omit step 8.
   c. If SHIPALT 4735, SHIPALT 4812D and A&I N3576 have been installed, perform step 8 and omit step 7.
   d. These Pre and Post DISSUB quantities are from COMSUBLANT msg 231132Z JUL15 and NAVSEA ltr 4700 Ser 391/0348 of 4 Dec 15.
APPENDIX C

SSBN AND SSGN 726 CLASS SUBMARINE SALVAGE INSPECTION
CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces and buoy cable angle tests require substantial support equipment and are designated for industrial activity accomplishment.

2. Configuration differences are noted as comments in the reference column.

3. Portions of the Salvage Inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as "pre-availability inspections" to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship’s Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC, and the Senior Inspecting Officer.

4. The user is directed to use the most latest revision of the PMS maintenance requirement.

b. Verify from ships’ records that applicable ventilation system bulkhead flapper maintenance has been completed for VH-18 within required periodicity.

Note 6

#### 5. Hull Access Hatches, Watertight Doors and Torpedo Loading Hatches:

- Inspection performed by local PMT.

a. Perform or witness hatch maintenance to complete salvage inspection and reference the PMT annual inspection.

Note 6

#### 6. External Gagging Devices:

a. Witness demonstration that all valves with external gagging devices can be gagged from open to shut with the inspecting command’s salvage wrench and with the number of turns specified on the ship’s salvage system arrangement plan. Record number of turns to operate: _____ turns.

Notes 3, 7 and 8

An asterisk (*) will be used in addition to a check mark (✔) in the unsat column to identify any exceptions. An explanation of the exception will be provided with the Salvage Inspection Report, Appendix F of this chapter.

### 2. Escape Trunks, Logistics Escape Trunks and Forward Lockout Trunks:

#### a. Escape trunk hatch fairings must be maintained in a condition to be easily disassembled to support submarine rescue. Visually inspect escape trunk hatch fairings for compliance with the specification called out in the Submarine Maintenance Standard (SMS). Paint fouling or corrosion of fairing fasteners must be immediately corrected. Demonstrate the ability to remove one fastener in each fairing piece required to be removed in the fairing disassembly procedure.

Note 11
SMS No. 1670-081-011

#### b. Demonstrate that each access hatch operates satisfactorily with all respects of locking, unlocking, opening, shutting from below and above (with salvage wrench or hand wheel as applicable).

#### c. Demonstrate the escape upper hatches have the minimum specified pop-up.

#### d. Demonstrate satisfactory operation of the escape hatch closing mechanisms per the installed instruction plates and equipment.

An asterisk (*) will be used in addition to a check mark (✓) in the unsat column to identify any exceptions. An explanation of the exception will be provided with the Salvage Inspection Report, Appendix F of this chapter.

#### e. Demonstrate satisfactory installation of Improved Powered Hatch Operator with intensifier and compensator as one mode of hatch operation of Logistics Escape Trunks.

1. Verify inventory of all parts.

2. Verify periodic pressure testing of hoses.
3. Verify assembly of intensifier and gearbox to upper hatch operator.
4. Verify installation of upper hatch operator compensator.
5. Demonstrate satisfactory operational check of intensifier pump and gears.

#### f. Demonstrate satisfactory operation and examine the condition of the following equipment:

1. Vent valves (trunk and compartment).
2. Blow valves (trunk and compartment).
3. Flood and drain valves (including remote operation mechanisms and strainer installations).

An asterisk (*) will be used in addition to a check mark (✓) in the unsat column to identify any exceptions. An explanation of the exception will be provided with the Salvage Inspection Report, Appendix F of this chapter.

NOTES
(SSFN AND SSGN 726 CLASS)

1. Reach rods, universal joints, and connecting links in the superstructure should be secured with non-corrosive pins. Inspect valve stems for misalignment and ensure that reach rod connection is one of square socket design with the non-corrosive pin used only to secure the reach rod to the universal.

2. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of an availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship’s Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b., 2.c. and 2.d. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

3. The inspected ship’s, vice the inspecting command’s, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

4. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

5. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

6. The current submarine Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the Salvage Inspection item.

7. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship’s valve drawing.

8. Prior to testing Outboard Diesel Exhaust Valve, ensure replacement locking pin is available onboard.

9. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve
subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.

10. Unsatisfactory conditions degrade the SRC or SRDRS capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Part I, Chapter 8 of this manual.

11. One or more of the Logistics and Escape Trunks (LET) will be removed during refit. When removed, the LET is isolated from service air and electric power. Communications circuits, electrical power and charging manifold tests should be conducted prior to LET removal to ensure piping and electrical system continuity, and tested again upon reinstallation.

12. Diver’s knife and ballpeen hammer may be stored in secure stowage in escape compartment.  

13. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.

14. A minimum of 30 (SSBN) or 67 (SSGN) Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON-DISSUB canisters with quantities and location(s) logged by the crew.

15. Oxygen candle quantity and location impacts inspection acceptance criteria.
   a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be towed forward or aft.
   b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.
   c. Oxygen candle igniters must be of a quantity and location (FWD or AFT) that supports onboard candle load-out.

16. DISSUB pre and post D7DS supplies:
   a. If total ships manning exceeds designated 165 personnel (SSBN) or 166 personnel (SSGN), refer to OPORD 2000 to determine adjusted quantities of supplies.
   b. If TZ-0951 (SSGNs), or TZ-0937B, or TZ-0957A (SSBNs) have not been installed, perform step 7 and omit step 8.
   c. If TZ-0951 (SSGNs), or TZ-0937B, or TZ-0957A (SSBNs) have been installed, perform step 8 and omit step 7.
   d. These Pre and Post DISSUB quantities are from COMSUBLANT msg 231132Z JUL15 and NAVSEA ltr 4700 Ser 391/0348 of 4 Dec 15.
APPENDIX D

SSN 774 CLASS SUBMARINE SALVAGE INSPECTION
CHECK-OFF LIST

General Information

1. Items pertaining to rescue seating surfaces and buoy cable angle tests require substantial support equipment and are designated for industrial activity accomplishment.

2. Configuration differences are noted as comments in the reference column.

3. Portions of the Salvage Inspection (as specified by the maintenance activity) may be conducted prior to the start of CNO availabilities as “pre-availability inspections” to support planning of the availability. These items need not be re-inspected provided no work was performed during the availability which affects their status. When specified, these items will be performed by Ship’s Force and written certification by the Commanding Officer provided to the maintenance activity, the ISIC, and the Senior Inspecting Officer.

4. The user is directed to use the most latest revision of the PMS maintenance requirement.

An asterisk (*) will be used in addition to a check mark (✓) in the unsat column to identify any exceptions. An explanation of the exception will be provided with the Salvage Inspection Report, Appendix F of this chapter.
NOTES
(SSN 774 CLASS)

1. All high and low salvage valves are to be tested for freedom of operation at the frequency specified, except during the salvage inspection conducted incident to an overhaul. Salvage Air valve testing completed up to one year prior to the start of availability will satisfy the salvage inspection requirements provided that certified records verifying the tests are available. Written certification by the Commanding Officer that specified external salvage valves have been overhauled by the industrial activity or Ship’s Force and have been successfully hydrostatically tested will constitute certification that the valve operates freely, providing all inspections (Part I, items 2.b. and 2.c. of this Appendix) for each valve so certified are satisfactory. If the results of the inspection of operating gear are not satisfactory, or doubt exists concerning freedom of operation, the specific valves in question must be checked. Provide appropriate container for collecting anti-freeze drained from salvage piping when hull valve is cycled. Ensure controlled re-assembly per Quality Assurance requirements is performed when installing salvage caps. Exercise caution to prevent liquid in salvage air piping from impinging on nearby equipment when hull valve is cycled. Ensure anti-freeze is added to piping after inspection to prevent freezing.

2. The inspected ship’s, vice the inspecting command’s, salvage wrench must be used if the inspecting command is another submarine. Discrepancies in the actual, versus plan, number of turns which are greater than one full turn must be noted in addition to the number of actual turns recorded.

3. “J” pressure or seat tightness testing is not required for new construction ships.

4. Discrepancies between physical installation and salvage plans are to be reported to the TYCOM with an information copy to all plan holders.

5. Exercise extreme caution when testing operation of 4500-psi compartment pressurization valves.

6. The current submarine Salvage Inspection PMS Conversion Matrix is available on the JFMM web site at https://www.navsea.navy.mil/Home/SUBMEPP/Products/JFMM/ under the TYCOM Doc/Form tab for PMS completion of the Salvage Inspection item.

7. When inspecting the gagging gear for the inboard ventilation exhaust valve and the inboard ventilation induction valve, the valve linkages must be inspected and the valves must be adjusted per the requirements in the Non-Primary Plant Valves Technical Manual or individual ship’s valve drawing.

8. Prior to testing Outboard Diesel Exhaust Valve, ensure replacement locking pin is available onboard.

9. On some designs, operation of the gagging device overrides the regular operating gear of the valve indicator in such a manner that the entire mechanism must be reset or readjusted before the normal operating gear or the valve position indicator will function as intended. If the gagging mechanism is operated or used for any reason, the mechanism must be reset and the valve subsequently opened and closed by the normal operating gear in every manner in which the gear is designed to function to ensure the valve is in proper operating condition.
10. Unsatisfactory conditions degrade the SRC or SRDRS capability and require a CASREP be submitted per reference (a), and additional DFS reporting requirements per Volume V, Part I, Chapter 8 of this manual.

11. One or more of the Logistics and Escape Trunks (LET) will be removed during refit. When removed, the LET is isolated from service air and electric power. Communications circuits, electrical power, and charging manifold tests should be conducted prior to LET removal to ensure piping and electrical system continuity, and tested again upon reinstallion.

12. Diver’s knife and ballpeen hammer may be stored in secure stowage in escape compartment.

13. Man overboard swimmer to be competent as a swimmer or qualified diver as designated by Commanding Officer per MILPERS MAN Art. 1414-010 Series.

14. DISSUB D7DS supplies:
   a. If total ships manning exceeds designated 132 personnel, refer to OPORD 2000 to determine adjusted quantities of supplies.
   b. These DISSUB quantities are from SUBLANT msg 23113Z JUL15 and NAVSEA ltr 4700 Ser 391/0348 of 4 Dec15.

15. A minimum of 30 Granular LiOH canisters are required onboard to support NON-DISSUB applications and may be stowed forward or aft. LiOH canisters reserved for DISSUB must be segregated from NON-DISSUB canisters with quantities and location(s) logged by the crew.

16. Oxygen candle quantity and location impacts inspection acceptance criteria.
   a. Mission appropriate oxygen candle quantities reserved for NON-DISSUB must be in excess of quantities reserved for DISSUB. Oxygen candles supporting NON-DISSUB applications may be stowed forward or aft.
   b. Oxygen candles reserved for DISSUB must be segregated from NON-DISSUB candles with quantities and location(s) logged by the crew.
   c. Oxygen candle igniters must be of a quantity and location (FWD or AFT) that supports onboard candle load-out.

(b) NAVSEA S9086-HK-STM-010 - NSTM Chapter 241 (Propulsion Reduction Gears, Couplings, Clutches and Associated Components)
(c) NAVSEA S9086-HN-STM-010 - NSTM Chapter 244 (Propulsion Bearings and Seals)

LISTING OF APPENDICES.

A Bearing Log (Submarines Only)

19.1 PURPOSE. This chapter provides a listing of the inspection reports and equipment records, including the retention requirements, which must be maintained by each ship.

19.2 INSPECTION REPORTS. A copy of each of the following inspection reports will be retained until superseded by a subsequent report:

a. Board of Inspection and Survey Inspection Reports.
b. Hull Surveys.
c. Salvage Inspections.
d. Docking Reports (CNO Maintenance Availability to CNO Maintenance Availability).
e. Turbine Lifting and Repair Reports.
f. Technical Assistance Reports by System Commands, Naval Sea Systems Command Technical Representatives, etc.
g. Boiler Inspection Reports (retained until equipment is transferred or vessel is stricken. May be discarded if old data is incorporated in a new report).
h. Battery Inspection Reports.
i. Diesel Engine Inspection Reports since last overhaul and associated Naval message on the status of discrepancies.
j. Main and Air Ejector Condenser Eddy Current (Probalog) Reports.

19.3 RETENTION OF RECORDS OF EQUIPMENT CHARACTERISTICS AND TESTS. The following records will be maintained onboard until superseded:

a. Anti-Submarine Warfare Test Program Reports.
b. Structureborne, Airborne and Waterborne Noise Reports.
c. (Submarine Force surface units only) Radar, Radio and Acoustic Radiation Patterns.
d. Equipment Calibration and Alignment Graphs and Charts.
e. Antenna and Superstructure Arrangement Photographs.
f. Record of Shipboard Tests.
g. Lube Oil and Trend Analysis Reports.
h. Battery Record Book (test discharges, etc.).
i. Diesel trend analysis records inspection reports since last overhaul and associated Naval message on the status of discrepancies.
j. (Submarines only) Remote Temperature Element (RTE) Alarm Set point, Bearing Maximum Operating Temperature, Proximity to RTE Alarm, Installed Bearing Clearance, Actual Bearing Clearance, Bearing Replacement Clearance, Stamped Depth and Thrust Constant, Depth Micrometer Reading, and calculated bearing Wear for Main Thrust Bearings, Main bearings and Journals (required by reference (a) 231-7.2.1) for:
   (1) Main Propulsion Shafting.
   (2) Main and Auxiliary Engines.
   (3) Main Propulsion Motors and Generators.
   (4) Ship Service Turbine Generators.
   (5) Reduction Gear (RTE Alarm Set point and Bearing Maximum Operating Temperature only).

Appendix A will be used to record data.
k. Readings and Clearances for Main Bearings and Journals:
   (1) Rudder and Diving Planes.
   (2) Diesel Generator Bearings.
l. Navigational Light Certification.
m. Equilibrium Diagram.
n. Panama Canal Tonnage Certification.
o. Aviation Helicopter Certification.
p. Weight Handling Equipment Certification.
q. Cavitation Curves.
r. Machinery or Vibration Survey Results.
s. (SSN, SSBN, and SSGNs only) Resistance Test Records must be maintained for the following equipment in the Electrical Work Centers PMS Space Manual:
   (1) Ship’s Service Turbine Generators.
   (2) Ship’s Service Motor Generators.
   (3) 400 Hz Motor Generators.
   (4) Emergency Diesel Generators.
(5) Emergency Propulsion Motors.
(6) Secondary Propulsion Motors.
(7) Trim and Drain Pump Motors.
(8) Main and Shaft Lube Oil Pump DC Motors.
(9) High Pressure Brine Pump Motors.
(10) Low Pressure Blower Motors.
## BEARING LOG

Bearing: __________________________  Ship: __________________________

</tr>
<tr>
<td>Date</td>
<td>Data Taker (Print Name)</td>
<td>Data Taker (Print Rate)</td>
<td>Data Taker Signature</td>
<td>Max Allowable Wear (Wmax)</td>
</tr>
</tbody>
</table>

Notes:

For thrust bearings, record the measured thrust clearance in column 7 and maximum thrust specification in column 5.

RTE Set points are:
- 270ºF for Main propulsion turbine and SSTG thrust bearings.
- 250ºF for Main propulsion turbine and SSTG journal bearings.

For remaining propulsion plant bearings, 30ºF higher than the maximum observed during Sea Trials or the applicable HM&E Test Procedure (i.e., SUBMEPP Test Procedure or annual MRC to verify Set points).
<table>

<td>Comments: Date each entry. Note the serial number (if any) of this bearing, date of any bearing replacement, nonstandard dimensions, applicable Liaison Action Requests, Departure From Specification if approved, unusual conditions of journal or bearing (if opened), any additional or abnormal readings taken, recent temperatures for this bearing, temperature of lube oil cooler outlet used to set RTE alarm, or any other notes that may be helpful in the future.</td>
</tr>
</tbody>
</table>
BEARING LOG INSTRUCTIONS

Fill out for each Main Engine, Reduction Gear, Line Shaft, and SSTG Bearing. A logbook should have a section for each piece of equipment (Port and Stbd SSTG, Port and Stbd Main Engine, Reduction Gear, and Line Shaft). To fill out the log, complete the following entries:

1. **Name of ship and hull number**: i.e., USS *SEAWOLF*, SSN 21
2. **Bearing Name and location**: i.e., #1 Propulsion turbine forward journal bearing.
3. **Name and date**: Print the data takers name and the date data was recorded.
4. **Data Taker Signature**: Signature of data taker.
5. **Max Allowable Bearing Wear (Wmax)**: The maximum increase in depth micrometer measurement above the stamped depth constant.
6. **Stamped Depth and Thrust Constant (DC) or Bearing Constant**: The depth micrometer reading taken when this bearing was installed, aligned and bolted down. It is found stamped on the bearing bracket near the depth micrometer hole. Thrust constants are normally not stamped. These must be obtained from builders new construction completed test procedures on microfiche or repair activity work documents when replaced.
7. **Depth Micrometer Reading (MR)**: Depth measurement taken between machined surface of bearing bracket and top of rotor journal.
8. **Measured Wear (W)**: Measured bearing wear. Calculated as W = MR-DC. (MR = Depth micrometer reading, DC = Stamped depth constant.) If the measured bearing wear (W) is greater than the maximum allowable wear (Wmax) or wear limit per applicable PMS MRC, then the bearing must be disassembled, inspected and repaired or replaced.
9. **RTE Alarm Set point (ASP)**: As determined by reference (a) (231-3.10.3.4.3, 231-3.10.3.4.4, and Table 231-3-2) and ships operating logs or by approved shipyard or repair activity test procedure meeting the requirements of the Naval Ships’ Technical Manual (NSTM) or SUBMEPP test procedure.
10. **Bearing Full Load Maximum Operating Temperature (Tmax)**: The maximum operating temperature noted on the bearing during Post Construction or Overhaul Sea Trial testing following a SUBMEPP or Shipyard test procedure or the latest performance of RTE testing per appropriate NSTM or PMS MRC. The temperature should be compared to observed temperatures during normal ships operations for abnormalities.
11. **Alarm Safety Margin (ASM)**: Calculated as ASM = ASP - Tmax (ASP = Alarm Set point, Tmax = Maximum normal operating temperature). If the alarm set point does not meet the requirements of NSTM references (a), (b) or (c), as applicable, reset the alarms per the NSTM or SUBMEPP test procedure or PMS MRC, as required, following the guidance of the NSTM.
12. **Comments**: Date each entry. Note the serial number (if any) of this bearing, date of any bearing replacement, nonstandard dimensions, applicable Liaison Action Requests, Departure From Specification if approved, unusual conditions of journal or bearing (if opened), any additional or abnormal readings taken, installed (assembled clearances) and
maximum clearances if the bearing is installed by Ship’s Force, recent temperatures for this bearing, temperature of lube oil cooler outlet used to set RTE alarm, or any other notes that may be helpful in the future and applicable PMS MRC. Installed assembly documentation is not required to be retained in this log if bearing removal and installation was performed by an IMA, IMF, Regional Maintenance Facility or a Shipyard since data is maintained by those installations and can be obtained by the ship, if required, via ISIC. Ships are required to obtain initial depth micrometer readings to ensure stamped depth constant is updated any time a bearing is rolled out.

(e) NAVSEA 00C Instruction 10560.2 - Diving Equipment Authorized For Navy Use (ANU) Program

LISTING OF APPENDICES.
A System Safety Certification Verses Authorized for Navy Use Requirements Matrix

20.1 PURPOSE. To provide guidance for the proper administration of a uniform maintenance program in support of the certification requirements for Diver Life Support Systems (DLSS).

20.2 DIVER LIFE SUPPORT SYSTEM MAINTENANCE AND CERTIFICATION.

20.2.1 General. This chapter of the JFMM is intended to cover all afloat, portable and shore-based diving and manned hyperbaric systems capable of supporting one or more divers, operators or occupants embarked in wet or dry pressurized environments which are certified per reference (a) by either the NAVSEA 00C4 or NAVFAC OFP Certification Authority. Submarine based diver life support systems such as Dry Deck Shelter (DDS), Virginia Class Lock-Out Trunks (LOTS), SSGN Lock-Out Chambers (LOCS) and Submarine Rescue Chamber (SRC) are handled by a Deep Submergence Systems (DSS) System Safety Certification program under NAVSEA 07Q4. These type of deep submergence systems are addressed in Volume V, Part III of the JFMM.

20.2.2 Objective. The objective of system certification is to verify, by use of an independent technical review, that a diving system provides acceptable levels of personnel safety throughout its specified operating range, when approved operating and maintenance procedures are followed. This review is accomplished by performing a detailed assessment of the material and procedural adequacy of the system. The certification process establishes maximum reasonable assurance that diving system personnel can be recovered without injury. Certification of a diving system does not relieve its operators from the responsibility of maintaining system safety on a continuing basis. System certification cannot positively ensure that an accident will not happen; it is, however, intended to provide “maximum reasonable assurance” that a catastrophic or critical accident will not occur.

20.2.3 United States Navy Diving and Manned Hyperbaric Systems Safety Certification. The requirements, procedures and guidance for the administration of the certification program for all
portable, surface ship afloat and shore-based DLSS must be per reference (a). In addition, references (b) through (e) provide further key guidance related directly to various aspects of DLSS.

a. Reference (a) provides a single document which:

(1) Identifies the administrative and technical requirements leading to the initial dive system material and system certification.

(2) Documents the requirements for maintaining satisfactory material and operability conditions to support continued Unrestricted Operation to design depth.

(3) Identifies the responsibilities for implementing and executing the certification program policies and procedures.

(4) Provides procedures for requesting waivers to approved operating and maintenance procedures, and for departures from approved system design.

(5) Provides standardization for re-entry control (REC) procedures. These procedures provide the necessary instructions for maintaining the DLSS in the “as certified” condition. It is mandatory that these procedures be followed for any activity conducting work within the DLSS Scope of Certification (SOC).

b. Reference (b) provides a wide variety of information, including diving system design, configuration management, materials, toxicity, flammability, pressure vessels, lubrication, construction, testing, QA, traceability and repair. It is intended to be used by the various U.S. Navy diving communities in case their existing system specific design documentation does not specifically address their particular need or application.

c. Reference (c) supplements reference (b) providing specific building requirements for ashore manned hyperbaric systems.

d. Reference (d) establishes Navy-wide diving program policy, requirements and guidance for the development, oversight and operation of all Navy diver DLSS and associated support systems and processes. It specifically delegates System Certification Authority to Commander, Naval Sea Systems Command for all portable and afloat systems and to Commander, Naval Facilities Engineering Command for all shore-based systems. Also, reference (d) identifies the Authorized For Navy Use (ANU) program for authorizing the use of diving life support and non-life support equipment. The ANU process for evaluating equipment for inclusion on the ANU is described in reference (e). The Appendix A matrix identifies what type of DLSS equipment is being handled by ANU or System Safety Certification program(s) as a general guide.

### Notes:

1. Certification may be required for initial use.

2. When compressor or diving air systems are permanently installed as components of a diving or recompression system, they must be included in the SOC. The Commanding Officer or Officer In Charge must ensure that compressors and diving equipment are properly installed and maintained per reference (a).

21.1 PURPOSE. To establish the prerequisites and procedures for qualification of personnel, operation and maintenance of shipboard submarine oxygen generating plants designated 6L16 Electrolytic Oxygen Generators (EOG), 6L16 Automated Electrolytic Oxygen Generators (AEOG), Low Pressure Electrolyzers (LPE) and Integrated Low Pressure Electrolyzers (ILPE).

21.1.1 Policy. Type Commander (TYCOM) policy regarding the operation and maintenance is:

a. All current technical documentation must be available at the oxygen generator for operator use. As a minimum, the on hand documentation will include reference (a), (b), (c) or (d), as required, and the MRCs that support the installed unit.

b. Planned Maintenance System (PMS) must be maintained current to the latest Periodic Force Revision and all scheduled and situational planned maintenance requirements must be accomplished.

NOTE: OXYGEN GENERATOR OPERATORS AND MAINTENANCE TECHNICIANS MUST BE LIMITED TO THOSE INDIVIDUALS HOLDING THE NAVY ENLISTED CLASSIFICATIONS (NEC) REQUIRED BY REFERENCE (e) FOR THE TYPE OF OXYGEN GENERATOR PLANT OPERATED OR MAINTAINED. REFERENCE (e) REFERS.
c. At least two qualified operators and one qualified technician must be onboard during oxygen generator operation. Two qualified operators meet this requirement if at least one of the operators is also a qualified maintenance technician.

d. **Safety related deficiencies must be corrected prior to oxygen generator operation.**

e. There must be a minimum of two qualified Oxygen Clean Workers on board to conduct maintenance on oxygen systems and the oxygen generator (except submarines with LPEs and ILPEs).

f. For *Virginia* Class submarines, the following hulls must be required to maintain a minimum of two qualified Oxygen Clean Workers on board: SSN 776, SSN 777, SSN 778, SSN 779, SSN 782 and SSN 784 or as determined by TYCOM.

21.1.2 **Background.**

a. Oxygen generator casualties result primarily from improper maintenance, operation or insufficient operator familiarization with current operating instructions and safety precautions. The recurring nature of these casualties necessitates that positive action be taken to ensure operating and maintenance personnel are properly trained and qualified. Additionally, technical documentation must be continuously updated for use by the ship’s oxygen generator operating, maintenance and support personnel.

b. Naval Sea Systems Command (NAVSEA) and TYCOM Technical Notices and Advance Change Notices (ACN) provide the Fleet with the latest technical information and operating instructions concerning oxygen generators. These Notices and ACNs will remain in effect until cancelled by a subsequent Notice or ACN, or are incorporated as a revision to the applicable technical manual.

21.2 **RESPONSIBILITIES.**

21.2.1 **Immediate Superior In Command.**

a. Ensure assigned units are in compliance with the policy stated in paragraph 21.1.1 of this chapter.

b. Conduct periodic inspections and audits to ensure that:

(1) Operating and maintenance personnel proficiency is being maintained.

(2) Technical manuals, operating and maintenance notices and PMS documentation are current.

(3) Operation and maintenance is per this chapter, reference (a), (b), (c) or (d), as required, and the supporting PMS.

c. Ensure Performance Monitoring Team (PMT) inspectors perform material inspections of the ship’s oxygen generators approximately 90 days prior to entry and departure from a Chief of Naval Operations (CNO) Maintenance Availability. The material inspection, prior to the availability, will identify material deficiency corrective actions which must be corrected prior to completion of the availability.
21.2.2 Performance Monitoring Team.
   a. Conduct periodic and pre and post-CNO Maintenance Availability material inspections. Ensure a review of the inspected units Material Maintenance Log is part of the material inspection.
   b. Initiate a quarterly monitoring program for those units receiving an unsatisfactory grade during the material inspection. Maintain the units on the quarterly monitoring program until two consecutive satisfactory evaluations, with no safety related deficiencies noted.
   c. Provide copies of all reports following material inspections, monitoring periods and On Site Analysis Reports to the TYCOM and the ISIC.
   d. Ensure appropriate TYCOM personnel are contacted regarding safety related issues.
   e. Conduct an operational inspection following the applicable PMS prior to Fast Cruise during a CNO Maintenance Availability. Conduct oral interviews with all oxygen generator qualified personnel to determine individual knowledge levels and training effectiveness. The operational inspection will include:
      (1) Start up checks.
      (2) Power-Off maintenance check out.
      (3) Start up.
      (4) Operation to maximum allowable amperage.
      (5) Performance of operational PMS.
      (6) Shutdown.
      (7) Placement in a static condition and restarted.
      (8) Shutdown and purge complete.

21.2.3 Commanding Officer.
   a. Report reduced status following established procedures any time the personnel requirements stated in paragraphs 21.1.1.c and 21.1.1.e of this chapter cannot be met.
   b. Implement and execute a shipboard training program to qualify and maintain oxygen generator personnel qualifications.
   c. Prohibit operation of the oxygen generators if shipboard procedures are not in compliance with this chapter and reference (a), (b), (c) or (d), as required.
   d. Ensure the Oxygen Generator Material Maintenance Log is maintained and correctly reflects all corrective and planned maintenance performed.
   e. Ensure periodic reviews of the Oxygen Generator Material Maintenance Logs are conducted by the Division Leading Petty Officer, Division Officer and Engineer Officer.
   f. Ensure all safety related deficiencies are promptly entered into the Equipment Status Log.
g. Prior to a CNO Maintenance Availability, ensure the PMT conducts a material inspection of the oxygen generators. Ensure oxygen generators are placed into Lay Up and adequately protected following Inactive Equipment Maintenance requirements.

h. Ensure PMT conducts a Post-CNO Maintenance Availability material inspection prior to placing the oxygen generators in electrolysis.

i. Ensure the PMT conducts an operational inspection per paragraph 21.2.2.e of this chapter prior to commencing Fast Cruise during a CNO Maintenance Availability. Oxygen generators will be operated by Ship’s Force qualified operators as described in paragraph 21.1.1 of this chapter. The oxygen generators will be in a static shutdown condition, pressurized with nitrogen and meet the 3000 PSIG testing requirements of reference (a), (b), (c) or (d), as required.

j. Ensure electrolysis is secured and units are placed in a safe condition prior to commencing any training drill which may cause a “loss of power” casualty (either normal or alternate power). If the oxygen generators are to be placed in a static condition for the duration of the training drill, ensure normal power will be restored to restart electrolysis, or alternate power will be available to conduct a complete purge, prior to the expiration of the 45-minute hold limitations of reference (a), (b), (c) or (d), as required.

21.3 REQUIREMENTS FOR SHIPBOARD PERSONNEL QUALIFICATION.

21.3.1 Training. Oxygen generator operators and maintenance technicians must be graduates of the training courses required for the appropriate NEC per the requirements of reference (e).

NOTE: PERSONNEL QUALIFIED TO PERFORM MAINTENANCE ON THE OXYGEN GENERATOR MUST ALSO BE GRADUATES OF OXYGEN CLEAN WORKER SCHOOL (EXCEPT SUBMARINES WITH LPEs AND ILPEs).

a. The NECs required for EOG installations:
   (1) NEC 4252: An individual certified to this NEC will have successfully completed EOG Operator and Maintenance Course A-852-0050.
   (2) NEC 4752: An individual certified to this NEC will have successfully completed EOG Operator and Technician Course A-623-0039.

b. The NECs required for AEOG installations:
   (1) NEC 4208: An individual certified to this NEC will have successfully completed AEOG Operation and Mechanical Maintenance Course A-652-0087.
   (2) NEC 4708: An individual certified to this NEC will have successfully completed AEOG Electrical and Electronic Maintenance Course A-623-0008.

c. The NECs required for LPE installations:
   (1) NEC 4253: An individual certified to this NEC will have successfully completed LPE Operation and Mechanical Maintenance Course A-652-0190.
IV-21-5

(2) NEC 4653: An individual certified to this NEC will have successfully completed LPE Electrical and Electronic Maintenance Course A-623-0050.

d. The NECs or course completion required for ILPE installations:

(1) An individual certified by either holding NEC 4234 or successful completion of ILPE Operation and Mechanical Maintenance Course A-652-0093.

(2) NEC 4641: An individual certified to this NEC will have successfully completed ILPE Electrical and Electronic Maintenance Course A-623-0132.

21.3.2 Watchstanding Prerequisites. Prior to being certified as qualified for oxygen generator watches, the following watchstander prerequisites must be met:

a. For 6L16 NEC 4252: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway, with the oxygen generator(s) in operation.

b. For 6L16 NEC 4752: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only. Technicians qualifying as operators are governed by paragraph 21.3.2.a of this chapter.

c. For AEOG NEC 4208: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway with the oxygen generator(s) in operation.

d. For AEOG NEC 4708: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only; technicians qualifying as operators are governed by paragraph 21.3.2.c of this chapter.

e. For LPE NEC 4253: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway with the oxygen generator(s) in operation.

f. For LPE NEC 4653: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only; technicians qualifying as operators are governed by paragraph 21.3.2.e of this chapter.

g. For ILPE NEC 4234 or successful completion of course A-652-0093: Stand watches, under instruction, for a minimum of three (3) six (6) hour watches underway with the oxygen generator(s) in operation.

h. For ILPE NEC 4641: Stand watches, under instruction, for a minimum of one (1) start-up, one (1) shutdown and purge, and one (1) three (3) hour watch underway with the oxygen generator(s) in operation. For technicians, this is a familiarization watch only; technicians qualifying as operators are governed by paragraph 21.3.2.g of this chapter.

i. Demonstrate an understanding of the approved NAVSEA Oxygen Generator Log Sheets, including the significance of data recorded and operational limits.
j. Demonstrate a knowledge of corrective action(s) to be taken in the event of sudden changes in equipment operating parameters.

k. Successfully complete qualifications for the oxygen generator and support systems per references (f) through (j).
REFERENCES.
(a) NAVSEA S9425-CG-STD-010 - Installation Standards for Submarines

22.1 PURPOSE. To provide Type Commander policy with respect to pressure testing submarine communication antennas and Photonics systems. This policy is not applicable to periscopes, radar antennas and other non-communication masts and cabling. Amplifying information is contained in reference (a).

22.2 BACKGROUND. Submarine antenna and Photonics systems associated cable connections between the antenna and electrical hull fitting are sensitive to seawater intrusion. In the event that seawater enters an electrical hull fitting, radome or other powered component and the system is subsequently powered-on or used for transmission, significant component damage may occur.

22.3 POLICY.

22.3.1 Hydrostatic Pressure Testing.

a. Hydrostatic pressure testing of submarine antennas with cables attached prior to initial installation (or after any maintenance actions that requires the disassembly of the antenna) is mandatory except for buoys and floating wires. This pre-installation test is intended solely to verify the correctness of the final assembly and does not equal or replace the more elaborate acceptance testing required for various individual manufactured components. Submarine communications antennas that are required to be hydrostatic pressure tested are:

NOTE: ALL OE-538/592 MAST ARE HYDROSTATICALLY TESTED AT EITHER THE OE-538/592 DEPOT OR WATERFRONT I-LEVEL FACILITY.

(1) Multifunction Masts, OE-538 (SSNs) and OE-592 (SSBNs and SSGNs).

NOTE: ALL SUBHDR MASTS ARE HYDROSTATICALLY TESTED AT THE SUBHDR NATIONAL MAINTENANCE CENTER (NMC) PRIOR TO BEING ISSUED TO THE FLEET FOR INSTALLATION.

(2) Submarine High Data Rate Mast, OE-562 (SubHDR).

b. Buoys that are excluded are:

(1) Submarine Launched One-Way Tactical (SLOT) Buoys (AN/BRT-1 and AN/BRT-1A).

(2) Submarine Emergency Position Indicating Radio Beacon (SEPIRB) Buoy (T-1630/SRT or T-1630A/SRT).

c. All versions of Floating wires are excluded (i.e. Buoyant Cable Antennas).
NOTE: THE TOWED BUOY ANTENNA, AN/BRR-6 (SSBN 730 - 738) AND THE AN/BRR-6B (SSBN 739 - 743) WILL BE HYDROSTATIC TESTED BEFORE INSTALLATION ACCORDING TO THE MAINTENANCE MANUAL.

22.3.2 Fleet Maintenance. Maintenance actions conducted by Fleet Maintenance Activities or Ship’s Force regarding the watertight integrity test requirements between submarine antennas and their respective hull connectors, must be:

a. When the antenna or cable is disconnected or replaced shipboard, the Technical Work Document will include the following checks in the assembly procedure to reconnect the cable to the base of the antenna or electrical hull fitting:

(1) Craftsman verification that surface finishes of O-ring seating surfaces are per applicable specifications.

(2) Craftsman verification that the O-ring is properly installed and per applicable specifications.

(3) For submarine SubHDR and Photonics systems outboard cable removal and replacement, accomplish per Volume V, Part I, Chapter 7, Appendix B, NOTE 31 of this manual.

b. Prior to performing a deep dive certification after a maintenance action, passive testing or pre-energize testing, or both, must be performed following the system specific Technical Manual, SUBMEPP approved Maintenance Standard, SUBMEPP approved Standard Test Procedure or Maintenance Requirement Card (MRC) to ensure the system is not grounded prior to use.

c. Upon completion of a deep dive certification for a maintenance action, passive testing, pre-energize testing, or both, must be performed following the system specific Technical Manual, SUBMEPP approved Maintenance Standard, SUBMEPP approved Standard Test Procedure or MRC to ensure the system is not grounded prior to use.

22.4 PROCEDURE.

a. Upon completion of maintenance and before underway for submerged operations, the ship must place CAUTION tags on the Main Power Switch or transmit keys for the affected antennas. The Amplifying Instructions for the CAUTION tags will state - “DO NOT OPERATE OR TRANSMIT ON THIS ANTENNA UNTIL COMPLETION OF PASSIVE CHECKS FOLLOWING A DIVE TO TEST DEPTH. PASSIVE CHECKS MUST BE PERFORMED PRIOR TO EACH USE UNTIL THE DEEP DIVE IS COMPLETE.”

b. It is understood that in some cases, due to water depth restrictions, the deep dive may not be performed for quite some time. In these cases, the ship should dive to the maximum depth possible and conduct passive checks. Provided the checks are satisfactory, the CAUTION tag may be replaced with one stating - “DO NOT OPERATE OR TRANSMIT ON THIS ANTENNA FOLLOWING OPERATIONS GREATER THAN (enter max depth obtained). PASSIVE CHECKS MUST BE PERFORMED PRIOR TO EACH USE UNTIL THE DEEP DIVE IS COMPLETED.”
c. The tag(s) may be removed following completion of a deep dive to test depth and completion of satisfactory passive testing performed following the system specific technical manuals or Maintenance Index Pages and MRCs to ensure the system is not grounded.
REFERENCES.

(a) OPNAVINST 9220.3 - Propulsion and Auxiliary Plant Inspection and Inspector Certification Program
(b) NAVSSES 9332-GGTB 11 - General Gas Turbine Bulletin Number 11 (Gas Turbine Fleet Representatives)
(c) NAVSEA S9086-HC-STM-000 - NSTM Chapter 234 (Marine Gas Turbines)
(d) NAVSSES 9352-GGTB 0 - General Gas Turbine Bulletin Number 0 (Technical Directive Zero Index)
(e) NAVSSES 933-GGTB 3 - General Gas Turbine Bulletin Number 3 (Marine Gas Turbine Logbook and Service Records)
(f) OPNAVINST 3120.32 - Standard Organization and Regulations of the U.S. Navy

23.1 PURPOSE. The Marine Gas Turbine Inspector (MGTI) program is intended to provide for the timely identification of discrepancies prior to Planned Major Maintenance Availabilities, deployments, when mandated by operating hour requirements and to provide technical assistance to operational units when so directed by the Type Commander (TYCOM). This chapter provides the guidance for Marine Gas Turbine inspection requirements, including preparation, procedures, criteria and reporting and is applicable to all gas turbines on fleet surface, amphibious and auxiliary platforms and craft.

23.2 DISCUSSION. It has long been the Navy’s practice for Ship’s Force to accomplish as many repairs as possible at the organizational or intermediate levels. This maintenance philosophy requires trained and experienced personnel, capable of identifying problems so that planned and corrective measures can be recommended, planned for and accomplished in a timely manner. To address the need for experienced personnel the MGTI program has been developed. Reference (a) provides the details for the MGTI program.

23.3 MARINE GAS TURBINE INSPECTOR.

23.3.1 Certification. MGTI inspector certification and recertification requirements outlined in reference (a) are amplified as listed in sub-paragraphs “a” through “e”:

a. MGTIs function as the Naval Sea Systems Command (NAVSEA) Technical Representatives. All their technical decisions and recommendations are made in concert with and fully supported by their appropriate Regional Maintenance Center (RMC).

b. Upon verification of competency, Naval Surface Warfare Center, Philadelphia Division (NSWCPD) will issue a 36-month certification. Certification will remain valid provided the MGTI conducts at least two (any combination) of the following: Gas Turbine Readiness Reviews (GTRR), Assessments, pre-deployment inspection, pre-Planned Major Maintenance Availability inspection and attends one MGTI seminar during the previous 12 months.
c. MGTI certifications will be extended in 18-month intervals. Requests for extension must be submitted to NSWCPD with info to NAVSEA 05Z via the TYCOM. By endorsement, the Commanding Officer will certify that the MGTI meets the requirements of paragraph 23.2.1.b of this chapter. A MGTI whose certification has lapsed or been suspended will be required to recertify, under procedures established by NSWCPD, on a case-by-case basis.

d. Commanding Officers will ensure MGTIs are afforded the opportunity to attend MGTI seminars and maintain certification. Commanding Officers are also encouraged to nominate to the TYCOM motivated and capable technicians for certification as MGTIs as outlined in reference (a).

e. A MGTI assigned as ship’s company cannot perform inspections as described in section 23.3 of this chapter on that ship. (No inspector will be permitted to inspect himself.)

23.3.2 Authorized Functions and Responsibilities

23.3.2.1 Naval Sea Systems Command. NAVSEA must provide technical authority oversight over all marine gas turbines and associated equipment. The designated NAVSEA Technical Warrant Holder must:

a. Assure safe and reliable system operation.

b. Set and enforce all technical requirements.

c. Approve all major Departures from Specifications (DFS).

23.3.2.2 Naval Surface Warfare Center, Philadelphia Division. NSWCPD must:

a. Provide support to NAVSEA for the MGTI programs. Ensure that the required technical documentation to support the MGTI Inspector programs is maintained current.

b. Establish and monitor the requirements and standards for routine and industrial inspections of marine gas turbine systems.

c. Develop, implement and maintain a program to train and certify MGTIs.

d. Ensure that inspections of newly constructed ships and ships undergoing major overhaul or conversion are conducted per this instruction.

e. Conduct periodic technical audits of the MGTI Training Course.

f. Provide management of technical data, gas turbine history and the associated repair management information database system.

g. Conduct the semi-annual MGTI seminars.

h. Maintain a roster of all certified MGTIs by name, rating, duty station, date of certification and expiration date of certification. Revoke inspector certification and initiate action to decertify inspectors who fail to comply with requirements of reference (a).

i. Ensure that the requirements for MGTI certification, recertification and certification extensions are met prior to final approval.
j. **Provide technical oversight and management of the MGTI and NSWCPD programs:**
   
   (1) Establish and enforce requirements for MGTI certification and recertification.
   
   (2) Ensure periodic MGTI seminars are conducted.
   
   (3) Ensure periodic technical audits of all Integrated Logistics Support documentation and Training.
   
   (4) Maintain the Gas Turbine Management Information System WEBLOG.
   
   (5) Routinely evaluate and ensure state of the art inspection, maintenance and repair tools and techniques are used.

23.3.2.3 **Fleet Commander.** The Fleet Commander must:

   a. Identify and designate those fleet activities which have inspection responsibilities and maintain a base of certified MGTIs within those activities.

   b. Ensure the availability of “school ships” to support MGTI Inspector training.

   c. Host the semi-annual MGTI seminars on an alternating coast basis.

23.3.2.4 **Regional Maintenance Center.** The RMC must:

   a. Provide certified MGTIs to perform inspection.

   b. Review the guidelines and inspection requirements for all gas turbine inspections required by this instruction and ensure that each inspection report is recorded and updated into the Gas Turbine Management Information System.

   c. Schedule and coordinate inspections of all marine gas turbine systems required by this instruction with the appropriate technical activities to avoid the unnecessary opening of gas turbines.

   d. Provide a qualified MGTI when requested by the ship, Immediate Superior In Command (ISIC) or TYCOM.

23.3.2.5 **Regional Maintenance Center Commanding Officers.** RMC Commanding Officers must:

   a. Coordinate inspections in cognizant maintenance areas.

   b. Maintain an up-to-date status of required marine gas turbine system inspections which must include the latest inspection for all ships assigned to RMCs in their respective area of responsibility.

23.3.2.6 **Immediate Superior In Command.** The ISIC must:

   a. Monitor the follow-up action required to correct noted discrepancies by randomly sampling the ship’s deferred maintenance action file and most recent gas turbine inspection report.

   b. Assist Commanding Officers in arranging for the corrective action of items beyond the capability of Ship’s Force, when requested.

23.3.2.7 **Ship Commanding Officer, Officer In Charge or Maintenance Team.** Ship Commanding Officers, Officers In Charge or the Maintenance Team must:
a. Request gas turbine inspections.
b. Prepare for scheduled inspections to include required operational testing.
c. Review inspection results and initiate corrective action for those items within Ship’s Force capability. Initiate requests for the correction of items beyond Ship’s Force capability. If any of the discrepancies cannot be corrected within 72 hours following completion of the inspection, or if said discrepancies will impact the ship’s operational schedule, initiate a Casualty Report for the affected gas turbine(s).
d. Assess the impact (if any) of corrective action on operating schedules and advise the operational commanders. Decide (with repair activities) the optimum timing of repair actions to minimize impact on operating schedules.
e. Submit reports.
f. Schedule gas turbine inspections as required by appropriate Planned Maintenance System (PMS) or Class Maintenance Plan item.

23.3.2.8 Marine Gas Turbine Inspectors. MGTIs are authorized and responsible for, but not limited to, performing the following:

a. Perform periodic intermediate level inspections per Gas Turbine Bulletins (GTB) and Ancillary Equipment Bulletins.
b. Perform GTRR, Assessments, post casualty investigations, pre-deployment inspections and pre-Planned Major Maintenance Availability inspections.
c. Provide troubleshooting assistance to ships and Fleet Maintenance Activities (FMA).
d. Oversee in-place gas turbine repairs if currently qualified for the specific repair.
f. Monitor compliance with configuration status accounting and technical directive reporting requirements.
g. Make engine change-out recommendations to NSWCPD via the RMCs.
h. Act as team leader (if currently qualified for specific repairs) for in-place gas turbine repairs and gas turbine change-out if attendant FMA does not have a team leader qualified for the specific repair.
i. MGTIs are part of the technical authority chain-of-command and are accountable to the NAVSEA Technical Warrant Holder for the performance of their inspection duties.

NOTE: THE SHIP’S FORCE MGTI CAN ONLY ACCOMPLISH SPECIAL INSPECTIONS AND OPERATIONAL ASSESSMENTS ON THEIR OWN SHIP. THE SHIP’S FORCE MGTI WILL ASSIST THE RMC MGTI DURING ROUTINE AND AVAILABILITY RELATED INSPECTIONS. THE SHIP’S FORCE MGTI MAY NOT INDEPENDENTLY CONDUCT ROUTINE, STRENGTH AND INTEGRITY INSPECTIONS ON THEIR OWN SHIP.
23.4 GAS TURBINE INSPECTIONS AND REQUIREMENTS.

23.4.1 Applicability.

a. All gas turbine engines on surface, amphibious or auxiliary platforms or craft of the force will be inspected as prescribed in this section.

b. Frequency of inspections of gas turbine installations by a certified MGTI will be scheduled for execution by the Commanding Officer using the Gas Turbine Assessment Class Maintenance Plan tasks issued by SURFMEPP. All Gas Turbine Readiness Review assessments and inspection will be conducted per references (a), (b) and (c), established PMS and GTB Inspection requirements as listed in reference (d). ISIC or TYCOM guidance may be solicited to avoid scheduling conflicts.

23.4.2 Pre-Planned Major Maintenance Availability.

a. Prior to planned Depot level maintenance availabilities, a routine inspection should be performed on all ship’s gas turbine engines to determine maintenance or overhaul requirements. Where possible TYCOM or ISIC should ensure there is adequate time set aside in the ships employment schedule to support these inspections.

b. Results of this inspection will be entered into the Current Ship’s Maintenance Project (CSMP) and will enable the ship to submit work requests for work accomplishment by FMAs or industrial activities during Planned Major Maintenance Availabilities.

23.4.3 Pre-Deployment.

a. Gas turbine engines must be inspected by a certified MGTI prior to deployment. A deployment is defined as scheduled operational commitments of 90 days or greater away from a ship’s homeport.

b. Discrepancies resulting from this inspection will be entered into the ship’s CSMP. Noted discrepancies provide the basis for but do not limit the work to be accomplished by Ship’s Force or FMAs prior to deployment. A follow-up inspection may be scheduled 30 to 60 days before deployment or as operational commitments dictate to verify the status of repairs. The requirement to conduct a follow-up inspection will be determined by the MGTI. Follow-up inspections will be conducted when possible by the same MGTI who conducted the initial inspection.

23.4.4 Gas Turbine Bulletin Inspections.

a. GTB Inspections are determined by engine operating hours and require scheduling 60 days prior to the inspection. Operating hours, updated monthly in the Marine Gas Turbine Information System WEBLOG via reference (e), are the engine hours used to determine inspections.

b. Reference (d) lists all Technical Directives and their revisions and amendments.

c. When GTB inspections are required coincidence with pre-availabilities or pre-deployments, they should be coordinated with pre-availability or pre-deployment inspections to minimize duplicate effort and optimize inspections.

d. Any ship not able to complete required GTB Inspections within the required periodicity will request a DFS from the TYCOM.
23.4.5 **Casualties.** Ship’s Force must conduct the initial investigation after a casualty following current directives. If Ship’s Force is unable to identify the cause of the casualty or repairs required, a certified MGTI or an RMC Technical Representative must be requested to verify the nature of the casualty, investigate for cause and make recommendations for repairs. This may be a partial inspection covering failed areas only. However, the MGTI must ensure the inspection is sufficient in scope to determine the full extent of damage and necessary repairs.

23.5 **REQUESTING PROCEDURES.**

a. Gas turbine inspections are to be scheduled by the ship per PMS, GTBs or ISIC or TYCOM directives.

b. Gas turbine inspections are actively managed by SURFMEPP utilizing the Class Maintenance Plan. All routine gas turbine inspections will be pushed by SURFMEPP to the ship’s CSMP as part of the ship’s BAWP. SURFMEPP will also push non-routine gas turbine inspections as requested by TYCOM or the Maintenance Team.

c. Once the Work Notification is available in the CSMP, the Maintenance Team may schedule the requisite inspection(s). Scheduling requests should be submitted a minimum of 60 days prior to the desired dates of routine inspections.

d. Gas turbine inspections may be conducted in conjunction with assessment programs scheduled by the ISIC or TYCOM.

23.6 **PREPARATION FOR INSPECTION.** The MGTI must send out a preparation package 30 days prior to the inspection.

23.7 **INSPECTION PROCEDURES.**

23.7.1 **Post Casualty Inspections.** For post casualty inspections, the Commanding Officer, Engineer Officer, Main Propulsion Assistant (MPA) and leading Gas Turbine Technician (GS) should meet with the inspector on his arrival and, where possible, the Engineer Officer, MPA and leading GS should accompany the MGTI during the inspection.

23.7.2 **Pre-Availability Inspections.** For pre-availability inspections, pre-deployment inspections, GTRR and Assessments, the MPA and the leading GS should meet and where possible, accompany the MGTI during the inspection.

23.8 **INSPECTION CRITERIA.** Deficiencies and out-of-specification readings or observances noted should be immediately corrected or recorded as specified in the applicable bulletin(s) and re-inspections scheduled. Three categories of deficiencies must be recorded per the guidance of paragraphs 23.8.1 through 23.8.4. Document the assessment finding of maintenance ready work notification (2-Kilo) per Volume VI, Chapter 42, paragraph 42.5.5 of this manual.

23.8.1 **Repair Before Operating.** A Repair Before Operating (RBO) is any condition existing that, if left unattended, would definitely pose a hazard to personnel safety. Only a MGTI that is currently certified may issue a RBO. RBO deficiencies require re-inspection by a MGTI that is currently certified after repairs and before the gas turbine engine is operated. A DFS will not be approved for RBOs. The following items are examples of RBO items and are not to be construed as a complete list.

   a. Conditions existing that if left uncorrected would definitely result in an uncontained failure of the engine.
b. Continuous Fuel Oil leak with puddling that poses risk of ignition.

c. Loss of structural integrity in intake or exhaust ducts which may result in personnel injury.

d. Exhaust duct crack(s) that may allow exhaust gas leakage into ship compartments.

e. Non-functional over-speed trips.

f. Lube oil leaks that exceed maximum limits in GGTB 17.

g. Any disk cracks.

23.8.2 Severely Degraded. A severely degraded condition is any condition existing that if left unattended, would pose a hazard to equipment that may result in catastrophic failure rendering the gas turbine inoperable but does not pose a hazard to personnel safety. Any condition which is designated as severely degraded requires a Major DFS. A gas turbine with a severely degraded condition cannot be operated until it is corrected or repaired and re-inspected unless it has been properly approved as a Major DFS by the Technical Warrant Holder. The following items are examples of severely degraded items and are not to be construed as a complete list.

a. Intake duct cracking that may allow foreign debris into inlet airstream.

b. Blow-In-Door (BID) discrepancies resulting in unfiltered air entering the combustion air gas path as detailed in GGTB 27.

c. Loose paneling, insulation, fasteners or other mechanical features in the inlet.

d. Bent, broken or binding Variable Stator Vane (VSV) actuation arms.

e. Compressor blade tip clang.

f. Non-functional compressor surge control bleed valves.

g. Casing cracks.

h. Bearing debris found within lube oil sumps.

23.8.3 Major Deficiencies. This finding is made when major problems exist, but the engine is still operable with restrictions. Any deficiency that has been noted as major must require either immediate correction within 30 days of discovery or a report must be submitted and updated quarterly to the TYCOM per paragraph 23.8.c of this chapter until the deficiencies are corrected or resolved or brokered by the Maintenance Manager. Major deficiencies require re-inspection, by an MGTI that is currently certified, after repairs and before the gas turbine engine is operated. This requirement does not alter the normal Casualty Reporting or DFS reporting requirements. The following items are examples of major items and are not to be construed as a complete list.

a. Improperly rigged or worn VSVs and bushings.

b. Chafed fuel oil or lube oil lines. (Beyond serviceable limits of GGTB 6)

c. Stall (no tip clang)

d. Bent or damaged blades.

e. Loose or missing casing split line bolts.

f. GTB inspection periodicity or time limits exceeded.

IV-23-7
g. Combustor liner out of specifications.

h. Degraded turbine shrouds beyond serviceable limits.

i. Eroded turbine section beyond serviceable limits.

j. Vertical or side mount out of specifications.

k. Enclosure shock mounts exceeding GGTB 10 limit.

l. Fuel nozzles not maintained per PMS or GTB.

m. Turbine thermocouples not per technical manual requirements.

n. Fuel nozzles not maintained per PMS.

o. Broken or discrepant electrical harness cannon plugs on engine controller or sensor systems.

p. Foreign Object Damage screen with cracks or missing wires that are beyond serviceable limits.

q. Excessive compressor or bleed air leaks.

r. Non-fuel hydraulic system leaks.

s. Continuous vibrations exceeding alarm limits (not to include alarms that occur during transient operations).

23.8.4 Minor Deficiencies.

a. Deficiencies exist which do not adversely affect reliability, performance or safety of the engine or operating personnel. These deficiencies, if not corrected, could result in gradual deterioration of the engine, reduced efficiency and eventually major repairs.

b. Gas turbine engine can be operated with no restrictions. Discrepancies must be entered in the CSMP and scheduled for correction at earliest opportunity.

23.9 INSPECTION RESULTS. Upon completion of inspections, the MGTI will brief the Commanding Officer, Engineer Officer, MPA and senior GS of the results. Provide information for inclusion into the ships CSMP.

a. Any RBO will be noted in Block 35 of the OPNAV 4790/2K.

b. The engine cannot be started until RBO repairs are complete and re-inspected by an MGTI.

c. A formal GTRR report must be submitted to the TYCOM Code N434 via the Navy Propulsion web site (https://propulsion.navsses.navy.mil). All Gas Turbine GTRR reporting to be in compliance with the latest revision of reference (b).

24.1 PURPOSE. This chapter contains procedures for the inspection, repair and maintenance of wood decks and structures on wood-hulled ships and craft.

24.2 WOOD DECAY.

24.2.1 Primary Causes. Wood decay is caused by a fungus growth which breaks down the cell structure within the wood. This fungus thrives in fresh water but its growth is significantly retarded by salt water. Wood decay generally occurs in those spaces which are poorly ventilated and where fresh water has gained access. Poor drainage, allowing fresh water to stand, even in small amounts, is particularly hazardous. The primary causes of wood decay found in ships using wood for hulls, decking and structures are identified as:

a. Insufficient ventilation and air circulation especially in spaces plagued by dampness and high humidity (i.e., chill room platforms and areas around fresh water tanks).
b. Obstructed drainpipes, scuppers, limbers, and drain holes.
c. Uncaulked or poorly maintained deck seams, especially around plywood decking and deckhouse areas.
d. Washing down with fresh water.
e. Depressions in the deck from sanding which allows fresh water to stand.
f. Leaking plumbing especially in heads, water closets, and food preparation areas.

24.2.2 Recognition. Decay in the deck and hull structure is often concealed and hard to detect. It is usually not recognizable by visible fungus except in joints between surfaces. Decay may be suspected if paint coating is discolored or the wood surface is cupped. The affected wood has a pronounced stringy, fibrous appearance. Thoroughly decayed wood is brittle which, when dry, breaks easily across the grain with a distinct brash fracture and may crumble into powder. Black stains spreading along the grain from ferrous metal fastenings are usually a result of chemical reactions instead of from decay fungi. Testing procedures for suspected decay areas are detailed in reference (a).

24.2.3 Preventive Measures. Detailed preventive measures are described in reference (a). General preventive measures for the reduction of wood decay are identified in the following paragraphs, and should be accomplished by Ship’s Force.
a. Correct or remove all interference with complete water runoff.
b. Repair fresh water leaks in plumbing drains and fresh water supply systems.
c. Maintain ventilation system in proper operation. Ensure ventilation system filters are kept clean, maintained clear of all foreign material, and ventilation terminals remain open.
d. Carefully caulk and maintain deck seams, especially around plywood decking, deckhouse, hull fittings and foundation areas.
e. In fair weather, open hatches and deck plates to supplement the air circulation.
f. Remove wet dunnage or shoring in below deck spaces and permit to dry.
g. Avoid washing down with fresh water. Use only salt water due to its preservation values.
h. Wash down the ship or craft with salt water following periods of inclement weather to eliminate fresh water and restore salt washed away by the rainfall.
i. Avoid heavy buildup of paint.
j. Check MCM bilges and accessible voids for standing fluids once each watch. Identify and correct any leaks and promptly remove any fluids. MCMs are designed to operate with dry bilges. Prolonged contact with fluids will result in wood swell, which can lead to external glass reinforced plastic delamination, planking damage, and machinery misalignment.

24.2.4 Corrective Measures.

a. Treat new wood, used during new construction or in repaired areas, with a copper naphthenate preservative. This product is produced in a clear and colorless form or in a bright green color. The green preservative has a higher level of copper and is considered to be the more durable and efficient of the two preservatives. If the treated wood is to be varnished, finished with light-colored paints or left bare, use the clear preservative since the green color will bleed through varnishes and light-colored paints.

b. Build up a heavy concentration of the preservative with a series of three or more heavy applications using a brush, spray or immersing the wood in a preservative filled tank. On-going protection requires periodic application of the preservative to bare wood structures at about five-year intervals. Wood treated on this basis will last indefinitely.

c. Early identification of decayed areas will allow damaged wood to be treated with an anti-decay product that will harden up the soft wood and prevent the further spread of decay. The product, available commercially, is a two-part mixture with deep penetrating properties that fills wood pores with a capillary action.

d. Before a wood structure is so badly decayed that its replacement is necessary, a possible long lasting repair is made by drilling a series of 1/4" to 3/8" diameter holes in and around the affected areas and gravity feeding the anti-decay mixture in sufficient quantity to allow total penetration of the damaged area. A guide for proper application of this product is provided with each repair kit. Avoid removing or
disturbing bad wood during repairs, since the original wood, whether good or bad, serves as a container for the product and preserves the shape and size of the affected member. Initial curing of the product takes place about one hour after application. Total curing takes place after one week, at which time the treated wood resembles petrified wood and the growth of rot in the treated area is effectively stopped. Repairs should be accomplished by Ship’s Force during regular maintenance periods.

24.3 DECK AND HULL MAINTENANCE.

24.3.1 Inspection Requirements. With reasonable care, wood-hulled ships can give many years of economical service. Make frequent inspections to detect any leaks beneath the covering board, around the deckhouse areas and seams in the deck planking. Reference (a) lists general maintenance requirements for wood-hulled ships.

24.3.2 Maintenance Policies. Specific maintenance policies and repair practices are described in the following paragraphs.

a. As a general policy, because of the ever present risk of decay developing beneath any wood coating, leave wood strip planked decks uncoated and unpainted.

b. Limit the cleaning of wood decks to scrubbing with mild detergents and salt water. Never use fresh water for wash-downs since it encourages growth of decay producing fungi. Do not use strong detergents, acids, and bleaches for deck cleaning. Do not sand decks.

c. Set up a routine of daily wetting down of wood strip planked decks with salt water. This wetting down causes strip deck planking to remain swollen and creates a tighter fit between planks. Wetting down is especially necessary during warm weather periods when the sun’s heat will quickly dry out the deck planking. Do not allow water to accumulate in deck recesses for any length of time.

d. Cover all plywood decks with a coating following the application and deck preparation procedures of reference (b).

e. Planking renewal will be approved by the TYCOM only on the basis of a technical survey that has positively shown specific need and complete justification for such renewal. Often used general terms such as "Rotten and Worn" are not considered sufficient justification. The technical basis for planking renewal must be formed in the following manner:

(1) Drill test bore holes in weather deck areas to find planking thickness in specific areas where plank wear is suspected. If the planking is not worn beyond the limits set forth in reference (b), the planking will not be renewed unless other extenuating and justifiable circumstances dictate, and replacement is authorized by the TYCOM.

(2) Take boring plug samples of planking suspected of being decayed. Notify the TYCOM of inspection results.

(3) Once planking has reached the maximum wear limits (found by bore test), the TYCOM will determine the need to replank or apply a deck coating.

f. So far as practicable, repair deck leaks by recaulking deck seams.
g. When deck planking wear limits have been reached, and other factors such as extensive deck leaks suggest use of a deck covering, a coating of polyurethane deck overlay may be used. Non-skid material must be Naval Sea Systems Command approved material compatible with the deck overlay as defined in reference (b).

h. Reset metallic planking fasteners when fastener heads are level with, or protrude above, deck level. Where the planking level is within 1/4” or less of fastener head, filling with seam filler vice wooden plugging is authorized. Where bung plugs are installed, they must be set in black polyurethane seam filler per the requirements of reference (c).

i. Ships currently having polysulfide or polyurethane coated strip deck planking in good condition must continue to use the applied covering. Make minor repairs to this polyurethane coating as necessary using either a polysulfide or polyurethane repair kit. When the polysulfide covering is no longer economically repairable, replace it with a polyurethane type coating. Repairing cracks and holes in impervious deck coatings must be accomplished as soon as practical. Failure to do so will lead to deck rot and costly repairs.

24.3.3 Deck Covering Repairs. Interior and exterior deck covering material is prescribed by Military Specifications and will be installed only as approved by the TYCOM. Repair previously installed deck coverings as necessary. Reference (b) prescribes approved materials and preparation procedures for wooden decks.

24.3.4 Caulking Techniques. Removal of old caulking from leaking seams and recaulking is the standard method for repairing deck leaks. Fill the caulked seams with a black polyurethane seam filler, per the requirements of reference (c). Before filling, caulk the seams with sufficient cotton. Seam out gaging (beveling) as specified in reference (d). Detailed instructions concerning equipment used, the preparation of seams, the method of application and primers to be used are described in reference (b).

24.3.5 Weather Deck or Planked Deck Repair.

a. Remove all loose or decayed cotton or oakum caulking after removing all seam filler. In areas where caulking is found to be in good condition, set this material deeper into the seam opening, ensuring it is driven in solidly to make room for additional caulking.

b. Small, tight seams will require a new single thread of cotton. The size of the seam in width and depth determines the amount of cotton or oakum required. Install sufficient cotton or oakum so that the level of the top of the caulking is 1/4” to 3/8” below the surface of the decking. This will allow room for the seam filler.

c. Unless marine glue (pitch) is used as a seam filler, seal the surface of the caulked cotton or oakum with a special seam primer that is compatible with the seam filler. Do not use a rubber-type seam filler over oakum.

d. Prime or fill newly caulked seams at the end of each day’s caulking to keep moisture out of the caulking material and to protect the dry surface of the deck plank seams.

e. Rubber type seam fillers that are installed in seams with a caulking gun must also be hand worked into the seam with a putty knife. This is necessary to eliminate air
pockets and voids in the seam. Hand working of the seam filler must be in one single direction to avoid air pockets.

24.3.6 Underwater Planking Repairs.

a. The forward and after rabbet must receive a thorough inspection. The rabbet seam in the stern area is covered with an anchor chafe plate and is not available for inspection or repair unless the anchor chafe plate is removed. Slack or rotten caulking allows for infestation of marine burrowers and decay which, in the case of the rabbet seams forward, goes undetected.

b. Inspect and test caulked plank seams covered with bottom sheathing for soundness whenever areas are exposed due to the removal of sheathing. In most cases, the seams have been covered for many years and have not been available for periodic maintenance. These seams, although covered with sheathing, do eventually waste away or become slack. The seams at the planking butts are more susceptible to slackening and erosion due to movement at the joints. Under normal conditions, it is necessary to recaulk these joints every 10 to 15 years.

c. If the outer strand of oakum caulking appears to be satisfactory, then the seam may be repaired by setting the existing caulking deep into the seam and adding more strands of oakum to fill the seam depth. If the old caulking is wasted away or decayed, clean out the seam and remove all caulking and residue to make room for the new material.

d. Before filling the newly caulked seam with a seam compound, paint the oakum and seam with anti-fouling paint. Painting the seam protects the oakum from marine burrowers and primes the wood in the way of the seam filler. Painting the oakum produces a hard surface finish which also makes a water barrier necessary for the protection of the oakum.

24.4 SURFACE PREPARATION AND PAINTING.

24.4.1 General Techniques. The greatest single factor affecting the performance of any paint system is the method and care used in the preparation of the surface to be coated. The preservation of wooden ships presents some unique problems not encountered in other types of ships. Reference (e) provides guidance for surface preparation materials and methods of application, techniques, and general safety precautions for painting.

24.4.2 Preparation and Painting Policies. Specific TYCOM policies pertaining to the preparation and paint application are identified in the following paragraphs:

a. The use of torches to blister the existing paint coating for removal is authorized; however, care must be taken to guard against damage to other items or equipment in the vicinity. Avoid application of heat on or near items such as electric wiring, plastics, gaskets, and all flammable materials. Use only enough heat as required to blister the paint. Excessive heat chars the wood fibers and removal of the charred wood results in an uneven surface. Remove all interferences that can reasonably be removed before applying heat. This includes all label plates, brackets, clips, etc.

b. Scraping tools used to remove blistered paint must be kept sharp to be effective. Do all scraping in the direction of the wood grain to prevent shredding of wood fibers and
gouging of the bare wood surface. This phase of paint removal is important in preparing the surface for sanding.

c. All areas stripped as previously described are now ready for sanding before priming. Hand sanding, with wooden blocks where practicable, using the correct grit paper, is the prescribed final step. Careful dusting before paint application is absolutely necessary to achieve a good primer bond, or bond between subsequent paint coats.

(1) Power disc sanders are not authorized for use in surface preparation. Improper use of the disc sander is the biggest cause of uneven surfaces and damage.

(2) Belt sanders and vibrating sanders are authorized for use in preparing the hull freeboard for priming and top-coating.

24.5 WOODEN HULL BOTTOM SHEATHING. For bottom sheathing to be effective and to provide protection to the underlying hull planking, the sheathing must fit the shape of the vessel’s contoured bottom, be securely fastened, and be fairied to the level of adjoining pieces of sheathing. The sheathing must be installed per the requirements of reference (a).

a. Sheathing the bottoms of wood vessels serves to protect the hull from burrowers, especially if the vessels are to endure long periods between dry-dockings.

b. For vessels that are active and are dry-docked annually, the use of sheathing is not required.

24.6 WOODEN SEA CHEST FOUNDATIONS.

a. To prevent overheating of the wood filler blocks and wood cap blocks in sea chests, the wood must be insulated from the metal fittings. Use of delron sleeves or bushings around the body of the through-hull fitting and around the bolt fastenings is one approved method.

b. A Cathodic Corrosion Control system using an impressed current through anodes installed on boat bottoms isolates the anode fittings with the use of delron bushings and by the application of a mastic material applied over bare wood in a 36” diameter area around the anode.

c. Replace wood fillers and caps that are badly decayed. If repairs cannot be made immediately, then treat the bad wood with a preservative or decay inhibitor to slow up the rate of deterioration until the bad wood can be replaced. When new fillers in the form of blocks and caps are fabricated, they should be treated with preservative prior to installation and after the wood has been finally shaped and fitted.

LISTING OF APPENDICES.

A  Gas Free Engineering Program Assessment Sheet

25.1 PURPOSE. To define Fleet Gas Free Engineering (GFE) inspection policy and oversight policy.

25.2 SCOPE. This chapter is applicable to all Gas Free service provided by all personnel (military and civilian) assigned to a Naval Maintenance Facility (NMF), Navy ship or submarine. NMF is defined as Regional Maintenance Center (RMC), Regional Support Group (RSG), Ship Repair Facility (SRF), and Department of the Navy Shipyards.

25.3 DISCUSSION. The correct application of GFE programs is varied and may be confusing to individuals unfamiliar with references (a) through (d).

a. During ship repair operations including shipbuilding, ship repair, ship breaking, and related employment (related employment means any employment performed as an incident to or in conjunction with ship repairing, shipbuilding, or ship breaking work, including, but not restricted to, inspection, testing, and employment as a watchman).

b. Table 25-1 shall be used to identify applicable requirements for the entity performing work.

</table>
| Non-Department of Defense (DoD) Contractors (including foreign contractors) performing any ship repair operations including hot work and entry into confined or potentially dangerous atmospheres within U.S. territorial waters. | X | | | • Non-DoD (contractor) personnel: contractor personnel conducting ship repair work on ships located inside U.S. territorial waters are required to follow reference (c) requirements whether the ship is in a government or privately owned ship repair facility.  
• NSAs shall ensure all contracts include reference (c) requirements and ensure contractor compliance. |
| Non-Department of Defense (DoD) Contractors (including foreign contractors) performing any ship repair operations including hot work and entry into confined or potentially dangerous atmospheres outside U.S. territorial waters. | X | X | | Provisions in reference (b) allow the shipboard GFE to provide GFE services to contractor personnel when the ship is located outside U.S. territorial waters. These provisions are intended solely as a last resort to accomplish mission and time critical work and are not intended to relieve contractors of the obligation to provide their own services in accordance with reference (c) whenever and wherever possible. Until this distinction can be formally addressed, the contracting office shall notify Ship’s Force whenever a contractor cannot provide their own GFE services. Ship’s Force will then seek applicable Type Commander/Echelon III N43 approval on a case-by-case basis prior to providing GFE services to contractor personnel (both foreign and U.S. nationals) outside U.S. territorial waters. |
Notes:

1. NMF is defined as Regional Maintenance Center (RMC), Regional Support Group, Ship Repair Facility, Department of the Navy Shipyards.

2. Contractor work onboard naval vessels outside U.S. territorial waters: Provisions in reference (b) allow the shipboard Gas Free Engineer to provide GFE services to contractor personnel when the ship is located outside U.S. territorial waters. These provisions are intended solely as a last resort to accomplish mission and time critical work and are not intended to relieve contractors of the obligation to provide their own certified GFE services whenever and wherever possible. Until this distinction can be formally addressed, the contracting office must notify Ship’s Force whenever a contractor cannot provide their own GFE services. Ship’s Force will then seek applicable Type Commander or Echelon III N43 approval on a case-by-case basis prior to providing GFE services to contractor personnel (both foreign and U.S. nationals) outside U.S. territorial waters.

3. Example: An Assault Craft, conducting landing craft repair work at its shore repair activity.

4. When an RMC is conducting work on a naval vessel that is located pierside, NMF personnel must follow reference (a) requirements.

5. a. Ship’s Force should follow reference (b) requirements or may obtain NMF GFE or National Fire Protection Agency (NFPA) marine chemist services, if necessary, when pierside for Ship’s Force entry into confined and enclosed spaces for inspections, preventive maintenance, and access to stowage.

b. Ship’s Force should follow reference (b) requirements or obtain NMF GFE or NFPA marine chemist services, if necessary, when pierside for hot work certifications for Ship's Force work in confined and enclosed spaces, except as noted in paragraph c. of this note. Ship’s Force will not provide hot work certification following reference (b) requirements to conduct work where DOD civilians or contractors are working in the same space or may be affected by work conducted by Ship’s Force. The afloat Gas Free Engineer must coordinate hot work aboard ship with NMF Gas Free Engineers or NFPA marine chemists aboard ship in advance of specific Ship’s Force evolutions to ensure awareness and coordination of Ship’s Force work. The afloat Gas Free Engineer must follow NMF Gas Free Engineer and NFPA marine chemist guidance as appropriate.

c. Ship’s Force, when pierside, must not certify hot work operations within, on or immediately adjacent (through heat transfer, spark or hot slag contact) to:

   (1) Spaces that contain or last contained combustible or flammable liquids or gases.

   (2) Fuel tanks that contain or last contained fuel.

   (3) Pipelines, heating coils, pump fittings or other accessories connected to spaces that contain or last contained fuel.

d. Ship’s Force, when pierside, must obtain support services for hot work operations listed in paragraph c. of this note through the local supporting NMF. When pierside in a private shipyard, optional GFE services for operations in paragraphs a. and b. of this
note and required GFE services for operations in paragraph c. of this note will be obtained from an NFPA marine chemist by Ship's Force through the governing contract with the private shipyard. If such support services are not provided for in the contract, Ship's Force must obtain required GFE services through the local supporting NMF.

e. When in a port location without services from NMF GFE or NFPA marine chemist, the afloat Gas Free Engineer will seek approval to conduct certification for emergent hot work operations referenced in paragraph c. of this note from the applicable Type Commander or Echelon III N43. Ship's Force afloat Gas Free Engineer must not provide GFE services to DOD or contractor civilian personnel under these circumstances.

f. With permission of the local supporting NMF, if conditions remain unchanged from the environment described on the confined space entry tag, afloat Gas Free Engineer may maintain certificates initially issued by NMF Gas Free Engineer or NFPA certified marine chemist referenced in paragraphs a., b. and d. of this note. If conditions change, immediately evacuate space and obtain recertification by originating NMF Gas Free Engineer or NFPA marine chemist.

g. Submarine personnel must obtain GFE services from the local supporting NMF while pierside.

6. Tenders must follow reference (b) for all repair work, on the tender itself or ships or submarines, except when the work is conducted while the vessel (tender, ship or submarine) is at an NMF at which point reference (a) becomes the governing instruction. Locations where in port GFE services are not available ensure that entry into, or hot work in or on fuel tanks, spaces in which fuel tank vents terminate, piping or equipment servicing such spaces or other confined spaces known to contain flammable fuels or fuel vapors is permitted only if approved by the Commanding Officer (CO) for each occasion as specified in paragraph 074-19.4.b of reference (b). Treat tanks as Immediately Dangerous to Life or Health and follow procedures in paragraph 074-19.14 of reference (b).

7. Non-DoD (contractor) personnel: contractor personnel conducting ship repair work on ships located inside U.S. territorial waters are required to follow reference (c) requirements whether the ship is in a government or privately owned ship repair facility. RMCs must ensure all contracts include reference (c) requirements and ensure contractor compliance.

25.4 OVERSIGHT. To ensure compliance with reference (b), the afloat GFE program on surface ships, aircraft carriers and submarines must be evaluated using the following requirements:

a. The CO must require the safety officer to evaluate the GFE program at least annually as outlined in reference (b). The safety officer, Damage Control Assistant, and submarine Medical Department Representative must use Appendix A, Gas Free Engineering Program Assessment Sheet, to conduct the annual evaluation. A copy of this report will be sent to the Type Commander (TYCOM) Safety Officer.

b. The TYCOM Safety Officer must perform an annual evaluation of the afloat GFE program and provide a report to the Fleet N43 during the first quarter of the calendar year.
(1) TYCOM, as part of the annual evaluation, must collect and analyze data from assessment results from Safety Center Surveys, Board of Inspection and Survey (INSURV) material inspections, Afloat Training Group (ATG) program assessments, crew certification and Immediate Superior In Command (ISIC) assessments.

(2) TYCOM must also spot check afloat GFE programs using Appendix A to include in the annual self-evaluation.

c. Submarine ISICs, INSURV, ATG, and TYCOM may use Appendix A to support scheduled assessments of afloat GFE programs. Table 25-2 outlines applicable sections to be assessed. Each assessing agent will have the option of expanding their assessment to other sections, if they deem necessary, based on any developing deficiency trends during the assessment. The assessing agent may elect to accept satisfactory results of another recent assessment, if it was performed within the last 3 to 6 months. Section 9 of Appendix A is the performance section that can be observed as a stand-alone event or in conjunction with planned unit drills.

APPENDIX A

GAS FREE ENGINEERING PROGRAM

ASSESSMENT SHEET

Purpose: This assessment tool is comprehensive because it reviews the GFE Program administrative requirements, training records, equipment usage, GFE personnel performance and gas free evolutions.

Directions: This evaluation will take approximately 4 to 6 hours to complete. Review the assessment sheet in its entirety before starting. To ensure a complete and thorough assessment, applicable reference material, training records, 3-M documentation, equipment and coordinated drill observation with Ships Force personnel should be pre-arranged prior to starting the evaluation.

a. If a line item requirement is met, annotate “yes” in the appropriate block.

b. If a line item is not met, annotate “no” in the appropriate block.

c. If a line item does not apply on the check sheet, depending on ship configuration, place not applicable (N/A) in the appropriate block.

NOTE: THE REFERENCES IDENTIFIED BELOW ARE SPECIFIC TO THIS APPENDIX, NOT THE MAIN BODY OF THE CHAPTER.

(i) INSURVINST 4730.8 - Reports of Trials, Material Inspections and Survey Conducted by INSURV
(j) INSURVINST 4730.3 - Trials of Surface Ships

LISTING OF APPENDICES.

A INSURV Plan of Action and Milestones

26.1 PURPOSE. To define the responsibilities and provide guidance for the preparation and conduct of a Board of Inspection and Survey (INSURV) Inspection.

26.1.1 SCOPE. The policies and actions required by this chapter are applicable to all ships of the U.S. Navy.

26.1.2 BACKGROUND. INSURV was established by Title 10, U.S. Code, Section 7304, as a board of Naval Officers to make recommendations to the Secretary of the Navy as to which vessels, if any, should be stricken from the Naval register. Additionally, per reference (a), INSURV has been tasked with providing assurance to the Chief of Naval Operations (CNO) regarding the ship’s material readiness and command’s self-assessment effectiveness.

26.1.3 DISCUSSION.

a. INSURV is charged with conducting four basic types of inspections.

NOTE: COMBINED TRIALS AND GUARANTEE MATERIAL INSPECTIONS (MI) ARE CONDUCTED ON SUBMARINES ONLY. ACCEPTANCE TRIALS AND FINAL CONTRACT TRIALS ARE CONDUCTED ON ALL OTHER SHIPS.
(1) Combined Trials or Acceptance Trials for new construction or conversion ships. Details are discussed in Volume I, Chapter 4 of this manual.

(2) Guarantee Material Inspection or Final Contract Trials for new construction or conversion ships. Details are discussed in Volume I, Chapter 4 of this manual.

(3) MI is conducted on U.S. Navy commissioned ships and submarines as discussed in this chapter and reference (a).

(4) Surveys for ships scheduled for decommissioning, Retention, Mobilization or as a Foreign Military Sale. Refer to reference (b) for additional information.

b. Detailed procedures for reporting MI deficiencies in the Maintenance and Material Management (3-M) system are contained in reference (c).

c. Milestones for inspections are shown in Appendix A of this chapter.

26.1.4 Policy.

a. As designated in reference (a), material inspections are to provide assurance to Commanding Officers and higher authority that mechanisms to identify, document and resolve material deficiencies are adequate. To this end, the ship will establish a program to complete administrative and organizational preparations for the INSURV inspection commencing approximately 12 months prior to the scheduled inspection. Ships must utilize the guidance shown in Appendix A of this chapter.

b. Adequate preparation for an INSURV inspection does not imply that all deficiencies must be corrected. The goal is to present a ship that is fully aware of all existing deficiencies. All deficiencies must be properly documented and those which are considered to be mission degrading must be reported by Casualty Report (CASREP) per reference (d). Administrative preparations, in addition to deficiency documentation, must be complete and comprehensive.

26.2 RESPONSIBILITIES.

26.2.1 Type Commander. The Type Commander (TYCOM) must:

a. Act as the cognizant authority for the conduct of INSURV inspections for all ships of the force (including new construction ships and submarines) and maintain a schedule of inspections due.

b. Nominate ships and submarines for inspections and surveys by INSURV. Promulgate schedules of inspections to be conducted by INSURV on ships of the force.

c. Schedule accomplishment of Class Maintenance Plan maintenance assessments per Volume VI, Chapter 42 of this manual.

d. Review Safety Survey results and corrective action status report provided by the ship’s Commanding Officer.

e. Track and work to resolve historical issues with systems, equipment and processes identified by INSURV.

f. Coordinate with the Immediate Superior In Command (ISIC) to disseminate the best practices and lessons learned.
26.2.2 Immediate Superior In Command. The ISIC must (TYCOM responsible if ISIC is not assigned):

a. For Surface Force Ships only, if the ISIC is deployed, the ISIC will request the numbered fleet commander assign non-deployed local Squadron to assist with inspection preparations.

b. Monitor Ship’s Force preparation for the inspection.

c. Send reports per Appendix A. Surface Ships ISIC will conduct an inspection readiness assessment prior to submitting. Develop and disseminate a standardized Schedule of Events for assigned ships.

d. Ensure preparation for the sequence of accomplishing inspection underway demonstrations is conducted in advance of inspection.

e. Ensure post inspection reporting procedures are followed.

f. Attend post-INSURV inspection critiques.

g. Ensure supporting subordinate commands are prepared for the scheduled INSURV.

h. Ensure that the ship is prepared to discuss Current Ship’s Maintenance Project (CSMP) deficiencies which have not been corrected, and those items which have been removed from the CSMP and passed to history.

i. Monitor the reporting and correction of inspection deficiencies through the CSMP.

26.2.3 Ship Commanding Officer. The Commanding Officer must:

a. Ensure that the ship is prepared for the inspection.

b. Promulgate a ship wide Plan of Action and Milestones (POAM) in preparation for INSURV.

c. Be prepared to discuss with the senior member of the board any item from the previous INSURV Inspection which is still on the CSMP, all items which were determined to be not correctable and designated “pass to history”, or those for which reporting had been deferred by the TYCOM, including supporting rationale and reference material.

d. Designate an officer as INSURV Coordinator and a Chief Petty Officer, preferably the 3-M Coordinator, as his assistant.

e. Assign a senior coordinator for each INSURV functional area as defined in paragraph 26.4.2.b of this chapter.

f. (Surface Force Ships Only) Submit a letter of concern to INSURV, TYCOM and ISIC.

26.2.4 INSURV Coordinator. The INSURV Coordinator must:

a. Brief all Department Heads on the review of the CSMP, confirm existing Job Control Numbers as valid, and report any existing deficiencies which are not in the CSMP.

b. Review the Automated Work Request (AWR) or CSMP package with the TYCOM or ISIC Maintenance Document Control Office to ensure quality (e.g., readability, proper printing and page-break by Work Center).
c. Segregate the AWR originals by INSURV departmental designations for turnover to the INSURV team.

d. Provide the original of the complete CSMP Report to the INSURV team.

e. Retain a copy of the AWRs and the CSMP for use during the inspection.

f. Distribute copies of the AWRs to Department Heads and Work Centers.

g. Collect and track all INSURV deficiencies identified during the inspection.

h. Coordinate Work Center updating of the CSMP and the processing of updated OPNAV 4790/2Ks or AWRs.

26.2.5 Regional Maintenance Centers. In support of the tasking and funding, the Regional Maintenance Centers (RMC) will:

a. Provide RMC support coordination for INSURV in each home port.

b. Upon TYCOM direction, provide a weekly or, if required, daily update for critical path inspection repairs.

c. Provide or obtain subject matter experts with the experience and system knowledge for assessment to accomplish INSURV approved procedures based on the tasking, schedule and funding provided by INSURV.

d. Provide documented subject matter experts findings to, and formatted for, INSURV.

e. Utilize subject matter expert resources in the most cost effective manner to support the tasking.

f. Develop annual INSURV budget estimate based on projected INSURV schedule. Mid-Atlantic Regional Maintenance Center INSURV Support Coordinator will correlate individual estimates for transmittal to INSURV.

26.3 INSPECTION SCHEDULING.

26.3.1 Combined Trial or Acceptance Trial Inspections. The scheduling of these trials for new construction or conversion ships will be coordinated by the TYCOM and Program Executive Officer (PEO) Submarines per Volume I, Chapter 4 of this manual and reference (e).

26.3.2 Guarantee Material Inspection or Final Contract Trials. The scheduling of the Guarantee Material Inspection or Final Contract Trials will be coordinated by the PEO Ships or PEO Aircraft Carriers per Volume I, Chapter 4 of this manual and reference (e).

26.3.3 Material Inspections. Scheduling the INSURV MI at a consistent time in the Fleet Response Training Plan will provide invaluable independent assessments of how well naval maintenance processes perform.

a. An INSURV MI will be included in a unit’s five-year plan. The desired outcome is for INSURV’s MIs to be conducted at a consistent time within the Fleet Response Training Plan, and in a manner not to interfere with carrier strike group or amphibious readiness group operations. In achieving this end state, TYCOMs will avoid scheduling INSURV MIs in the time frame between the numbered fleet commander deployment certification event (e.g., Composite Training Unit Exercise, Joint Warrior, etc.) and the end of post-deployment stand down.
(1) Surface Force Ships. The MI will optimally be conducted after the Unit Level Training phase and prior to the start of the Integrated Level Training phase, after every other deployment, not to exceed 54 months. With these scheduling considerations, the overall average time between examinations for surface ships will be about 48-54 months.

(2) Aircraft Carriers. The optimal time to conduct MIs is 60 to 90 days following the completion of the CNO maintenance availability. Avoid conducting MIs after the air wing is embarked for carrier qualification. With these scheduling considerations, the overall average time between examinations for carriers will be about 48-54 months, not to exceed 60 months.

(3) Submarines. INSURV MIs are integrated into the submarine engineered operating cycle per reference (f). MIs should be scheduled post major availability and at mid-cycle. With these scheduling considerations, the overall average time between examinations for submarines will be about 65-70 months, not to exceed 84 months.

b. Conduct of INSURV MIs outside of these time frames requires approval from Commander US Fleet Forces Command or PACFLT (N43). Material inspections of surface ships and aircraft carriers that cannot be conducted within 60 months, and submarines that cannot be conducted within either 84 months or within 180 days of completion of a major CNO availability planned for greater than 180 days in duration require a formal waiver of periodicity requirements from CNO per reference (a).

c. Scheduling the INSURV inspection at a consistent time in the Fleet Response Training Plan will provide invaluable independent audits of naval maintenance processes. Coordinating these inspections with TYCOM assessment events reduces the burden on sailors and saves money.

d. Assessment planning must be per Volume VI, Chapter 42, paragraph 42.5.4 of this manual.

26.4 PREPARATION FOR INSURV INSPECTION.

26.4.1 Active Preparation. Ships routinely must maintain their CSMP in accurate condition, continuously monitor, and accurately report their own material readiness posture per reference (d). However, due to outside agency assessments, audits, inspections and certifications the scheduling of an inspection should occur at an optimum time when full material condition awareness is maximized. Active preparation for the INSURV inspection will commence upon receipt of the TYCOM approved proposed INSURV inspection schedule. The TYCOM will notify the Commanding Officer (via the ISIC if applicable) of the proposed dates with specific guidance for the preparation and execution of the inspection. Direct and early liaison with the INSURV is essential to ensure agenda approval, facilitate travel arrangements, berthing and other similar items. Ships should make use of the information and data available at the INSURV web site (http://www.public.navy.mil/fitfor/insurv) to better understand and prepare for an inspection. Ships are strongly encouraged to liaison with INSURV regarding current material problem areas that may exist within the fleet and to actively resolve them as appropriate within their own command.
26.4.2  **Ship’s Internal Organization.** The ship will establish an internal organization for the INSURV. While the details of such an organization will vary from ship to ship, two key elements must be addressed:

a. Specific personnel assignments must be made to ensure that all necessary logistic and support arrangements for the INSURV are adequately covered (e.g., transportation, berthing, laundry, clerical assistance).

b. INSURV inspects by functional areas, which may not exactly correspond to the standard ship’s organization. For purposes of the inspection, the ship will assign one-to-one correspondence for each inspector, with a senior coordinator for each INSURV functional area. Assigned individuals should be thoroughly familiar with each CSMP deficiency, show the inspector exactly where the deficiency is, be able to explain why it has not been corrected and answer questions about related items in the same category, etc. Knowledgeable ship’s representatives are essential for a successful inspection.

26.4.3  **Updating the Current Ship’s Maintenance Project.**

a. The CSMP must be reviewed, updated and purged of all completed maintenance actions. All outstanding corrective maintenance should be documented as a deferral. This evolution is important since the CSMP is the primary source of deficiencies that will be presented to INSURV. A vital part of the review is to ensure that deficiencies are properly assessed and documented.

b. Any deficiencies noted during the pre-inspection audit will be entered in the CSMP and reissued for final INSURV documentation.

26.5  **BOARD OF INSPECTION AND SURVEY INSPECTION CONDUCT AND DOCUMENTATION.**

26.5.1  **Inspection Conduct.** The inspection will be conducted as specified in reference (g) for surface ships and reference (f) for submarines.

a. Flight operations (if applicable) and other ship evolutions will not be scheduled during the conduct of the inspection, except when scheduled in direct support of the inspection or when specifically requested by INSURV.

b. A proposed “open and inspect” list will be submitted to the ship’s assigned senior coordinator for each INSURV functional area no later than the start of the underway portion of the inspection. The senior INSURV member may modify the “open and inspect” list at any time.

26.5.2  **Deficiency Documentation.**

a. Preparation of INSURV deficiency forms will be per references (c), (h) and this instruction.

b. INSURV will provide the ship with a copy of new deficiencies found during the inspection.

c. The final forms generated by INSURV will be screened by the TYCOM following the inspection. Whenever an item is considered not cost-effective to correct or is
inconsistent with reference (c), the TYCOM will authorize passing the item to the history file.

d. Deficiencies corrected while INSURV is on board are still required to be properly documented.

26.6 POST BOARD OF INSPECTION AND SURVEY INSPECTION ACTIONS.

26.6.1 Deficiency Processing and Resolution.

a. INSURV deficiencies will be reported by entering them into the ship’s CSMP within 30 days following completion of the inspection (90 days for Naval Air Force ships).

b. Upon completion of the INSURV inspection, Ship’s Force must take the following actions:

1. With TYCOM assistance, screen all INSURV deficiencies. Identify those which are mission degrading or safety items.

2. Initiate prompt action on all mission degrading and safety items. All Part I “Mission Degrading” items and any additional items that are deemed to significantly degrade the ability of the ship to carry out its assigned mission must be documented by an appropriate CASREP per reference (d).

3. Correct all deficiencies within the capability of Ship’s Force as soon as possible. Deficiencies corrected within seven days must be documented as completed maintenance actions. All other outstanding deficiencies originated by INSURV must be incorporated into the CSMP as soon as possible but no later than 30 days following the inspection.

4. Modify deficiencies previously identified and processed to include the assigned INSURV number and any modifications, per the requirements of reference (c).

5. Comply with the requirements of reference (c) if instances occur where INSURV enters multiple deficiencies under a single INSURV number.

26.6.2 Post INSURV Inspection Reports. INSURV will issue a final report per reference (i). The report will contain a recommendation on the material condition of the ship per reference (a).

26.6.3 Unsatisfactory Finding. Upon a finding of “Unsatisfactory” by the Board of Inspection and Survey:

a. The ship must submit by message to the ISIC or TYCOM, an analysis of the causes of the Part I deficiencies found during the INSURV inspection and a plan of corrective actions within one week after completion of the inspection. This plan should include estimated completion dates for the corrective actions that will be performed by the ship. For corrective actions that are deferred to a Fleet Maintenance Activity, the Naval Supervising Activity Lead Maintenance Activity must provide to the ship and the TYCOM estimates or recommended dates for the corrective actions that will be performed by the Fleet Maintenance Activity.

b. The TYCOM will coordinate and direct all actions associated with restoring the ship to operational readiness for those Part I deficiencies judged unsatisfactory or
incomplete by INSURV. The TYCOM must submit to the appropriate chain of command a POAM to correct these Part I deficiencies and restore the ship to operational readiness. In addition, the TYCOM must:

(1) Evaluate the ship’s and ISIC preparations for the INSURV inspection.

(2) Review corrective actions and training plans submitted by the ship. Ensure these plans not only correct the specific deficiencies noted by INSURV, but that they also address the fundamental underlying causes of the deficiencies.

(3) Take action as required to assist in correcting the Part I deficiencies (e.g., scheduling, outside technical assistance, training, etc.).

(4) Re-examine those areas that were judged unsatisfactory or incomplete within 60 days of the completion of the INSURV inspection. Report the results to the appropriate chain of the command and to INSURV.

(5) Report by message to the appropriate Fleet Commander when the ship is adequately restored to operational readiness.

LISTING OF APPENDICES.

A Sample Steam Reboiler Inspection Request
B Sample Inspection Confirmation Message
C Sample Steam Reboiler Inspection Report Cover Letter
D Sample Boiler Inspection RBO or Severely Degraded Deficiencies Message
E Sample 30 Day Update Message

27.1 PURPOSE. To establish policy and provide procedures and inspection requirements for Steam Reboilers and support systems, including:

a. Inspection scheduling.

b. Required preparations for inspections.

c. Inspection guidelines.

d. Reporting requirements.

27.2 POLICY. Periodic standardized inspections are required of all Steam Reboiler and associated support systems including outlet and inlet steam piping, safety devices, feed water and drain systems, control and indicating systems associated with maintaining system pressure and water level controls. Specific inspection criteria, attributes and intervals are detailed in references (a) and (b). Inspections will be conducted by a certified Steam Generating Plant Inspector (SGPI), Naval Surface Warfare Center, Philadelphia Division (NSWCPD) inspector and Ship’s Force per the requirements of references (a), (b) and (c). Responsibilities for standardization of Steam Reboiler inspections will closely parallel those requirements and responsibilities of the boiler inspection program described in reference (b), as modified by references (a) and (d).
27.3 TYPES OF INSPECTIONS.
   a. Annually.
   b. Eddy current inspections (ECI).
   c. Routine (RTE).
   d. Pre-Start of Availability Inspection (PSAI).
   e. Start of Availability Inspection (SAI).
   f. Strength and Integrity (S & I).
   g. Completion of Availability Inspection (CAI).
   h. Special.
   i. Industrial Support Visit (ISV).
   j. Inactivation or Reactivation Inspection.
   k. Pre and Post Operational Assessments

27.4 RESPONSIBILITIES.

27.4.1 Naval Sea Systems Command. Naval Sea Systems Command (NAVSEA) must provide Technical Authority oversight for all Steam Reboilers and associated equipment. The designated NAVSEA Technical Warrant Holder must:
   a. Assure safe and reliable system operation.
   b. Set and enforce all technical requirements.
   c. Approve all major Departure From Specifications (DFS).
   d. Provide technical oversight and management of the SGPI and NSWCPD.
      (1) Establish and enforce requirements for SGPI certification and recertification.
      (2) Ensure periodic SGPI seminars are conducted.
      (3) Ensure periodic technical audits of all Integrated Logistics Support documentation and Training.
      (4) Maintain the Steam Reboiler Inspection and Repair Management Information System (RIRMIS).
      (5) Routinely evaluate and ensure state of the art inspection, maintenance and repair tools and techniques are used.

27.4.2 Naval Surface Warfare Center, Philadelphia Division.
   a. Provide support to NAVSEA for the SGPI and NSWCPD Life Cycle Engineering Manager (LCEM) programs. Ensure that the required technical documentation to support the SGPI and NSWCPD-LCEM Inspector program is maintained current.
   b. Establish and monitor the requirements and standards for routine and industrial inspections of Steam Reboilers.
c. Develop, implement and maintain a program to train and certify NSWCPD inspectors per references (b) and (c).

d. Ensure that inspection of newly constructed ships and ships undergoing major overhaul or conversion are conducted per this instruction.

e. Conduct periodic technical audits of the SGPI Training Course per references (b) and (c).

f. Provide management of technical data, reboiler history and the associated repair management information database.

g. Provide technical support to the SGPI seminars.

h. Maintain a roster of all certified SGPIs by name, rating, duty station, date of certification and expiration date of certification. Recommend inspector certification and initiate action to decertify inspectors who fail to comply with the requirements of references (b) and (c).

i. Ensure that the requirements for SGPI certification, recertification and certification extensions are met prior to final approval.

j. Conduct SAI, ISV, Strength and Integrity Inspections, CAI and special inspections as specified in section 27.6 of this chapter and references (b) and (c).

27.4.3 Type Commander.

a. Arrange for certified SGPIs to perform inspections per the requirements of references (a), (b) and (c).

b. Schedule inspections of all Steam Reboilers and support systems required by reference (a). Coordinate the inspections with the appropriate technical activities to avoid unnecessary opening of Steam Reboilers.

c. Assist Commanding Officers in arranging for the corrective action of deficient items which are beyond the capability of Ship’s Force to perform. Monitor the follow-up action to correct these deficiencies.

d. Review the RIRMIS to ensure deferred inspection deficiencies are entered into the Current Ships Maintenance Project (CSMP) and are planned or programmed for repair.

27.4.4 Regional Maintenance Center.

a. Provide certified SGPIs to perform inspections per section 27.7 of this chapter.

b. Review the guidelines and inspection requirements for all Reboiler inspections required by this instruction and ensure that each inspection report is recorded and updated into RIRMIS.

c. Schedule and coordinate inspections of all reboilers required by this instruction with the appropriate technical activities to avoid the unnecessary opening of reboilers.

d. Provide a qualified SGPI when requested by the ship, Immediate Superior in Command (ISIC) or Type Commander (TYCOM).
e. Provide certified Subject Matter Experts (SME) to perform inspections per paragraph 27.4.10 of this chapter.

27.4.5 Regional Maintenance Center Commanding Officers.

a. Coordinate inspections in cognizant maintenance areas.

b. Maintain an up-to-date status of required Reboiler inspections, which shall include the latest inspection for all ships assigned to RMCs in their respective area of responsibility.

27.4.6 Immediate Superior In Command.

a. Maintain overall cognizance of the Steam Generating Plant Inspection Program within their area of responsibility to ensure requirements and standards are met.

b. Schedule routine Reboiler inspections in coordination with the cognizant RMC.

c. Arrange for the availability of an SGPI during the SAI and CAI in coordination with NSWCPD and the cognizant RMC.

d. Monitor the follow-up action required to correct noted discrepancies by randomly sampling the ship’s deferred maintenance action file and most recent Reboiler inspection report.

e. Assist Commanding Officers in arranging for the corrective action of items beyond the capability of Ship’s Force, when requested.

27.4.7 Ship’s Commanding Officer.

a. Request inspections via Naval Message with desired primary and alternate dates to the Type Commander (TYCOM) with info copies to cognizant Regional Maintenance Center (RMC) and NSWCPD for accomplishment of inspections using the format in Appendix A.

b. Prepare for the scheduled inspections to include required operational assessment in accordance with references (a), (b) and (c).

c. Conduct Ship’s Force responsible (Annual) inspections as required by references (a) and (c).

d. Review inspection results and initiate corrective action for those deficiencies within Ship’s Force capability. Initiate requests for those actions beyond Ship’s Force capability and those items that are identified as being deferred. Submit a Casualty Report per reference (e) for any discrepancies that will impact operational schedule.

e. Assess the impact of corrective actions on the ship’s operating schedules and advise the TYCOM and operational commanders of any adverse effects. Decide (with repair activities) the optimum timing of repair actions to minimize impact on operating schedules.

f. Submit reports per paragraph 27.8.2 of this chapter.

g. Schedule boiler inspections as required by appropriate Planned Maintenance System (PMS) or Class Maintenance Plan item.

27.4.8 Regional Maintenance Center Senior Inspector. RMC Senior inspectors must:
a. Ensure all assigned SGPIs maintain current SGPI certificates per reference (b) and (c).

b. Perform Steam Reboiler inspections per references (a), (c) and section 27.7 of this chapter.

c. Review and submit reports per paragraph 27.8.2 of this chapter.

d. Coordinate inspections in cognizant maintenance areas.

e. Send inspection confirmation message using Appendix B of this chapter.

f. Maintain an up to date list of required Steam Reboiler inspections which must include the latest inspections for all ships assigned to their geographic area of responsibility.

27.4.9 Steam Generating Plant Inspector.

a. Maintain certification per the requirements of reference (b) and (c).

b. Perform Reboiler inspections per the requirements of references (a), (c) and section 27.7 when directed.

c. Steam Generating Plant Inspectors (SGPI) are part of the technical authority chain-of-command and are accountable to the NAVSEA Technical Warrant Holder for the performance of their inspection duties.

27.4.10 Regional Maintenance Center Steam Subject Matter Expert.

a. Review job specifications during work package development for completeness, adherence to proper technical documentation and requirements, and ensuring the work packages include proper repair procedures.

b. Providing guidance, instruction and technical direction for evaluation and oversight of all shipboard steam generating plant repairs or overhauls performed locally by the RMC, as well as on naval ships or at naval or private shipyards located throughout the world.

c. Provide technical oversight on all scheduled and emergent work performed by the overhauling activity personnel, contractors and Ship’s Force (as required). This work includes scheduled depot level maintenance, major disassembly, repair, reassembly and testing of steam generating plants and their auxiliary systems.

d. Attend periodic maintenance production meetings to assist in scheduling of events during the overhaul/availability and resolve technical issues. Attend other meetings as required to assist in schedule and funding issues for the project.

e. Resolve technical barriers to the work effort and provide solutions to technical issues regarding shipboard steam generating plant repairs or overhauls.

f. Coordinate all aspects concerning operation and testing (including support systems) with RMC, Ship’s Force, SGPIs, and repair contractor to support pier side and underway operational assessments tests.

27.5 INSPECTION SCHEDULING. Commands will initiate inspection requests to assist with inspection coordination. Commands must ensure that the inspection scheduling complies with reference (c) and Commanding Officers must request Steam Reboiler inspections by message.
using the format in Appendix A. In addition, an OPNAV 4790/2K must be submitted to the RMC requesting a certified SGPI or NSWCPD inspector as required to conduct inspections.

27.6 SAFETY PROCEDURES.

a. Ensure idle Steam Reboiler condition is accomplished following the provisions of the Steam Plant Manual and reference (a) in preparation for the inspection.

b. Ensure all safety precautions associated with entry into sealed tanks, voids or pressure vessels including gas-free certification are performed per the requirements of references (f), (g), and Chapter 23 of this volume.

c. Ensure proper maintenance barriers are established per the requirements of Chapter 10 of this volume.

d. Station an attendant outside the Steam Reboiler to provide assistance when maintenance and inspections are performed on the Steam Reboiler internals.

e. Ensure all precautions and warnings cited in Chapter 5 of reference (a) are followed when conducting maintenance and inspections.

f. Maintain accountability of all items taken into the Steam Reboiler. Foreign material exclusion enclosures will be used to the maximum extent practical to prevent tools or other foreign materials from being inadvertently left in the Steam Reboiler or associated ship’s systems.

(1) Personnel entering Steam Reboilers will empty their pockets of all unnecessary items.

(2) Removal of all items and foreign material exclusion enclosures from the Steam Reboiler will be verified and accounted for prior to conducting a final closeout inspection.

(3) Final closeout inspection of the Steam Reboiler must be accomplished by the Reactor Officer or his designated assistant.

27.7 STEAM REBOILER INSPECTIONS AND REQUIREMENTS. Steam Reboiler inspections conducted per references (a), (b) and (c) must fulfill all other Steam Reboiler inspection requirements. All boiler inspections, including pre- and post-operational assessments, should be scheduled for coincidental performance. Appendix A of this chapter is a summary of Reboiler inspection scheduling and responsibilities. Reboilers will be inspected by a certified SGPI at the intervals identified in paragraphs 27.7.1 and 27.7.2 of this chapter.

27.7.1 Eddy Current Inspection. Eddy Current Inspection (ECI) must be accomplished at Post Shakedown Availability and every 32 months, per reference (g).

a. The ECI will be scheduled by Planned Maintenance System (PMS) 312.

b. The ECI will be performed by personnel trained and qualified in the use of ECI equipment and ECI data interpretation.

27.7.2 Routine Inspection. RTE Inspections will be conducted at least once every 32 to 36 months by SGPI certified personnel in accordance with OPNAVINST 9220.3 and shall not exceed 42 months from its last inspection. The normal interval between RTE inspections shall be 32 months. To provide scheduling flexibility, inspections may be performed as early as 24
months or as late as 42 months. Inspections that exceed the 32 month interval will require a minor Departure from Specifications (DFS) to the TYCOM with concurrence from NSWCPD Code 412. Extensions shall not result in the inspection interval exceeding 42 months. Any reboiler which exceeds the inspection interval of 42 months shall be placed out of commission until inspected by a certified SGPI. A major DFS with NAVSEA TWH approval is required to operate beyond 42 months without an RTE Inspection. The inspection shall be documented in the RIRMIS.

a. The Routine inspection will be scheduled by the TYCOM.
b. The Routine inspection will be performed by a certified SGPI.
c. The Routine inspection will be conducted concurrent with ECI or tube renewals.

27.7.3 Pre-start of Availability Inspection. The PSAI may be required at the discretion of the TYCOM to support early bid specification and work package development.

a. The PSAI will be scheduled by the ISIC, as approved by the cognizant TYCOM.
b. The PSAI will be performed by an NSWCPD inspector and the cognizant SGPI.

27.7.4 Start of Availability Inspection. The SAI will be accomplished at the beginning of an availability to better define or re-evaluate the Steam Reboiler bid specification and identify those major items which may impact ship’s operational schedule.

a. The SAI will be scheduled by the TYCOM or PMS 312.
b. The SAI will be performed by a NSWCCD Inspector and the cognizant SGPI.

27.7.5 Strength and Integrity Inspection. The normal interval between S & I Inspections shall be 64 months. S & I Inspections may be performed as early as 54 months or as late as 72 months after the last S & I Inspection to provide scheduling flexibility. S & I Inspections shall not exceed 72 months since the last inspection. Any reboiler which exceeds the inspection interval of 72 months shall be placed out of commission until inspected by an NSWCPD Code 412 inspector and a certified SGPI. A major DFS with NAVSEA Technical Warrant Holder (TWH) approval is required to operate beyond 72 months without a Strength and Integrity Inspection.

a. The Strength and Integrity inspection will be scheduled by PMS 312.
b. The Strength and Integrity inspection will be performed by an NSWCPD inspector and the cognizant SGPI.
c. The Strength and Integrity inspection will be conducted concurrent with ECI or tube renewals.

27.7.6 Industrial Support Visit Inspection. The ISV inspection must be scheduled during the availability but may be waived by the TYCOM for availabilities of short duration.

a. The ISV inspection will be scheduled by the industrial activity or supervising authority as applicable.
b. The ISV inspection will be performed by an NSWCPD inspector and the cognizant SGPI.
27.7.7 Completion of Availability Inspection. The CAI will be conducted prior to final close out of the Steam Reboiler shell watersides.

a. The CAI inspection will be scheduled by the industrial activity or supervising authority as applicable.

b. The CAI will be performed by an NSWCPD inspector and the cognizant SGPI, preferably the same NSWCPD inspector or SGPI who conducted the SAI.

c. The inspection report will be dated when steam is aligned to the reboiler. This will reset the periodicity for both the RTE and the S & I Inspection.

27.7.8 Inactivation or Reactivation. The Inactivation or Reactivation inspection must be conducted on all Steam Reboilers prior to the completion of the inactivation or reactivation.

a. The Inactivation or Reactivation inspection will be scheduled by the industrial activity, Supervising Authority and Inactive Ship Facility as applicable.

b. The Inactivation or Reactivation inspection will be performed by an NSWCPD inspector and the cognizant SGPI.

27.7.9 Special Inspection. An additional Steam Reboiler inspection when the TYCOM desires to assess the material condition of the Steam Reboilers.

27.7.10 Annual Inspection. An Annual inspection of the reboiler (shell side) will be conducted, as directed by references (a) and (c), by Ship’s Force.

27.7.11 Operational Assessments. An operational assessment must be accomplished prior to and at the completion of all Chief of Naval Operations scheduled maintenance availabilities. These assessments are part of the Routine Strength and Integrity inspection requirements. These assessments will include both cold and hot plant in-port safety checks and an operational evaluation per Chapter 5 of reference (a).

27.8 REBOILER INSPECTION GUIDELINES AND REPORTS.

27.8.1 Guidelines.

a. Inspections conducted under paragraph 27.7.5 of this chapter normally encompasses the pressure vessel portion of the Steam Reboiler and associated piping connections as outlined by reference (c) and is conducted by NSWCPD inspectors accompanied by a certified SGPI. Other areas such as, Steam Reboiler controls and Steam Reboiler appurtenances, must be inspected as part of the Routine inspection prior to Steam Reboiler lite-off by a certified SGPI. Inspections to coincide with ECIs or tube renewals.

b. Routine inspections of Steam Reboilers will be conducted by certified SGPIs. Only an SGPI with a current certification may issue a Repair Before Operating (RBO) deficiency.

c. All RBO items must be corrected and re-inspected by a certified SGPI or NSWCPD inspector, and preferably by the same SGPI or NSWCPD inspector who originally identified the discrepancy prior to operation of the reboiler. RBO discrepancies include those for which continued unrestricted operation could endanger personnel. RBOs may not be departed via DFS. If there is not an immediate or near future
danger to personnel, the discrepancy must be assigned as SEVERELY DEGRADED with major operational restrictions.

d. An SGPI-designated discrepancy discovered in accordance with reference (a) and paragraph 27.10.2 of this chapter which is assigned as severely degraded with major operational restrictions, and is considered for a DFS submission, is a major DFS and must be brought forward to the attention of the NAVSEA Boiler and Condenser Technical Warrant. A Major DFS must be forwarded for NAVSEA review and approval with accompanying engineering analysis recommendations from the originator. A severely degraded discrepancy in accordance with this chapter must be corrected or repaired prior to reboiler operation unless it has been properly approved as a Major DFS.

e. The status of a reboiler related DFS will be verified by the SGPI during the inspection for conformance with the requirements of this manual prior to placing the reboiler into operation.

f. Whenever Steam Reboilers are in a stand down status for routine maintenance or disassembly, an inspection should be conducted simultaneously. Prepare the Steam Reboiler as described in section 27.9 of this chapter for inspection of the Steam Reboiler shell watersides and Steam Reboiler controls and appurtenances.

g. All deficiencies should be corrected as soon as possible, consistent with good engineering practices.

27.8.2 Reports.

a. The NSWCPD Code 412 inspector or SGPI must provide an oral critique and preliminary report to the ship’s Commanding Officer or his designated representative. The report will contain the findings of the inspection, with note of recurring discrepancies from previous inspections. The SGPI shall ensure a maintenance ready 2-Kilo for every discrepancy found during the inspection is entered into the Current Ship’s Maintenance Project.

b. The Senior inspector will forward a copy of the RIRMIS report with cover letter per sample shown in Appendix C to the ship’s Commanding Officer no later than ten days after completion of all discrepancies.

c. The SGPI must report all RBO deficiencies discovered during the inspection to the TYCOM and ship’s Commanding Officer by message, using the format in Appendix D, within 24 hours. This message shall contain both RBO and severely degraded deficiencies as described in paragraph 27.10.2 of this chapter.

d. The SGPI must report by message to the TYCOM the correction and re-inspection of all RBO deficiencies prior to start-up of an inspected Steam Reboiler.

e. The ship’s Commanding Officer must submit a copy of the Current Ship’s Maintenance Project to the SGPI for verification of 2 Kilos.

f. The ship’s Commanding Officer shall report corrected deficiencies, by message, to the ISIC and TYCOM using the format in Appendix E of this chapter, within 30 days of the completed inspection and at 30 day intervals thereafter until all deficiencies are
corrected or deferred to a CNO Maintenance Availability. The TYCOM is the sole authority for deferral of deficiencies. Update messages shall list the RIRMIS item number/2K Job Sequence Number of those items which have been completed since the last update message.

g. The ship’s Commanding Officer must notify the TYCOM when a scheduled Steam Reboiler inspection cannot be conducted by submitting a DFS request. State the reason why the inspection cannot be conducted and recommend a revised date.

27.9 STEAM REBOILER INSPECTION PREPARATION.

a. Conduct the pre-operational assessment prior to start of availability. Ship’s Force will demonstrate the performance of the reboiler electronic controls, including the uninterruptible power source and safety devices per the guidance provided in reference (a) and documented in RIRMIS.

b. Prepare the boiler using the guidance provided in reference (b).

c. The ship’s Reactor Officer shall ensure all Ship’s Force responsibilities are complete using the guidance provided in reference (a).

d. Wire shut and danger tag all steam and water valves to the Steam Reboiler using the Steam Plant Manual and reference (a) as guidance.

e. Open manway, ventilate and gas free. Notify SGPI that watersides are available for inspection. The purpose of this inspection is to assess the effectiveness of the Steam Reboiler chemistry control procedures. Detailed waterside inspection will be conducted after completion of cleaning if determined by the inspector that a cleaning is necessary. Mechanically clean watersides to be inspected.

f. Install temporary plugs in all nozzles, to prevent foreign debris from entering piping systems.

27.10 STEAM REBOILER INSPECTION.

27.10.1 Steam Reboiler Inspection Forms. Steam Reboiler inspections will be conducted using the appropriate RIRMIS forms. Include specific comments on the state of preservation and material condition of the Steam Reboiler.

27.10.2 Reboiler Repair Before Operate Criteria. A discrepancy is classified as an RBO which, if left uncorrected, could endanger personnel safety. All RBO items shall be corrected prior to reboiler operation and re-inspected by a certified SGPI or NSWCPD Code 412 Inspector as applicable, preferably the same SGPI or NSWCPD Code 412 inspector who originally inspected the reboiler. RBO deficiencies may include but are not limited to the following:

a. Inoperative or misadjusted safety devices.

b. Lube oil contamination of control systems.

c. Control equipment inoperable in their automatic mode or failed cold checks.

d. Steam Reboiler that does not pass design hydrostatic test.

e. Non-deferrable defects or indications in the pressure vessel boundary.
f. Ultra-sonic tests on pressure vessel piping that are less than minimum requirements, or when visual inspection dictates replacement.

g. Tube leakage.

h. Out of periodicity, in-operative critical temperature or pressure measuring instruments.

i. Valve tightness integrity and operation which limits its ability to perform its intended function and exceeds the criteria of reference (i).

j. Non-conformance of electrical safety and deteriorated or damaged wiring or components.

l. Any other discrepancy deemed by the SGPI which will cause injury to personnel.

NOTE: A SEVERELY DEGRADED DESIGNATION IS ASSIGNED TO A DEFICIENCY THAT IS NOT AN IMMEDIATE OR NEAR FUTURE DANGER TO PERSONNEL, BUT WILL HAVE MAJOR OPERATIONAL RESTRICTIONS. A SEVERELY DEGRADED DISCREPANCY PER THIS CHAPTER MUST BE CORRECTED OR REPAIRED PRIOR TO REBOILER OPERATION UNLESS IT HAS BEEN PROPERLY APPROVED AS A MAJOR DFS.

27.10.3 Completion of Inspection. An oral critique and a preliminary inspection report, including a summary of restrictive deficiencies, will follow the inspection. Paragraph 27.8.2 of this chapter identifies official reporting requirements.

27.11 STEAM REBOILER CONTROL SYSTEMS AND ONLINE VERIFICATION GUIDELINES. Control systems which include steam pressure and water level controls have been designed and installed for the purpose of maintaining a steady pressure and volume of low-pressure steam throughout the hotel steam piping system.

a. Ships must use controls at all times while the reboiler is in operation. Remote manual operation must be used when the reboiler is placed in operation and while securing. When the Electronic Automatic Boiler Control system cannot be operated in automatic, this must be reported via a Steam Plant Action Request (SPAR) to NSWCPD Code 412 or Code 518 and NAVSEA 05.

b. Prior to operating the reboiler, all applicable testing must be completed per the Steam Plant Manual.

c. Maintenance and calibration of the Electronic Boiler Control systems must be accomplished by qualified technicians following the direction provided in applicable PMS and the manufacturer’s technical manual.
